The development of culture is associated with historical and social conditions, creating conditions for cultural activities, and culture also brings a new face to society. The new cultural elements of society originate from the new nature and level of labor. Culture promotes development and is the result of development, a measure of human and social development. Perfecting humanity, human personality, developing a just and civilized society, for human freedom and happiness, that is the highest cultural value. That is also the deepest goal of culture. At present, the investment in effective development of human resources not only strengthens the endogenous creative labor source of the national culture, but also enhances the ability to master technology, competitiveness and absorb modern scientific achievements.

THE PROCESS OF TAKING OVER AND UNIFYING THE BANKING SYSTEM IN VIETNAM AFTER 1975 - POLICIES ON RESOLVING CONFLICTS DURING THE TRANSFER PROCESS

PhD. Pham Thi Hong Ha

honghalsvn@gmail.com

Institute of History, Vietnam Academy of Social Sciences, Vietnam

Abstract

Unlike 1945, after the successful August Revolution, the revolutionary government could not take over the Indochina bank, which was still in the hands of the French at that time, however, one of the successes of the revolution after the liberation of the South and the reunification of the country in 1975 was that the revolutionary government took over the entire banking system of the Saigon regime. The article clarifies about one of the economic management policies of the Vietnamese government after the liberation of the South Vietnam in 1975. Through the study of the process of merging and unifying the banking system between South and North Vietnam, on the basis of original documents from the National Archives Centers and State Bank Archives, the article shows the ways that the Vietnamese government took to minimize conflicts during that transfer. The article shows two main measures by which the Vietnamese took over and unified the banking system: First of all, it made careful calculations based on the legal basis to build the legality for the takeover and inheritance of the entire banking system of the former Saigon's regime as well as its assets inside and outside Vietnam. Second, even while the country was still at war, it had prepared material and human conditions for the process of bank takeover and unification. The use of staff of the former Saigon's regime as an important force in the process of merging and unifying the banking system had contributed to minimizing the friction of the transfer process.

Keywords: *Unification, Banking system, Economic policy*

1. Introduction

When any country is invaded and divided, the damage to the territorial unity and integrity is always shown most clearly. Therefore, national unification is a long and complicated process. That unity is reflected in many fields, in which it is especially important in terms of territory, institutions and economy.

After April 30, 1975, in Vietnam, there were two entities: the North was a centrally planned economic model, while in the South, due to the policy of colonialism the capitalist elements had penetrated strongly into all economic sectors and oriented the South's economy to develop along the capitalist path. Especially at this time, the situation of money circulation in both regions of the country was quite complicated, while the banking systems in the two regions were also built according to different models.

Meanwhile, money and banking, which are reckoned as the nervous system of the economy, were well prepared for takeover and unification after liberation day. The Vietnamese government had issued many legal documents, forming a system of policies on monetary, credit, payment and foreign exchange to operate monetary and banking activities uniformly across the country. Therefore, the study of the banking unification process in Vietnam since 1975 will contribute to the identification and assessment of the Vietnamese economy in this period in general and the economic management and administration of the Vietnamese government in particular in a more specific, positivistic and profound way.

The article focuses on clarifying the process of unifying the banking system in Vietnam after the liberation of the South and reunification of the country. The article points out the main reasons contributing to minimizing conflicts of interest, legal as well as emotional in the process of transferring and unifying the banking system.

Up to now, historical and economic researchers have had a lot of research works, monographs on Vietnam's banking activities, banking history from historical or economic perspective:

- *Vietnamese authors:*

In 1981, the book titled "*30 years of Currency - Credit - Banking*" of the State Bank of Vietnam provided knowledge about currency, credit and finance in Vietnam through historical periods and on different regions of the country such as the North, the Central and the South. In particular, the work introduced and analyzed the history of the Vietnamese currency, along with images of money samples over time, the role of the national bank in credit allocation and currency issuance.

On the occasion of the 50th anniversary of the establishment of the State Bank of Vietnam, in the special issue of Banking Review in 2001, scholars, former bank leaders, and bank officials or those who participated in the bank takeover after the liberation of the South published a number of articles. Typical were articles such as: "*Unifying the Country, Unifying the Monetary -Banking System*" by Pham Ngoc Phong, "*The Journeys of Operation and Struggle on the Finance - Currency - Banking front*" by Hong Linh, "*Taking Over the Southern Banking System in 1975*" by the author with the pseudonym N.C.T, "*Journey to the Office Central Bureau of the South to Take Over Saigon - Gia Dinh*" by Le Hoang. These works were about the takeover of Saigon's banking system. Some of the works were the memories of those directly involved in the takeover. The takeover policies, the preparation for the unification of the two South - North banks have been mentioned vividly and truthfully in the above articles.

One of the prominent researchers on modern Vietnamese economic history was Dang Phong The book "*History of Bank for Foreign Trade of Vietnam 1963-2003*" by Dang Phong published in 2003, records the achievements of the Bank for Foreign Trade of Vietnam in different revolutionary periods, especially the time of implementation of aid for the southern revolution during the years of resistance against the US and the early period of market economy access. The work also analyzes Bank for Foreign Trade of Vietnam's activities, the takeover and currency exchange in the South of Vietnam in the early days after liberation. In 2015, Duong To Quoc Thai published the article "*The Process of Taking over and Reorganizing the Banking System in South Vietnam after liberation (1975 - 1979)"* on the Journal of Historical Research, No. (474), p. 38-49, 75; The article analyzes the process of restructuring the banking system in the South by the Provisional Revolutionary Government of the Republic of South Vietnam with the main tasks such as: establishing state management rights over the entire banking system; take over vaults, mortgage shops, records of all kinds, books, invoices, vouchers...

In 2016, the State Bank of Vietnam published the work "*History of Vietnam Bank*", National Political Publishing House, Hanoi. This work records important milestone of the banking industry in both the South and the North Vietnam, in which chapters 9, 10 and 11 of the book refer to some banking activities in Vietnam since 1975.

- *Foreign authors*

Ten years after reunification, in 1985, Rüdiger Machetzki, published the book "*Vietnam in 1985: The Fettered Economy*" published in Southeast Asian Affairs (1986), pp. 353-365. The work refers to the economic development results of Vietnam after 10 years of reunification The author believes that although Vietnamese leaders see this period as a "shining" chapter in Vietnam's modern history, there were setbacks in the economic field. According to the author's assessment and conjecture, the economic reforms in the years 1979-1985 only led to patchy results and political and ideological opposition.

In 1989, Tetsusaburo Kimura - scholar of the Kyoto Institute of Developing Economies published the work: *The Vietnamese Economy 1975-1986 Reforms and International Relations*. The work is a macro analysis of the Vietnamese economy after reunification, emphasizing the level of economic growth and the inefficiency of foreign aid. The author believes that when "reunifying" the country, the government of the Socialist Republic of Vietnam has applied the economic model of the North to the South. The consequences of the process of "Northernization" led to an economic crisis across the country. Although Vietnam carried out partial "reforms", it ended up falling into a financial and economic crisis after the September 1985 monetary reform.

With the same interest in research on Vietnam's economy in the transition period, in 1996, Adam Fforde and Stefan de Vylder published a book "*From Plan to Market: The Economic Transition in Vietnam*", Boulder and Oxford: Westview Press. The book consists of 9 chapters that deal with aspects of Vietnam's economy during the transition period that began when North Vietnam adopted the command economy model under the government of the Democratic Republic of Vietnam and was extended until the post-unification period (1957-1979).

The above studies have brought a multi-dimensional view of the Vietnamese economy, Vietnamese government's economic policies and limitations of the Vietnamese economy after the reunification of the country. However, most of the above works have not explored deeply into Vietnamese government's specific measures and policies to minimize conflicts in the process of transferring and unifying the banking systems of the South and North Vietnam as well as difficulties in diplomatic and monetary relations that Vietnam was facing at this time. The use of original documents, which are executive instructions and investigation and statistical data on the financial and banking situation of the former Saigon government and of foreign banks during that time in Saigon, which are stored at the Archives Centers in the above works, is still missing. This article will try to supplement the above limitations.

2. Method

Historical method and logical method are the two main methods used in the research process. The article exploits many original sources of documents stored at the National Archives Center II - where most of the documents and reports on economic activities in general and the operation of the banking and monetary system in the last days of the Saigon regime were concentrated. At the same time, the article also exploits other important archival materials currently being kept at the National Archives Center III and the State Bank's Archives with records on government policies and currency's situation as well as the operation of the State Bank of Vietnam after the reunification.

3. Result

3.1. Situation of taking over and unifying the banking system in Vietnam after 1975

With a brilliant military victory on April 30th 1975, the Vietnamese revolution entered a new phase: From war to peace, from half of the country divided and dominated by neo-colonialism to an independent and unified country.

In the economic field, after the liberation of the South, the Central Office for South Vietnam issued a Resolution on maintaining the economic status quo for a period of time to ensure stable life for the people. However, when the resolution was presented at the 24th Conference of the Central Committee of the Communist Party of Vietnam, it was not accepted. The majority of delegates at the meeting wanted to immediately unify on an economic model, because they believed that after peace, Vietnamese government could organize business better than the economic model of the former Saigon regime (Dang, 2001, p.91). By the time the Conference officially issued the Resolution, this trend was even more confirmed: In favor of renovating and eliminating non-socialist economic sectors, economic management in the North's style, nationalization of bourgeoisie economic property and basic, turned them into the ownership of the entire people and were managed by the State (Communist Party of Vietnam, 2004, p. 408).

The guidelines and policies on monetary and banking unification were affirmed in the 24th Conference Central Executive Committee of the Communist Party of Vietnam, dated September 29, 1975 as follows: "It is imperative to renovate and build urgently banking system, expand the operation of state banks and professional banks of the State serving production and business; abolish all private banks; Depending on the case, it is possible to allow the opening of a number of international banks on the basis of reciprocity between our country and foreign countries; Soon to unify banking system in the whole country" (Communist Party of Vietnam, 2004, p. 418). Thus, in terms of directions as well as tasks, the Central Government had resolutions indicating relatively fully that monetary-banking unification was an important step in the chain of completing the reunification of the country.

In July 1976, Vietnam was reunified in terms of the State administration, and the official name of the country was "Socialist Republic of Vietnam" (Office of the National Assembly, 2003, p. 304-305). The management of the country was under the responsibility of the Council of Ministers, the Government of the Socialist Republic of Vietnam. All apparatuses of ministries and branches in both regions, which previously temporarily held two titles of two different regimes, had officially merged. After the consolidation of the banking system in the two regions, the first State Bank Directors' Meeting was held in Hanoi (May 1976). The meeting discussed and decided on major policies and measures in banking activities of the whole country. Since then, the principle of unified centralized management in the monetary, credit and banking fields, the principle of import and export management, and the issuance of money in the State Bank system had been thoroughly understood and strictly followed in the whole system.

The State Bank of Vietnam was the central agency of the Government Council and was a sector-wide economic accounting organization, performing the unified state management of credit, payment, issuance and cash management. As an instrument of the State dictatorship of the proletariat, the State Bank of Vietnam unified its organization according to the principle of democratic centralism. The General Director of the State Bank leads and directs all aspects of activities of the entire State banking industry, was responsible to the National Assembly and the Government Council for the activities of all State Bank agencies in the whole country.

The State Bank system consists of 3 levels: Central Bank; Provincial and city banks; Banks of districts, towns, neighborhoods and concentrated economic zones.

According to the State Bank of Vietnam statistics, right in the first year of unifying banking, the revolutionary government quickly took over the banking system of the former government in the South Vietnam, keeping assets (including: money, gold and silver precious metals, documents) safe, liquidating private banks, immediately building a revolutionary State Bank system, establishing a banking organization in provinces, cities, districts and about 1,000 transaction offices (Prime Minister Office, Social Republic of Vietnam, 1976, p. 62).

3.2. Policies on resolving conflicts in the process of merger and unification

** Building legitimacy for the takeover, unification*

After liberation of the South, while the State was facing difficulties in capital to serve the 5-year economic plan (1976-1980), the South was able to revoke tens of millions of dollars of goods, foreign currency and could use hundreds of millions of dollars of foreign credit. However, the revolutionary government had to deal with a very complicated and difficult situation in monetary, credit and payment operations:

- Foreign exchange assets of the former Saigon’s regime were scattered in foreign banks (large amounts of foreign currency, bullion, standards were located in US banks and other countries blocked by the US).

- Foreign currency balances of foreign exchange banks under the Saigon’s regime were also located in foreign banks. These banks had not confirmed their balances and had not acknowledged the revolutionary government in South Vietnam as owners.

- Exports of merchants under the former Saigon’s regime as of April 30, 1975, which had not yet been confirmed by foreign countries for payment. Goods imported by trade and aid were scattered at many ports abroad[73].

Thus, although foreign currency and gold were within reach, it was not easy to revoke because many problems related to the US and its allies were one of the obstacles to the above work.

At the request of the US Department of State, the US Treasury Department announced the seizure of any assets that North Vietnam might have in the US and prohibited all financial and commercial transactions between Americans and North Vietnam people. Besides, the attitude of the authorities in Hong Kong and Singapore, although they want to help Vietnam, on the other hand, were under pressure from the US. The authorities had an unequivocal attitude, asking Vietnam to send lawyers to court to reduce US pressure on them. Some boats (such as Vung Tau 260, Patrick, Truong Hai, Hong Van, Bong Hong 9 and 109 motor fishing boats) had changed their names, changed flags, and operated mainly within Singapore, Thailand, Malaysia and Philippines, so it was very difficult to detect (Prime Minister Office, Social Republic of Vietnam, 1976, p. 60).

In addition, the export business of the capitalist banks located in South Vietnam was very complicated. Importers (overseas) may dispute about the quantity and quality of goods, including whether they were received or not. In many cases, importers (foreigners) pay directly to foreign banks or the Vietnamese who had evacuated, regardless of whether the importers' branches locating Saigon. They took advantage of unfinished business opportunities in the period of transferring between old and new regime (Prime Minister Office, Social Republic of Vietnam, 1977, p. 50).

The liquidation of banks in the South was also difficult because the Letter of Credit (L/C) had been sent to the exporter (foreign) but the item code had not been sent or had already been sent but lost along the way. There were cases where the goods had arrived, the

[73] The specific situation was as follows: trading firms of Hong Kong, Singapore, Japan... still kept Vietnamese goods without reporting. Goods at Saigon port were still stagnant: over 1,000 tons, while some items need to be delivered quickly such as cigarette filters, new medicines, shaving blades, and auto parts. If left them for a long time, they would be destroyed.
According to the Bank for Foreign Trade, imported goods that had been paid for but had not been received were $30 million. At that time, the quantity of goods exported but not yet collected was 3.000.000 USD. The assets of the embassies and diplomatic facilities of the former Saigon’s government abroad include 19 buildings, 65 cars and a large number of office equipment, houses, air conditioners, vehicles and other property. The foreign currency of the Saigon embassies abroad was about 47.350 USD and the local currency was 68.568 USD, excluding the money in the banks of the US allies and US. (Prime Minister Office, Social Republic of Vietnam, 1976, p. 3)

import department of Vietnam had received the goods but had not yet paid the payment between the bank and the foreign exporter because of the lack of payment records.

In addition, there were many unsettled checks and bills of exchange between intermediary banks and agents, between domestic and foreign customers. Moreover, foreign exchange blocked by the US, therefore, this issue of liquidation and foreign payment had been long, difficult and complicated for the Bank for Foreign Trade of Vietnam and for the handover later.

Therefore, in the first period after liberation, the policy of the Government of Vietnam was to only take over the banking system to avoid losing important assets and foreign currencies of the former Saigon's government, which were currently located abroad. Especially to create legitimacy in inheriting the assets (gold, foreign currency) left by the former Saigon's regime, on June 6, 1975, just a few dozen days after liberation, the Revolutionary Government Provisional South Vietnam signed Decree No. 04/PCT/75 dated June 6, 1975 allowing the National Bank of Vietnam to resume operations and allowing operations in all fields of currency and credit, payment, foreign exchange management, gold and silver and precious metals, gems. For previous deposits and savings, indebted banks (including foreign banks) were responsible for payment and transfer the books to the National Bank of Vietnam in the South. The National Bank of Vietnam in the South also undertaken all external-banking operations, encouraging the concentration and use of all foreign exchange and foreign currency sources to promote import and export activities beneficial to the national economy (The State Bank, 1976, p.1-2). This was an important legal basis for the takeover and liquidation of banking system of the former Saigon's regime.

As such, the Government and State of the Democratic Republic of Vietnam quickly found an appropriate approach to the takeover and unification of the banking system through some spectacular institutional stepping stones to synchronously handle the turning points of financial, monetary and banking life in half of the newly liberated country from the very first days of that special historical period. That was to allow the former National Bank of the Saigon regime to operate again but with a completely new nature, becoming the National Bank of the Provisional Revolutionary Government of the Republic of South Vietnam, which was the legal basis for inheriting the assets of the former Saigon's regime inside and abroad.

However, unlike the previous Financial-Banking Institution in the liberated area, the National Bank of the Provisional Revolutionary Government split assumed its duties in the new situation. The national banking system includes both a treasury organization, and state-owned banks such as the Agricultural Development Bank, the Industrial Development Bank, and the Vietnam Commercial Bank. Therefore, the branches of the National Bank in the localities had taken over the facilities and assets of the old banking system (including records, headquarters, vehicles and machines: computers, cars, safes…). At this time, the Politburo of the Central Committee also immediately made a decision that the new currency should not be changed immediately, but still kept the transaction name of the National Bank and the money of the former Saigon's regime for a while. This was considered a wise decision because it had created conditions for maintaining international relations, to recover the foreign currency assets, gold and silver of the old regime, and it had helped the Provisional Revolutionary Government of the Republic of South Vietnam to continue as a membership and capital at world monetary organizations such as IMF, WB, ADB...

Along with institutional building, in foreign policy, the Government of Vietnam had firmly grasped and applied international law and justice to fight for the establishment of inheritance rights to assets and credits, which could be used. From June 1975, when the Provisional Revolutionary Government of the Republic of South Vietnam decided to establish the National Bank of Vietnam on the basis of the takeover of the National Bank of the former Saigon's government, the Vietnam Commercial Bank (new)- *Viet Nam Thuong tin was* also born, with its own legal status and seal[74]. This was related to Vietnam's inheritance of foreign exchange rights for the later years.

When the Provisional Revolutionary Government announced the sole legal inheritance of the Provisional Revolutionary Government of the Republic of South Vietnam, from then on, periodically the balances on the accounts of Vietnam both capital and interest were regularly confirmed by foreign banks. On that basis, the new revolutionary government could in turn use the balances scattered at banks in New York, London, Paris, Singapore, Los Angeles to serve the purpose of economic construction and remedial war. According to the policy of the National Bank of Vietnam, Viet Nam Thuong tin was ready to restore and develop equal friendship relations and banking transactions with all banks in the world without any distinguish the political and economic regimes of each country[75].

The takeover of Viet Nam Thuong Tin shows the smart thinking of the Vietnamese Government in solving problems and conflicts in terms of economy and foreign policy between our country and many countries around the world. It is clear that the Vietnamese government not only accepts this bank to enforce the liquidation policy, ensure the public interests and legitimate interests of residents and "non-residents", but also uses the legal name of Viet Nam Thuong Tin, which was under the management of the Provisional Revolutionary Government of the Republic of South Vietnam, to take over the market according to the principle of inheritance. Thus, in a very difficult and sensitive context, Vietnamese Government used a flexible and flexible strategy. All foreign banking activities were still in the name of the National Bank of Vietnam and Viet Nam Thuong Tin. The purpose of the Provisional Revolutionary Government of the Republic of South Vietnam was very clear: until July 1976, when the country was unified administratively, according to the Resolution of the National Assembly of the Socialist Republic of Vietnam, the domestic

---

[74] Vietnam Commercial bank (Viet Nam Thuong tin) was a large public commercial bank of the Saigon government, accounting for nearly 60% of the market share of foreign business activities of Saigon and the whole of South Vietnam before reunification.

[75] The legal basis of this inheritance was clearly explained in Notice No. 02/NH/75 dated 4/7/1975 of the National Bank of Vietnam in the South of Vietnam. Article 1 of the Notice clearly stated: All monetary, credit and payment transactions with foreign countries can continue to operate under the control of the National Bank of Vietnam (General Department of Foreign Exchange). (The State Bank, 1975, p. 3).

and foreign activities of the new National Bank have been gradually transferred to the Bank for Foreign Trade and the State Bank of a unified Vietnam.

Thanks to the above measures, the verification of inheritance rights with overseas assets in the name of the Provisional Revolutionary Government of the Republic of South Vietnam had obtained positive results. Until January 31, 1976, the work of protecting and recovering assets of the former Saigon's government abroad achieved the following results:

Regarding goods and ships:

For imported goods: According to the report of the staff of the former Saigon government, the imported goods paid for was 66.1 million USD (including foreign currency that had been advanced for kerosene and fertilizer). The Ministry of Foreign Trade had just revoked: 1436 tons of goods (milk powder, welding rods, chemicals, new medicines) valued at 2.896.984.71 USD; 465 tons of white cement sold in Japan for 2.700.000 yen, converted into 9000 US dollars; the amount of fuel, auto parts, and Honda parts recovered in Japan was 9,573 kg were brought to Hai Phong, and 15,618 kg were brought back to Saigon.

Regarding exports: According to reports, exported goods had been sent with a value of over 3 million USD, but the Government of Vietnam had only obtained 127 sets of certificates worth 866.187,70 USD and 262.769,17 Franc. Until December 31, 1975, Vietcombank only recovered 226.716,34 USD. Preliminary value of recovered goods recovered was 3.132.701,50 USD.

Number of boats recovered 6 ships 8.970 DWT (two ships of unknown tonnage). Among these, there was a damaged Truong Xuan ship sold at the price of scrap metal at HK$299.522 (remitted to Vietcombank) and another ship was transferred to Saigon and handed over to Sovosco for use. The estimated value of these 6 ships was about 1.000.000 USD. In addition, 9 DC3 aircraft engines and spare parts were delivered to the Civil Aviation Administration with a value of HK$300.000, equivalent to 60,000 USD (Prime Minister Office, Republic of Vietnam, 1976, p. 2-3).

About foreign currencies: In total, more than 4,700,000 USD was recovered, mainly because the delegation we sent to Hong Kong and Singapore recovered on the spot. However, until April 7, 1976, according to the Foreign Trade Bank's report on foreign currency issues:

(1) Early recoverable foreign currency for use (excluding in US banks) was 70.198.023 USD;

(2) The foreign currency that haD been owned, but continues to maintain the status quo (gold and deposits in the IMF, BIRD, IDA, SFI, ADB) including contributions to the international agency were: 61.680.395 USD.

(3) The foreign currency that the Vietnamese government had the right to own, but had not been able to recover because it was deposited in American and American banks: 130.709.447 dollars (Prime Minister Office, Social Republic of Vietnam, 1976, p.1).

The revolutionary government fought wisely to maintain normal relations such as: Conducting international payment operations according to common practice with foreign banks; actively using new credit relations with banks and international monetary and financial institutions. As a result, imports had been gradually recovered which were scattered at overseas ports; determined the revolutionary government's sovereignty over the former Saigon government's assets, foreign exchange and gold deposited at foreign banks and international monetary organizations (IMF, WB, ADB), and succeeding as members to replace the former Saigon's administration at these organizations.

Next, the Vietnamese government also soon established credit relations with a number of capitalist and nationalist countries. By all means, the Vietnamese government had grasped the foreign reserves of foreign currency and gold and silver left by the former Saigon regime and the number of imported goods scattered abroad to take measures to protect and recover; The Revolutionary Government also soon opened agency relationships with banks in a number of countries, to receive money transfers from abroad to Vietnam for individuals and other non-commercial payments; struggled with foreign banks to use our foreign currency reserves, which were blocked by the US. Those were the ways that were both flexible and ingenious but also very resolute, minimizing the loss of property for the country.

Thus, right after the National Bank in South Vietnam was established, in reality, the bank had been placed under the centralized and unified direction of the Bank State of Vietnam. The regulations and regimes on monetary - credit and payment of the socialist banking system in the North had been systematized and re-compiled with necessary adjustments in content to suit the actual operation of the National Bank system in South Vietnam at that time.

**** "Old" and "new" banking cadres - the way to use people for the transition process***

Months before the liberation of the South, the Vietnam Communist Party and Government of Democratic Republic of Vietnam prepared policies, measures and forces to take over the southern banking system after liberation.

Even during the fierce war, leaders of the State Bank of Vietnam had a strategy of "planting people". In 1968 alone, the banking industry mobilized nearly 360 officials from the central and local levels in secret batches to the South to support the finance and banking industry to build a base. Participating in the takeover of the banking system in the South after liberation was Mr. Tran Duong, Deputy General Director of the State Bank of Vietnam, who was previously mobilized by the Central Government to supplement the Central Finance Committee of Central Office for South Vietnam. The force taking over also included cadres who were "rehearsed" through the Tet Offensive in 1968. Especially Mr. Lu Trieu Phu (Lu Minh Chau) was previously assigned by the "Viet Cong" to work at Saigon's bank since 1965; he also joined the military administration (Le, 2001, p.21).

Along with the cadres "located in the area" mobilized from the North, participating in the takeover of the banking system of the former Saigon's regime, there were the officers who had matured in foreign banking after years of operating in the "Hong Kong - Beijing - Moscow - Paris" quadrilateral that belonged to the line of B29 (special payment unit) during the anti-American resistance war. Some other officers were rotated for long-term internships at Euro bank-Paris. In addition, there were a number of bank staffs who received long-term training in China, the Soviet Union, and Czechoslovakia.

With a force of cadres returning from the liberated zone, the revolutionary government quickly took over the banking system of the old regime, keeping assets safe, money, gold, silver, metals, gems, documents… immediately built a revolutionary state-owned banking system, establish banking organizations in provinces, cities, districts and transaction offices.

The first task to be performed was to immediately seize the National Bank of the former Saigon's regime to control the money-issuing apparatus. On May 1, 1975, the delegation of officials, under the direction of the head of the military management department of the bank Lu Minh Chau, took over the National Bank at 17 Ben Chuong Duong, Viet Nam Thuong Tin at 79 Ham Nghi and all other banks only on May 1, 1975. In the provinces, the Finance Committee in the Military Committee took over the local bank branches. The Bank's Military Management Board had sealed and protected all types of assets; cash fund, local currency, metals, gems and bank documents to prepare for the next step. The revolutionary government confiscated all assets of public and public banks, including: National Bank (Central Bank), Industrial Development Bank, Technological and Commercial Bank, Rural Banks and Industrial Development Fund (under the National Bank), and Viet Nam Thuong Tin. For private capitalist banks (16 banks of Vietnam and 14 banks of foreigners), the operation was suspended. These banks had to liquidate assets and pay off loans with their old customers, according to their inventory records.

After grasping the money issuance tool and holding the vault of the National Bank of the former Saigon's government and centralizing the cash fund of private banks with a total of 150 billion VND (of which the National Bank was 125 billion), the revolutionary government used the above money as a means of spending, in which it spent most of the money to meet the needs of the army, buy rice in the Mekong Delta, and provide aid to the people in provinces of zone V and two provinces of Tri – Thien (Pham, 2001, p.6). It can be said that, thanks to carefully preparing a strong team of cadres to take over and strictly complying with the instructions of their superiors, the takeover took place quickly and smoothly.

In the process of taking over and unifying the banking system in Vietnam, besides pressure from countries like the US and its allies, the process also suffered from other objective impacts such as loss of money's documents, records and papers of the properties of the former Saigon's government, banks and credit institutions operating under the old regime. The loss of these records made the process of verifying, recovering and liquidating assets of the Saigon's banking system more difficult. In particular, in the last days of the Saigon regime, the bankers either fled or dispersed their assets, making the solvency of the banks very low after the revolutionary government took over. Cash balances and deposits at the National Bank of private banks were only 9.5% of the total deposits of the people at the bank. More than 30% of the total deposits raised by banks were used to buy bonds, but at 100% risk at that time. The rest was used for lending, most of which were subject to unforeseen risks (borrowers had fled abroad, production and business had stalled, or assets were destroyed by war...) (Pham, 2001, p.7).

Faced with that situation, the Government of Vietnam had commented: "Banking takeover is a major policy, requiring a comprehensive takeover, stability must be maintained after the takeover, and the policy of national harmony must be well implemented" (Dinh. H., Nguyen. L., Han. H., Dao. T., 2001, p. 64). To implement the above policy, the Government of Vietnam had set up the Liquidation Committee to recover the assets of the former Saigon's government abroad. This committee consists of specialized staff in the fields of banking, foreign trade, finance and diplomacy to search, verify, supplement and complete thousands of documents to ensure the accuracy and legality of the documents. At the same time, the Vietnam Communist Party and Government of Vietnam also consulted and used some employees of the former Saigon government, mobilized extensive cooperation, and properly resolved the interests of the industry owners and merchants in the South who were the owner of the goods or the account holders in a foreign country.

The cadres who used to work in the banks of the former Saigon's regime continued to work under the direction of the Revolution government. At that time, the prestige of the revolution was great, so they were very impressed. At the meeting in the great hall of the National Bank, regulations were disseminated to the executives who were the heads of the departments, assigning specific responsibilities to the cadres who had worked for the former regime (Dinh. H., Nguyen. L., Han. H., Dao. T., 2001, p. 66). Moreover, after liberation, the Vietnam Communist Party and Government of Vietnam advocated using the intellectuals at Viet Nam Thuong Tin - the largest bank allowed to do foreign exchange business and foreign payments of the former Saigon's government to keep money in another country. At that time, the number of staffs of Viet Nam Thuong Tin who held with 2-doctorate degree was more than 50 people, they were proud to be Vietnamese and they thought that Vietnamese people should try to protect Vietnamese property, including that property in another country.

At the end of the 70s, when the work of liquidating banks, especially foreign banks, faced many difficulties, on March 14, 1979, the Government Council issued Decision No. 114 regulating the handling of the banking system of the former Saigon's regime in South Vietnam. In this work, the concerned agencies had mobilized to the maximum extent people who were knowledgeable about the assets and accounting situation of that bank, such as the members of the Management Board of these banks. According to the eyewitnesses' judgment (officials who used to work in the Southern Economic and Finance Department such as Tran Duong, Ba Chau, Ba Dung, Le Van Tu, Nam Hai...), employees of the banks of the former government generally good, most of them were salaried people, they would do well when they understand the guidelines and policies of the revolution government.

The former regime's policy of using officials from the banking system had brought positive results. The documents were kept completely, later the revolutionary government used it to effectively manage the banks. Even the administrators and executives of the former banks clearly saw their responsibilities before the people and revolution's government. The employees of the public and private banking system also understand the leniency and concern policy of the revolution to solve jobs according to each person's level and ability in the general difficult situation at the beginning of the unified country.

Thanks to the right, timely and accurate policy of the Government of Vietnam, thanks to the efforts of officials, including those who served for the former Saigon’s regime, participating with a pure "heart"... The takeover of the Southern banking system in 1975 had achieved results according to the optimal plan. The takeover operation was done quickly and neatly. All assets of precious metals, gems, cash funds in local and foreign currencies, records, books, papers and documents of banks were managed and sealed for processing.

4. Discussions and Conclusion

After the liberation day (April 30 1975), the situation of Vietnam had many advantages but also many difficulties and challenges, but in a short time, the Vietnamese Communist Party and Government of Vietnam quickly unified the country in terms of administration, from that unification of economic, cultural and social aspects. Money and banking were considered the lifeblood of the economy, so the unification of the monetary and banking system had been urgently implemented, which was one of the pioneering fields in the unification of the country. The entire banking system of the former regime was managed and used by the new government. All cash in the Treasury and other valuable assets were inventoried and preserved to avoid any loss to the outside. This was considered a fairly flexible takeover policy and was suitable for the practical context of Vietnam at that time. In addition, during the unification of the banking system, the steps were carried out methodically and closely, from the takeover stage, determining the legal basis, to the unification of the administrative apparatus, and the appropriate use of human resources to ensure that the unification went smoothly. This approach showed efficiency and minimized conflicts in the transfer process.

In fact, in the process of merging and unifying the banking system between the South and North, although inevitably tough measures such as nationalization of state-owned banks, the revolutionary government had oriented towards policies that quite flexible and suitable for practical contexts of Vietnam. These policies aimed at stabilizing the situation, social life and production activities, avoiding major socio-political disturbances and facilitating economic circulation after the war. Those policies also aimed at national harmony plan, using local and mobile human resources, using the number of employees of former banks who were enthusiastic for the revolution government. At the same time, the Vietnamese government's banking system takeover policy was also very skillful, ensuring the implementation of the principle of national inheritance in the international financial - monetary market, ensuring the maximum recovery of the assets that the new revolutionary government was inherited, serving the restoration and construction of the country after the war.

Abstract

The Chinese in Binh Duong worship the gods in the community at the temples, palaces such as Thien Hau Thanh Mau, Quan Thanh De Quan especially Ong Bon and many other gods. However, for each dialect group, there is a specific worship for each religious object. Phuoc An temple festival is one of the typical festivals of worshiping the deity of the Chinese in Binh Duong. This festival has formed a belief system of the Chinese community with the same a traditional profession that we need to preserve from technology, heirloom experience to the rituals and cultural activities of the community with over hundred years. The Chinese in Binh Duong have a rich spiritual and cultural life, it makes the customs more meaningful and valuable before the integration trend. The article introduces the general belief and festival of Ong Bon at Phuoc An Mieu.

Keywords: *belief, Chinese, festival, Ong Bon, Phuoc An temple*

1. Introduction

The Chinese came to settle in Binh Duong through each wave of migration, influenced by many historical factors, settled down and developed in different regions. In which, the largest and earliest residences are in the areas such as: Lai Thieu, Bung, Chanh Nghia, Phu Cuong, Tan Phuoc Khanh, etc. According to each language community group: Fujian, Guangdong, Chaozhou, Hakka (Huynh Ngoc Dang, 2010). The Chinese has a common feature that is preserving the community's traditional cultural values in terms of customs, practices, folk beliefs and religions. Typical and most prominently expressed through the religious facilities and festivals still preserved to this day.

Belief and festival of Ong Bon at Phuoc An temple is one of the typical festivals of the Chinese custom of worshiping Ong Bon in Binh Duong. This festival has formed a belief system of the Chinese community with the same occupation, a traditional occupation that needs to be preserved from techniques and heirloom experiences to rituals and cultural activities of the community that have been attached over a hundred years. Through the beliefs and festivals of the Chinese community in Binh Duong, further clarify the ethnic characteristics, cohesion and community development of the Chinese.

As the Chinese in other provinces and cities in the South of Vietnam, the Chinese in Binh Duong has a rich spiritual and cultural life. They carry, preserve and maintain the traditional rituals of their fathers attached to the professional community. It is this feature that makes the ritual more meaningful and valuable. The scope of this paper, author would like to refer to the belief and worship of Ong Bon at Phuoc An temple at Chanh Nghia ward, Thu Dau Mot city, Binh Duong.

2. Method

To achieve the research objectives, we use the theoretical research method, the data used by the author in the paper is secondary data. The paper knows how to select, collect, analyze and synthesize documents on the culture of the Chinese community in Vietnam, in the Southern and in Binh Duong. In which, we dig deeply into Ong Bon's beliefs and festivals of the Chinese community in Binh Duong and selected Phuoc An temple as a case study on the basis of ethnographic description.Depending on the basis of theoretical research and analysis of these documents and data, we withdraw some values and meanings about Ong Bon's belief and festival at Phuoc An temple - a typical tangible and intangible cultural heritage of the Chinese community in Binh Duong in the context of cultural exchange and integration with ethnic groups.

3. Result

3.1. A summary of Ong Bon's belief of the Chinese in Binh Duong

The Chinese in Binh Duong mainly includes 4 dialect groups: Fujian, Guangdong, Chaozhou, Hakka. As exiles, belief becomes an important need in life as a spiritual support, helping them to stabilize and develop. The beliefs of the Chinese are very diverse and rich in many aspects. In addition to the tradition of worshiping grandparents, ancestors, the Chinese in Binh Duong worship Thien Hau Thanh Mau, Quan Cong, Ong Bon, That Phu Dai Nhan[76] who are the protectors and blessers of the clans, every profession, and each family in their native land are maintained on the new land they are living in (Huynh Ngoc Dang, 2010).

For the Chinese, Ong Bon[77] is a common noun in the region calling the gods brought by the Chinese from their native homeland to worship. “Bon” means “root”, “Ong Bon” means “ancestor”. Actually, “Ong Bon” is just a symbol, similar to a “Phuoc Duc Chanh

---

[76] is the ancestor of the clans (families): Luc, Chu, Quach, Tieu, Trieu, Ly and Chau. This is also the main symbol of Ong Bon of the Chinese community – the Ly clan from Fujian in the area of Phuoc An temple (Chinh Nghia, Thu Dau Mot). The Ly clan of the Chinese in Binh Duong is also known as That Phu Dai Nhan.

[77] *The customs of festival of Ong Bon pagoda*, updated at: https://hoangnguyen1608.wordpress.com/2014/03/02/phong-tuc-le-hoi-chua-ong-bon/.

Than" of the Chinese, although each dialect group has its own conceptions and beliefs about this god.

The Chinese Fujian in Cholon has concretized Ong Bon as Chau Dat Quan – a mandarin of the Nguyen Dynasty. The Chinese Chaozhou and Haina in the Southwest region are concretized as Tam Bao Thai Giam Trinh Hoa - a man of the Ming Dynasty. The Chaozhou people in Hoi An are concretized as Phuc Ba Tuong Quan (Ma Vien). The Guangdong people in Cholon believe that theii Ong Bon is the God of Earth, but the Chinese with the Vuong clan of Fujian origin in Binh Duong believe that their Ong Bon is Huyen Thien Thuong De and the surname Ly of Chaozhou origin for their Ong Bon is Ly's ancestors.

As presented above, unlike the Chinese communities in other areas, the Ly community from Fujian in the area of Phuoc An temple (Chinh Nghia ward, Thu Dau Mot city) worships Ong Bon as their ancestors: Luc, Chu, Quach, Tieu, Trieu, Ly and Chau. This is also the main symbol of Ong Bon here. They also worship Phuoc Duc Chanh Than that they call ong Dia, which is the local god of the land, and the Phuoc An temple festival in Chanh Nghia ward, Thu Dau Mot city. One of the typical festivals of Ong Bon's custom of the Chinese in Binh Duong.

In Binh Duong, currently there are five temples to worship Ong Bon. These include the palace worshiping their obligation of the Vuong clan in Binh Duong Vuong such as: Phuoc Vo Dien (Chinh Nghia, Thu Dau Mot), built in 1885; Ngoc Hu Cung (Lai Thieu, Thuan An), built around 1971; Phuoc Tho Duong (Hung Dinh, Thuan An), built around 1934; Phuoc Nghia Duong (Tan Phuoc Khanh, Tan Uyen), built around 1936. The Ly clan has a temple to worship Ong Bon called Phuoc An Mieu (Chinh Nghia, Thu Dau Mot), built in 1980. This temple was built by the Ly clan, in addition to worshiping the ancestors of the seven families as above, it was also worship hall of Ly clan, so it was also called Ly Thi Gia Mieu (Nguyen Viet, 2014).

In Binh Duong, currently there are five temples to worship Ong Bon. These include the palace worshiping their obligation of the Vuong clan in Binh Duong Vuong such as: Phuoc Vo Dien (Chinh Nghia, Thu Dau Mot), built in 1885; Ngoc Hu Cung (Lai Thieu, Thuan An), built around 1971; Phuoc Tho Duong (Hung Dinh, Thuan An), built around 1934; Phuoc Nghia Duong (Tan Phuoc Khanh, Tan Uyen), built around 1936. The Ly clan has a temple to worship Ong Bon called Phuoc An Mieu (Chinh Nghia, Thu Dau Mot), built in 1980. This temple was built by the Ly clan, in addition to worshiping the ancestors of the seven families as above, it was also worship hall of Ly clan, so it was also called Ly Thi Gia Mieu (Nguyen Viet, 2014).

Like the temples and shrines of the Vietnamese, the temples of Ong Bon are i ntegrated with many gods such as: Truong Thien Su (Truong Dao Lang - Han Dynasty), Bao

Cong (Song Dynasty), Canh Chu Ton Vuong, Linh Tu Ton Vuong, Cuu Thien Huyen Nu (Ha Truc, 2012).

According to Mr. Ly Hiep Son, 70 years old (in 2019), the head of the Ly clan in Chanh Nghia said that his Ly clan originated from Tuyen Chau, An Khe district, Fujian through Vietnam up to his generation is 4^{th} generations. Phuoc An temple probably appeared from that time. Right next to the temple of Ong Bon is worship of his Ly clan. Every year, the temple organizes three days of worshiping Ong Bon in the year (lunar calendar): (1) on the 16^{th} of January is the tour, (2) on the 12^{th} of August is anniversary of the birth, on the 12th of October is anniversary of the death. In particular, every year, on the day of birth, Phuoc An Temple holds worshiping ceremonies, but once every three years, the festival is held for three days and three nights. The wooden stelae are solemnly placed in the street engraved with the names of the deceased to 7 generations (of which 3 generations are people who originally lived in China, 4 generations are people who have moved to Vietnam to settle down. According to the elders, Chanh Nghia is the place with the earliest ceramic craft in Binh Duong. This is a hereditary profession, maintained when they migrated to Chanh Nghia, Binh Duong. From this cradle, ceramics continued to develop in the other areas in Binh Duong (Source: Author's in-depth interview in 2019)

3.2. Ong Bon’s festival of the Chinese at Phuoc An temple through ethnographic description

As described in part 1, every year, Phuoc An temple holds a ceremony to worship Ong Bon in 3 days. In which, August 12^{th} is the most important, the festival is held once every three years, so the author only presents this festival in this paper.

Overview of Ong Bon’s festival at Phuoc An temple

Although not as crowded as Thien Hau Thanh Mau’s festival, but Ong Bon’s festival also shows typical beliefs, associated with the main occupations of the Chinese. This is also considered as one of the important festivals of their year.

Ong Bon’s festival in Phuuoc An temple takes place from 11^{th} to dawn on the 14th day of August (lunar calendar). There is a big ceremony every three-year, with a performing and singing troupe. In the remaining years, the worshiping ceremony only takes place without inviting the singing group and the worshiping ceremony takes place only in one day, the main ceremony is August 12^{th} (Huynh Ngoc Dang, 2010).

Not only the structure and object of worship, but also the calendar and worshiping rituals of Phuoc An temple in Chanh Nghia are similar to Phuoc An temple in An Khe, China. This shows that the Chinese migrants to Thu Dau Mot to preserve and maintain the festival tradition in their native homeland. Many Chinese in Chanh Nghia said that sometimes there are still people with the Ly clan here come to An Khe, China to visit relatives, old hometown, and sometimes they even try to arrange to go on the right occasion to worship Phuoc An temple. In An Khe to give thanks, to show gratitude towards the source, etc. As for the Chinese in Chanh Nghia, whether they move to Cholon to trade or to Thuan An, Tan Uyen, etc. continue to make ceramics, on the occasion of worship Phuoc An temple ceremony also returned to Chanh Nghia to attend the ceremony. It makes Phuoc An temple festival become a gathering day for not only the Ly clan, the Chinese who make ceramics at all over Binh Duong, but also the Vietnamese.

As mentioned above, That Phu Dai Nhan[78] (Ha Truc, 2012) is the object of worship of Phuoc An temple, but in the days of worshiping ceremony, according to custom, Quan The Am Bo Tat and Hong Hai Nhi; Bao Sinh Dai De; Quan Cong, Chau Xuong and Quan Binh who were worshiped in Quan The Am pagoda not far away were also invited to Phuoc An temple to witness the ceremony (Huynh Ngoc Dang, 2010).

In the early morning of August 10th, the board of administrators sent seven men to Quan The Am pagoda make procession the statues of Quan The Am Bo Tat, Hong Hai Nhi, Quan Cong, Chu Xuong, Quan Binh and Bao Sanh Dai De to Phuoc An temple to attend the ceremony. After burning incense and praying of administrators, the statues of these gods are invited to the temple. One person asked for an incense burner, the rest held a statue in one hand and three incense sticks in the other, walking in a line to the temple. After the festival of Phuoc An temple ended, at dawn on August 14, the board of administrators did a ceremony to farewell these gods to the pagoda. Please also say more, when Quan The Am pagoda organizes worship ceremonies, the board of administrators also organizes to invite (statue) the Tieu clan (one of the That Phu Dai Nhan, supposedly the biggest role) to Quan The Am pagoda to attend the ceremony.

The positions of the statues are arranged during the festival days as follows: statue of That Phu Vuong Gia Cong (That Phu Dai Nhan) is in the top row and behind. In front of and the middle is a statue of Quan The Am Bo Tat, close to the right is Hong Hai Nhi. On

---

[78] on the other hand, Ong Bon of the Ly clan is also worshiped by Fujian, including 7 clans: Lich, Chu, Quach, Tieu, Trieu, Ly and Chau. According to legend, during the Eastern Han Dynasty (25 - 220), there were more than 300 soldiers who went to Truong An to be a candidate. They were romantic people, liked poetry and singing, so they often gathered together and performed in a cave, so Truong Tien Su, whose name was Truong Dao Lang, was the maker of talismans. is the magician in the palace - jealous and seeks harm. He conspired, made the king drunk and then issued a decree to kill all those soldiers. Truong Dao Lang brought the king's edict, made a spell to make the cave's door collapse, burying all 300 people. The ghosts of the soldiers constantly appeared asking the king why he killed them. The king brought the dream and asked Truong Dao Lang. Truong Dao Lang then took a bamboo tube, made a spell to trap all of their souls and then dropped them into the river to float to the sea. But that bamboo tube did not drift into the sea, but washed up on the shore. The beggars found it strange, immediately picked it up, opened the cloth covering the top of the bamboo tube, and immediately the souls of the men escaped and reappeared to ask the King. The King this time understood the situation, both regretting that he had accidentally killed people unjustly, and mourning their talent, so he issued an edict for anyone in which family to be the great person of that family and who in the region, people in that area set up shrines to worship. An Khe district, Phuoc Kien province has 7 people, so they set up a temple to worship them.

the far right is the statue of Bao Sanh Dai De. On the left is a statue of Quan Cong and two generals: on the right is Chu Xuong, on the left is Quan Binh. According to the Chinese concept, Bao Sanh Dai De is a medical god, has the function of protecting everyone's health, is it related to childbirth?

In front of and right next to the altar of the main hall, a great drum is placed; on the left is the gong. On both sides in front of this altar, there are also seven pots of clean water and seven towels, for That Phu Dai Nhan to wash. After bathing, changing clothes for the statues, the board of administrators burned incense at all the altars in the temple. Each censer lit three incense sticks.

The offerings in the ceremony are mainly vegetarian and dried foods, such as dried shiitake mushrooms, dried persimmons, dried bamboo shoots, noodles (raw, in long rolls), moon cakes and other pastries… Next accordingly, a wooden box is opened, inside contains 8 long iron trees, sharp as needles (three large trees each about 2.5m long and five small trees about 1.5m long), which the Chinese call "skewer". These eight iron trees are mounted on the largest incense burner in the middle of the main altar of Phuoc An temple (Dinh Van Hanh, 2010).

Outside and on the left and right sides of the temple door, two palanquins are also attached with sharp swords. On the back are three upright swords, the middle one is long, the two sides are shorter, the blade is turned forward, the two handrails are also attached with two swords that turn the blade upwards. The surface of the chair and the place to place the legs are sharp iron spikes. This is a palanquin (chair) that is not meant for ordinary people to sit on.

❖ **Festival progress**

- August 11th

As soon as the new day of August 11th, the festival begins with the ceremony of opening the drum. The ceremony begins when the shaman wears a black hat, a red ao dai, beats a drum (small drum held in his hand) to the sound of gongs. The shaman used three incense sticks to draw charms on the drum surface, then clamped three incense sticks together with the drumstick to beat for a long time. Then the shaman shook the bell to the beat of the gong. The shaman just shook the bell to the beat of one beat while praying. All the board of administrators performed the worshiping ceremony together, each person holds three large incense sticks, prays, bows three times, and then burns incense. After burning incense, each person bows twice. Next is the burning of joss paper. After each ritual, people burn a lot of joss paper.

The shaman stood in front of the altar of the main hall, took out the book to read, and at the end of each passage, the worshipers made one bow. Then the shaman went to the altar in front of the door, read the book, and after reading it, it was placed on the altar. The shaman asked for a hexagram. Hexagram as expected, the shaman continued to shake the bell, the left hand was placed on his chest and prayed.

At 9:00 am is the ceremony of building adoration and singing “Boi”. At the beginning, a large drum is placed in front of the temple yard, after worshiping including the heaven, the earth, the gods (each time, one sound is struck in front and on the left and right sides of the drum wall) there are three drum beats, the singing program begins. On the stage, after the performance of Tay Du Ky, one of member of the troupe sang, danced, and bowed three times. A god uses a mirror to project in all directions and dances to the rhythm. In the temple, the shaman still worships according to the ritual of burning incense, kneeling and praying in the sound of gongs and drums. The prayer of the shaman earnestly invites the gods to attend the ceremony, expressing gratitude, admiration and thanks for blessing a peaceful life, successful business, praying for favorable rain and wind… On stage, the music is getting busier and faster. Three men in the role of Phuc - Loc - Tho appeared to open the show.

Before the singing troupe performed, eight actors dressed up as Bat Tien, in turn entered the temple to worship, pray, and ask for his command to help and bless them. The troupe humbly invites That Phu Dai Nhan to enjoy the plays they will perform. Each actor plays a character and prays for something specific.

The worshiping ceremony takes place three times in the morning, noon and afternoon. These three ceremonies continued to be repeated in the days that followed. The board of administrators offered vegetarian food, and people offered many offerings, regardless of whether they were vegetarian or not.

At each ceremony, the main worshiper is still the shaman. He wears a red long dress, wears a black hat, always prays with his mouth, holds a bell in his right hand and shakes to the beat of the drum “tung tung khuong, tung tung khuong” creating a rushing sound.

In the evening, the day before the main ceremony, the shaman and the board of administrators went to the riverside to worship. Leading the delegation was a man holding a red flag, followed by those carrying incense burners, lanterns, and offerings. The shaman prayed for good things at the simple altar on the ground at the water's edge… The ceremony ended with the burning of joss paper. Then the group returned to the temple. Music in harmony along the way. When approaching the temple, the shaman blew a long horn, then continued to worship at the temple.

People put joss paper, mace with many sharp iron nails, and talismans on a large mat in the middle of the temple, then stand up the wrapped papyrus mat. The top of the mat is tied, covered with objects inside, and the worshiping ceremony begins. At this time, the shaman, wearing a black long-dress, performed the ceremony while blowing the horn. After praying, the mat is opened. The charms on the mat are glued to the palanquin, wrapped on skewers, wrapped in swords on the palanquin, and glued to the tables on the palanquin, where the feet are placed. Drums, gongs as well as all other sacrifices in the temple are tagged with charms. The talismans are written on yellow and red paper, glued in pairs, in the shape of an X. The two longest skewers and the two short skeins that had previously been placed on the censer are also taken down and wrapped in charms and built it on the side of the palanquin (Dinh Van Hanh, 2010). The sound of gongs and drums was bustling, and the people attending the ceremony were bustling in and out. All join in the excitement of preparing to welcome the most important day of the festival.

- August 12th

August 12th is the main ceremony. Legend has it that this is the birthday of Dai Nhan with the Tieu clan, the “biggest” saint in the “That Phu Dai Nhan”.

From early in the morning, people on foot, by car, bring offerings to the saints. The procession of pilgrims and worshipers is getting longer and longer from early morning until midnight, etc. In the four days of the festival, the 12th is the day most people come to offer the ceremony.

People bring a lot of offerings, depending on the ability of each family. The offering can be a whole roast pig or just a piece of roasted meat of about one or two kilograms. Vegetarian foods, dry foods such as shiitake mushrooms, dried bamboo shoots, moon cakes, homemade cookies made into large ones (from glutinous rice flour, sugar, coconut filling, green beans, persimmons), sponge cakes (also self-steamed, the material is just flour, chicken seeds, sugar). Cakes are sold in the market, fruits of all kinds and lots of joss paper… that people offer to That Dai Nhan.

But perhaps the following dishes are indispensable, almost every family brings offerings. It's “Banh To”. Banh To is made with glutinous rice flour, sugar, sprinkled with sesame on the surface and then steamed. Banh To symbolizes the ancestral offering ceremony. Since it is a popular item to offer to the ancestors, the name itself implies gratitude. A second offering is noodles, known locally as hair noodles. Raw hair noodles, whole, the longer the better. This is because it symbolizes longevity. Long noodles mean only long hair and beard and only long life has long hair and beard… Therefore, hair noodles are also an offering often offered in celebration of birthdays and long life celebrations of the Chinese. A third type of offering that abounds in the offerings that locals bring is red-painted duck eggs. The Chinese believe that a raw duck egg, painted red on the outside, symbolizes good fortune, so it is a good offering to offer to That Phu Dai Nhan. The management board of the temple also offers hundreds of red painted duck eggs so that everyone who attends the ceremony can bring them home, and offer them to the ancestors as a dish and fortune, a blessing to wish for (Source: Interview by author in 2019).

People who come to make worship and offer items to That Phu Dai Nhan are considered as a answer sacred ceremony to the saints who have supported and helped their families to be lucky, peaceful and prosperous in the past time; praying for the saint's continued support in the future with the promise to return to pay in next period. The festival is full of pay meaning and blessing. This is not only reflected in the offerings, prayers and supplications but also in the rituals performed.

Food offerings will be brought home by the owner after the saint has “enjoyed” to eat with his family and relatives in his own home. The people on the management board also went home to eat, not at the temple. This is a unique feature of the festival. The organization of a party as a thank you will be held by the management board at the end of the ceremony at a local restaurant. Absolutely no eating at the temple. When people come to offer offerings, the worshipers pray in the steady beat of drums.

Around noon, the management board organizes the worshiping ceremony from 11:00 a.m to 13:00 p.m (Ngo’s worshiping), also known as That Dai Nhan ceremony. Immediately after this ceremony is Dao binh’s worshiping. The ceremony lasted about an hour. This is the biggest ceremony of the whole festival. In this ceremony, there are rituals to offer offerings to That Dai Nhan, to pay tribute to ancestors. In addition to making offerings at the temple, descendants of the Ly clan also offer offerings to their ancestors from the street with the meaning of wishing their ancestors a long life. People call it the ceremony to wish Ong Bon.

The ceremony of Dao binh is the ceremony of worshiping the soldiers of That Dai Nhan. The shaman is the person who administers the offering and the ritual. The ceremony of Dao binh begins when the shaman shakes the bell and leads the army. In the right hand the magician shakes the bell, the left hand holds the horn and a playing card. The shaman walked while praying. Next to the shaman is a man holding three incense sticks, a man holding a small drum beating to the beat, another beating a gong. Behind the four men is a young man holding a bamboo top, with a few leaves above it like a small tree, and a large chain on his shoulder. This young man is considered the officer of the army of seven teenagers that followed. These seven teenagers were all wearing knitted bamboo hats with high tops and holding red painted wooden sticks. These trees are considered as “command trees”. The shaman and the members of the management board said that these seven teenagers probably represent the seven soldiers of the That Dai Nhan. They do not confirm this because no one has explained it to them, just following the tradition.

The army lined up in the above formation, went five rounds from the temple to the road, then back to the temple. When the army arrived in front of the main altar of the main hall, the youth played the commanding officer chanted the phrase “pi hổ”, while the seven youths playing the role of soldiers said the “pi hổ” (pi-ô). The sound of gongs, drums and bells rang throughout the movement of the army. People offer five tables of offerings from worhip hall, the offerings are foods. When asked what the chanting and answering “pi hổ” means, most people hardly know, only conjecture. Dao binh’s ceremony ended with a lot of joss paper (Dinh Van Hạnh, 2010).

August 12th is also the anniversary of the theater profession's death anniversary. Therefore, from early morning, the singing troupe has returned to serve the festival, also makes chickens and ducks, cooks delicious dishes, prepares to worship the craft ancestors. Around 9 o'clock the offerings were offered. An altar is placed in the center of the stage with many hearty offerings: roasted pig, boiled chicken, sticky rice, fruits, cakes, flowers, tea, etc. In front of the altar is a tiger mask, in front is a incensory.

According to Chinese seniors in Chanh Nghia, That Dai Nhan is a talented person who loves music and art, so this is also an opportunity for the troupe to sing to their ancestors and offer to That Dai Nhan, not only offerings but also special plays. While making offerings to the theatrical profession, the troupe's actors also made offerings in front of the altar of That Dai Nhan.

Around 4:00 p.m, when the troupe was performing the play, a elder man about 55 years old possessed by god (Dinh Van Hạnh, 2010). Standing in front of the shrine, facing the stage, dancing while drawing a circle in the air.

The gongs and drums rose rapidly. The possessed person to the front of the stage to watch the performance of the troupe. He danced, people helped him get off his shirt. He pulled out his long skewer, held it in his hand, and continued to dance. A member of the organizing committee wore a red skirt at the waist, a white bib with a front pocket (later many people put money in that pocket). People throw a lot of rice and salt towards him. After holding the skewer and dancing for about 20 minutes, he used the skewer to pierce one cheek, with both hands outstretched, tightly grasp the skewer and continue dancing. About 15 minutes later, she walked towards the palanquin and then quickly sat down and stepped on the sharp iron pole. He sat on a palanquin and watched singing for about 30 minutes. On the stage, the play was still performed by the actors, although those attending the ceremony were only interested in watching the old man in awe and awe. After leaving the palanquin, he slanted red flag waved as if to express a hidden meaning. At that moment, he jumped onto the altar and sat down. He signaled, suggested to light three incense sticks, then said what the gods sent, everyone bowed. He took many offerings on the altar and delivered them to everyone. The skewer through the cheek bone was pulled out and transferred to the altar of That Phu Dai Nhan. As soon as the skewer was pulled out, a piece of dried leaf was applied to the wound, but if you looked closely, you could see that there was bleeding. The board of administrators made prostrations and prayers about what he was told by the gods, while he continued to dance. People continue to put on two palanquins two pearls with sharp iron nails.

According to the saying of possessed person, this time was entered by Na Tra Thai Tu. Na Tra is one of the four popular and powerful gods in the beliefs of the Chinese. The custom of worshiping the four gods namely Huyen Thien Thuong De, Quan Am Bo Tat, Na Tra Thai Tu, Nam Trieu Dai De and the festival of this belief in Binh Duong has many unique features that attract people's attention.

The possessed person is any person who comes to the ceremony, not selected in advance, nor does he has any martial arts. They are a random selection of gods who entered for some reason unknown to outsiders. It is often said that people who are “light-hearted” are easy to get on. Usually every three years, there is a new singing troupeto get up, but only once in a while, there is an occasional show, not often. The spirit will convey prophecies or rebuke that only the possessed person who can hear and “speak back”.

According to the people's opinion, a lot of possessing spirit is not good, it is a bad omen. Legend has it that before 1952 and the years 1965-1975, each time Phuoc An temple held a festival to increase a lot. At that time, Chanh Nghia was in turmoil and business was difficult. If they want to avoid disasters and bad things, they have to calm down the evil so that the villagers can be at peace. People exorcise evil spirits and avoid harm by pouring a long pile of charcoal, about 6 meters long, fans it to burn, then the shaman makes offerings, prays, expresses wishes, and asks for. The shaman jumps over the fire first, and then the entire village jumps over to stop the evil spirits and pray for the safety of the disaster.

- August 13th

On August 13th, the festival continues with three main ceremonies: morning, afternoon and evening. The management board offer of offerings. The shaman worshiped with the same ritual as the previous day. People continue to come to give thanksgiving and pray for good things.

During the festival, people arganizes “xin keo” and “xin xăm” for those who come to make offerings. It can be said that this is an activity that attracts many people who want to be told by the gods their lucky or fortune. People who come to worship, when leaving, do not forget to ask for talismans (red paper peace amulet and yellow paper evil charm) to stick on both sides of the main door. There are also many people who ask for a lot of talismans to stick all the main and side doors in the house, as many doors as asking for so many pairs of charms. Sometimes talismans are also glued to important items.

In addition, the management board organizes to make many different large and small lanterns with different prices and is completely supportive for the festival so that people can come home both to pray for good luck but also through it to offer gifts to the gods. It is believed that bringing these things home is a blessing and a prosperous business in the near future.

In the evening, as usual, the management board holds a meeting to evaluate three years of operation, elect the executive board for a new term and invite guests to a party. An art program imbued with the cultural identity of the Chinese really attracts visitors.

At midnight, the Ton Vuong's ceremony will take place. The shaman offers incense and worships to the sound of gongs and drums. The troupe sang offerings, each person offered a prayer to the tune of the song. Then, one by one, each actor, one by one, came to the altar of the main hall to worship. Each actor bows three times and bows three times. The leader of the group sang offerings and made vows on the altar of That Phu Dai Nhan.

At the end of Ton Vuong's ceremony, the shaman reads the book and turns it into gold and silver. The shaman prayed in Chinese language and asked for "xin xăm". After that, the shaman just prayed according to the results of "xin xăm" and bowed to the eight directions, one bow in each direction. The shaman blew a long horn and ended the ceremony of Ton Vuong.

- August 14th

At dawn on August 14th, at 3 o'clock, Ong Bon festival in Phuoc An temple ends with the farewell ceremony. After the worshiping ceremony, the shaman thanked the gods, the ceremony was to see off the gods invited to attend, the worshiping statues were brought back to Quan The Am's pagoda. The shaman prayed for peace and the ceremony ended.

3.3. Ong Bon's beliefs and festival at Phuoc An temple of the Chinese in Binh Duong: value and meaning

Chinese folk beliefs in Binh Duong are quite diverse in terms of types, from the temple of Thien Hau Thanh Mau to the temple of Quan Thanh De Quan, That Phu Dai Nhan, Huyen Thien Thuong De, etc. show the preservation of traditional beliefs of the Chinese when settled in the new land of the South of Vietnam.

The gods worshiped by the Chinese in Binh Duong are those who have a great influence on their real life in the process of migrating and immigrating to a new land. Those are the gods that they believe have blessed them on the way of migration, the floating road on the sea, and the folk gods they bring from their homeland so that they can always remember their roots.

Chinese worship facilities in Binh Duong annually organize sacrifices associated with festivals. In the worshiping ceremony at the temples of Ong Bon of the Chinese, including Phuoc An temple, there are often anomalous magical elements of Taoism nature such as: skewer, spirit possession, sitting on a nail chair, walking on a wooden table, etc. which they normally cannot do. These are also mysteries that can only be explained by beliefs and magical elements in folk beliefs. Although the festival has Taoism colors, it still shows the basic cultural value, which is the cohesion of the community even if it is only a local community. In Taoism, there is a form of co-incarnation, there are shamans who practice rituals but without excessive superstition. The people who do this work also have a normal life, they have their own jobs to make a living and only participate when there is a festival.

The festival also preserves many traditional ceremony and festival elements. The festival has the participation of performances of Hat Boi, Cai Luong singing with many ancient Chinese fairy tales.

In Binh Duong, the folk beliefs of the Chinese are prominently expressed in the form of festive activities that attract a large number of attendees, both Chinese and Vietnamese. Ong Bon's festival at Phuoc An temple of the Chinese in Binh Duong is a form of religious and cultural activities that are both social and spiritual. It is both spiritually satisfying and creates a close bond belong ethnic communities (Chinese, Vietnamese, Khmer, Cham, etc.) Chinese beliefs and festivals in Binh Duong in general and Ong Bon festival in particular have become a typical local culture, contribute to embellish the traditional cultural colors of the resident communities in Binh Duong. At the same time, it also contributes to enrich the Vietnamese national cultural identity.

In summary, Ong Bon's beliefs and festivals at Phuoc An temple are typical tangible and intangible cultural heritages of the Chinese community in Binh Duong. These heritages have been contributing to the preservation and promotion of typical cultural values of the Chinese in the South in general and the Chinese in the Southeast in particular in the context of cultural exchange and integration with Vietnam. nations.

1. Conclusion

Learn about the Ong Bon's beliefs and festivals of of the Chinese in Binh Duong in general, and in the Phuoc An temple in particular, shows a common motif. It is the worshiping ceremony of a clan that makes traditional ceramics in Binh Duong. But the festival of Ong Bon at Phuoc An temple with other areas in Binh Duong have formed the belief system of the Chinese community with the same occupation, a traditional occupation that needs to be preserved from traditional techniques and experiences to the rituals and cultural activities of the community that have been associated with that profession for more than a hundred years

These beliefs and this festival contain human values, honoring careers, paying tribute to ancestors, helping exiles overcome difficulties, sharing difficulties, and believing in their spiritual support as saints that are also their ancestors, can protect their lives, bless their difficult and challenging business. Although it is a festival of a Chinese clan specializing in ceramics, but the festival of Ong Bon at Phuoc An temple has attracted a large number of residents in Binh Duong, from the Chinese to the Vietnamese, from the ceramicists of the Ly clan and not from the Ly family to those who do not work in ceramics participated, created a vibrant and meaningful career festival. In addition to the cultural value, many rituals of the festival are very strange and attractive, capable of attracting tourists.

Ong Bon's belief and festival at Phuoc An temple is a folk belief and festival, a cultural heritage that contributes to enriching cultural characteristics of Binh Duong in particular and the Southern in Vietnam in general. Therefore, it should be recognized, preserved and promoted, to serve the goal of building an advanced Vietnamese culture imbued with national identity.

EXAMINING THE IMPACTS OF OUT-OF-CLASS STUDENT ENGAGEMENT ON STUDENT COMPETENCIES IN THE CONTEXT OF BUSINESS STUDENTS IN VIETNAM

MBA. Trinh Thi Thu Giang

trinh.giang@isneu.org

International School of Management and Economics, National Economics University, 207 Giai Phong, Hanoi, Vietnam

Abstract

Since the mid-1990s, the topic of "student engagement" has received considerable attention in the literature, especially in higher education, for its robust correlation with many desirable and positive educational outcomes, such as student retention, students' satisfaction, persistence, academic achievement, social engagement, and personal development. While in-class student engagement has been largely researched as it happens in the primary environment of learning, out-of-class student engagement seems to receive less attention. However, some researchers favor the approach that for students at higher education, out-of-class environment is crucial to contribute to their complete development. With regards to an increasing and undeniable role of student competencies for business students, this paper attempts to examine the relationship between out-of-class engagement and student competencies. This paper starts by reviewing literature related to student engagement and out-of-class engagement of students at higher education, and the linkage between out-of-class student engagement and student competencies. It then provides exploratory and confirmatory factor analyses on two different samples of 491 and 492 business students in Hanoi to conclude about the relationship between out-of-class student engagement and student competencies.

Keywords: *Agentic engagement, out-of-class engagement, student competencies, student engagement*

1. Introduction

Since the mid-1990s, the topic of "student engagement" has received considerable attention in the literature, especially in higher education, for its robust correlation with many desirable and positive educational outcomes, such as student retention, students' satisfaction, persistence, academic achievement, social engagement and personal development (Appleton, Christenson, & Furlong, 2008; Astin, 1984; Chickering & Gamson, 1987; Finn, 1993; Finn & Zimmer, 2012; Fredricks, Blumenfeld, Friedel, & Paris, 2005; George D Kuh, 2003; Lei, Cui, & Zhou, 2018; Newmann, Wehlage, & Lamborn, 1992; Ernest T. Pascarella & Terenzini, 2005; Voelkl, 1997).

Eccles and Wang (2012) emphasized that "*There is no doubt that "engagement" is currently a very hot topic in the broad field of school achievement".* Kahu (2013) also agreed that *"Student engagement is widely recognized as an important influence on achievement and learning in higher education and as such is being widely theorized and researched"* (page 758).

Though there are variations of student engagement concept with different definitions and different components, student engagement in higher education is generally accepted to cover two main contexts of in-class (or academic) and out-of-class (or non-academic) environments (Finn, 1989; Fredricks et al., 2005; Gunuc & Kuzu, 2015). While in-class student engagement has been largely researched as it happens in the primary environment of learning, out-of-class student engagement seems to receive less attention. In a literature review of student engagement by Trinh (2020), among 17 concept definitions of student engagement, there are only 10 definitions mentioning out-of-class engagement while 16 out of 17 including in-class engagement. However, some researchers favor the approach that for students at higher education, out-of-class environment is crucial to contribute to their complete development (Audas & Willms, 2001; Finn & Voelkl, 1993; Trowler, 2010).

Regarding important school achievements at higher education, skills and competencies have been considered as increasingly essential for students seeking employability after graduation. The importance of equipping students with competencies has been emphasized by the society and employers (Humburg, Van der Velden, & Verhagen, 2013). In Vietnam, the graduate skills gap has been discussed and emphasized, but still very few researchers paid attention to the great benefits that student engagement can make on students' skills and competencies (Tran, 2017). Foster and Rahinel (2008) was among those who mentioned this relationship in their research, but just focused on how faculty can impact in-class student engagement to help improve student competencies. To the best knowledge of the author, no research has so far addressed the impacts of out-of-class student engagement on the development of competencies at higher education.

Therefore, this paper will examine the relationship between out-of-class engagement and student competencies, with a focus on business students for the undeniable role of competencies for graduate business students.

This paper starts by reviewing literature related to student engagement and out-of-class engagement of students at higher education, and the linkage between out-of-class student engagement and student competencies. It then provides exploratory and confirmatory factor analyses on two different samples of 491 and 492 business students in Hanoi to conclude about the relationship between out-of-class student engagement and student competencies.

2. Method

2.1. Literature review

2.1.1. Student engagement concept

There are different terms and definitions for the concept of "student engagement". This concept was initially mentioned to as "time on task" (Tyler, 1930s, cited by George D. Kuh (2009)) and "quality of effort" (Pace, 1960–1970s, cited by George D. Kuh (2009)). Later on, Astin (1984) introduced "student involvement" to indicate the level of physical and mental energy that students spent on educational experiences. Other studies then continued to develop new aspects related to student engagement and student interaction with school in educational activities, including social and academic integration (Tinto (1987) cited by Ghori (2016)), participation-identification (Finn, 1993), and student engagement (G. Kuh, 1991; Ernest T Pascarella, Pierson, Wolniak, & Terenzini, 2004).

While the concept of "student engagement" became more popular, variations of this concept definition have been found with quite similar components but not entirely consistent (Appleton et al., 2008; Fredricks, Blumenfeld, & Paris, 2004; Fredricks & McColskey, 2012; Furlong et al., 2003). Fredricks et al. (2004) argued that this is a complex, multidimensional concept, and its conceptualization is still far from reaching an overall agreement. Other authors also proposed that further research should focus to clarify the concept and its components, and on how to measure these components (Fredricks & McColskey, 2012; Glanville & Wildhagen, 2007; Lei et al., 2018; Sinatra, Heddy, & Lombardi, 2015).

In this paper, the concept of student engagement proposed by Kuh et al. (2007) will be used, in which, student engagement is conceptualized as "*students' participation in educationally effective practices, both inside and outside the classroom, which leads to a range of measurable outcomes*".

In terms of the concept of "student engagement", some early scholars proposed a two-dimensional model of engagement, including behavioral (such as participation, effort, positive practices) and emotional (care, belonging, values and positive emotions) (Finn, 1993; Marks, 2000).

In a later period, a large number of studies have focused on identifying aspects of the concept of "student engagement" and have been quite consensus on the three aspects of this concept, including: (1) cognitive (conscious engagement, engagement in learning), (2) behavioral (participation in social and community activities), and (3) emotional (affection, affection) (Appleton et al., 2008; Fredricks et al., 2004; Yazzie-Mintz, 2007).

The most recent model introduced by Reeve and Tseng (2011) proposed to add agentic engagement as the fourth component since they believed students can actively participate and actually contribute to the education process, and therefore affecting to the learning outcomes of their owns (Lawson & Lawson, 2013). Later studies have confirmed the validity of agentic engagement as “a distinct and an important construct” (Jang, Kim, & Reeve, 2016; Reeve, 2012; Sinatra et al., 2015).

2.1.2. Student engagement theories

In order to explain and better understand student engagement, we’ll look into student engagement theories. There are two main lines of research on school successful performance over the last three decades: (1) the research studies related to Engagement Theory (ET) which closely linked to drop-out prevention and at-risk students – key authors of this approach can be named as Astin (1984), Finn (1993), Newmann et al. (1992), Christenson et al. (2008), and (2) the research studies related to psychological motivation theories, such as Self-Determination theory and Flow theory with key authors like Bandura (1986), Deci and Ryan (2000), Skinner and Pitzer (2012), Eccles and Wang (2012), Csikszentmihalyi, and Shernoff, Csikszentmihalyi, Schneider, and Shernoff (2014).

In his Student Involvement Theory, Astin (1984) defines student involvement as “*the investment of physical and psychological energy (of the student) in academic experience*”. He described a highly involved student as someone who spends more time to study, shows more effort in doing homework, and/or interacts more frequently with other students and teachers, and he assumed such involvement would lead to student learning and development. This theory provides a foundation for the behavioral component in the concept of student engagement. However, the main drawback of this theory is that it did not attempt to explain the mechanism of student engagement, how it works and how it interacts with other factors in the educational environment.

Therefore, many researchers started to move away from education-based theories to psychological and management theories to explain student engagement and further investigate its constructs, precursors and outcomes (Burch, Heller, Burch, Freed, & Steed, 2015).

Self-determination theory is originally a theory of human motivation and personality in social contexts (Deci & Ryan, 2012). The core idea of this theory is about human intrinsic motivation to explore, to learn and to possess knowledge of what surrounds them. “*When these needs are met by social contexts or activities, people will engage constructively with them; when these need are thwarted, people become disaffected, that is, they withdraw, escape, or act out*” (Skinner & Pitzer, 2012). This theory has set a theoretical ground to understand student engagement as a human social behavior and explained different mechanisms through which students have different level of engagement or disengagement in the school context, in which cognitive and emotional engagement play very important roles.

In the Flow theory, according to Nakamura and Csikszentmihalyi (2002), flow is a “state of deep absorption in an activity that is intrinsically enjoyable”, as we can observe artists or athletes focusing on their play or performance. Based on this Flow theory, one must simultaneously experience concentration, interest and enjoyment in an activity in order for flow to occur (Csikszentmihalyi 1997, cited by Shernoff et al. (2014)).

According to this theory, student engagement is affected by class and school environments as well as other contextual and personal factors. However, it's students who are the key actors of this mechanism where they boost their concentration and interest to a certain level where flow actually occurs and turns into their deep engagement in learning activities (Shernoff et al., 2014). This theory provides a strong support for the agentic component in student engagement concept as it confirms the proactive role of students in their own engagement process.

Based on these theories, this research will take the approach of a four-typology concept of student engagement in examining the relationship between out-of-class student engagement and student competencies in the context of business and management students in Vietnam.

2.1.3. Out-of-class student engagement

At college and university, students will have more opportunities to interact with the broad school community, not just limiting within their classroom, as they need to prepare for the real-life environment. Therefore, student engagement at higher education is often associated with the school community (Bryson, 2010; Fullarton, 2002).

Out-of-class engagement (or non-academic engagement, campus engagement), is to refer to the engagement with the school community, participation in social activities, sense of belonging and valuing university of students (Gunuc & Kuzu, 2015; Hausmann, Schofield, & Woods, 2007).

Participation in university activities, or behavioral engagement in the out-of-class context, is seen in students' participation in non-academic activities, membership of clubs and student associations, involvement in sports and other extra-curricular activities (Finn, 1989; Willms, 2003). Regarding feelings of belongingness or attachment to school, this emotional component refers to feelings of being accepted and valued by their peers, and by others at their school, and sense of being a part of the school environment (Voelkl, 1996; Willms, 2003). The other cognitive aspect of engagement refers to "valuing school" which is concerned with "*whether or not students value school success – do they believe that education will benefit them personally and economically*" (Voelkl, 1996).

In the out-of-class context, agentic engagement can be operationalized as initialization of or proactive participation in extra-curriculum activities, and in some cases, participating in school governance (Finn, 1993).

Reeve (2013) made a clear categorization of those four dimensions based on two criteria regarding forms of engagement. He concluded that "*a difference among these four forms of engagement lies in (1) proactive and reactive behaviors, and (2) internal and external responses*". Agentic engagement is the only proactive form of engagement as it is defined as student' initiated activities, which is different from the other three reactive forms of behavioral, emotional and cognitive engagement. At the same time, emotional and cognitive engagement are internal forms of engagement as they are not easily observable. Behavioral and agentic engagement are categorized as external forms because students will demonstrate these forms of engagement in an explicit and observable manner.

Figure 1 summarizes those forms of engagement in a model as followed:

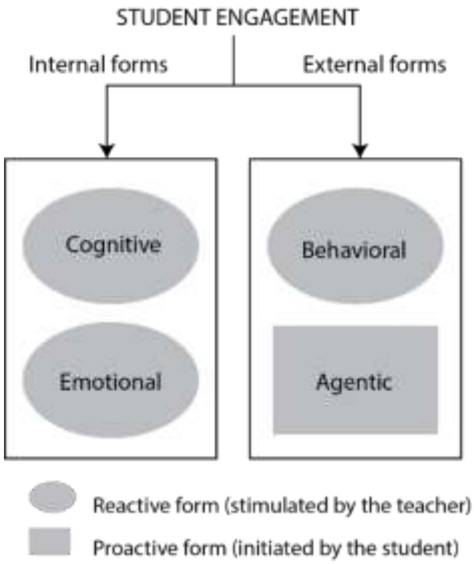

Figure 1: Forms of student engagement

Source: Montenegro (2019)

2.2. Conceptual framework and measurement instruments

2.2.1. Student engagement and competencies

Ernest T. Pascarella and Terenzini (2005) asserted that students "*become more mature, knowledgeable, and focused during college in thinking about a career*" based on their research results in three decades. Students at higher education therefore are expected to be more conscious about their competency development.

And the way that students develop such important skills and competencies is through activities, interactions, and engagement at school, especially by out-of-class activities.

"*These extracurricular activities are recognized widely [...] as providing students with opportunities for leadership, for personal growth and for developing a sense of commitment to the well-being of the wider community. They offer students opportunities to apply skills learned in the classroom in an applied setting, for them to learn the value of* *teamwork, competition and cooperation, individual and group responsibility."* (Fullarton, 2002) (pp.1)

Holland and Andre (1987) also found very similar results that participating in activities in school helps students "*to acquire new skills (organizational, planning, time-management etc.)*". Extracurricular activities are said to "*provide an opportunity for students to develop these skills in a less formal setting than the classroom*" (Fullarton, 2002).

Such results show potential relationships between out-of-class student engagement and student competencies. In their research about higher education, Barth, Godemann, Rieckmann, and Stoltenberg (2007) concluded that key competencies for sustainable development are mainly formed during the interaction between students and different contexts created by the university, namely academic context and extracurricular activities outside the classroom. In other words, these competencies are developed through student participation and student engagement.

Coates (2005) suggested that while institutions and teachers are to provide necessary resources for students to develop at school, it is essential that students need to interact with these conditions "in ways that will lead to productive learning". It means that in the course of interaction with the class and school environment where students demonstrate their 'quality of effort' (Pace, 1982), students gain their achievements by "*challenging themselves to learn, interacting with new ideas and practicing the communication, organizational and reflective skills*" (Coates, 2005).

When students participate in extracurricular activities or live in a campus residence, they have joined in a broader environment outside their classroom which gives them more opportunities to interact with their peers and develop themselves. They therefore may gain social competencies and strengthen their connectedness with school ((Fredricks et al., 2005), Jordan & Nettles, 1999; Knifsend & Graham, 2012, cited by (Lawson & Lawson, 2013)). Other researchers who study impacts of college experience also agree that what happens outside the classroom, or termed as extra-curriculum activities, contribute to valued outcomes of college, e.g., student learning, cognitive and social development (Janosz, 2012; George D Kuh, 1995; Liem & Martin, 2011).

Therefore, main hypotheses are predicted as follows:

H1: Out-of-class behavioral engagement has a positive impact on student competencies.

H2: Out-of-class emotional engagement has a positive impact on student competencies.

H3: Out-of-class cognitive engagement has a positive impact on student competencies.

H4: Out-of-class agentic engagement has a positive impact on student competencies.

2.2.2. Out-of-class student engagement measurement

Based on literature review, the author collected some student engagement instruments from various research studies. These instruments were then put in a table to compare their usage and to match with the research objectives. A suitable instrument to measure student engagement should be used for undergraduate students, cover three to four constructs of student engagement, and explicitly include out-of-class engagement.

Among 14 student engagement instruments being collected, student self-report is the most popular data collection method for all questionnaires – only one other instrument used teachers' report as a supplementary method besides student's self-report. There are four questionnaires used for undergraduate students, but no questionnaires specifically used for students in business and management. Eight out of 14 questionnaires used both in-class and out-of-class forms of student engagement. Those instruments include sub-scales and items to measure behavioral, emotional, and cognitive engagement for out-of-class context. Regarding agentic engagement, there are only items to measure in-class engagement in the instrument developed by Reeve and Tseng (2011). Out-of-class agentic engagement was only mentioned in the level 3 and level 4 of student participation by Finn (1993) and need to develop more items to measure.

A final list of 17 items collected from suitable instruments as follows: 5 items of Valuing used for out-of-class cognitive component, 6 items of Sense of belonging used for out-of-class emotional component, 4 items of Participation used for out-of-class behavioral component; and 2 items from out-of-class Agentic engagement.

All these items were then translated into Vietnamese by an expert Vietnamese translator working in the education field. After that, the translated version was reviewed by another Vietnamese university lecturer who is proficient in both English and Vietnamese. Minor adjustments were made to the translated list of items.

As a result of the literature review, the out-of-class agentic engagement was not much researched and lack of measurement instrument. Therefore, expert interviews and focus group were chosen as qualitative research methods to generate possible new items to measure out-of-class agentic student engagement in the context of business and management students in Vietnam. The author invited three experts in the field of student's psychology and behavior with more than 10 years of experience to join expert interview and did a group focus discussion with eight students. Each expert interview lasts from 48 minutes to one hour. The focus group took place in one hour and 45 minutes.

Main findings from expert interviews and focus group discussion show that: (1) Interactions between students and their friends, faculty staff, and school on social network (e.g. Facebook) were mentioned as an emerging aspect of student engagement. Those interactions demonstrate various components and levels of engagement, consisting of commenting on Facebook, sharing events and spreading awareness, giving advices, and protecting the reputation of the school; and (2) Active participation in extracurricular activities can be displayed in the form of membership of club management board and event organizers.

Based on the findings, two new items were added to measure out-of-class behavioral engagement, and five new items were added to measure out-of-class agentic engagement.

2.2.3. Student competencies and its measurement

Unlike in high schools, at colleges, students often study different subjects, in larger classes, communicate with different teachers and interact with many different peers. Teaching and learning methods change, requiring students to be active for their self-study and take more responsibility for their learning process (Ernest T. Pascarella & Terenzini, 2005).

The current fast changing social and economic development in the new millennium requires education to equip the learners with the skills and competencies appropriate to the needs of the knowledge economy (Ananiadou & Claro, 2009). For most young people, school is the only place where they can learn these skills and competencies (Ananiadou & Claro, 2009).

Some recent studies on higher education mentioned the need to equip students with the necessary competencies of the 21st century (Ananiadou & Claro, 2009; Wiek, Withycombe, & Redman, 2011), and build a theoretical framework for the required competencies of students (Hipkins, 2006). These studies all suggested that students need to be equipped with competencies - not skills (Rychen & Salganik, 2000). Hipkins (2006) noted the emerge of key competencies to replace the "essential skills" in recent curriculum framework as "unlike skills, competencies focus on all the requirements of a task and this includes what you need to know, not just what you can do". He also suggested the following definition: "*Competencies include the skills, knowledge, attitudes and values needed to meet the demands of a task*."

Although the number of research studies related to this topic is increasing, it must be emphasized that there is currently little consensus regarding what the most necessary set of competencies for graduates is.

As competencies are increasingly essential for graduate students to find jobs in the market, another model called Making the Match Between University Graduates and Corporate Employers developed by Evers and Rush (1996) has proposed four base competencies that are needed during the transition from university to work. These four base competencies are (1) mobilizing innovation and change, (2) coordinating people and managing tasks, (3) communicating, and (4) managing self-developed, which have been comprised from 18 workplace skills. This model has been used to assess competencies of undergraduate business students (Berman & Ritchie, 2006) as well as in other research studies by Berdrow and Evers (2011), Man, Lau, and Snape (2008), and Pinto and Ramalheira (2017). The biggest advantage of this model is its emphasis on employment competencies with a vision where most employees are empowered to make more of the decisions within their organizations. This approach has been highly evaluated by employers in the labor market.

Within the scope of this study, the author intends to use the four base competencies to do the research, therefore, the measurement of competencies will be drawn from measurement instrument proposed by Evers and Rush (1996). Minor changes were made to get a shorter version of the instrument to fit with undergraduate students.

2.2.4. Data collection method

There are several methods used to measure student engagement, but self-report survey measures are considered as the most common method for assessing student engagement (Fredricks & McColskey, 2012).

The overall scale used in student self-report is 7-level Likert Scale, which is more complex but allows respondents to give the answer closest possible to their feelings, thus showing the differences between levels and creating a seamless scale (Williams & Cappuccini-Ansfield, 2007). This scale is described with “1” is “Strongly disagree” and “7” is “Strongly agree”.

The questionnaire used in this research has four parts for the main content. The first part of the questionnaire is an introduction providing an explanation of the research purpose, type of informants and information collection, confidentiality policy, statement of consent and instruction of completing the questionnaire. At the end of this introduction, respondents will be asked to complete a “consent statement” where they show their voluntary consent of taking part in the survey.

The second part was about out-of-class student engagement items, with 6 items of out-of-class behavioral engagement, 6 items of out-of-class emotional engagement, 5 items of out-of-class cognitive engagement, and 7 items of out-of-class agentic engagement.

The third part was about student competencies, with 5 items of Innovation (mobilizing innovation and change), 10 items of Coordination (coordinating people and managing tasks), 10 items of Communication (communicating), and 10 items of Self-management (managing self-developed), a bit shorter than the original version.

The last part was about informant’s demographic and personal information, such as age, gender, year level, major, number of subjects that they are taking and university name.

As the questionnaire was quite a long one and takes much time of respondents to complete it, no reversed item was designed in the form to help respondents focused on the main content of the survey.

2.2.5. Data collection

The sampling method is quota sampling, where the author sent questionnaires to ten different big universities in Hanoi that provide courses in business and management. There were 300 questionnaires sent to the first university (National Economics University), 200 questionnaires sent to the second and the third universities (Hanoi University of Business and Technology, and Hanoi University), and 100 questionnaires sent to the rest seven universities. In each university, the author either asked some lecturers to help collect responses from students in their classes or came directly to those classes to collect data.

After being collected, responses were scanned for their validity before being coded into Excel file. Invalid responses with more than five missing data in a row were removed. After being coded into Excel file, data were then cleaned up by computing Max, Min, Mean, Standard Deviation (SD) for each observation. After checking, the final data set comprises of 991 responses, out of 1,400 questionnaires sent, showing a response rate of 70,8%.

Outliers were identified and eliminated using Mahalanobis distance in SPSS based on a linear regression. In total, eight outliers with values of the Mahalanobis Probability variable less than .001 (Leys, Klein, Dominicy, & Ley, 2018) were identified and removed from the dataset, resulting in a final dataset of 983 observations.

Sample information

University	n	%
National Economics University	266	27.1%
Hanoi University of Business and Technology	149	15.2%
Hanoi University	116	11.8%
Banking Academy	74	7.5%
Foreign Trade University	87	8.9%
Vietnam University of Commerce	41	4.2%
Hanoi University of Science and Technology	71	7.2%
Hanoi Open University	75	7.6%
Economic School, Hanoi National University	59	6.0%
University of Economics - Technology for Industries	45	4.6%
Total	983	100.0%

The total sample was then divided into two datasets for separately running Exploratory factor analysis (EFA) and Confirmatory factor analysis (CFA), as these two analyses should not be run on the same set of data (Appleton, Christenson, Kim, & Reschly, 2006; Fokkema & Greiff, 2017; Hinkin, Tracey, & Enz, 1997) to avoid overfitting data problem. All odd observations were chosen as dataset 1, and all even observations were put in dataset 2.

	Dataset 1		Dataset 2	
Gender	n	%	n	%
Male	135	27.4%	127	25.9%
Female	334	67.9%	341	69.5%
Prefer not to say	10	2.0%	10	2.0%
Missing	13	2.6%	13	2.6%
Total	492	100.0%	491	100.0%
Age				
17-18	26	5.3%	21	4.3%
19	109	22.2%	100	20.4%
20	125	25.4%	137	27.9%
21	175	35.6%	172	35.0%
>=22	53	10.8%	56	11.4%
Missing	4	0.8%	5	1.0%
Total	492	100.0%	491	100.0%
Study year				
Year 1	100	20.3%	91	18.5%
Year 2	135	27.4%	141	28.7%
Year 3	179	36.4%	172	35.0%
Year 4	67	13.6%	78	15.9%
>=Year 5	2	0.4%	1	0.2%
Missing	9	1.8%	8	1.6%
Total	492	100.0%	491	100.0%

Both datasets are dominant by female students: 67.9% female to 27.4% male in dataset 1 and 69.5% female to 25.9% male in dataset 2, but those ratios are consistent and quite normal for students in business and management where female students are often the majority. Both datasets contain students from all study years, from Year 1 to Year 4.

3. Results

3.1. Exploratory Factor Analysis

In this part, an Exploratory Factor Analysis EFA were used to explore the factor dimensions as well as to reduce the set of observed variables to a smaller, more parsimonious set of variables (Hinkin et al., 1997) for dataset 1.

KMO and Bartlett's Test

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.934
Bartlett's Test of Sphericity	Approx. Chi-Square	9117.288
	df	276
	Sig.	.000

The KMO value is 0.934 > 0.7 and the Bartlett’s test of sphericity is significant at sig=0.000.

For this EFA, the extraction method used is Principal Component Analysis, with Eigen value greater than 1, rotation method is Varimax and the absolute value of small coefficients to be suppressed is 0.4 (Hair, Black et al., 2010). The initial result of EFA for out-of-class engagement is as follows:

Total Variance Explained

Component	Initial Eigenvalues			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	11.084	46.184	46.184	11.084	46.184	46.184	5.300	22.082	22.082
2	3.220	13.418	59.602	3.220	13.418	59.602	4.426	18.441	40.524
3	1.246	5.193	64.795	1.246	5.193	64.795	3.705	15.437	55.961
4	1.080	4.500	69.295	1.080	4.500	69.295	3.200	13.335	69.295
5	.879	3.662	72.957						
6	.744	3.099	76.056						
7	.622	2.593	78.649						
8	.567	2.361	81.010						
9	...	...	...						

Extraction Method: Principal Component Analysis.

There are four components identified based on the criteria of Eigen value of greater than 1 with 69.295% of total variance explained. The total number of components is four as expected and the total variance explained is greater than 50%, which is good.

Initial factor loadings from an exploratory factor analysis of all 24 items to measure out-of-class student engagement are obtained as follows.

Rotated Component Matrix[a] and item description

	Items	Component 1	2	3	4
OB1	I take part in periodical student clubs / student associations activities at school	.764			.405
OB2	I attend in sports, cultural or social events of my class/school	.780			
OB3	I go to campus willingly	.691	.407		
OB4	I participate seriously in extra-curricular activities	.751			
OB5	I actively interact with student clubs/student associations of my school on social networks	.712			
OB6	I actively interact with my school on social networks	.583	.421		
OE1	I look forward to going to campus		.806		
OE2	I feel myself as a part of the campus		.725		
OE3	I enjoy the activities carried out in campus		.674		

OE4	I feel happy in campus		.828		
OE5	I like spending time in campus		.797		
OE6	I feel secure in campus		.575	.475	
OC1	I believe university is beneficial for me			.770	
OC2	University is of great importance in my life			.802	
OC3	I give importance to university education			.844	
OC4	I give importance to extra-curricular activities and take them seriously	.447		.604	
OC5	I determine my own socializing goals	.535			
OA1	I actively contribute to extra-curriculum activities of my class	.608			
OA2	I actively contribute to extra-curriculum activities of my school	.638			.443
OA3	I am a core member of at least one student club/ association / group of my school				.848
OA4	I involve in the management of at least one student club/ association / group of my school				.859
OA5	I actively contribute to my student club's / student association's activities	.476			.641
OA6	I share campaigns/ events of my school on social networks	.447			.495
OA7	I protect reputation and image of my school on social networks			.550	

Extraction Method: Principal Component Analysis.
Rotation Method: Varimax with Kaiser Normalization.
a. Rotation converged in 8 iterations.

There were minor cross loadings in the rotated component matrix. The author first removed OA1, OA2, and run the EFA again. This time, the author chooses the absolute value of small coefficients to be suppressed is 0.5 to focus on components with strong loadings. The next run of EFA showed that OC5 and OA7 should be removed. The final rotated component matrix is as follows, with total variance explained slightly increases to 72.463%.

Rotated Component Matrix[a]

Items	Component			
	1	2	3	4
OB1		.737		
OB2		.752		
OB3		.698		
OB4		.769		
OB5		.713		
OB6		.575		
OE1	.808			
OE2	.746			
OE3	.707			
OE4	.844			
OE5	.806			
OE6	.588			

OC1			.778	
OC2			.821	
OC3			.865	
OC4			.579	
OA3				.871
OA4				.874
OA5				.674
OA6				.508

Extraction Method: Principal Component Analysis.
Rotation Method: Varimax with Kaiser Normalization.
a. Rotation converged in 8 iterations.

This EFA result has confirmed the four subcomponents of out-of-class engagement, where out-of-class agentic engagement was a separate component of the structure. The measurement instrument of out-of-class agentic engagement is also reduced to four items with quite strong loadings for each item, ranging from 0.508 to 0.874.

3.2. Internal Consistency Assessment

In this step, the reliability of the scale will be tested based on Cronbach's Alpha.

Item-Total Statistics

	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted
OB Cronbach's Alpha		**.899**		
N of Items		6		
OB1	23.32	49.740	.744	.878
OB2	23.51	50.193	.760	.875
OB3	22.84	53.073	.649	.892
OB4	22.69	52.919	.746	.878
OB5	23.16	50.512	.777	.873
OB6	23.02	53.014	.681	.887
OE Cronbach's Alpha		**.917**		
N of Items		6		
OE1	24.76	40.074	.777	.901
OE2	24.89	39.482	.782	.900
OE3	24.91	40.171	.765	.903
OE4	24.97	38.971	.860	.889
OE5	25.12	39.728	.792	.899
OE6	24.45	43.274	.621	.921
OC Cronbach's Alpha		**.868**		
N of Items		4		
OC1	17.16	9.937	.763	.813
OC2	17.24	9.488	.813	.791
OC3	16.92	10.323	.776	.811
OC4	17.36	10.990	.547	.901
OA Cronbach's Alpha		**.839**		

	N of Items	4		
OA3	11.23	25.695	.738	.766
OA4	11.63	25.699	.702	.783
OA5	10.51	26.967	.699	.784
OA6	10.13	30.184	.553	.845

All Cronbach's Alpha of OB, OE, OC, OA are greater than 0.8, which showed that the measurement items are reliable. In each sub-construct, most of Cronbach's Alphas if Item Deleted were smaller than the main Cronbach's Alphas, except the three cases of OE6, OC4, and OA6 which showed minor improvement with the overall scale. Hair (2016) indicated that a scale item should only be deleted if they are below 0.4, therefore all scale-items of the measurement tool are retained.

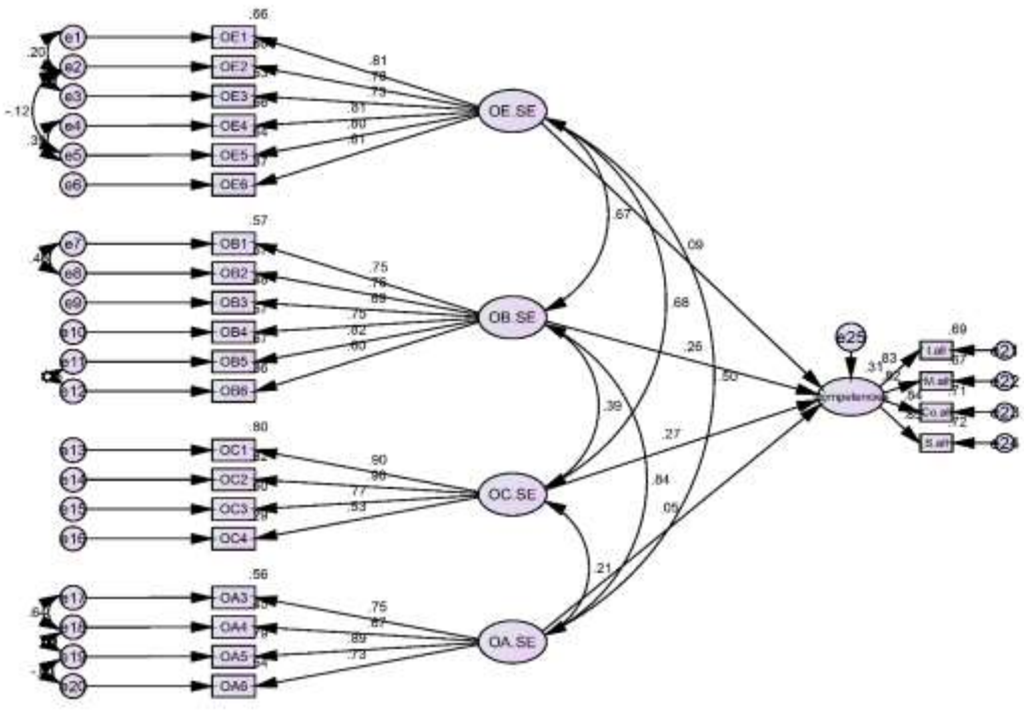
Besides, all Corrected Item-Total Correlation > 0.5, it means they are highly interrelated and likely to measure the same construct.

Therefore, the items used to measure the components of out-of-class student engagement are reliable.

3.3. Confirmatory Factor Analysis

The dataset 2 was used to run a Confirmatory Factor Analysis based on the result of the EFA from dataset 1.

The rotated pattern matrix of out-of-class engagement was put into Amos Graphics version 20. Student competencies was used as a single dependent variable with four competencies as observable variables in the model.



Among different indices of fitness assessment, Hooper, Coughlan, and Mullen (2008) suggested to report the Chi-Square statistic, its degrees of freedom and p value, the RMSEA and its associated confidence interval, the SRMR, the CFI and one parsimony fit index such as the PNFI, as these indices have been found to be "*the most insensitive to sample size, model misspecification and parameter estimates*".

In this model, the fitness indices are compared with the norms to get the model fitness assessment as follows:

Criteria	Model value	Norm	Source	Model fitness assessment
Absolute fit indices				
Normed chi-square CMIN/DF (Chi-square/ Degrees of freedom)	3.360	<5	Wheaton, Muthen, Alwin, and Summers (1977)	Good
P value	.000	>=0.05	Wheaton et al. (1977)	Not good
Root mean square error of approximation RMSEA	.069	< =0.07	Steiger (2007)	Good
90% confidence interval of RMSEA	.064 - .075	< =0.08	Steiger (2007)	Good
PCLOSE	.000	>=0.05	Steiger (2007)	Not good
Standardized root mean square residual (SRMR)	.0733	<=0.08	Hu and Bentler (1999)	Good
Incremental fit indices				
Normed-fit index (NFI)	.906	>=0.9	Byrne (1994)	Good
Comparative fit index (CFI)	.932	>=0.93	Byrne (1994)	Good
Parsimony fit indices				
Parsimony normed-fit index (PNFI)	.906	>=0.9	Mulaik et al. (1989)	Good

Among those 9 indices, seven indices were good, only two indices of P value and PCLOSE were not good.

However, Moss (2009) stated that many researchers disregard the index P value "*if both the sample size exceeds 200 or so and other indices indicate the model is acceptable*". Since other indices of model fitness are good, this model is considered satisfactory and acceptable for the test.

3.4. Results

The hypotheses being tested in this model have results as follows:

Regression Weights: (Group number 1 - Default model)

			Estimate	Standardized Regression Weights	S.E.	C.R.	P
Competencies	<---	OE.SE	.063	.093ns	.061	1.032	.302
Competencies	<---	OB.SE	.151	.265*	.077	1.959	.050
Competencies	<---	OC.SE	.206	.267***	.052	3.937	***
Competencies	<---	OA.SE	.026	.050ns	.060	.443	.658

(*** p<0.001, ** p<0.01, *p<0.05, ns=not significant)

Squared Multiple Correlations

	Estimate
Competencies	.306

The standardized regression weights for out-of-class emotional engagement (OE.SE) and out-of-class agentic engagement (OA.SE) are low (0.093 and 0.05 respectively) with insignificant p values. Therefore, the hypotheses of H2 (*Out-of-class emotional engagement has a positive impact on student competencies*) and H4 (*Out-of-class agentic engagement has a positive impact on student competencies*) are not supported.

The standardized regression weights for out-of-class behavioral engagement (OB.SE) is 0.265 at p = .05, and the standardized regression weights for out-of-class cognitive engagement (OB.SE) is 0.267 at p < .001. Therefore, the H1 and H3 hypotheses that out-of-class behavioral and cognitive engagement has positive impacts on student competencies are statistically significant.

With R square = 0.306, 30.6% of variation of student competencies can be explained by the independent variables of out-of-class student engagement.

This result has confirmed the role of out-of-class student engagement in relationship with student competencies in the context of business students in Vietnam.

4. Discussion and Conclusion

4.1. Discussion

The findings of this test show that out-of-class student engagement has significant positive impacts on student competencies at higher education, especially with out-of-class behavioral and cognitive engagement. Though the importance of competencies has been widely confirmed, the acquisition of competencies is "hardly comparable with learning as knowledge acquisition" as described by Barth et al. (2007): "they are learnable but not teachable". Therefore, an initially established relationship between student engagement in general and out-of-class engagement in specific will provide possible intervention and development for student competencies. However, such relationship still needs further research and testing in different contexts, both theoretically and empirically.

This finding also shows a comparable interesting aspect of student engagement in different contexts, where previous research also demonstrated that "behavioral and cognitive engagement in learning activities strongly predicts achievement and learning competencies" (Janosz, 2012).

The findings of this research, however, did not support the impact of out-of-class emotional and agentic engagement on student competencies. This is not very consistent with other research where they emphasized the role of emotional engagement as "*there is much potential for school environments to have broad influence on students' development and growth*" (Yusof, Ang, & Oei, 2017). As a new subcomponent of out-of-class student engagement, out-of-class agentic engagement has not been much researched in different contexts, and the measurement instrument of this construct is still under development.

4.2. Conclusion

In this research, the author has reviewed literature relating to relationships between out-of-class student engagement and student competencies to establish a theoretical linkage and then empirically test it with two samples of business students in Vietnam.

The author has contributed to the knowledge of student engagement by generating new items to help measure a new subcomponent of out-of-class agentic engagement through literature review and qualitative research.

An exploratory factor analysis on a sample of 492 students has confirmed the four separate components of in-class engagement in the context of Vietnam. The measurement instrument of out-of-class student engagement was successfully tested as a valid and reliable instrument with both convergence and differentiation criterion.

The research also produced promising results with satisfactory model fitness in the confirmatory factor analysis on another sample of 491 students. The findings from this research shows statistically significant positive impacts of out-of-class behavioral and cognitive engagement on student competencies at higher education, while the impacts of out-of-class emotional and agentic engagement was not significant. Such findings show initial contribution to the current knowledge body of student engagement and calls for further research and testing of this relationship in different contexts, both theoretically and empirically.

RATE OF RETURN FOR HIGHER EDUCATION IN VIETNAM: A DISCIPLINE BASE COMPARATIVE ANALYSIS

Dr. Nguyen Quynh Hoa

National Economics University, Hanoi, Vietnam

Abstract

In Vietnam, higher education has been highly appreciated by the public as well as policymakers as a bachelor's degree is believed to be a competitive advantage for future career. Although the effect of higher education on wage is quite obviously in Vietnam, the effect of university major on wage is not much mention in previous research. Using the Labor Forced Survey (LFS 2019), to match with the university's training sectors according to the Circular No: 06/2018/TT-BGDDT dated February 28, 2018, the paper estimates the average rate of return to a university degree in Vietnam with discipline based comparative analysis using Mincer method and propose some recommendations and suggestions for higher education in Vietnam. The result shows that the average monthly salary of works is at VND 7.2 million with training or special qualifications - university receive a high salary by around 11.11% which is up to VND 8 million per month. In comparison of all major study, the incomes are different, but the gaps are not significant.

Keywords: *Higher education in Vietnam, Rate of returns on education, University's discipline*

1. Introduction

Economists have traditionally sought to identify the rates of return for educational investments because of the implications for total economic growth, and also to mention the help it provides individuals in determining how much they should invest in their education. Higher education is central to creating a knowledge economy and it is critical for economic development in general. However, in most countries, higher education (and especially university education) remains expensive. So, one popular question that has been asked by many universities and college students is: Is university education a good investment? To get the answer, there is a growing body of empirical literature that investigates the rate of return for higher education. In general, the papers have confirmed that better-educated people are receiving higher wages rather than less-educated people by the studies of Mincer (1991), Åberg (2003), Zhigang and Shunfeng (2006), England (2010) of Harberger et.al (2012). To estimate the rate of return to higher education, most of the papers use production function in the Mincer model way in order to achieve log-linear equation with household survey data and the result indicates that educational achievement seems to be a dominant forecaster of labor-market outcomes. The members of better-educated households suggest not to accepting low salaried works (Akguc, 2011; Comola and Mello, 2011; Purnastuti, 2012; Magdalyn, 2013).

Concerning the choice of college major, there is a significant amount of empirical evidence suggests that earnings potential affects individuals' choice of college major (Willis and Rosen, 1979; Zarkin, 1985; Berger, 1988). There is less definitive evidence on the extent to which lifetime earnings considerations factor into college major choices, though, as suggested above, it is clear that there are significant differences in rates of return according to one's major (Carnevale et al., 2012), and recessions and economic fluctuations can have significant and persistent effects on new college graduates that depends, in part, on the major with which they enter the labor market (Oreopoulos et al., 2012). Work that focuses on connecting field of study to potential future earning generally relies on strong forecasting assumptions. Accordingly, Berger (1988) estimates the relationship between a college student's predicted future earnings and choice between five broad fields of study. In models that attempt to correct for self-selection bias, assuming individual ability and cohort affects earnings but not college major, he finds evidence suggesting that students are likely to choose majors that offer greater lifetime earnings streams. Similar to Berger, Beffy et al. (2012) estimate the relationship between expected earnings and college major across broad fields of study, and they attempt to account for self-selection by exploiting variations in the relative earnings returns induced by the business cycle. They find heterogeneous responses to changes in anticipated earnings and conclude that the elasticity of major choices is modest and primarily driven by non-pecuniary factors.

In Vietnam, higher education has been highly appreciated by the public as well as policymakers as a bachelor's degree is believed to be a competitive advantage for future career. There are some papers investigated the effect of higher education on wage. Despite the difference in data and method, the impact of education on wage appears to be always positive. In 2008, university education is expected to raise individual wage rate by 68%, ceteris paribus (Doan, 2011). By selecting the survey subjects are wage earners in the Mekong Delta, using descriptive statistical methods of the variables in the model, Pham (2012) shows that education is an important determinant of personal income, thereby confirming the benefits of education for learners in the market economy. The conclusion is quite similar in Le (2015), Tran et al. (2018). Although the effect of higher education on wage is quite obviously in Vietnam, but up to now, there in only research of Tran et al. (2018) mention about the effect of university major on wage, but in this research, the list of university's main majors and also the Vietnam's industrial classification of General Statistic Office is out of date, thus this paper by using Labor Forced Survey (LFS 2019), to match with the university's training sectors according to the Circular No: 06/2018/TT-BGDDT dated February 28, 2018 to estimate the average rate of return to a university degree in Vietnam with discipline based comparative analysis using Mincer method and propose some recommendations and suggestions for higher education in Vietnam.

2. Method

2.1. Method

The paper uses the Mincer equation model based on human capital theory to explain the effect of trained labor on wages and income. According to this model, salary income is explained based on schooling, experience, and experience squared:

$$LnYi = \beta 0 + \beta 1Si + \beta 2Xi + \beta 3Xi^2 + ei, (1)$$

In which, LnY is the logarithm of salary, S is number of years of schooling or represents the variable of professional and technical qualifications, Xi is experience (year), X^2 is experience squared, and $\beta 0$ is the constant intercept of the model. Then random, and unobserved components are known as e $\sim$N (0, $\sigma 2$).

In addition to information on training in the basic Mincer income model, explanatory variables such as workplace characteristics, professional occupation and individual characteristics of employees are added, which allows research to grasp or to capture partial heterogeneity of observed variables in equations (Bartel, 1995).

$$LnYi = \beta 0 + \beta 1Si + \beta 2Xi + \beta 3Xi^2 + \beta 4Xi + ei (2)$$

Statistical analyses based on non-randomly selected samples can lead to erroneous conclusions. To correct bias from non-randomly selected samples or otherwise incidentally truncated dependent variables, a pervasive issue in quantitative social sciences when using observational data, it is often used the Heckman correction, a two-step statistical approach (Heckman J. (1979)

Step 1, regression of determinants of wage employment using the probit model.

The results of step 1 estimation will obtain Mills variable, according to Heckman (1979), Mills variable is controlled for the second stage of the regression model.

Step 2, the model to estimate wages based on the Mincer model according to Heckman's adjusted method

2.2. Data

Currently, Vietnam higher education system consists of 07 main sectors, including Education science and teacher training, Art; Business, Management and Law; Social sciences and humanities; Health care; Maths, statistic, and computer science; Services and social service (Ministry of Education and Training, 2018). According to General Statistic Office (2018), university majors can be divided into 24 groups, including: Science education and teacher training; Art; Humanities; Social and behavioural sciences; Press and information; Business and Management; Law; Human science; Natural sciences; Math and statistics; Computers and information technology; Production and processing; Architecture and construction; Agriculture, forestry and fishery; Veterinary; Health; Hotels, tourism, sports and personal services; Military and Defense, etc. So, in this paper we match the university major of GSO with 07 main sectors of Ministry of education and Training to make the discipline base comparative analysis

This paper examines the rate of return to university education based on and Labor Forced Survey (LFS 2019), which was taken by General Statistics Office of Vietnam. The LFS 2019 was conducted nation-wide with a sample size of 824,116 individuals which were representative at national, regional, urban, rural and provincial levels. It provided an up- to-date source of data on labor to be used in policy design, monitoring and evaluation of policies and programs. The survey collected information during four periods, each period in one quarter from the first quarter to the fourth quarter in 2018 through face-to-face interviews conducted by interviewers with labor in sample enumeration areas. Large sample size, on the one hand, offers more precise estimates. On the other hand, that facilitates separate analyses on specific sub-populations, such as: group by technical qualifications, age group, major of training or type of employment.

3. Results

3.1. Description of data

Based on the LFS 2019, the average monthly salary of labour is about 7.2 million. Workers with university degrees receive highest rate of salary, about 8 million per month; Primary, intermediate and college respectively receive 6.9, 5.9 and 6.2 million respectively. This situation is the same with all training major sector. In term of wage by field of major, employees trained in the Service sector receive of about 7.9 million per month, the highest average salary per month among major sectors, while the wage per month in health sector is the lowest. However, when compare the level of wage by field of major among labour has university degree, although employees trained in the Service sector still get highest wage, but the second is people trained in health sector. The lowest wage among university degree workers is Education science and teacher training (table 1).

Table 1: Average monthly salary of employees by fields of majors and certifications.

Unit: thousand VND

	Primary degree	Intermediate Degree	College degree	University degree	Total
Total	6,917	5,946	6,270	8,075	7,228
Education science and teacher training	1,100	4,959	6,051	6,908	6,530
Art	7,039	5,627	6,059	7,533	6,735
Business, Management and Law	5,227	5,731	6,381	8,042	7,490
Social sciences and humanities	591	4,452	6,030	7,173	6,843
Maths, statistic, and computer science	5,748	6,200	6,507	8,643	7,274
Health	5,085	5,334	5,521	8,667	6,319
Services and social service	7,268	6,861	6,651	9,317	7,914
Others	5,744	5,056	6,358	7,364	6,292

Source: Calculate based on LFS 2019

By fields of majors and genders, the salary for men is 7.8 million per month, 6.5 million higher than that of women. If the employee is trained in Education science and Teacher training, the salary for men is 7.45 million per month and for women is 6.24 million per month. If they are trained in the Art field, the average salary of the two genders is quite balanced with about 6.7 million per month. In Business and Management and Law, the salary is 8.4 million per month. In general, in almost every field of training, wages for men are higher than for women.

3.2. Mincer equation model results

The table below is shortened results of estimating the wage model of workers from the LFS data and by the least squares method (OLS) and the sample error adjustment method (Heckman Selection).

Comparing the estimated coefficients from OLS method and from Heckman, it shows that the impact trend is not different, but there is difference in magnitude. The coefficients athrho (0.026) and lnsigma (-0.461) of the Heckman Selection model are significant at 99% confidence, confirming the existence of the sampling bias, so if estimated by OLS method, results may be skewed then the model estimated by Heckman is perfectly suitable. Model estimation results from the OLS method tend to overestimate the impact of the educational variables compared with the Heckman method. Thus, it may lead to an "over" impact statement.

The report uses the Heckman Selection model estimation results to analyze the impact results. The use of the Heckman method instead of conventional regression is intended to control the endogenous variable problem due to unobserved lack of variables.

Table 2. Results of estimating the wage model of labor

Source: Calculate based on LFS 2019

- The impact of higher training:

The group without certification is set as the base variable when comparing dummy variables, the vocational training variable is represented by the primary dummy variable, intermediate and college degree. The estimated results of these variables are statistically significant.

Research results from the Heckman model show that the average salary of the group with college and university degrees or higher is more than that of the untrained group with ($e^{0,284}$ - 1) * 100% = 32.8%. The trained group at primary level has higher average salary than the untrained group with ($e^{0,139}$ - 1) * 100% = 14.9%. The group of workers at intermediate vocational level has a higher average salary than the untrained group with ($e^{0,113}$ - 1) * 100% = 11.9%. And the group of vocational college level has the high average salary than the untrained group with ($e^{0,175}$ - 1) * 100% = 19.1%. Corresponding impact estimation coefficients from the conventional model OLS are higher than from the Heckman model for intermediate, college and university levels.

Thus, when other factors in the model such as the characteristics of the industry, occupation and region, age, and form of ownership are fixed, entering primary vocational education will bring a higher salary than the untrained, vocational intermediate and college with about 14.9%, 11.9% and 19.1% respectively. This result is completely consistent with previous studies that the higher professional and technical qualifications the worker, the higher the salary. Qualified workers generally will have better positions, and the ability to absorb new knowledge and access to the job when technology changes.

- The impact of major variable on the vocationally trained workers` income:

With the variable majors divided into 8 groups, the group "Educational science and Teacher training" was selected as the base group for comparison with the others. The results show that the estimated coefficients of these variables are statistically significant, but the directions of influence of the training fields on the employee's income are different. "Business and Management, Law" and "Services and Social service" are two occupations that generate higher income for workers than the group of "Education science and Teacher training" with 2.43% and 1.82%, respectively. This shows that although the income is higher, the gap is not much. Compared to the remaining groups of training fields, the group "Educational Science and Teacher Training" has the highest income, the biggest difference is compared to the group of "Others" with 17.59%. followed by the "Healthcare" group with 8.87%. Through the research results, it can be seen that the group "Educational science and Teacher training" generates high income in society. From the olden days, the Vietnamese spirit always highly appreciates the humanity in teaching profession. However, in recent years, implementing the new policy which of taking the graduation exam scores from high schools to serve as a basis for admission to universities also appeared a few shortcomings. The fact is that the number of students applying to schools in the pedagogy is not much, or there are schools of pedagogy that require very low admission scores, even less than 15 points when calculating the combination of 3 subjects for admission. This irrationality leads to the quality of teacher training, which is not high. Therefore, all levels of government need to have synchronous solutions to improve the quality of training in the field of Education Science and Teacher Training. It is necessary to raise the entry standards, create favorable conditions and support tuition fees for pedagogical students. In addition, there is a need for commitment to students about their dedication to education and training after graduating.

4. Discussion and Conclusion

According to the above findings, the average monthly income or salary of works is at VND 7.2 million with training or special qualifications - university receive a high salary by around 11.11% which is up to VND 8 million per month - with higher degree, workers earn up to VND 9.3 million in average per month. This is equal to 16.25% higher than average salary of workers with university degree. Of course, the assumption for this comparison is that this does not consider on the different fields of work, but only the average of all fields is accounted.

At the same time, with the use of Mencer equation measures on the impact of field or major of study on the vocationally trained workers` income. In comparison of all major study, the incomes are different, but the gaps are not significant. For instance, the group of "Educational Science and Teacher Training" reflects the highest income level where If is only 17.59% higher when compared to the group “Others”.

The result shows that higher education plays an important role in increasing job opportunities. Higher education has helped select and categorize individuals with different qualifications, providing information to employers to hire or redistribute income between skilled and non-skilled labors. An important issue in education finance is that who should play a major role in higher education finance. In Vietnam, it is often argued that the government should play a major role in financing education and provide capitals for the public and private sectors. This is the basis for educational planners to discuss which method would be best suited to finance education in Vietnam. It is suggested that the Government should determine the optimal method of funding for higher education in Vietnam. The data in the study also shows that the salary in some industries in the category "Business, Management, Law" or "Services" are the highest. Among these industry groups, a prime example is that Hotel management is being considered a "hot" industry. It will bring employees an income of about 7-10 million per month, with manager and supervisor positions, the average salary is 24 million per month. Because of the favourable conditions to study, and upon graduation, students will ensure a good standard of living due to high income, so it is really reasonable if the tuition fees of these majors are set higher than the other sectors. Tuition for the group of "Business, Management, Law" and "Services" should be considered to match the level of income of workers trained in them.

Conversely, the Government should also consider the tuition fees of low-income sectors of labor. The industries in the “Education science and Teacher training”, “Healthcare” or “Arts” category are indispensable factors for society. They ensure a better quality of life physically and mentally. However, the workers trained in this group receive a lower salary than the general level. In order to attract human resources, and to motivate students, the policies should be to exempt, or reduce tuition fees, and increase scholarship for students in these industry groups. This is necessary for us to have fairness, and above all, it meets the needs of the country's development in the present conditions.

Abstract

Vietnam's lower secondary boarding schools for ethnic minorities must organize educational activities in the classroom, educational activities outside of class time and boarding education activities in a flexible and effective manner in order to connect and integrate the contents of life skills education activities in general and life skills education activities in response to climate change and disaster prevention in particular. The authors of the article analyze and evaluate the situation of managing life skills education activities in response to climate change and disaster prevention in ethnic minority boarding lower secondary schools in the northeastern provinces of Vietnam, thereby proposing a system of management solutions suitable to the reality of lower secondary boarding schools for ethnic minorities in the current period in order to develop life skills education model to cope with climate change and prevent natural disasters at lower secondary boarding schools fIntroductionor ethnic minorities in the northeastern provinces of Vietnam.

Keywords: *Development management; Life skills education model; Responding to climate change and preventing natural disasters; Lower secondary boarding schools for ethnic minorities; Northeastern mountainous provinces.*

1. Introduction

Ethnic minority students are young advocates for their families and communities. They play a very important role in propagating and responding to climate change, forecasting, warning, preventing, responding to, and minimizing harms of natural disasters and recovering from natural disasters.

The conduct of regular training to improve the capacity to respond to climate change and prevent natural disasters for ethnic minority students studying at lower secondary boarding schools for ethnic minorities in the regions. Northeastern mountains is a very important and urgent job.

Life skills education includes four basic components: building a life skills education plan, organizing the implementation of the life skills education plan, directing the implementation of the life skills education plan, and testing and evaluate the implementation of the life skills education plan through extracurricular activities, boarding activities oriented to respond to climate change and disaster prevention for ethnic minority students. extremely important, conducted flexibly, flexibly and attractively in lower secondary boarding schools for ethnic minorities.

2. The current situation of life skills education management to respond to climate change and prevent natural disasters through boarding activities in lower secondary boarding schools for ethnic minorities

2.1. Actual situation of developing life skills education plan oriented to respond to climate change and prevent natural disasters for ethnic minority students through extracurricular activities

We conducted a questionnaire survey for 231 administrators and teachers of 12 ethnic minority lower secondary boarding schools. The results show that: 94.2% of the respondents said that the school has actively developed educational plans for students in peak competitions; 82.6% life skills education plan for students works according to the subjects in the program. For the life skills education plan for students working in the aspects of social activities and through activities outside of class time, only 54.4% of respondents confirmed that there is a plan to be implemented at school.

Therefore, the school needs to focus on building more specific and detailed plans in terms of social activities and through activities outside of class time to make timely and reasonable adjustments to strengthen management. management of life skills education for students. The plan needs to be approved before being put into practice and adjusted when necessary, in accordance with the actual situation. Developing a life skills education plan in the direction of climate change response and disaster prevention for ethnic minority students is placed in the school's overall comprehensive education plan associated with the implement the school year's tasks, professional plans, plans for activities outside of class time. At each Ethnic Minority Boarding Secondary School, planning has been taken care of from the beginning of each school year.

2.2 Actual situation of organizing the implementation of life skills education plan oriented to respond to climate change and prevent natural disasters for ethnic minority

students through extracurricular activities

In order to well implement the life skills education plan for ethnic minority students, the stage of implementing the plan is a very important and indispensable step. Lower secondary boarding schools for ethnic minorities have implemented various life skills education plans in response to climate change and disaster prevention through overtime activities classes for ethnic minority students are flexible, diverse, attractive and effective (picking flowers for democracy, acting...). We have conducted a survey on the current situation of organizing life skills education for students through 231 administrators and teachers.

Through the survey results, it can be seen that the lower secondary boarding schools for ethnic minorities in the provinces are also initially interested in the management of life skills education for students in the direction of coping with climate change. climate change and disaster prevention, there is a plan to closely direct the organization of management and education of life skills for ethnic minority students in the direction of responding to climate change and preventing natural disasters.

The surveyed subjects confirmed that it is best to organize the implementation of the life skills education plan in the direction of responding to climate change and disaster prevention through the activities of the Youth Union (ranked 1st place). - 91.3%). Life skills education through class activities, or through a team of classroom teachers are prioritized in the next positions (2nd and 3rd). The school strictly manages class activities (1 period/week). Life skills education through activities of the Youth Union is a highly effective activity.

2.3 The current situation of directing the implementation of skills education plans for ethnic minority students in the direction of responding to climate change and preventing natural disasters

Educating ideological, emotional, lifestyle and behavior for ethnic minority students, organizing and engaging them in activities of preventing and responding to natural disasters and disaster risks is an invaluable task equally important to the school. In order to achieve this educational goal flexibly and effectively, the problem is that the school must organize in conjunction with the family and the society, mobilizing the strength of the whole society to contribute to improving the efficiency of the school. life skills education for ethnic minority students in response to climate change and disaster prevention. To understand the current situation of direction and coordination between schools and educational forces in educating ethnic students in life skills in response to climate change and disaster prevention. We have conducted a questionnaire survey with 231 administrators, teachers, union officials and representatives of organizations in the school.

Through the survey, we have commented: The direction and coordination between administrators and educational forces is a regular job and is highly appreciated by staff and teachers. Specifically: the team of homeroom teachers (95.65%), the Ho Chi Minh Communist Youth Union (88.41%), subject teachers (84.06%), the parents' association (73.91%), students' families (63.77). This result proves that school administrators have had a very good direction and coordination with the team of classroom teachers, subject teachers, parents' unions and youth unions.

2.4 Actual situation of inspection and assessment of life skills education activities for ethnic minority students in the direction of responding to climate change and preventing natural disasters

To better understand the current situation of testing and evaluating the implementation of the plan of life skills education activities for ethnic minority students in the direction of responding to climate change and preventing natural disasters, we conducted Survey by questionnaire with 231 administrators, teachers, union officials and representatives of organizations in the school. The results are shown as follows: the assessment of life skills education results for school students is conducted by semester and by school year with the highest results, with an average score of 2.70; having clear criteria content has the second average score of 2.62; regularly assessed with a third-place average score of 2.55. Demonstrate that the assessment of life skills education results by semester, school year, with clear criteria and regular assessment is the most attentive and objectively evaluated by the management staff and teachers. objectively and frankly in order to bring life skills education to students more and more practical and effective.

Some contents have low average scores: coordination of self-assessment of students with the student body, homeroom teacher, school; focus on learning cultural subjects; focus on the implementation of order, with the average score that administrators and teachers evaluate in order of: 2.32; 2.23; 2.13. It is necessary to overcome these limitations in order for the evaluation results to be more fair and accurate.

General assessment of the status of life skills education management for ethnic minority students in the direction of responding to climate change and preventing natural disasters through extracurricular activities

Ethnic minority students have the right awareness and understanding of the importance of life skills education in response to climate change and disaster prevention for themselves. The children have actively participated in life skills education activities through activities organized by the school to equip themselves with knowledge, understanding and practice their ability to behave, communicate, decision-making... related to capacity to respond to climate change and disaster prevention. The school, administrators and teachers have realized the importance, role and position of life skills education management for ethnic minority students in the direction of improving coping capacity. With climate change and disaster prevention in the process of comprehensive education, it has timely developed an action plan and implemented it in various forms, with policies to coordinate with the family. families and society to provide life skills education for ethnic minority students in order to effectively improve the quality of life skills education for students, respond to and avoid natural disasters and disaster risks.

In the past time, the education of life skills for students in the direction of improving their capacity to respond to climate change and prevent natural disasters has been concerned by managers by developing an integrated education plan. grafted through extracurricular activities, moral education, etc. However, the effectiveness is still very low, some managers are still confused when they understand about life skills education according to regulations. towards improving capacity to respond to climate change and prevent natural disasters.

For some administrators and teachers, the issue of life skills education for ethnic minority students is still a new issue and an appropriate educational method has not been found (contact, integration, integration, etc...) to develop appropriate life skills education content in the direction of improving capacity to respond to climate change and prevent natural disasters for ethnic minority students. Organizational forms are not yet rich, diverse, not deep enough to attract students and raise their deep awareness, strong feelings and beliefs to form and develop a comprehensive personality. The form of education is sometimes stressful and burdensome for both teachers and students of ethnic minorities, educational methods have not been improved in accordance with the requirements of innovation in teaching and learning, especially for special education. enemies of the lower secondary boarding school for ethnic minorities. The coordination of forces is not synchronized, especially the parents and students are not aware of the goals, contents and methods of life skills education in the direction of improving capacity to respond to climate change. and disaster prevention to work with schools and mass organizations in educating ethnic minority students in life skills.

3. Solutions for managing and developing life skills education models in response to climate change and disaster prevention through flexible and diverse boarding activities at boarding lower secondary schools for ethnic minorities the basis of the mountainous provinces in the northeast of the northeastern region

3.1 Solution 1: Organize educational propaganda to raise awareness for administrators, teachers, students and students' parents about the importance of life skills and life skills education for students according to orientation to improve capacity to respond to climate change and prevent natural disasters for ethnic minority students

Raise awareness for staff, teachers, and school mass organizations on life skills education for ethnic minority students in the direction of improving capacity to respond to climate change and prevent natural disasters, so that they can see the importance and urgency of the management of life skills education activities for ethnic minority students in the current period. Thereby raising the sense of responsibility, actively participating in activities to contribute to improving the quality of life skills education for ethnic minority students in particular and the comprehensive education quality of the school in general.

* For managers: Must thoroughly grasp all guidelines and guidelines of the Party, State policies, regulations and regulations of the Ministry of Education and Training, directives of the Department of Education and Training create comprehensive educational goals, focusing on life skills education for ethnic minority students.

* For homeroom teachers: Being the core force in life skills education for ethnic minority students. The homeroom teacher directly manages the students, is close to the class, to the students, understands the children's aspirations and circumstances, is the person they feel as close as a great friend, a father/mother, brother/sister to be able to confide and share.

* For Youth Union cadres: Must grasp all policies and resolutions of the Party and government in order to have orientation activities throughout the school year with many rich, diverse and practical forms of activities in order to educate Life skills for ethnic minority students.

* For parents: There must be a right awareness of the importance of life skills education for their children. Actively seek out and update information to improve understanding of psychological knowledge, life skills education knowledge and regularly coordinate with schools to effectively educate ethnic minority students in life skills education. high fruit.

3.2 Solution 2: Renovate the way to develop and organize the implementation of life s kills education plans for ethnic minority students in the direction of improving capacity to respond to climate change and prevent natural disasters

The plan is built close to reality, ensuring that administrators and teachers actively organize life skills education activities effectively. The plan has specific assignments but ensures flexibility for educational forces to actively implement educational goals. The plan must enable the manager to actively direct the implementation of effective activities. At the same time, it is more convenient to control and manage subordinates.

The organization and implementation of the plan to concretize the task of life skills education for ethnic minority students in the direction of improving capacity to respond to climate change and prevent natural disasters has set a scientific way and achieve the highest efficiency.

The development and implementation of a life skills education plan in the direction of improving capacity to respond to climate change and prevent natural disasters must be based on the purpose of forming and developing in students skills. basic skills, necessary for the development of age psychology.

3.3 Solution 3: Directly direct the implementation of the life skills education plan in the direction of improving the capacity to respond to climate change and prevent natural disasters for ethnic minority students

Directing classes and branches to deploy activities in accordance with the set plan. When there are obstacles or objective impacts that make the plan difficult to implement, timely adjustments must be made, creating the most favorable conditions for educational activities, themed activities organized by the school. office. Attach the responsibility of teachers and school departments with the implementation of educational activities in accordance with the set plan.

Directing the implementation of the life skills education plan is a key measure throughout the system of measures to manage life skills education for ethnic minority students. Therefore, in order to successfully direct the implementation of the proposed work plan, it is necessary to develop operating regulations, determine criteria and standards for evaluating the results of implementing the life skills education plan for students. ethnic minority; launching the movement of emulation, cultivating life skills, self-training of teachers and students and building a system of reward, encouragement and punishment in the school.

3.4 Solution 4: Enhance the role of the Youth Union in life skills education for ethnic minority students

Promoting the core role of Ho Chi Minh Communist Youth Union members in life skills education activities for ethnic minority students in the direction of improving capacity to respond to climate change and prevent natural disasters. Create an operating environment suitable for the psychology of union members and students. In management, there is a good coordination with relevant forces, taking advantage of the direction and advice of the Party committee, the school's management board to innovate the content, operation form and assessment method. emulation and commendation according to regulations of the Union organization.

The youth union is the most favorable environment for educating ethnic minority students in life skills, and is an environment to encourage and encourage union members and young people to establish themselves and establish careers. Through activities, specific action programs, youth union members are equipped with more knowledge and understanding of skills to respond to natural disasters and disaster risks. The Youth Union is the place to organize healthy, vibrant and youthful activities, where students have the opportunity to practice life skills in the direction of improving their capacity to respond to climate change and prevent natural disasters. Therefore, every organization in the school (the cell, the management board, ...) should pay attention and create all conditions for the union and association to operate. Through seminars, quizzes, picnics, camping with friends from other schools, life skills education in the direction of improving capacity to respond to climate change and disaster prevention for students. minority students.

3.5 Solution 5: Strengthen the coordination of 3 forces: school, family and society in life skills education for ethnic minority students in the direction of improving capacity to respond to climate change and prevention avoid disaster

Close cooperation between the family, the school and the society, in which the school plays the leading role in the education of the young generation. Create a unified implementation of educational goals and build a clean, healthy environment, free of social evils.

Making the most of the synergy of the school - family - society, the community is responsible for taking care of life skills education for ethnic minority students and promoting the rich potentials of the whole society. material as well as spiritual) to participate in the education of the young generation.

Create a community of responsibility among educational forces. There is a clear division of responsibilities between the school, family and social forces. Student education activities are the responsibility of the whole society, the school plays the role of an educational center and coordinates with students' parents and forces outside the school to take care of students' education.

3.6 Solution 6: Innovating, testing and assessing the results of life skills education for ethnic minority students in the direction of improving capacity to respond to climate change and disaster prevention

School leaders have developed a process of testing, evaluating and regularly renewing the examination and evaluation of educational outcomes and life skills training of ethnic minority students; help adjust the plan, content and method of organizing the implementation of life skills education activities to suit the actual conditions of the school and the locality. Through testing and evaluation to detect positive factors, effective life skills education activity models for deployment and replication.

Help administrators and teachers understand the training situation, the positive aspects and the shortcomings of the children's life skills, thereby taking measures to promptly adjust the limitations in skills education. living for students from ethnic minorities. At the same time, help children self-assess, form self-assessment skills about their life skills. Develop criteria for assessing life skills of junior high school students; develop evaluation process and methods; evaluation tool design; guidance on how to conduct an assessment. First, determine the objectives and content to be assessed, select assessment methods and techniques, and finally guide and organize the forces in the school to conduct the assessment.

The results of the survey on the urgency and feasibility of 06 measures show that: the proposed measures are evaluated by educational administrators and teachers at lower secondary boarding schools for ethnic minorities. expensive.

4.Conclusion

Life skills education for ethnic minority students in the direction of improving their capacity to respond to climate change and prevent natural disasters is of great significance in the formation and development of their personality. Life skills education in the direction of improving capacity to respond to climate change and disaster prevention at school is an extremely necessary activity; through it, helping ethnic minority students will have the right awareness of the types of natural disasters that often occur in the mountainous provinces of the Northeast and the North and how to avoid them. The knowledge and skills to avoid natural disasters and disaster risks will be acquired by the children and transmitted to their families and local communities. The education of life skills in lower secondary schools in general and ethnic minority boarding high schools in particular will help ethnic minority students link theory with practice, unifying awareness and action. . Ethnic minority students who are educated in basic life skills will know how to face, cope and overcome difficulties and challenges of natural disasters and disaster risks in the future.

It is possible to identify the content of managing life skills education activities for lower secondary students at boarding schools for ethnic minorities through four management functions: planning, organizing, directing, and evaluating. price of life skills education activities. There are many factors affecting the management of life skills education activities for ethnic minority students, including psychological characteristics of boarding ethnic minority students, education of their families, themselves and other conditions. other school-specific events.

Most ethnic minority students are very interested in life skills education activities oriented to improving capacity to respond to climate change and disaster prevention. Ethnic minority students actively participate in the design and implementation of life skills education contents associated with capacity building to respond to climate change and disaster prevention. Forms of organization of life skills education are effectively linked, integrated and integrated with knowledge and skills to improve the capacity of ethnic minorities to respond to climate change and prevent natural disasters. The place and community where students live is quite diverse and rich.

Abstract

The research team approved surveys, analysis and data processing on the status of education in social evils prevention and control skills in lower secondary schools in Hanoi, Vietnam. The research team has deeply analyzed the strengths, weaknesses, opportunities and challenges of education activities on social evils prevention and control skills in lower secondary schools of Hanoi Capital City of Vietnam has since then proposed an effective system of solutions to develop an educational model of social evils prevention and control skills to build a sustainable community in lower secondary schools of the Hanoi Capital City in Vietnam in the context of the current industrial revolution 4.0. This study also details the experimental steps to develop a model of education on social evils prevention skills to build sustainable communities in lower secondary schools of Hanoi Capital City in Vietnam in the context of the current industrial revolution 4.0

Keywords: *Development management; Model of education on social evils and prevention skills; Sustainable community development; Lower secondary schools of the Hanoi Capital City, Vietnam; The context of the industrial revolution 4.0.*

1. Introduction

In the current period, we are living in the early years of the 21st century - the century of integration, Vietnamese society is affected both positively and negatively by the market mechanism. Improved social life leads to development evils such as addiction, violence, gambling, cheating... These evils are like a dangerous epidemic spreading into the whole school. That is swearing and insulting personal honor. It is cheating in exams that degrades the moral character of students. It is school violence that destroys the personality and soul of students and becomes cruel. It is an information explosion with a lot of unhealthy information that has caused the young generation to have many distorted cognitive expressions and live far away from traditional moral values and many other dangers.

There are many causes, but according to education experts, the root cause is the lack of skills for children to live with the difficulties of life such as parents' divorce, family breakdown, academic decline... They were attracted to a pragmatic, demanding lifestyle, not having the courage to say "no to evil". From the above situation, schools have responded to the emulation movement "Building friendly schools, active students" in order to create a safe cultural environment, strengthen the teacher-student relationship and help students develop creativity, form healthy ethical lifestyle habits. One of the five most important contents of the emulation movement "Building friendly schools, active students" is education and life skills training for students. This is a practical content, associated with educational activities in schools and is becoming increasingly urgent for the younger generation, especially junior high school students, an age where psychophysiology has many changes. change, lack of deep understanding of society, lack of life experience, hyperactivity, easily manipulated...if not properly educated from the beginning, students are prone to fall and get caught up in the bad.

The education of social evils prevention and control skills in schools will help students to be aware of the dangers of social evils that have affected people's lives, thereby directing them to form their own lives. social norms and habits. Up to now, the implementation of educational activities on social evils prevention and control skills in high schools in general and especially in lower secondary schools in particular has not been regular and if implemented, the effectiveness of such activities has not been achieved. The results are not high, the implementation is not synchronized, the system is not updated. Education activities on social evils prevention and control skills for students in lower secondary schools have been carried out mainly by integrating the content of education on social evils prevention skills through teaching social evils prevention and control skills. basic subjects, through educational activities outside of class time, through extracurricular activities, and collective activities. However, the activities of education on social evils prevention and control skills for junior high school students in recent years have only stopped at the implementation according to documents of the Ministry of Education and Training, the Department of Education and Training. Training and the Department of Education and Training. The school has not actively developed a plan to implement the task of educating social evils prevention skills for lower secondary students, has not well directed the educational forces in the school, and has not diversified forms of education. Knowledge of social evils prevention and control skills education for junior high school students.

Students who are educated in social evils prevention and control skills will identify their obligations towards themselves, their families and the community. Therefore, educating children with necessary skills to know how to prevent and combat social evils is the responsibility of school administrators and teachers.

The building of an educational model of social evils prevention and control skills for junior high school students in the current period will aim to implement two basic components that are closely related to each other:

1) Organize educational activities on skills to prevent and combat social evils for junior high school students in the current period (in the context of the Industrial Revolution 4.0). Participants and beneficiaries are teachers, staff, parents and junior high school students.

2) Managing educational activities on social evils prevention and control skills for junior high school students in the current period (in the context of the Industrial Revolution 4.0).

In order to have a friendly, healthy and safe cultural environment in each middle school, according to the motto "Friendly school, active students", building each middle school will as a solid fortress to prevent and combat social evils for junior high school students, the development of an effective model of education on social evils prevention and control skills for junior high school students in the context of Industry 4.0 is a very important and urgent thing to do in the current period.

2. The current situation of managing education on social evils prevention and control skills for students in junior high schools today

Education of social evils prevention and control skills for junior high school students is one of the very important educational contents. Middle school students are the age when many physical, intellectual and cognitive changes in behavior begin. Equipping them with skills to prevent and combat social evils will help them confidently step into their future lives, and avoid potential bad behaviors and phenomena. Strengthening the skills of students to prevent and combat social evils is to contribute to moral education, to train students to obey the law, to improve the quality of human resources for society in the context of the current.

Recently, social evils in schools (school evils) tend to increase in complexity and become a painful problem for many schools, many families and society. Specific manifestations of school evils such as: students dropping out of school, skipping classes, cheating in exams, swearing, school violence, being selfish, pragmatic, insensitive in relationships with teachers, friends, use of force, violence, fights, spending money, demanding, accessing harmful, depraved cultural products, addicted to Game, playing video games at Internet cafes, addicted Smoking, using stimulants, gambling, drinking alcohol... causes a lot of bad consequences to moral education and social standards in schools, affecting all aspects of social life.

Thus, we see that the management of students in schools and families is not really tight, there is still a phenomenon of students dropping out of school, especially outside of school hours, students are still hanging around Internet cafes playing video games. , playing games, accessing many unhealthy information flows without control, then quarreling, fighting, playing around leading to addiction, using stimulants such as e-cigarettes, smoking Shisha …

Thus, if students are not well managed and educated, to let loose, they are easy to fall into the path of social evils quickly. Before the development of today's society, the education of social evils prevention and control skills is an urgent and very necessary issue for young people, especially students of lower secondary school age, which is the age in the world. a period of development with rapid physical, intellectual, psychological and personality changes. Therefore, educating children on social evils prevention and control skills is extremely necessary to properly meet the standards of today's society. Recognizing that importance, over the years, Hanoi's lower secondary schools have paid attention to the education of students in social evils prevention and control skills. There are skills to prevent and combat social evils that have been taught so far, but not as much as drug prevention and control skills; HIV/AIDS prevention and control skills and these skills were also recognized by students and their parents. However, there are still some skills that ne ed special attention, especially in the current period such as skills to prevent and combat school violence; or skills that have not been regularly educated such as skills to prevent and combat child sexual abuse; skills in preventing and combating tobacco and alcohol; skills to cope with stressful situations… need to be focused on implementing and developing specific educational plans for students.

The research team conducted a survey of 39 teachers, 87 parents, and 261 students about the goals and survey results about the necessity for the goals, the results are as follows: The questionnaire shows that the majority of teachers and students' parents see the necessity of educating students on social evils prevention and control skills for students in the current period. Survey results with the necessary level for the goals are highly appreciated (over 85%). Thus, parents are aware of the importance of this work. This is a favorable factor for schools in implementing education on social evils prevention skills for students in schools.

For students, most of them are also aware of the education of social evils prevention and control skills in school. The survey results on the essential for the goals reached approximately 60%. However, there is still a part of students who are not aware of the importance of education in social evils prevention and control skills, and over 10% rate it as less necessary (goals 1 and 6). .

The school has organized education on social evils prevention skills for students in many forms, has done a good job for students to learn the rules and sign the commitment at the beginning of the year (100%). Next is education through teaching that integrates classroom subjects, through educational activities outside of class time, in combination with educational organizations in schools, in combination with families and with a sense of building Good educational environment.

In order to understand students' awareness in the prevention and combat of social evils, the research team conducted a survey of students in the following areas:

- The survey results show that: The level of students' awareness of the harmful effects of social evils is very good and good is still low (average 41.9%). The school only propagates about the harmful effects of drug evils (at a very good and good level of 63.2%), while other social evils are not well understood by students, there are perceived evils in school. the level of normal and not good accounts for the same high rate as school violence (73.2%); spreading depraved cultural products (79.3%), extortion and theft (59.8%); child sexual abuse and stimulant use (54.8%). Is it an alarm in the awareness of the harmful effects of social evils for students today, when school violence and drug use are dangerous evils that easily happen to students of all ages lower secondary school.

- The survey shows that: At a very good level for educational skills to prevent and combat social evils, all are below 40%. Skills to recognize the causes of social evils, skills to recognize consequences, severity of social evils and skills to show attitudes and behaviors against social evils not good level still accounts for a high rate of over 50%. Most of the children only know the skill of recognizing what is a social evil. Thus, schools need to deploy deeply, widely and effectively to educate students on social evils prevention and control skills in order to achieve the goal of education and comprehensive personality development for students.

- Survey data has shown students' attitudes towards social evils violations. Although students have been able to dissuade and prevent (55.7%) and report to teachers, teachers and schools (68.6%) but not much; and still students have attitudes of alienation, disregard, indifference, even indifference to the manifestations and behaviors of social evils (53.1%). This shows that the education of social evils prevention skills for students as well as understanding the harms and seriousness of social evils has not been really effective as expected. Comparing the difference between boys and girls, it can be seen that male students tend to dissuade and prevent wrongdoing, but girls tend to abuse wrongdoing with schools and teachers.

Regarding objective reasons: The biggest reason students fall into social evils is first of all due to the loose management of the family (accounting for 85%) and also from the lax management, lack of attention from the teachers. family should be next to be easily dragged, seduced, fallen by friends (accounting for 70%), followed by the lack of strict management by the authorities (accounting for 60%).

Regarding subjective reasons: Due to impulsiveness, lack of understanding, wanting to assert themselves (accounting for 65%), not fully understanding the harmful effects of social evils (accounting for 55%), in addition to the lack of information Information about the dangerous level of social evils (accounting for 45%) and along with other causes that push students into social evils raised the question: So what should the responsible people do to eliminate them? remove social evils from social life.

As we said above, social evils have a great temptation when people cannot control themselves, there are objective and subjective reasons for social evils to enter the school. With their age, due to their limited awareness, they cannot control themselves before social evils, but social evils are very sensitive issues for students of school age, related to emotions.

and gender should be extremely complicated. Students often disagree between the perception and behavior of each individual. Along with the influence of Western lifestyle, Sex movies, Dark Web, Violent games ... spread on the Internet, there are students who have access to video tapes to pass on to each other for use. Because of the lack of knowledge about safe sex and premarital sex, it has led to the inevitable pregnancy of female students. At the same time, with the loose management, especially outside of school hours, if there are no resolute and timely preventive measures, social evils spreading among students will be unavoidable.

From the above situation, it has created a basis for a group of experts to build a model of education on social evils prevention skills for students, including the development and implementation of measures to educate students on social evils prevention skills. anti-social evils and the management of educational activities on social evils prevention and control skills for students of lower secondary schools in order to promote their advantages and overcome existing deviant limitations. In today's junior high school students, creating new changes in quality in the management and education of social evils prevention and control skills for students, contributing to the education and comprehensive development of their personality. In the past time, the school has launched and directed the educational forces in the school such as professional groups, homeroom teachers, subject teachers, officials of the Youth Union - Team, Board of representatives of students' parents. jointly implement educational activities on skills to prevent and combat social evils for students of the whole school. The organization of social evils prevention and control skills education activities and the management of social evils prevention and control skills education for students initially created a change in awareness for teachers, staff, and students. students and students' parents.

The school has organized the education of social evils prevention skills through classroom subjects and extracurricular activities. Students already have some basic and necessary skills, but their applicability to practical situations is still limited, and it is necessary to pay more attention to the self-education factor of students, especially in the integration period. , boom in information technology, complex social evils, always stalking the school, ready to find ways to entice students to participate. The school has developed a specific plan for the education of skills to prevent and combat social evils. However, more positive measures are still needed in organizing and directing the education of social evils prevention and control skills. The management and education of skills to prevent and combat social evils depends a lot on the actual conditions of the school.

3. Measures for implementing education on social evils prevention and control skills for students in lower secondary schools of Hanoi Capital City

3.1. Measure 1: Organize a seminar on education on social evils prevention skills for students with the participation of educational forces inside and outside the school

Implement this measure to create a close agreement between the school educational environment and the community education environment to prevent and limit spontaneous, negative and harmful effects of social evils. has been and is affecting and spreading in schools every day. In order to organize a seminar on educating students on social evils prevention and control skills, the school must play a leading role in planning a master plan on purposes, requirements, content, methods and methods of organization. The implementing organization, the educational force participating inside and outside the house specifically include members representing which units and organizations? Determine the time and space where the event takes place…

Right from the beginning of the school year, based on the regulations of the Ministry of Education and Training, the Department of Education and Training and the District Department of Education and Training on moral education, lifestyle and crime prevention. Social problems for students, the school administrators have thoroughly grasped the documents related to the prevention and control of social evils, crime prevention, especially drug and HIV/AIDS. AIDS, child sexual abuse, drug addiction... to all members of the pedagogical council, students and students' parents. The school has also advised the Party committees and authorities at all levels, coordinated with other departments and unions to care for the cause of education in general, and unified awareness of the importance of moral education. Lifestyle ethics, education on social evils prevention and control skills for students with the coordinated participation of educational forces inside and outside the school, because social evils spread, can appear in any place. environment without close management and coordination.

In the current period, the Industrial Revolution 4.0 marks a great turning point for people thanks to the application of the latest technological achievements to life. It brings humanity a lot of opportunities, but it also contains many unpredictable risks.Therefore, the school also organized forums and seminars on the topic "Youth with the Industrial Revolution 4.0". In addition to propagating and introducing the utility of the industrial revolution 4.0 by the reporter, the students were also able to frankly exchange, share, and raise their views and insights about the application. of the 4.0, with what are the positive and negative impacts of this Industrial Revolution, so that schools need to put out content to manage the access to Web sites with content supporting other activities. healthy learning and entertainment activities, supplementing knowledge of classroom lectures, and preventing access to dark Web sites with bad and unhealthy content. Such organized seminars have helped

3.2. Measure 2: Directing and strengthening the implementation of educational content on social evils prevention skills for students in a systematic way through classroom subjects

In high schools, the teaching and learning activities of cultural subjects hold a central position, are the main activities of the school and through the main activities of the school and through this activity, a number of activities are carried out. other educational duties. Education on social evils prevention and control skills is an interdisciplinary and interdisciplinary type of education, so many subjects have the ability to integrate and integrate the education of social evils prevention and control skills.

Develop a plan to teach the content of education on social evils prevention skills for students in a systematic way through classroom subjects:

Right from the beginning of the school year, the school's management board has advocated, orientated, and built plans from the Board of Directors to professional groups, to teachers on how and how to integrate and integrate knowledge about preventing and combating social evils into the teaching process, requiring teachers to make teaching plans that integrate knowledge of social evils prevention and control through their subjects in a scientific and reasonable manner, avoiding coercion , but must ensure practicality in education.

The school has organized seminars, training, exchange of information and experiences. Through these forms, teachers will be provided with more knowledge about social evils, methods of student management, educational methods of prevention and control skills, methods of detecting and dealing with social evils. In case students are caught in evils... The fostering and training we usually conduct before the start of the school year so that each teacher will actively develop a teaching plan that is related, integrated, and integrated with the content. educate students on social evils prevention and control skills with their awareness, roles and responsibilities towards students in the face of increasing dangers of social evils, especially dangers of drugs, HIV/AIDS , child sexual abuse and school violence.

3.3. Measure 3: Direct the diversification of forms of organizing education on social evils prevention and control skills for students through experiential activities

Students are not only educated in social evils prevention and control skills through contacting, integrating and integrating in cultural subjects in the classroom, all students are also able to participate in activities. creative experiences, educational activities outside of class time... organized by the school to provide students with basic and practical knowledge, with the right attitude, belief and ability to prevent, know how to actively apply measures to prevent and combat social evils in daily life for themselves, their families and the community, contributing to reducing the possibility of spreading social evils and limiting the dangers caused by evils. caused by society.

Deploying various forms of education on social evils prevention and fighting skills for students to ensure rich, lively and attractive for them to participate in activities. For each organized activity, it is necessary to define clearly the goals of education in social evils prevention and control skills, have specific activity program content, have an assignment, and be well prepared before organizing the activity. motion. Forming social evils prevention skills for students such as skills in preventing and combating school violence, preventing and combating drug crimes, prostitution, child sexual abuse... Organizing extracurricular activities, creative experience activities, and educational activities outside of class time such as culture, sports, fun and entertainment for students in the school so that through each of these activities, they contribute to the education of students. Moral education and lifestyle for children. The school has organized competitions: Presentation contest to learn about social evils; Examination on drug prevention and control, HIV/AIDS; Performing arts competitions, composing literature and poetry, drawing posters, propagandizing on the prevention and combat of social evils, democratic flower picking contest, presenting skits, performing self-edited animations; Role-playing game; Shadow puppets; Rhetoric through a story on drug prevention and control; Good propagandist contest…

At the beginning of each school year, the school organizes to sign commitments and covenants: Student regulations, commitments to prevent and combat social evils such as: Commitment to drug and HIV/AIDS prevention and control; Commitment to preventing and combating school violence; Committed to preventing and combating tobacco, alcohol, etc., "Don't keep, don't try, don't use drugs", "Say no to school violence". Assign the classroom teacher through weekend activities to regularly propagate the school's rules and regulations, especially to strictly comply with the following regulations: No fighting, quarreling or having aggressive behavior that poses a danger to you or others.

3.4. Measure 4: Build a friendly school environment, students actively participate in educational activities to prevent and combat social evils in the current period

Building a friendly school environment, a healthy culture is an important condition in the formation of personality for students. Moreover, a healthy, clean and friendly educational environment will not allow social evils to appear and exist. Besides the main activities of teaching and learning, other activities and movements bring a unique look to each school. But the most important thing is that a safe and healthy living environment for children is essential.

In order to build a safe, friendly and healthy environment in the school, we have directed and together with educational forces to unite, join hands to build a healthy cultural environment, ensuring security and order. , school safety, disciplined and civilized life in school. Coordinate with organizations to sign commitments to build a healthy cultural environment, organize exchanges between school teachers and students with ward government organizations in educating social evils prevention and control skills for students. the student.

The school has organized propaganda to raise awareness and understanding among teachers, staff and students of legal documents on prevention and control of social evils, basic concepts , development, spread and harmful effects of social evils. Preventive measures, typical examples in the work of preventing and combating social evils. Propaganda and education must always be considered as a basic task and must be carried out regularly and contin uously.

3.5. Measure 5: Mobilize funding sources, physical facilities and means for education of skills in preventing and combating social evils

Good preparation in terms of funding, physical facilities and necessary means will contribute significantly to the success of educational activities on social evils prevention and control. In the process of organizing activities, the school has exploited the conditions of facilities: playground, training ground, system of function rooms along with means, equipment, and teaching aids as tools. effectively support teachers and students to innovate, create, and flexibly diversify forms of organizing educational activities on skills to prevent and combat social evils. Take advantage of all possibilities of mobilizing funding sources to motivate and encourage educational forces to participate well in ed ucating students on social evils prevention and control skills through emulation and commendation assessment. reward and receive typical examples in the work of preventing and combating social evils.

The school's management board, the steering committee of the school's social evils prevention and control activities have cooperated with the Board of representatives of students' parents, mass organizations, ward authorities, and sponsors to support the school. funds and facilities in the school and through the work of educational socialization to continue investing in the procurement of school facilities in general and teaching equipment in particular, renovating the school's landscape safely. safe, clean and beautiful to meet teaching requirements and organize other educational activities, including education on skills to prevent and combat social evils to achieve the highest efficiency.

The school's management board shall base itself on the annual financial plan to build a project of funding sources, strengthen facilities, purchase teaching aids and equipment to serve the work of classroom skills education. against social evils. Directing teachers, staff, equipment and supplies to build a list of necessary facilities for effective education in social evils prevention and control.

3.6. Measure 6: Manage and coordinate forces involved in educating students on social evils prevention and control skills

In order for the education of social evils prevention skills for students to achieve the goals, the organization and direction of the manager is extremely important. Further strengthening the management and close coordination between the educational forces inside and outside the school will create a synchronous consistency in the process of planning, directing, organizing and evaluating. quality and effective activities to prevent and combat social evils inside and outside the school.

In order to organize and direct well, the school's steering committee has built a scientific and reasonable organizational and operating mechanism to help organizations and members inside and outside the school understand and understand the functions, their duties, scope, powers and responsibilities, thereby highly agreeing on methods and forms of organization to closely coordinate to create overall strength, friendly relationship and solidarity in raising improve the effectiveness of educating students on social evils prevention and control skills.

To operate effectively, we must first determine the composition of the educational force involved in coordination, the role and function of each force. The force of education on social evils prevention and control skills in lower secondary organizations, parents, and teachers. student mother. Education forces outside the school such as: Police, health, study promotion association, child care committee, Youth Union, cultural department, police, local government leaders...Each educational force has its own Specific functions but activities are not separate from each other but need to have close coordination with each other. This close cooperation will create the best educational environment for students, especially in the education of social evils prevention and control skills with clear assignments and assignments.

The coordination of forces has helped the force outside the school understand and care about education, on the other hand, raise their awareness and responsibility in working with the school to educate students and educate themselves. surname. Helping students have a favorable environment to learn and practice skills and behavior in accordance with social standards. Resolutely prevent bad effects, deviant expressions that violate social norms from entering the school. Forces outside the school will work with the school to build the school into a solid fortress to prevent and prevent social evils from entering the school.

The school cooperates with community forces to promote the material and spiritual potential, which is favorable for the education in general and the education of social evils prevention and control skills for students in particular. Taking advantage of the synergy of all social forces, attracting all members to participate in order to turn educational activities as well as skills education in preventing and fighting social evils into the task of the whole people.

4. Conclusion

Social evils have caused serious harms and unpredictable consequences in all aspects of human life and are more dangerous. Currently, the risk of social evils entering schools has been having an impact. adversely affect the formation and development of students' personality, causing anxiety to the school, family and society. Therefore, education in social evils prevention and control skills is a task and an urgent requirement of educational managers, teachers, staff and other forces involved in education in schools.

Educating students on social evils prevention and fighting skills and managing education on social evils prevention skills for students in lower secondary schools has the impact of the management staff on the the force of education on social evils prevention and control skills inside and outside the school in order to effectively implement the plan and content of educational activities on social evils prevention and control skills for students, towards the goal of educating students on social evils prevention and fighting skills. educational standards, moral training, habits and behavior in accordance with social standards and comprehensive personality development for students.

Education on social evils prevention and control skills for students and management of education in social evils prevention and control skills for students in lower secondary schools of Hanoi city includes the following contents: manage the educational program on social evils prevention and control skills for students through classroom subjects; Managing the program of education on social evils prevention skills for students through educational activities outside of class time; Managing the forces involved in the education of social evils prevention and control skills; Managing the implementation conditions, factors, and measures to educate students on social evils prevention and control skills.

It can be said that the school is not only a place to teach culture and provide knowledge for students, but also a solid fortress to prevent and combat social evils for students, and to educate students on skills to prevent and combat social evils. society for students, forming social ethical standards, contributing to building and developing a healthy and safe community.

Lower secondary schools in Hanoi have built a friendly, healthy and safe cultural environment under the motto "Friendly schools, active students", and have initially built successful schools. a solid fortress to prevent and combat social evils for junior high school students, students know and practice effective social evils prevention and control skills.

NATIONAL PAGODAS ARCHITECTURAL AND ARTISTIC RELICS IN NINH BINH IN THE CONTEXT OF TOURISM DEVELOPMENT IN RECENT YEARS

MA. Nguyen Viet Hung

nguyenviethung.0188@gmail.com

PhD student in Vietnam National Institute of Culture and Arts (VICAS), Vietnam

Abstract

Ninh Binh is the ancient capital, a land rich in history and culture, and is one of the centers of Buddhism in Vietnam. In Ninh Binh, there are hundreds of ancient temples, many of which are ranked as national monuments with outstanding values of history, culture and art architecture. The development of tourism at these monuments contributes to the promotion and promotion of the value of the relics, making an important contribution to the socio-economic development in the locality. However, the development of tourism has negatively affected the temples: changing the size and structure of many temples; commercialization of temples; distort the nature and value of religious activities.

Keywords: *Artistic architectural relics, pagodas in Ninh Binh, spiritual tourism, promoting the value of relics*

1. Introduction

Tourism is a smokeless industry, a development trend of many localities today, including Ninh Binh province. Ninh Binh province has many advantages in tourism development. This is the ancient capital of many feudal dynasties, where there are beautiful natural landscapes, majestic mountains, many beautiful landscapes. With a rich history and culture, once the capital of a number of feudal dynasties when Buddhism was prevalent, Ninh Binh has many ancient temples with a history of thousands of years, which are ranked as national monuments, has many outstanding values in history, culture, religion, has typical values of the country in architecture and art. With those advantages, in recent years, Ninh Binh province has promoted the development of tourism associated with relics, especially with famous temples in the province.

Developing tourism in association with worship facilities and temples accounts for an increasingly large proportion of Ninh Binh's tourism industry, making an important contribution to local socio-economic development. Tourism at the monuments creates jobs and direct income for local people, promotes initiative and is active in exploiting, revitalizing and contributing to the preservation of tangible and intangible cultural values. Along with the opening of spiritual tourist areas, many temples have been restored, embellished, and built spaciously and superficially. On the contrary, tourism also changes the scale and structure of ancient works, disturbs religious and belief activities at temples, and turns temples into commercial areas. This article focuses on clarifying the two-way effects (positive and negative) of tourism development on the pagodas architectural and artistic relics in Ninh Binh in recent years.

2. Method

The article is the result of our research on the management of national architectural and artistic relics of pagodas in Ninh Binh, carried out from 2015 to present. The research method used includes observation, participant observation at a number of major temples, typically in Ninh Binh. In addition, we did in-depth interviews with some people working in the management of monuments, some monks, some researchers and tourists. Documentary research method is also used to be able to inherit other research results.

3. Results

3.1. National pagodas architectural and artistic relics in Ninh Binh province in the context of tourism development phát

3.1.1. Overview of the national pagodas architectural and artistic relics in Ninh Binh

Ninh Binh is located at the southernmost point of the Red River Delta, connecting the North and the Central region by the Tam Diep mountain range. Ninh Binh is 93km south of Hanoi capital, a place to continue the economy and culture between the Northern Delta and the Northwest mountains. This land still has many vestiges directly related to ancient civilizations in Vietnam such as Trang An culture, Hoa Binh culture, Da But culture, and Dong Son culture. Here is the Hoa Lu ancient capital, which was the capital of three dynasties of Dinh, Early Le and Later Ly dynasties. The rugged area in the mountains of Ninh Binh was the military base of the Tran and Tay Son dynasties. During the resistance war against foreign invaders, this place had the Tam Diep line, Quynh Luu war zone, Vu Lam palace and was a key area of the historic Ha Nanning campaign. The characteristics of history, culture, nature and people have created for Ninh Binh a rich and diverse system of relics, including many famous temples [3].

After being the capital, Hoa Lu gradually became the center of Buddhism, from which many temples were built. In Ninh Binh province, there are more than 350 temples, in which, many ancient temples were built during the reigns of Dinh Tien Hoang and Le Dai Hanh; Many pagodas were built during the Tran and Later Le dynasties [3].

Among the hundreds of temples in Ninh Binh, there are many that are ranked as national monuments. According to the provisions of the Law on Cultural Heritage (amended and supplemented in 2009), relics are classified into 3 classes: provincial-level relics, national relics, and special national relics. A national monument is a relic of typical national value. Temples that are ranked as national relic are those of typical national value in terms of history, culture, architecture and art.

Among the temples in Ninh Binh that are classified as national relics, there are many pagodas belonging to the type of architectural and artistic relics. Artistic architectural relic is an artistic architectural work, the overall urban and urban architecture of typical value in the development stages of the nation's architectural art. Complex of architectural works or single architectural works of typical architectural and artistic value of one or more historical periods.

Some temples in Ninh Binh are recognized as national architectural and artistic relics such as:

Bai Dinh Pagoda: Located in Gia Sinh commune - Gia Vien district. The present Bai Dinh pagoda complex is the second largest pagoda complex in Vietnam, after Tam Chuc pagoda complex, including the old temple dating from the Dinh dynasty and the new pagoda area with many Vietnamese and Asian records being established.

Bich Dong Pagoda: The pagoda belongs to Ninh Hai commune - Hoa Lu, located in a cave in the heart of Bich Dong mountain, which is known as the second most beautiful cave in Vietnam.

Nhat Tru Pagoda: Located in Truong Yen commune - Hoa Lu district. This is an ancient temple of the Early Le Dynasty, where there are national treasures of stone pillars with many vestiges proving the brilliant development of Hoa Lu Buddhism in the 10th century.

Dich Long Pagoda: Located in Gia Thanh commune - Gia Vien. The pagoda is located in Dich Long cave, which is known as the third most beautiful cave in Vietnam. The temple worships Buddha and national monk Nguyen Minh Khong.

Ban Long Pagoda: Located in Ninh Xuan commune - Hoa Lu, formed before the 10th century. Ban Long Pagoda is located in a mountain cave. When Lord Trinh Sam came to visit, he personally wrote three big words: "Ban Long Pagoda" on the wall of the cave door.

Kim Ngan Pagoda: Located in Truong Yen commune - Hoa Lu district. This is an ancient temple from the Dinh Dynasty, belonging to Chi Phong village - the western citadel of Hoa Lu capital, the birthplace of Ly Thai Tong king, and a famous temple of prayer in Vietnam.

Duyen Ninh Pagoda: Located in Truong Yen commune - Hoa Lu district. The pagoda was built in the 10th century under Dinh Tien Hoang king. Duyen Ninh Pagoda is considered one of the most famous temples in Vietnam [3].

It can be said that the above-mentioned temples are all religious establishments, but also national monuments with a long history, unique architecture, and typical values in the development of architectural art. architecture of the nation. In addition, many temples are located in areas with beautiful natural landscapes. Because of these special values, these relics have become attractive tourist attractions for tourists inside and outside Ninh Binh province.

3.1.2. Tourism development in Ninh Binh in recent years

Ninh Binh is home to rich tourism resources with many historical and cultural relics, famous scenic spots and very valuable natural ecological environment. Not only famous for its beautiful landscapes, Ninh Binh is a land rich in historical and cultural traditions with 1,821 listed historical sites. Besides the historical and cultural relics, Ninh Binh also has many famous intangible values that are valuable for tourism development, such as festivals, culinary culture and traditional craft villages... Ninh Binh has a system relatively synchronous road and rail transport system connects tourist areas and attractions in the province and inter-region, creating many tours and tourist routes that are continuous and closed. The system of tourism facilities and services has developed quite rapidly. Currently, the province has nearly 700 accommodation establishments and thousands of food service establishments of quite good size and quality to serve the accommodation and shopping needs of tourists. Along with that, the human resources for tourism, especially the type of community-based tourism, have been interested in training and fostering knowledge and skills in tourism, cultural behavior and tourism civilization. Up to now, there are nearly 21,500 people working in the tourism industry. Thanks to these advantages, Ninh Binh can organize many types of tourism such as: Currently, the province has nearly 700 accommodation establishments and thousands of food service establishments of quite good size and quality to serve the accommodation and shopping needs of tourists. Along with that, the human resources for tourism, especially the type of community-based tourism, have been interested in training and fostering knowledge and skills in tourism, cultural behavior and tourism civilization. Up to now, there are nearly 21,500 people working in the tourism industry. Thanks to these advantages, Ninh Binh can organize many types of tourism such as: Cultural - historical tourism; Festival - spirituality tourism; Ecotourism - mountain climbing - craft village tourism; Tourism, convalescence, medical treatment; Tour discover; sport tourism (golf); travel to conferences, seminars…

Having identified these advantages, Ninh Binh province has actively invested and developed comprehensive tourism. Along with the promulgation of management mechanisms, administrative reform, investment attraction, training and retraining, and improvement of human resource quality, tourism products are being expanded in a diversified direction. . The tourist areas and attractions are improved in quality. The system of accommodation establishments in the area is gradually meeting the needs of tourists; amusement and entertainment spots are interested in expanding investment. The number of visitors to Ninh Binh is increasing day by day. People's income from tourism-related activities has also improved significantly compared to before… Currently, tourism has gradually become a key economic sector, accounting for an increasing proportion of the labor structure. and economic structure of the province.

The growth rate of tourist arrivals in the period 2015-2020 will reach 5.96%/year, especially international visitors will reach 11.4%/year. Tourism revenue increased by 27.2%/year. Particularly in 2019, the number of visitors to Ninh Binh reached over 7.65 million, revenue reached over VND 3,600 billion. In 2020, due to the Covid-19 epidemic, the number of tourists decreased, but Ninh Binh still received nearly 3 million visitors [4].

Vietnam's tourism development master plan to 2020, vision to 2030 identifies Ninh Binh as a national tourism center.

Besides many types of tourism, in recent years, the type of spiritual tourism close to religious relics has developed very strongly with many famous tourist attractions attracting a large number of domestic and foreign tourists. The most typical is Bai Dinh pagoda. Information from the master plan on tourism development in Ninh Binh to 2025, orientation to 2030 shows that from 2010-2016, domestic tourists to Bai Dinh pagoda grew continuously, accounting for a relatively high proportion of the total number of tourists. domestic tourists to Ninh Binh. In 2016, the number of tourists to Bai Dinh pagoda accounted for 48.5% of the total number of domestic visitors to Ninh Binh. Statistics from the Management Board of Trang An Scenic Landscape Complex also show that the number of visitors to Bai Dinh ranges from more than 200,000 to more than 800,000 visitors per month, of which February is the largest. In the remaining seven months, each month also reaches from more than 105,000 to more than 160,000 visitors [1].

Besides the achievements, the development of Ninh Binh tourism over the past time is still at the initial growth stage. It is an increase in scale to meet the needs of a rapidly increasing number of tourists. Tourism growth is mainly based on expansion investment. The value of tourism products is not high and the unique value of tourism resources has not been fully promoted.

In addition, the factors of tourism infrastructure and facilities for tourism are not synchronized and modern, along with the tourism workforce, which is largely unprofessional. The system of tourism businesses has been formed and expanded, but there is no travel business strong enough, competitive enough to reach far away markets to attract visitors. The lack of uniformity in policies, limited investment resources, inter-sectoral conflicts of interests with tourism, tourism awareness that has not yet adapted... are barriers and challenges for Ninh Binh tourism development.

In addition, the development of tourism, especially spiritual tourism in the past time, has had positive and negative effects on the architectural and artistic relics of pagodas in Ninh Binh in the following aspects: scale, structure, architecture, religious activities at the relics...

3.2. The influence of tourism development on the national pagodas architectural and artistic relics in Ninh Binh in recent years

3.2.1. Positive influence

Thanks to tourism development, many temples have been restored, embellished and expanded, typically Bai Dinh Pagoda: From a small temple, thanks to tourism development, it has been expanded into a massive, palatial temple.

Bai Dinh Pagoda is located at the western gateway of Hoa Lu ancient relic site, on National Highway 38B, in Gia Sinh commune - Gia Vien - Ninh Binh, 15 km from Ninh Binh city, 95 km from Hanoi. The current Bai Dinh pagoda complex covers an area of 1,700 ha, including an ancient pagoda area and a newly built pagoda area.

Ancient Bai Dinh Pagoda was built in the Ly Dynasty, located on the top of Bai Dinh Mountain, is a very sacred ancient temple. The founder of Bai Dinh pagoda was the national monk Nguyen Minh Khong (the national monk of the Ly dynasty). Legend has it that, in the Ly dynasty, Saint Nguyen Minh Khong went to Bai Dinh mountain to find medicine for the king's illness and then he realized that this was a fairyland with the mountain position facing the West as if worshiping the land of Buddha. The mountains here are vast with many precious medicinal plants, that's why he decided to stop and build a temple here. In 968, Dinh Tien Hoang put down the rebellion of 12 warlords and ascended the throne. At that time, he went to the mountain of Bai Dinh Pagoda - a sacred mountain to set up an altar to sacrifice to heaven, pray for favorable rain - wind harmony - national Thai - people's peace and ordained a servant to worship a general. After that, King Quang Trung also came here to set up a chess altar to encourage soldiers before going to Thang Long to destroy the Qing army.

The main items of the ancient Bai Dinh pagoda include: Buddha worshiping cave, mother worshiping cave, Saint Nguyen Minh Khong shrine and Saint Cao Son shrine. In general, like most other ancient temples in Vietnam, the architectural features of the ancient Bai Dinh pagoda are not large in scale, hidden among nature.

The new Bai Dinh pagoda was built by a private company in 2003, based on the foundation of the old temple. The new Bai Dinh pagoda has an area of 80ha, located on the other side of the mountain compared to the old pagoda. This is a large work including many items: Tam The Palace, Phap Chu Palace, Quan Am Palace, Bao Thap, Bell Tower, Maitreya Buddha Statue and other infrastructure and auxiliary works, Buddhist academy area, Tam Quan outside, Tam Quan inside... were built in many different stages.

The architecture of the new temple area stands out with large, monumental blocks bearing the impression of Vietnamese architecture such as using main local materials (Ninh Binh green stone, Tu Thiet wood), brown Bat Trang glazed tiles... The most distinctive thing about the architecture of Bai Dinh pagoda is reflected in the dark brown dome, which is curved in the shape of a phoenix's tail, which is not the same as the rough straight lines of Chinese pagodas.

The architectural details of the pagoda also bear the imprint of famous traditional craft villages in Vietnam. When it was built, Bai Dinh Pagoda was called a "great construction site" with 500 artisans including many workers' groups from famous craft villages in Vietnam. These artisans used local materials such as ironwood, Ninh Binh green stone, Bat Trang glazed tile... to create a pure Vietnamese character in the architecture of Bai Dinh pagoda.

Bai Dinh Pagoda is a combination of the sacredness and contemplation of the ancient Bai Dinh temple, and the magnificence and magnificence of the most massive new Buddhist architecture in Vietnam, setting many Asian records and Southeast Asia region.

Besides Bai Dinh pagoda, in the complex of Trang An tourist area, there are also many newly built pagodas as stops on the sightseeing journey.

In addition to the restoration, embellishment and new construction of temples, the development of tourism associated with temple relics has promoted the economic potential of the heritage in association with tourism, spreading the values of the temples. heritage to the community at home and abroad. Ninh Binh people have been more active with local authorities in preserving and protecting spiritual and cultural values, religious architectural works, both to serve the spiritual life of the community and at tourism development.

Recently, people's material life has been improved, spiritual life is more and more focused. The psychology of most Vietnamese people respects religion, so the demand for spiritual tourism tends to increase. It can be said that visiting, sightseeing and worshiping at worship facilities is not a strange activity for people. However, the orientation and exploitation of this activity for tourism development is a new job in Vietnam. Along with the strong development of tourism, in recent years the number of tourists and Buddhists coming to the temple has increased; Religious activities became active. Besides the sacred ancient temples, new large-scale, elaborately designed and superficial temples always make a strong impression on visitors.

More than 10 years ago, Bai Dinh was a land unknown to tourists. However, in recent years, the number of visitors to Bai Dinh has increased dramatically, accounting for nearly half of visitors to Ninh Binh. As mentioned above, the number of visitors to Bai Dinh ranges from more than 200,000 to more than 800,000 visitors/month, of which February is the most. The remaining seven months, each month also reaches from more than 105,000 to more than 160,000 visitors. According to statistics of the Management Board of Trang An Scenic Landscape Complex, in 2016, the total number of visitors to Bai Dinh Pagoda reached over 3.2 million, while the total number of visitors to Trang An Scenic Landscape Complex was more than 5,7 million. The corresponding figures for 2017 are approximately 3.2 million and over 6.1 million.

3.2.2. Negative influence

Understanding the social movement as well as the spiritual needs that many investors and businesses have invested in building and developing spiritual resorts and destinations on a large scale. Based on the trend of "heritage" and policies on preserving and promoting the cultural values of the nation, freedom of religion and belief, cultural heritage such as temples, communal houses and pagodas are invested. restored, embellished, granted the title of heritage. Along with the development of media, information, and tourism services that attract a lot of tourists to participate in spiritual tourism. Vietnamese people have a fondness for what is majestic and popular, so a tourist resort built big, beautiful and eye-catching is often easy to attract visitors. During the restoration process, the ancient monuments in many parts of the country were "expanded" for more. The pursuit of titles has distorted the legacy, both materially and spiritually. Worship facilities were enlarged, cultural and spiritual heritages were also upgraded and upgraded, sometimes deforming the heritage in many manifestations.

Public opinion from the people as well as the voices of researchers have also raised many questions in the massive development of temples, communal houses and other pagodas such as Bai Dinh pagoda (Ninh Binh), Tay Thien (Vinh Phuc). Is it possible that cultural heritage has become something for business, despite deforming the heritage, losing its identity with hybrid architecture?... Particularly, the construction of large works than the original has received special attention from the public and there are many mixed opinions.

Some people support the construction of a large pagoda because they believe that "The relics must also be of the era". Little pagoda is suitable for the old times, when Vietnam had only a few million people, and now, the country has nearly 100 million people. People in the past were small in size, people are now taller and larger. So why take the effort to repair exactly the same as the old one, but not build a new one in the direction compatible with the times. It would be a pity if the country opened up and innovated without any cultural and spiritual works worthy of its stature [8].

Opponents said that: Our ancestors had a very good idea of architecture such as temples, pagodas, and communal houses that nestle and blend in with nature. The ancients created a separate architectural language in a spiritual space, a space that is in harmony with nature and cozy, making people's hearts become peaceful and relaxed... If the new construction was not beautiful than traditional values should also be reconsidered. The concept of building as big as Bai Dinh pagoda is an example. It is essentially a Chinese temple built in Vietnam. That structure is entirely of a Chinese temple, not a Vietnamese one [8].

With this same view, Venerable Thich Tho Lac, Standing Deputy Head of the Central Committee of Culture of the Vietnam Buddhist Sangha admitted: Recently we see a disorientation. Some temples are built in some strange motif, not according to Vietnamese tradition. Even at the 2014 Vesak celebration, he was asked by international friends if a temple in Vietnam was built by the Chinese [9].

With the view of preserving the traditional values left by his ancestors, heritage researcher - Assoc. Prof. Dr. Tran Lam Bien said: Relics are extremely important in proving the development of the nation's history. . Improper remodeling is ruining the monument, smearing history. What has belonged to the ancestors, please leave it to the ancestors, and we will go there to admire. The communal house, the temple blends in with the trees, because our ancestors thought to blend in with the nature of the universe to survive, but now, if we want to meet the increasing worship requirements of the people, let's build a temple on another land [8].

Considering the size of the pagoda, the old Bai Dinh cannot be compared with the new one. This is also a pity because most tourists are stunned by the magnificence of the new temple and ignore the ancient Bai Dinh temple, while this is the place that keeps the soul of the temple's nearly thousand years of history.

Admittedly, once spiritual factors are exploited to serve the tourism economy, the monuments, places of worship, beliefs and spirituality will no longer simply serve the spiritual purposes of tourists, which have become more or less *the tools of economic exploitation.*

Over the past ten years, many beliefs and religious buildings (mainly temples) have been growing more and more and more, with the reasonable listening purpose of developing spiritual tourism. If you know that nearly half of the visitors to Ninh Binh in the past few years have come to Bai Dinh pagoda, people will understand why so many great spiritual tourism projects have been born and continue to have Spiritual tourism projects trillion VND is under construction or "asking for approval".

One thing is easy to see, when the spiritual tourist destination aims to profit, things like collecting fees, placing dense donation boxes, offering offerings, making prayers, offering stars for good luck... become normal story. The business element is evident when the investor has implemented many services at tourist pagodas, including reasonable services, some services are "thought out", forcing tourists to use. Unlike traditional pagodas, right in the basement of Tam The building, Bai Dinh pagoda and Tam Chuc pagoda is a large restaurant with thousands of square meters, can serve food for thousands of people and there are many working rooms, conference room. And like a regular tourist destination, Bai Dinh pagoda has a large area selling souvenirs and catering services near the gate; Parking is quite expensive and electric car service, cleaning service...

One point to note is that these huge spiritual projects and projects with the investment capital of trillions VND billion come from the capital of large private corporations. However, speaking of the words of Venerable Thich Tam Thuan - abbot of Sung Phuc Zen Monastery (Hanoi) - although acknowledging the merit of the temple-building enterprise, it also points out a sad thing at these tourist pagodas, that's not doing a good job of a temple: Propagating Buddhist teachings. Because, in these pagodas, there is almost no figure of a monk and there is a lack of research and propagation of Buddhist teachings - which are the main purposes of a pagoda. According to Venerable Thich Tam Thuan, a large pagoda like Bai Dinh should have 500-1,000 learners. Meanwhile, Venerable Thich Quang Minh, representative of the Vietnam Buddhist Church, directly cares for the two temples of Bai Dinh and Tam Chuc, saying that Bai Dinh pagoda often has 300-400 people working at the pagoda but not must be monk [7].

The development of spiritual tourism services in recent years on the one hand meets the spiritual needs of tourists, but on the other hand also distorts the nature and value of religious-spiritual activities, promoting the phenomenon of "spiritual profiteering" when a large number of tourists go to sacred relics just for the purpose of begging for fame and fortune.

From the materialistic purpose of the ceremony, many people no longer know how to keep themselves in a sanctuary, leading to the scene of burning votive papers, buying a full tray to "bribe" the gods... If before Here, praying to the gods comes from pure faith, as long as the subject is sincere, it doesn't matter whether the ceremony is small or big, today, the supplication has brought commercial thinking with the concept that there must be a big ceremony. If you have a lot of money to donate, you can expect to receive the favor of the gods and gods. The cultural space, the sacredness of the festival and the worship space are therefore distorted and distorted.

It can be said that the above-mentioned acts of profiteering are manifestations of the phenomenon of "spiritual corruption" stemming from the pursuit of personal benefits, lack of understanding and being attracted to crowd psychology. From here, the deformed acts have been replicated, become popular, creating opportunities and conditions for some organizations and individuals to turn some worship establishments into "god-trading, semi-holy" addresses, taking advantage of people's trust to cheat to gain profit.

In addition, the massive tourism development at the temples makes the human spirit of festivals as well as religious activities distorted with many objectionable behaviors.

For example, in the Bai Dinh pagoda festival. After each Lunar New Year, on average, thousands of tourists visit Bai Dinh Pagoda every day. This is also the time when all kinds of photography services, street vendors, gold incense, change money ... race to operate. In two rows of Arhat corridors, the statues are mottled with two contrasting black and white colors. Due to being newly carved, the statues are all white in color, but the positions such as the knees, elbows, and hands of the statues have become black because of being touched by thousands of tourists. Many statues are also blatantly broken by tourists to bring home to get lucky. More importantly, all 500 Arhats, each one of them "hugs" in their lap a bag of change from tourists. Not only put in the lap, the money is also put in the hands, mouth or anywhere that can be put by the donors. From time to time a gentle breeze blew, causing change to fly down the corridor. Many tourists casually stepped on the bank of money, while trying to reach up to stuff money into the statue's hand [6].

Ninh Binh province has deployed interdisciplinary inspection teams to Bai Dinh pagoda to maintain security and order, ensure environmental sanitation, prevent and handle objects that solicit, force customers to buy goods, take pictures, ride motorbike taxis, illegally park cars, ensure the safety of tourists coming to spring. However, the new forces have only partially suppressed the active beggars, and most of the services at Bai Dinh pagoda have not been properly adjusted and managed.

4. Discussion and Conclusion

Researching on the influence of tourism development on the architectural and artistic relics of pagodas in Ninh Binh, an important issue is raised: How to reconcile the needs of economic development and conservation traditional cultural - religious values of the nation?

It can be said that the negative impacts of spiritual tourism on the above-mentioned belief-religious traditions are partly due to the laxity in management organization of functional agencies as well as authorities at all levels. Sometimes, because they attach too much importance to economic benefits, they ignore the stages of supervision and inspection, making the organization still spontaneous and messy. In recent years, the culture - tourism industry has issued many documents to limit the manifestations of profiteering and superstition in the festival. The work of inspection, inspection and handling of violations before, during and after the festival has been promoted by industry and local inspection forces. As a result, chaos, jostling, and various manifestations such as offering for hire, vowing for hire, burning votive paper, etc., were initially prevented in places of religious practice during the festival. But it seems that these solutions only solve the "top" of the situation, because if we do not strengthen the inspection and handling of violations, when conditions permit, spiritual profiteering can still erupt. The above issues pose a requirement for State agencies to further improve their roles and responsibilities in managing tourism activities at relics.

It is necessary to take drastic measures to protect ancient architectural works and ancient temples when expanding spiritual tourist areas. The investment and construction of spiritual tourism works are often associated with places with national monuments and heritages, so they need to be managed closely. Competent agencies only grant permits when investment procedures are open and transparent, on the basis of ensuring the consistency between science and history - culture, with consultation from the central government to the locality, and experts on religious culture, environmental impact assessment experts... In order to limit the occurrence of illegal construction spiritual works, the most essential solution is to strengthen the role and management function of local authorities, in which special attention is paid to the role of detecting, People's supervision to promptly take measures to handle and prevent. On the other hand, it is also necessary to strictly handle mistakes in all stages from the construction of spiritual resorts, to the organization and administration of all activities in this field, especially not to let this happen. the state of taking advantage of spiritual factors for profit.

In addition, people in many places, due to not being aware of the value of sustainable tourism, have taken spontaneous and arbitrary actions for the main purpose of attracting tourists and earning more income. Therefore, the fundamental and long-term solution must still be to focus on propaganda to change the public's perception when participating in religious practice, as well as to increase the knowledge and understanding of local people and the community. tourists about spiritual culture, how to behave when participating in festivals or visiting places of worship.

Temples, especially ancient ones, are not only places of worship and religious practice of believers, but also preserve cultural values and the "soul" of the nation. The development of tourism to these monuments contributes to the promotion and promotion of the value of the relics, thereby meeting the spiritual needs of the people. Monuments are an important resource in tourism development. However, if exploited indiscriminately, without methodical, snatching, for immediate benefit, the long-term consequences will be the loss of traditional religious-spiritual values, which also means the loss of factors that make up the value of spiritual tourism.

QUALITY OF ONLINE TEACHING AT UNIVERSITIES IN THE CONTEXT OF INDUSTRIAL REVOLUTION 4.0

Assoc. Prof. Dr. Bui Huy Nhuong
nhuongbh@neu.edu.vn
National Economics University, Hanoi, Vietnam
PhD Candidate. Ha Dieu Linh
dieulinhha83@gmail.com
Ministry of Education and Training, Vietnam

Abstract:

Developing an online training method to improve the quality of online teaching in Vietnam is proving to be an appropriate direction and receiving the attention of universities in developing a curriculum framework, meet student needs, and make higher education accessible to more students. This study will provide a theoretical and practical basis for the development of online teaching and the quality of online teaching in universities in Vietnam, thereby proposing solutions to improve the quality of online teaching in Universities in the context of Industrial Revolution 4.0.

Keywords: *Online teaching, University, Industrial Revolution 4.0*

1. Introduction

Recent decades have seen steady growth in online teaching, with institutions offering more courses and programs online (Allen & Seaman, 2013; Allen et al., 2016). Universities have expanded their online teaching services to meet the needs of students and make higher education accessible to more students (Kampov-Polevoi, 2010; Picciano, 2006). Therefore, online teaching method has been popular all over the world and in Vietnam, it is accepted as a new training method with an important role in changing the mindset of educational activities. Chen et al. (2010) asserted that the use of the Internet and information communication technology has become a common practice in all aspects of higher education.

In the context of the industrial revolution 4.0, the construction and development of online training methods to improve the quality of online teaching in Vietnam is proving to be an appropriate direction and receiving attention of universities in developing curriculum frameworks. Universities in Vietnam have initially researched and implemented online teaching since 2002 through the organization of seminars on online training methods. Up to now, a number of training institutions have initially implemented training support software and gave positive results: National Economics University, VNU University of Engineering and Technology, University of Science and Technology,... Most recently, the Informatics

Center of the Ministry of Education and Training has deployed an e-learning portal to systematically provide e-learning information in the world and in Vietnam. In addition, Vietnam has joined the Asia E-Learning Network (AEN) with the participation of the Ministry of Education and Training, the Ministry of Science and Technology, the Ministry of Information and Communications... This shows that the research and application of this type of online training has been interested in Vietnam.

However, when compared with other countries in the world as well as countries in the region, online teaching in Vietnam is only at the beginning stage, this is clearly reflected in the "health" of universities in this time, especially when affected by the Covid-19 pandemic. In the context that most universities do not organize for students to have concentrated learning in lecture halls since the Lunar New Year holiday 2020 until now, instead deploying online teaching to limit mass contact. According to the report of the Ministry of Education and Training, as of March 25, 2020, the country has 92/240 higher education institutions (accounting for 38.3%) that have applied the online training method; in which 79 institutions apply completely online, 13 institutions combine online and face-to-face training. Higher education institutions have started to apply online learning management systems (LMS) capable of managing the process of organizing teaching, learning, online assessment together with online teaching applications such as Microsoft Teams, Google Meet, Zoom, Zalo... In addition, the report also shows that some universities themselves, when implementing their own online training system, have encountered difficulties in information technology infrastructure when the number of students participating in online learning is large. Therefore, studying the quality of online teaching in universities in the context of the industrial revolution 4.0 is necessary and urgent.

This study will provide a theoretical and practical basis for the development of online teaching and the quality of online teaching in universities in Vietnam, thereby proposing solutions to improve the quality of online teaching. Online teaching in Universities in the context of Industry 4.0. The results of the research are also a premise to contribute to the innovation, creativity and improvement of the quality of comprehensive higher education in the future, towards a modern education according to international standards.

2. Method

This study employs qualitative research methods that use secondary data sources. By synthesizing, analyzing to related data and previous research outcomes, the study has theory and practice the development of online teaching and the quality of online teaching in Vietnamese universities, through it proposes solutions to improve the quality of online teaching in universities in the context of Industry 4.0 according to the goals of the study.

3. Results

3.1. The development of online teaching in universities

Human history has been witnessing the evolutionary development of a more civilized human being. That evolutionary development process cannot deny the role of education, because education is the chain of life experience of each civilization. The specific expression of education is teaching, instructing, and guiding in order to pass on to the next generation cultural values, life experiences, scientific and technical knowledge, etc. Classroom teaching has long been considered a traditional form of education. When it comes to the traditional form of teaching, we often picture a classroom that is fixed in one place, with students sitting in the classroom and a teacher standing. However, thanks to the strong development of science and technology in the era of the knowledge economy, people can approach a different form of teaching to meet increasingly diverse learning needs, learners can learn anywhere, anytime, in many circumstances. That is the form of distance learning. With this form, learners and teachers do not necessarily have to be present in the classroom but still actively communicate historical experiences to each other. From these new requirements of learners, the form of distance learning was born. It can be said that the first recorded milestone of distance teaching in the world is teaching the church clergy by mail from 50-60 AD. In modern history the timeline is recorded by Isaac Pitman teaching stenography by mail in England in 1840.

Over the course of the development history, the name of this field has been changed: homeschooling, correspondence learning, extracurricular learning, independent learning and extended learning. All of these involve teaching and learning styles that are appropriate when and where they learn. The form of distance learning was formed with the participation of technologies such as printing technology (learning by letter), radio technology, telegraph etc. to multimedia communication and electronic communication in the 90s of the last century. Television is also a fundamental advantage that has been used in distance learning. The development of a large-scale television network becomes consistent with a classroom model with only one teacher on site and learners in multiple locations. The obstacle to this teaching method is that learners must be ready to learn at broadcast time. Next came the Internet and Web technology, and today e-learning systems and online teaching technologies are asserting their place in the learning environment. Practical distance learning began with the appearance of the "Computer Aided Learning Center" in 1982 in Rindge, New Hampshire, USA - the nation's first online school in the West. From 1994 - 1995, when the Internet became popular from an initial small model of in-house Internet providers, online education really exploded. The benefits of online education are becoming more and more obvious. It is the development of online training technology, the ability to organize a virtual classroom and a virtual learning environment that has gradually disrupted the existence of previous notions that did not really attach importance to distance learning when moving from traditional education to online training with the help of computers, information and communication technology systems. Nowadays, an online degree program can be easily found from colleges and professional schools. Furthermore, the opportunities from online education are increasing rapidly every day and online degrees have been accepted by employers as usual. And to this day, electronic learning systems (E-learning System) and online teaching technologies (Interactive, Online) are mentioned at almost all levels of education.

In recent years, with the development of online training technology, the ability to organize a virtual classroom and a virtual learning environment (VLE) has gradually disrupted the existence of old concepts that did not really attach importance to distance learning when switching from the traditional education model to online training with the effective help of computers and information and communication technology systems.

According to Thomson NETg, the development wave of E-Learning is divided into the following stages:

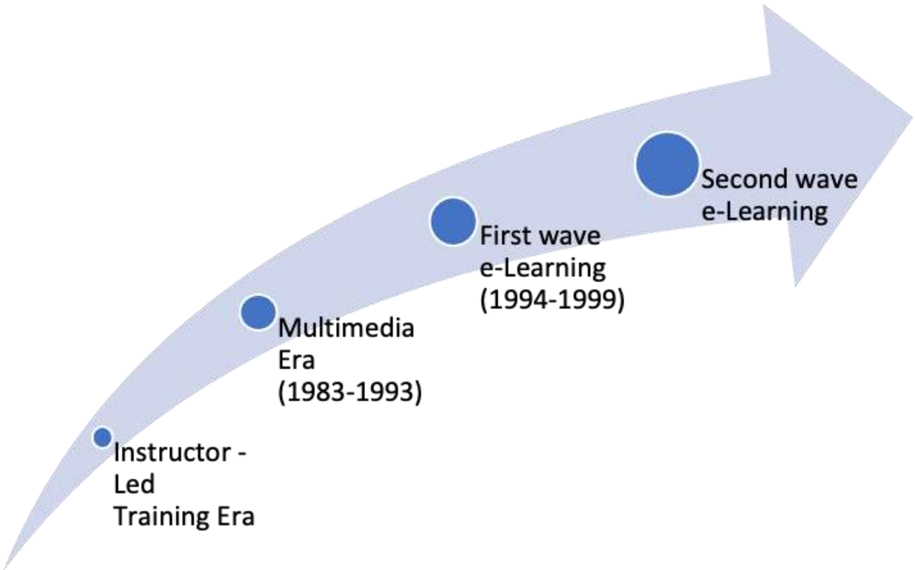

Figure 1: The development wave of E-Learning

- The Instructor-Led training Era (before 1983): Before computers were widely used, the “Teacher-Led training” educational method was the most common method in schools. Students can only exchange focus around lecturers and classmates. The feature of this type is the low cost of organizing training.

- Multimedia Era (1984-1993): Windows operating system, PowerPoint presentation software... These are the basic technologies in the multimedia era. It allows the creation of computer-based audio and visual-integrated lectures using Computer Based Training (CBT) technology that distributes instructional content via CD-ROM or floppy disk. At anytime, anywhere, learners can buy and learn. However, the instructor's guidance is very limited.

- First wave E-learning (1994-1999): When Web technology was invented, education and training service providers began to research how to improve educational methods with this technology. The wise teacher has gradually revealed through the following means: E-mail, CBT via Intranet with simple text and images, training by Web technology with low-speed moving images has been deployed on a large scale. .

- Second wave E-learning (after year 2000): Advanced technologies and enhanced Internet bandwidth, advanced Web design technologies have become a revolution in education and training to form online training systems. Today, through online training, instructors can provide online instructions (visual, audio, demonstration tools) to all learners, improving the quality of teaching. Day by day, online training technology has proven to be highly effective in education and training, allowing the diversification of learning environments (information exchange, teaching, learning, control, assessment). All of which creates a revolution in education and training with low cost, high quality and efficiency. It was the second wave of online training, and we are in the midst of this wave right now.

E-learning develops unevenly in different regions of the world. E-learning has the strongest growth in North America. In Europe E-Learning is also very promising, while Asia is a region that uses this technology less. In the US, e-teaching and learning has received support and government support policies since the late 90s. According to statistics from the American Society for Training and Development (ASTD), in the US in 2000, nearly 47% of universities and colleges offered different types of distance learning models, creating 54,000 online courses. According to analysts of the International Data Corporation (IDC), by the end of 2004, about 90% of US universities and colleges had launched the E-Learning model, the number of study participants increased by 33% annually in the period 1999 - 2004. E-Learning is not only deployed in universities but also in companies, the construction and implementation also takes place very strongly. There are many companies implementing E-learning instead of traditional training methods and have brought high efficiency. Due to the large market and strong attraction of E-Learning, a series of companies have turned to specialize in researching and building E-Learning solutions such as: Click2Learn, Global Learning Systems, Smart Force…

In recent times, Europe has taken a positive attitude towards the development of information technology as well as its application in all socio-economic fields, especially its application in the education system. The countries of the European Community are aware of the great potential that information technology offers in broadening the scope, enriching the content and improving the quality of education. IDC company estimates that the European E-Learning market will grow to 10 billion USD in the coming years at a growth rate of 96% annually. In addition to actively implementing E-Learning in each country, there are many multinational cooperation between European countries in the field of E-learning. A typical example is the trans-European network construction project - EuroPACE. This is the E-Learning network of 36 leading European universities in countries such as Denmark, the Netherlands, Belgium, the UK, and France, in cooperation with the American E-learning company Docent to provide courses on the fields such as science, art, and people are suitable for the learning needs of university students, graduate students, and professionals in Europe.

In Asia, E-Learning is still in its infancy, has not had much success due to a number of reasons such as: conservative rules, regulations, bureaucracy, traditional training preference of Asian culture, language heterogeneity, poor infrastructure and backward economies in some Asian countries. However, these are only temporary barriers as the training demand in the continent is also becoming increasingly unmet as traditional educational institutions force Asian countries to gradually accept the undeniable potential that E-Learning brings. Some countries, especially those with more developed economies in Asia, are also making efforts to develop E-Learning in their countries such as Japan, Korea, Singapore, Taiwan, and China... Japan is the country with the most E-Learning applications compared to other countries in the region. E-Learning application environment is mainly in large companies, manufacturers, enterprises... and used to train employees.

The E-Learning market is growing at breakneck speed and is expanding worldwide. The ability to replace traditional education in some fields is becoming an inevitable trend. Following that trend, it is meaningful to research, build and perfect an online training model to improve the quality of online teaching in the economic sector of universities in Vietnam in the context of the industrial revolution 4.0. theory and practice.

The rapid worldwide growth in teaching has necessitated greater attention to the nature and quality of online in general and in higher education in particular. However, there are few studies that address quality in online programs (Fresen, 2002; Sonwalkar, 2002). Much of the research on distance education prior to 1990 was devoted to understanding the differences between traditional courses and distance learning. These studies have focused on comparing traditional learning outcomes and distance learning methods or student satisfaction (Arbaugh, 2000; Hiltz & Wellman, 1997). Research focuses on gap-specific pedagogical tools and how they can affect learning and quality.

Many studies assessing the quality of Internet-based teaching focus on the difference between distance and traditional classroom instruction. Russel (1997) cites more than 300 studies since 1928 that demonstrate no significant difference between distance and learning tradition. However, Russel's research included various distance learning modalities such as mail, radio, one-way television, and videotape. In addition, the methodologies used in many of the studies are questionable. Russel's conclusions suggest that it may be time to move beyond simply comparing distance learning courses with traditional classrooms and strive to understand whether quality learning occurs in Internet-based or not. Arbaugh (2002) asserted that research on the effectiveness of online learning is still significantly limited.

Online Quality Research: Benchmarks for Success in Distance Education Internet-based, authorized by the National Education Association, the nation's largest professional association for educational departments, and Blackboard, a leading Internet education company (Phipps & Merisotis, 1999). This study looked at case studies of six colleges and universities that offer Internet-based degree programs. In addition, a thorough review of the current literature on distance education was conducted to identify benchmarks used by other organizations to measure quality and learning. Case studies designed to determine the extent to which the various quality measures identified in previous studies are actually being incorporated into the policies, procedures and practices of training institutions from far away. The results are benchmarks that measure the roles of institutions, administrators, faculty, and students needed to ensure quality in Internet-based distance education.

Two leading organizations in the field of distance education, the American Association for Distance Education (1999) and Pennsylvania State University (in the Innovation Project in Distance Education), have also developed guidelines for distance education. Their instruction addresses issues of learning goals and outcomes, interactive learners, and knowledge and problem-based learning. There is additional research indicating that online program quality must be addressed in course planning and instructional design development (Graham & Scarborough, 2001; Harasim et al., 1995; Li, 2002). Much of this research also highlights the fact that ongoing program evaluation is necessary to identify successes and problems while summative evaluation must be directed to external parties.

The University of Illinois (Chicago, Springfield, and Urbana-Champaign campuses) conducted a year-long faculty workshop to address faculty concerns about implementing technology for instruction (1999). The workshop concluded that high-quality online teaching and learning can be achieved if new approaches are adopted to compensate for the limitations of technology and if teachers strive to create a touch for learners. Issues considered are innovation in teaching, student engagement, interaction, and technical support.

3.2. Quality of online teaching in universities in Vietnam

Online teaching in Vietnam began to appear clearly nearly 30 years ago. Its predecessor is distance training, which is conducted by Voice of Vietnam through radio programs that teach Vietnamese, foreign languages, etc. This form of teaching is just a radio program, but looks at it from the perspective of education and training, this is a new form of teaching implemented in the media technology environment. Invisibly, it has become a form of teaching that has helped millions of Vietnamese people improve their people's intellectual level.

Researches on online training capture research related to "Distance Training", a tool known in the renovation of education and training in our country since the 90s of the century. This term is documented on Government decisions on the establishment of training institutions with distance training functions. Specifically: on July 26, 1993, the Prime Minister issued Decision No. 389/QD-TTg on the establishment of the Ho Chi Minh City Semi-Public Open University, in which Article 2 states "The semi-public open university, Ho Chi Minh City is a training institution with various types of distance learning, on-the-job training, training at satellite sites… to meet the diverse learning needs of society, contribute to strengthening the contingent of scientific and technical cadres for the country”. Following on November 3, 1993, the Prime Minister issued Decision No. 535/QD-TTg on the establishment of Hanoi Open University, in which Article 2 states "Hanoi Open University is a training institution and research with different types of distance learning, on-the-job training to meet the diverse learning needs of society, contributing to strengthening the potential of scientific and technical cadres for the country. These two training institutions have been implementing distance learning systems based on the open source learning management system Moodle (Modular Object Oriented Dynamic Learning Environment) founded by Martin Dougiamas in 1999. These two centers is considered as the core of Vietnam's distance learning system. So far, these two universities have a training scale of about 30-40,000 students/year. After the above 2 universities, by 2012, there were more than 12 universities that were allowed by the Ministry of Education and Training to organize distance learning with degrees.

Along with the rapid development of information technology in Vietnam, online training studies focusing on TV teaching methods have also developed strongly. Specifically, there are programs to teach university exams, learn foreign languages… on VTV2 channel of Vietnam Television. Beside universities, since 1993, the Voice of Vietnam (VOV) and Vietnam Television (VTV2) have implemented hundreds of training programs including both granting and non-granting diplomas and certificates on VOV and VTV. These programs have served millions of people across the country who are currently in need of fostering and updating their knowledge of the subjects and issues they are interested in. In 2003, the Ministry of Education and Training collaborated with VTV2 to have a research project on the establishment of a separate television channel for education. Besides training institutions and state agencies, businesses have also started researching and conducting a pilot business of online training through the production of video tapes, audio tapes, CD-ROMs. 2002 was recognized as the first year that commercial training activities were an independent form of training in the field of training via the Internet at Website: www.truongthi.com.vn. Up to now, most training institutions have built websites and provided online training services, online teaching via the Internet to train for certificates, diplomas or traditional training support. By 2009, the majority of training institutions had built websites and provided online training services through video conferencing (Video Conferencing), via the Internet for training, certification, and graduation or support traditional training. In the field of interactive teaching, there are hundreds of companies, enterprises and training institutions providing online teaching services. It can be said that teaching through information and communication networks has gradually become no longer strange in the Vietnamese education system. However, online training is a new form of training that has been introduced and developed in training institutions recently. In particular, the management of online training activities still has many problems, there are no specific sanctions suitable to reality.

Up to now, in parallel with the traditional training model, many domestic training institutions have implemented the online training model. These new training models have grown to be very diverse and powerful in a short period of time. In order to manage this type of training, the Government and the Ministry of Education and Training have issued a number of documents such as: Regulations on organizing training, examinations, tests, and granting of diploma certificates in the form of distance learning is promulgated by the Minister of Education and Training under Decision No. 40/2003/QD-BGD&DT dated August 8th 2003; Decision No. 1559/QD-TTg dated September 10, 2015 approving the Distance Learning Development Project for the period 2015-2020. Along with the development of the Internet, the ICT infrastructure and legal basis for content management on the Internet have become more and more complete with the introduction of the following documents: Decision No. 1497/QD-TTg dated November 8th, 2018 of the Prime Minister on the approval of the National Information Development Strategy to 2025; Law on Information Technology promulgated on June 29th, 2006.

Internet is increasingly popularized to remote areas. The speed of the Internet connection is also constantly increasing, significantly contributing to the development of online training. Online training has only developed in recent years after high-speed Internet transmission technologies such as Lease Line, ADSL,... were born.

In terms of management, online training institutions can be classified into the System of formal training institutions that award degrees according to the national education system and the System of non-formal training institutions. There are many informal training institutions that have succeeded with models of foreign language training, university exam preparation, knowledge refresher training… via the Internet. Formal online training institutions that grant degrees according to the national education system include the University of Information Technology - Vietnam National University, Ho Chi Minh City. This is a public university specializing in information technology, established under the Prime Minister's Decision No. 134/2006/QD-TTg dated June 8th, 2006. Currently, the university is organizing training courses and awarding degrees according to the regulations of the Ministry of Education and Training for bachelor's systems majoring in information technology (networking, applications). In addition, the Information Technology Institute – Vietnam National University, Hanoi is also an effective E-Learning implementation and application unit through the online testing system (CmTest) using tests for all educational forms.

Regarding the application of technology in online teaching, many online teaching systems are deployed on the open source Moodle platform. The Vietnamese Moodle community was established in March 2005 with the aim of building a Vietnamese version and supporting university to implement Moodle. Since then, many universities, organizations and individuals in Vietnam have used Moodle. It can be said that Moodle is one of the most popular learning management systems in Vietnam. The Vietnamese Moodle community helps users solve problems with installation, how to use features, as well as how to edit and develop. The Vietnamese Moodle community is built by the same Moodle software. According to statistics published on the Vietnam Moodle Community Website, there are currently 799 Vietnamese organizations and individuals using Moodle open source software. A typical specialized agency of the Ministry of Education and Training is the Department of Information Technology, which has also been researching information technology solutions for Vietnam using the Moodle open source learning management system.

Today, parallel to the traditional form of training, online training has been asserting its position in the education system because of its outstanding advantages such as saving time and training costs, learners do not have to attend class but can still participate. Currently, many universities have begun to move towards and gradually shift to online training (Do et al., 2021). Although there are still quite a few limitations, mainly because there is still no support policy and development orientation from the governing agencies, but online training is still gradually confirming the future of market expansion in Vietnam. It can be said that any industry or unit can use online training as a tool for any internal or external training activities, especially training service providers. The government is also making long-term plans to support the promotion and implementation of online training for propaganda and education activities for the people.

The Industrial Revolution 4.0 will change the way of life, work and communication of all mankind in a completely new way (Do, 2020). Industry 4.0 is said to be based on the development of many technologies, especially the internet, cloud computing, information technology, artificial intelligence, 3D technology, and automation. In the world, the first, second and third industrial revolutions have helped the economies of many countries develop brilliantly. It can be clearly seen that the efficiency in the application of high technology brings a leap in productivity and production quality, many countries have widely deployed the integration and close connection of many different technologies to ensure Optimum production efficiency including online training. The industrial revolution 4.0 has been playing a very important role and is significantly contributing to promoting the development of online mining despite the fact that in Vietnam there are still many difficulties such as:

The training facilities of universities in Vietnam are still very poor. Students and trainees do not have the habit of self-study and group work, do not have independence, still depend a lot on lecturers, are not self-conscious in learning... Ability to apply information technology in teaching of the majority of teachers is still limited, although there are projects and tools to support teachers in preparing lessons. To organize an online class requires teachers to spend more time and effort than traditional teaching, the traditional way of learning will still have to be the main and popular method because it is suitable for all learners and attached to the habits of each person from an early age. Therefore, with the traditional way of learning, learners feel safer when listening to live lectures, solving problems directly with lecturers. Traditional learning method aslo suitable for many different types of students, for those students who are not self-disciplined, do not have the habit of working on their own or actively working, the traditional way of learning more or less has an impact on them when they are taught directly with the teacher in class. For teachers, it is also possible to observe the learning attitude and learning ability of each student through direct contact. As for the online training model, it is not suitable for everyone, it is only suitable for those who have certain computer knowledge, have real needs and self-study. For each process, not all content easily converts to online training. There is a process where the content is practical and highly practical, it is difficult to use online training to teach, but for skill-based subjects and the process changes quickly, requiring timely updates, then it will be the appropriate content of online training.

4. Discussion and Conclusion

The above research results show that the research and application of this type of online training is receiving great attention and development in Vietnam with the influence of the industrial revolution 4.0 to solve difficulties relate to online training. In order for universities to improve the quality of online teaching to approach the industrial revolution 4.0, the study proposes a number of solutions as follows: The Government needs to build a model to evaluate the quality of online teaching in universities to approach the industrial revolution 4.0 and evaluate the current status of online teaching quality in universities; Raising awareness for administrators and lecturers about online teaching; Completing the online teaching management document system; Strengthening the system of equipment and software to support online teaching; and Regularly check and evaluate the organization of online teaching at universities.

SESSION 8:

SUSTAINABLE DEVELOPMENT

THE SOLUTION TO DEVELOP MEDICINAL HERBS VALUE CHAIN IN QUANG NINH

Tran Trung Vy

trantrungvy1971@gmail.com

Ha Long University, Viet Nam

Abstract

The article analyzes the practice of developing the medicinal herbs value chain, assessing the current status of the medicinal value chain development in Quang Ninh province. The situation of growing medicinal herbs; organizing the production of medicinal herbs; processing, distribution and marketing of medicinal products in Quang Ninh province have been studied meticulously. Factors influencing the development of the medicinal plants value chain in Quang Ninh province are evaluated, from which the author proposes solutions to develop the medicinal plant value chain based on the principle of ensuring that the views and development goals of medicinal plants value chain in Quang Ninh province are practical, feasible and systematic. For the locality: The research results are the scientific basis to help policy makers have a more comprehensive view of the management of agricultural production development project programs in the value chain; contribute to raising the income of workers directly involved in agricultural production.

s*Medicinal herbs, medicinal value chain, development solutions, herbal medicine in Quang Ninh province.*

1. Introduction

Medicinal herbs are one of many crops in the agricultural sector. The organization of production in the value chain, in accordance with the current policy of the Party and State on agricultural development is very necessary and pressing. Quang Ninh is a province with rich and diversified vegetation such as: Indian mulberry, Golden Camellia, Star Anise, Cinnamon, Betel leaf, Stephania rotunda Lour, Malaysian Ginseng, Japanese honeysuckle,... However, the development of these medicinal plants production in Quang Ninh is not yet commensurate with the potentials and strengths for many different reasons such as: the exploitation of medicinal plant resources is still spontaneous, not paying attention to regeneration and conservation. Many medicinal plants are in danger of exhaustion; Medicinal materials are mainly at the stage of fresh raw materials. The locals are not paying much attention to the preliminary processing, refined processing, creating different products, in order to increase their value. With its strong potential in natural, socio-economic, especially natural conditions, Quang Ninh can develop medicinal plants to become one of the important sources of income, in order to exploit its strengths in nature and a number of specialities, to develop into a major medicinal center in Vietnam.

2. Method

Research on the value chain of medicinal plants in Quang Ninh province, the current status of pharmaceutical production development in the province. On that basis, proposing solutions to develop the value chain of medicinal plants in Quang Ninh province to 2025 and beyond.

* The object of research is the value chain and value chain development of medicinal plants in Quang Ninh province.

* Scope of the study: The research topic is in Quang Ninh province, focusing on surveying 8 districts and cities of the province that are cultivated and exploiting natural medicinal herbs from 2013 to present.

* Research Methods:

About the research methodology: The author combines qualitative and quantitative research methods with different approaches, together with analytical criteria that comprehensively assessed the value chain for a specific medicinal plant.

* Specific research objectives:

- Evaluate the current status of developing the value chain of medicinal plants in Quang Ninh province.

- Analysis of factors affecting the development of the value chain of medicinal plants in Quang Ninh province.

- Proposing solutions to develop the value chain of medicinal plants in Quang Ninh province.

* Research question

- Research question 1: What is the development of pharmaceutical production in Quang Ninh province in recent years (especially from 2013 to now)?

- Research question 2: People directly produce and trade in pharmaceuticals; What recommendations should the State management agencies at district and village levels, the departments of the province and the People's Committee of Quang Ninh province implement to develop the value chain of medicinal herbs in the province in the upcoming time?

3. Results

3.1. Current situation of developing pharmaceutical production in Quang Ninh province

3.1.1. The situation of growing medicinal herbs in Quang Ninh province

Quang Ninh is considered as one of the provinces with favorable climatic conditions that soil is suitable for the development of medicinal plants, especially valuable medicinal herbs with high economic value such as Indian mulberry, Golden Camellia, Star Anise, Cinnamon, Japanese honeysuckle ... According to statistics, Quang Ninh province currently has 948 medicinal plant species belonging to 182 families, 561 different genera (of which: 134 species are planted, 814 species grow naturally)[79]. This biological system of diverse medicinal plants is an important prerequisite for Quang Ninh to develop medicinal herbs to serve people's lives, to meet the needs of medicinal production and to contribute to socio-economic development of the province. Taking advantage of endowed natural resources, advantages of the diversity of medicinal plant ecosystems, Quang Ninh province has actively investigated and planned medicinal plants in the province recently, which focus on key contents such as: Forming a conservation area, developing concentrated medicinal plants in Yen Tu national medicinal plant garden and Ngoa Van - Yen Tu green medicinal herbs valley, applying public scientific achievements in the cultivation and processing of medicinal plants, forming the product value chain and brand name of Quang Ninh medicinal herbs[80]. Along with investment activities for the development of the pharmaceutical industry, Quang Ninh province continues to attract investment, creating conditions for policies and legal corridors for enterprises to invest in the development of production and processing of medicinal herbs. Then, linking 4 factors in medicinal development (State - Farmer - Scientist - Entrepreneur), Quang Ninh would become a pharmaceutical center of the Northeast region and the whole country.

In recent years, there have been a number of investors participating in the development of medicinal herbs to create many products that have a foothold in the market to improve the economic efficiency of the business and decrease the number of unemployed people in disadvantaged, remote and isolated areas of the province. Some models of growing medicinal plants includes:

- Secoin Joint Stock Company has invested in an area of more than 180 hectares in Binh Khe and Trang Luong (Dong Trieu). The company allocates 40 hectares to establish a center for conservation and development of medicinal herbs, 70 hectares specialized in growing and developing medicinal plants. In 2013, the Company signed contracts with the people, planted 75 hectares of turmeric, and obtained more than 1,500 tons of fresh turmeric. In addition, the Company conducts trial planting of many types of medicinal herbs, thereby selecting some plants that are suitable for natural conditions in Trang Luong, Binh Khe such as Ming Aralia, Rehmannia Glutinosa, Japanese honeysuckle, Yam, Chamberbitter, Pink Striped Trumpet Lily, ...

- Dong Bac Pharmaceutical Planting, Manufacturing and Processing Co., Ltd. has more than 30 hectares of medicinal plants in Cong Hoa Village (Cam Pha). Some medicinal plants planted by the company such as Purple Indian mulberry (9 hectares), Yam (2

79 Gooch et al (2009), "Marketing and quality control of fresh grapes, fresh and processed apples and many other fruits of Ontario, Canada".
80 People's Committee of Quang Ninh province (2012), Program on establishing and developing brands for agricultural products of Quang Ninh province to 2015, Issued together with Decision No. 273 / QD-UBND dated February 13/2012 by the People's Committee of Quang Ninh province.

hectares), Five-leaf ginseng (2 hectares), transferred to the farmers 1 ha of Five-leaf ginseng, Australian cowplant, Chamberbitter, Solanum procumbens. The company signs a contract to plant medicinal plants with the cooperative in Yen Thanh village, Tien Yen district for processing materials.

- Dong Son Green Technology Joint Stock Company has 125 hectares of medicinal plant cultivation in Dong Son (Hoanh Bo), including Indian Mulberry (90 hectares), Ardisia sylvestris (1 hectare), Ming Arelia, and Golden Camellia; Transferring planting techniques to farmers in Dong Son, Ky Thuong, Tan Dan.

-Toan Dan Cooperative (Ba Che) has more than 1,100 ha of forest land, including 50 hectares of Purple Indian Mulberry grown in cell culture, 03 hectares of Sand Ginger Each stem of Indian Mulberry could harvest from 1.5 to 3 kg of fresh tuber/3 years. The average selling price is about 120,000 VND per kilogram of fresh Indian Mulberry, 750,000 VND per kilogram of dried Indian Mulberry. Compared with the wild Indian Mulberry, this price is much lower so that in the market, many people take advantage of consumers' lack of knowledge to overprice, which does not correctly reflect the real value of the goods.

- Ba Che Forestry Sole Member Limited Company planted 11.5 hectares of Indian Mulberry.

- The medicinal plant area of Dong Son Green Technology Joint Stock Company; Quang La Farm Cooperative (Hoanh Bo District) planted Ganoderma lucidum; Tung Lam Joint Stock Company has cooperated with DK Pharma Company, Hanoi University of Pharmacy to build Yen Tu medicinal plant garden, ...

In addition, households also participate in growing medicinal plants such as Star Anise, Cinnamon in Binh Lieu, Ba Che, and Mong Cai; Indian Mulberry, Dandelion, Desmodium styracifolium, Gac fruit, Japanese Honeysuckle, Sand Ginger, Ming Arelia, ... at Mong Cai, Tien Yen, Hoanh Bo, Ba Che, Uong Bi.

However, the cultivation and development of medicinal plants still faces many difficulties in techniques of cultivation, taking care and harvest. Medicinal materials have not been standardized (according to GMP-WHO) and poor yields create a lot of difficulties for the product to participate in the market, which leads to many unsold or low priced medicinal herbs.

Following the direction of the Provincial Party Committee and Provincial People's Committee, during 2015 - 2017, Ba Che district has supported more than 1.1 billion VND for 174 households participating in the projects of planting Golden Camellia. Thanks to that, Ba Che became the largest area planting Golden Camellia in the province with more than 140 hectares, concentrating in some villages such as: Thanh Son, Don Dac and Dap Thanh. It includes 50 hectares for harvested camellia and over 60 hectares for harvesting leaves (because the leaves are pre-harvested compared to flowers). In 2018, the district extended

100 hectares of Golden Camellia[81].

The government of Quang Ninh province has properly paid attention to the cooperation of 4 factors (State - Farmer - Scientist - Entrepreneur) in the development of medicinal herbs value chain. Recently, businesses have actively invested in facilities for preliminary treatment, pharmaceutical processing, production of products from medicinal herbs, with an increasingly large scale of investment such as: Secoin Joint Stock Company; Ba Che Forestry Sole Member Limited Company; Quang Duong Joint Stock Company, Cong Hoa Village (Cam Pha); Dong Bac Pharmaceutical Planting, Manufacturing and Processing Co., Ltd.; Tinh Hoa Green Agro-Pharmaceutical Cooperative; Dong Trieu Green Medicinal Cooperative, Dap Thanh Forest Products Joint Stock Company … In 2015, Pharmaceutical Joint Stock Company and Medical supplies Quang Ninh has completed the investment in manufacturing drugs and functional foods from medicinal herbs. They are now producing more than 30 products that meet the World Health Organization's (GMP-WHO) drug manufacturing standards. This is an important nucleus for the development of the pharmaceutical industry, functional foods from medicinal herbs in Quang Ninh province in the upcoming years.[82]

3.1.2. The situation of pharmaceutical production in Quang Ninh province

Recently, the production of medicinal herbs in Quang Ninh province is organized in two forms:

(i) Primary production: There are 14 economic organizations engaged in primary production. They are now growing 35 species of medicinal plants composed of 14 species by businesses and 21 species by households. Most of the farming households having suitable soil for medicinal plants use that strength to grow medicinal plants. But the number of other households boldly changing the main crop from rice to medicinal plants are rising now. However, they do not know how to process and preserve, and do not sign contracts for the consumption of raw materials for processing enterprises, which make them unable to sell products, limiting the expansion of acreage. Finally, some households have to switch back to growing rice.

(ii) Secondary production: There are 18 economic organizations engaged in secondary production to create groups of products such as: packaged medicinal herbs, essential oils, tea bags, and tablets.

Pharmaceutical products and medicinal products produced by economic organizations in both primary and secondary forms are distributed right on the premises,

---

81 Quang Ninh Provincial People's Committee (2014), Policies to encourage the development of agricultural production concentrated in Quang Ninh province, in the period of 2014 - 2016, Issued together with Decision No. 2901 / QD-UBND December 5, 2014 of the People's Committee of Quang Ninh province

82 People's Committee of Quang Ninh province (2013), Project "Quang Ninh Province - One commune One product (OCOP) for the period 2013-2016", Issued together with Decision No. 2870 / QD-UBND dated October 22, 2013 of the People's Committee of Quang Ninh province.

participating in fairs, a few enterprises product introduction goods, agents inside and outside the province. However, the distribution and marketing activities of enterprises are still very limited and passive. Currently, in the province, there is no economic organization specializing in the distribution of medicinal herbs and medicinal products but mainly combined with many other products.[83]

On February 27, 2015, the Prime Minister approved a project to develop medicinal plants associated with hunger eradication, poverty reduction, and new rural construction. Accordingly, there will be 8 natural exploitation regions and 8 areas planned for concentrated medicinal cultivation. Northern midland and mountainous region, including Bac Giang, Yen Bai, Quang Ninh, Lang Son, developed and planted 16 species of medicinal herbs, namely 13 indigenous species (Indian Mulberry, Ming Arelia, Sand Ginger, Gac, Five-leaf Ginseng, Oriental Motherwort, Desmodium Styracifolium, Star Anise, Cinnamon, Lemongrass, Amomum Longiligulare, Sweet Wormwood, Adlay) and 3 imported species (Dahurian angelica, Atractylodes, Rehmannia Glutinosa) on an area of 4,600 hectares. The project prioritizes the development of species of Indian Mulberry, Gac, and Sand Ginger along with sustainably maintaining and exploiting Cinnamon and Star Anise on the existing area. Until now, Quang Ninh is one of the potential locations to become a centralized pharmaceutical development center of the Northeast.

3.1.3. The situation of processing, distributing and marketing pharmaceutical products in Quang Ninh province

3.1.3.1. The situation of pharmaceutical processing

Most naturally cultivated and harvested medicinal materials are subjected to preliminary treatment locally by using manual equipment, with low value-added, and no specific quality standards. A few establishments already have machinery and equipment in the preliminary processing and processing of medicinal herbs, creating a number of medicinal products with high value-added such as: Golden Camellia tea, Indian Mulberry Glue, Moringa tea and Cleistocalyx operculatus tea (raw tea or tea bag) ...

The program (OCOP) has established or supported many economic organizations to apply technology to produce a number of herbal products and participate in the value chain of herbal production in the province, such as:

- Dong Bac Pharmaceutical Plantation, Production and Processing Co., Ltd. is producing a number of products: Five-leaf Ginseng Tea bags, Chamberbitter tea bags, Five-leaf Ginseng Soft Glue and has already provided to the market: Dong Bac liver detox tablets, Dong Bac diabetes tablets, ...

- Dong Trieu Green Medicinal Cooperative: Indian Mulberry Glue, Golden Camellia

83 People's Committee of Quang Ninh province (2013), Project "Quang Ninh Province - One commune One product (OCOP) for the period 2013-2016", Issued together with Decision No. 2870 / QD-UBND dated October 22, 2013 of the People's Committee of Quang Ninh province.

Glue, ...

- Yen Tu Herbal Cooperative: Yen Tu Betel Oil Massage ...

- DTFopro Joint Stock Company: Golden Camellia tea bags, Golden Camellia flower

- Giac Thanh Forest Products Trading Joint Stock Company: Dried Golden Camellia flower, Golden Camellia tea bags.

Till the production of pharmaceutical products participating in the OCOP Program, it has stimulated the producers to form sub-regions of medicinal plant cultivation, production and processing in areas in the province such as Trang Luong village, Dong Trieu town), Thuong Yen Cong, Uong Bi City, Dap Thanh village, Ba Che district ... These areas are considered as nuclei to spread to neighboring farmers to convert ineffective crops to plant medicinal plants in accordance with the natural conditions of the region and the economic conditions of the household.[84]

3.1.3.2. Distribution and marketing of pharmaceutical products

The distribution and marketing of medicinal herbs and medicinal products in localities are limited. Raw materials are mainly sold "in batches" to local collectors (or elsewhere), often at low value. The products from medicinal herbs are mainly sold on the spot (manufacturing facilities), customers come to buy in person or call to order. In the province, there are a number of companies distributing pharmaceuticals and products from medicinal herbs, but most of them import products from other places for distribution and marketing in Quang Ninh.

Many local herbal products have been gradually known by consumers inside and outside the province. The supporting activities of the OCOP program such as technical consultancy, fairs, exhibitions, radio, television, press promotion, connecting partners, ... have had a very good impact on the organizations and individuals who manufacture medicinal herbs and medicinal products. This will improve their distribution and marketing capacity to gradually actively distribute, thereby actively developing growing areas and developing production. From being a pioneer in implementing the program for each commune and ward, up to now, the success of the program has been considered as a pilot model for nationwide replication. Many localities in the country go to Quang Ninh to learn their experiences, which is a good opportunity to promote products to other localities. Many medicinal products are interested by consumers: Liver detoxifier, Five-leaf ginseng tea, Moringa tea, Golden Camellia ....[85]

---

84 People's Committee of Quang Ninh province (2013), Project "Quang Ninh Province - One commune One product (OCOP) for the period 2013-2016", Issued together with Decision No. 2870 / QD-UBND dated October 22, 2013 of the People's Committee of Quang Ninh province.

85 Quang Ninh Provincial People's Committee (2015), Product Evaluation and Classification Criteria Set of Quang Ninh Provincial Program One commue One product", Issued together with Decision No. 3479 / QD-UBND dated November 05 2015 of the People's Committee of Quang Ninh province.

3.2. Value chain analysis of medicinal plants in Quang Ninh province

3.2.1. Value chain analysis of medicinal plants in Quang Ninh province

Through the field survey, as well as the analysis of the production of medicinal herbs, the author determined that the production of medicinal herbs in the value chain in Quang Ninh has not yet developed. There are many medicinal species, but in Quang Ninh, two types of medicinal herbs that are of interest to the people as well as businesses and have formed a value chain are Indian Mulberry and Golden Camellia. The author focuses on economic analysis of the value chains of these two medicinal herbs to have a basis for proposing the development of value chains for other medicinal plants.

Value chain map of medicinal plants in Quang Ninh province

On the basis of practical research in Quang Ninh, the author focuses on analyzing the medicinal value chain of Golden Camellia and Indian Mulberry, including: (1) Planting and harvesting activities, (2) Raw material collectors; (3) Processing activities; (4) Product distribution.

There are many types of medicinal herbs in Quang Ninh, but there are two types of medicinal herbs that have formed the chain that is the value chain of Golden Camellia and Indian Mulberry, which are two types of medicinal herbs identified by Quang Ninh as key products in OCOP program. The factors participating in the Golden Camellia and Indian Mulberry product chain include: Producers (growers and collectors from nature); Fresh product collectors, Fresh produce handlers; Consumers of dry products (post processed include wholesalers and retailers).

3.2.2. Analysis of factors affecting the development of the medicinal value chain in Quang Ninh province

3.2.2.1. Macro factors

Policies to support local chain production[86]

- Land policy: The Provincial People's Committee has had a policy to support plantation. Support level does not exceed 6 million VND per hectare. To support land lease for organizations, households and individuals, with an area of 5 hectares or more, shall be supported with land rental costs not exceeding VND 20 million per ha per year for cultivated land. The support period is not more than 03 years. The total support cost for one project per producer is not more than 200 million per year.

- Policy to support infrastructure and equipment: Invest 100% of the cost to construct shared infrastructure items, including: main road; Main shaft power line; Water supply and drainage system; Project-based wastewater and waste treatment system approved by

86 People's Committee of Quang Ninh province (2016), Quang Ninh planning to 2030, vision to 2050 and beyond 2050 and general construction planning for localities in the province", Issued together with Decision No. 1588 / QD-UBND dated July 28, 2014 of the People's Committee of Quang Ninh Province.

competent authorities. The total cost is not more than 15,000 million VND / project. Support 50% of the cost to build preliminary treatment houses, preserve and process agricultural products; warehouse for preserving agricultural products. The level of support must not exceed VND 2,000 million per producer per project. Support 50% of the cost to build a product display fair under the Program, each commune a product, specifically: For district level product introduction fairs, the support must not exceed VND 1,000 million per project; For provincial product introduction fairs, the support must not exceed VND 2,000 million per project. The program supports 50% of the budget to purchase, build and install cold storage systems, agro-forestry and aquatic product processing lines, production lines, net houses, factories, agricultural machines and agro-forestry seed production establishments Seafood. The level of support must not exceed VND 5,000 million per project.

- Policy of support for buying medicinal plant varieties: The maximum support level of one time for communes, villages extremely difficult, border communes, communes with extreme difficulties in coastal areas and islands up to 70 %; 50% of the remaining communes. Maximum support funding per project: For enterprises and cooperatives is 250 million VND per time; Cooperative group, farm 150 million VND / time; Individuals, households 100 million VND per time.

- Policy to support the purchase of agricultural materials for organic production: Producers are supported with 50% of the cost of buying agricultural materials for production projects, including: organic fertilizers, biological products, plant protection drugs of biological origin. The level of support must not exceed VND 50 million per project.

- Loan interest rate support policy: For projects on the list of products with advantages approved by the province (implemented according to the centralized agricultural production plan), producers are eligible for the interest rate support. Interest rate in Resolution No. 232/2015/NQ-HDND dated 12/12/2015 of the Provincial People's Council on the promulgation of policies to support interest rates for investment in development of production and trading of agricultural products in Quang Ninh province in the period of 2016 - 2020.

- Marketing and sales policy: For current pharmaceutical products, in order to enhance market access, the Provincial People's Committee has adopted a policy to support:

+ The level of support must not exceed 10 million VND / producer / participation in fairs and exhibitions held in the province.

+ The level of support must not exceed 20 million VND / producer / participation in fairs and exhibitions held outside the province.

+ The level of support must not exceed 40 million VND / producer / time to participate in fairs and exhibitions held in foreign countries. Producers are only supported up to 01 time per year when attending overseas fairs and exhibitions and when approved by the Chairman of the Provincial People's Committee.

With the very active incentive policy of the People's Committee of Quang Ninh Province to implement the OCOP program, medicinal herbs are one of many products under the program also supported, every year, the Provincial People's Committee allows opening many fairs in order to promote the sale of goods under the provincial OCOP program, the policy has attracted many participants, which is a good opportunity to promote and consume medicinal products.

In addition, the province commits to implement preferential policies for investors in the field of pharmaceutical development in the province such as supporting ground clearance, leveling, and leasing land; Interest rate support; human resources support, branding and technology transfer, technology innovation.

Production capital

Is the value of assets used as a direct means of production and services, including fixed capital and working capital. The concept of capital is derived from the concept of national wealth. In this study, the author wants to refer to productive capital including fixed capital and working capital. (i) Fixed capital includes factories, machinery, equipment and means of transport; infrastructure, office facilities and office equipment; (ii) Working capital includes inventories of all commodities. Capital production is one of the factors that significantly affects the operation and development of the value chain. In Quang Ninh, capital production in the field of pharmaceuticals is fine The Provincial People's Committee is interested in investing: Supporting the construction of infrastructure, equipment and machines for processing establishments, directly supporting farmers growing medicinal herbs in some stages: seeding, soil preparation ...

3.2.2.2. Micro factors

Production organization capacity of actors participating in the value chain of medicinal plants

+ Farmers and cooperatives growing medicinal herbs, can imagine the main barriers: product quality, production scale, production techniques, processing and preserving raw products ... are very important factors to their participation in the medicinal value chain. Lack of techniques for planting, tending and processing, small scale of production, it is very difficult for people to join the supply chain. Besides, the positive factors from farmers are: Industriousness, hard work, suffering, along with natural conditions, favorable climate are essential factors for the development of the chain.

+ Collectors: It is one of the most important links in the chain, to connect raw materials created from farmers to processing facilities, as well as being a affiliate partner between the producers. and the end consumer of the value chain. Thus, collectors play a very important role in helping farmers, especially, farmers in isolated areas to consume medicinal products, and at the same time help businesses stabilize production. Without collectors, it is very difficult for businesses to have enough input materials. Enterprises themselves cannot sign contracts to directly sell products to farmers, farmers just want to sell to collectors and it is easier to buy and sell products with them.

+ Processing facilities: In the value chain of agricultural products in general and the value chain of medicinal herbs in particular, if you want to operate and develop, you cannot underestimate the role of processing establishments. Due to the characteristics of agricultural products as well as medicinal products that are fresh, processing and preservation play a very important role. Harvest medicinal materials must be processed, first of all, the processing of raw materials. From raw materials delivered to the refined processing facilities in the chain or consumed in the market. Therefore, processors are considered to be internal factors that directly affect the operation and development of the medicinal value chain.

Quang Ninh nowadays, because the pharmaceutical processing establishments are small, outdated technology, weak in finance, cannot meet the current pharmaceutical production needs of farmers, specialized production, large-scale are the huge challenge. Limited in capital, unable to compete with large enterprises, in addition, small businesses do not know how to link up to become the competitive large processing establishments in the market. In Quang Ninh, there is a medical equipment and materials company of Quang Ninh province that meets GMP WHO standard, but this company does not use the available pharmaceutical resources in the province but uses raw materials imported from external partners for many different reasons.

+ Consumption factors: Consumption is the last stage in the value chain. Whether or not the chain continues to operate is thanks to the consumer. For fresh medicinal products, consumption takes a very short time to ensure quality, for medicinal materials that are raw materials, as well as refined products from medicinal herbs, have a more flexible time. However, time will affect the medicinal properties in the raw materials. Therefore, consumption is the last but also the first important step. To produce something, we need to find the consumer market for the product. In Quang Ninh, the consumption of medicinal products is also concerned and directed by the Provincial People's Committee, the OCOP program has created favorable conditions for the consumption of products for people, especially agricultural products, that includes medicinal products. In addition, Quang Ninh is a province that has advantages in tourism both marine and spiritual tourism, along with a number of medicinal specialties (Indian Mulberry, Curculigo orchioides, Nervilia fordii Schultze ,Golden Camellia) have been well-known, which is also an advantage for better medicinal consumption.

Supply chain managing capability

In-chain producing is a phenomenon which has appeared recently; as a result, both supply chain management capability and pharmacognosy chain are still limited. Almost all administrations and supply chain managers depend on their own experiences; however, they still lack deep knowledge about chain management: the operation, the production, the brand, the store chain, customer service… Therefore, a good supply chain managing capability would not only help the value chain grow better, but also increase the added value in all sections of the chain.

This notion has newly applied in Vietnam and properly, the chain managers of Vietnam in general and the ones of Quang Ninh in particular have many limitations. According to the surveys and interviews that have been proceeded before, the authority and the management of input material and final product consumption are yet perplexed, especially that making and following the plan to ensure the value chain operated effortlessly.

Processing industry

Pharmaceuticals which are planted and harvested are mostly in-place preprocessed by manual tools and have low added value. Even, the quality standard of the products is vague which might lead to obstacles in consuming. In contrast, few companies which are equipped with machinery in preprocessing and processing have created pharmaceutical products with high added value like Dong Bac Pharmaceutical Plantation, Production and Processing Co Ltd. It has produced some products such as: gynostemma pentaphyllum, jasminum subtriplinerve, Chamberbitter tea… or Golden Camellia products of Dap Thanh Forestry Company: Golden Camellia tea bags, conserved Golden Mamellia… and others: Indian mulberry wine, Indian mulberry glue, moringa tea, Cleistocalyx operculatus tea…

The project “Per local per product” has established and supported many technology -applied commercial organizations create some herbal products and join in the product value chain in every local. Now, in Quang Ninh province, there are 18 pharmaceutical processing corporations, such as: Dong Bac Pharmaceutical Plantation, Production and Processing Co Ltd., Dong Trieu Green Herbal Cooperative, Y Vo Southern Herbal Company, Yen Tu Herbal Cooperative, DTGopro joint stock company, Dap Thanh Forestry joint stock company…

In Quang Ninh, processing technology is quite a big problem (there are few herbal processing companies here) because of the needs of high price technology investment, limited funds of the companies and narrow consumption market. With producers in mass producing areas, if they apply their own new technology and it is successful, they will be funded 100% of expenses of manual documents, sample analysis, technology transfer; 50% of expenses of hiring experts. (The support level will not be surpassed 50% of technology transfer expenses per technic and surpassed 1000 million VND per project.) The organizations which are on the list approved by the Provincial People's Committee are supported completing production process, technical tools, production line of the products which are included in the project “Per local per product” with the support level not surpassing 70% of total expenses per approved project when proceeding in extremely needy communes and villages, border communes, coastal areas and islands according to current regulations, not surpassing 60% of total expenses per approved project with local support level. Concisely, the total support fund is not over 1000 million VND per project.87

Enterprises' facilities

It can be said that to execute the tasks in pharmaceuticals value chain under Quang Ninh province's OCOP program, the enterprises' facilities are somehow restricted.

+ Dong Bac Pharmaceutical Plantation, Production and Processing Ltd. (Cam Pha City) was established in 2010. This is one of the first enterprises to invest in and develop the production of products from medicinal plants in the province. The company invests in a production line of functional food products from medicinal plants. Currently, the company has successfully processed 7 tea bags and 3 herbal capsules with the output of 1.2 million tea bags and 3 million pills per year. The practical survey shows that: Dong Bac Company has made many efforts in production activities, but with the current infrastructure, it does not meet the demand for input materials for farmers. And it limits the operation of the value chain of herbal plants in the province.

+ Yen Tu Herbal Cooperative was established in 2014, with the products under the OCOP program as: betel oil, betel essential oil, reishi mushroom, golden eye-grass wine, and Yen Tu Indian mulberry wine. In 2016, the cooperative provided to the market from 6000 to 7000 bottles of Yen Tu betel oil and 20000 bottles (10ml) of Yen Tu betel essential oil. However, when visiting the cooperative, the infrastructure was nothing but land and plant nursery. Thus, business infrastructure is one of the most important factors of the processing of the herbal plant value chain, to increase the value of products before being released to the market, but this factor is quite insufficient.

+ Dap Thanh Forestry joint stock company is too deep and performs too many functions in the chain (production, collection, processing, and consumption) while the human resource is limited in both quantity and quality. Processing equipment and technology are out-of-date and have not yet produced high-quality products (the shine of camellia, some other products from golden camellia) like Chinese processing technology. Therefore, when upgrading the company, it might be advisable to separate the functions of production and processing as well as consumption to ensure specialization in production and business.

+ Dong Bac Pharmaceutical Plantation, Production and Processing Ltd. has out-of-date processing equipment, has not yet high-quality processed products, difficulty in competing with others in the market (Dong Bac liver detox cannot compete with Tue Linh liver detox ...). Upgrading processing equipment and enhancing marketing and advertising as well as the scientists' influences are essential to maintain and promote processing equipment for the company. At the same time, increasing marketing and advertisements to sell products, enlarging processing scale, and consuming all raw materials for farmers are

87 People's Committee of Quang Ninh province (2013), Project "Quang Ninh Province - One commue One product (OCOP) for the period 2013-2016", Issued together with Decision No. 2870 / QD-UBND dated October 22, 2013 of the People's Committee of Quang Ninh province.

needed.

3.3. A general assessment of herbal plant value chain development in Quang Ninh province

3.3.1. Achievements

According to practical surveys, combined with computational analysis, the author has found that the results obtained from analyzing the status of the herbal plant value chain:

- In Quang Ninh, there are a lot of natural herbs as well as farming-households and businesses herbs, which shows the huge economic benefits pharmaceuticals production brings to the people, especially individuals, organizations which own products participating in the OCOP program. They focus on investing to expand the area of growing medicinal plants more and want to convert low-economic crops to medicinal plants.

- Another result is that it has formed the production chain link for two key medicinal herbs, namely Indian mulberry, and golden camellia. There are 5 main factors: Producers, Collectors, Processors, Wholesalers and Retailers. Producers include farmers, cooperatives and businesses; Collectors include small-scale collectors and large-scale collectors acquired by in-place collectors; Processors are enterprises, cooperatives or small processing establishments; Wholesalers and Retailers sell both processed and raw products.

- Forming 6 different product consumption channels in the typical medicinal plant value chain, the simplest channel is from producer to consumer directly to consumers of raw and fresh products. The most complete consumption channel is the sequential consumption by aspects participating in the value chain.

- The leaders of Quang Ninh province and the Departments and Agencies specially pay attention to the development of herbal plant production to accomplish the advantages in agricultural production of the province, hoping that pharmaceutical products will become a strong asset, beside the province's strengths in the mineral mining industry and tourism. The policies on land, production premises, science and technology, which are particularly interested in by the Provincial Party Committee and Provincial People's Committee, especially for pharmaceutical production and processing enterprises.

- Initially, businesses and local people have used written contracts to create binding relationships between elements; The link is shown horizontally (between households, cooperative groups, processors and consumers), and vertically (producers, collectors, processors, consumers).

- Farmers are very willing to participate in the value chain of herbal plants. They realize that planting herbs brings much higher economic efficiency than other crops; therefore, they are ready to convert paddy fields and some other crops for medicinal crops, when their products are consumed.

3.3.2. Difficulties

- Value chain production linkage is limited: There are many medicinal plants, but currently only two herbs have joined in chain production, but the participating components are not very clear. (Buyer - Processor; Processor - Wholesaler; Wholesaler - Retailer). The linkage between the components in the chain is weak, including that the vertical and horizontal links have not been clearly shown.

- Price and market problems: Despite of the proficiency of herbal production, the price of herbal products is yet expensive, because of the influences from other localities, from importing the products with the same use (for example, to treat diabetes but there are too many products, makes it difficult to compete on price, utility, and quality). The farmers' consuming market for raw materials is limited, making it difficult to expand the acreage to grow some non-specific medicinal herbs: gymnema, solanum procumbens, honeysuckle, lemongrass…

The output market of raw medicinal materials has faced many difficulties: households all sell to local traders; there are certainly few units or organizations who are representatives for farmers buying herbal products. Both are very unstable, are often price-squeezed by traders. Not only pharmaceutical products are difficult to consume, but the market is also small and there is no marketing policy to advertise the products to outside markets (like other provinces and international markets). Therefore, mainly products are sold to China by traders: golden camellia (Ba Che), cinnamon (Quang Lam - Dam Ha); sasanqua camellia (Binh Lieu) ... If the Chinese market is blocked, traders will not buy; thus, growers find it difficult to consume their products, thereby, they will limit the maintenance and expansion of production scale.

- Consumer awareness of medicinal herbs is restricted: On the one hand, consumers, especially province-outsiders, do not literally know the true value of herbs and not ready to buy due to high price (golden camellia), along with the harsh competitiveness and undistinguished replicas that are non-branded. On the other hand, the effects of medicinal products are often slower, compared to modern medicines, which are less interested by consumers, especially those who have low incomes, prefer products with quick effects ...

-Restraints of factors when participating in the value chain of medicinal herbs: The number of households that have signed contracts with processing facilities is quite modest, and the scale is small. Enterprises and people themselves have not truly made compromises to build value chains. The minor collaborations are written contracts, in contrast, they only do verbal contracts. Although some have had contractual agreements, the implementation process is not careful and thorough. The processing business depends on the market, while the farmers depend on the enterprises and the weather, there is a surplus of raw materials during the main season or a shortage of raw materials during the off-season, or lack of raw materials for large-scale processing enterprises.

- Laxity in each cooperation: The forms and measures of economic cooperation between processing enterprises and producing/harvesting farmers are still loose, and there is a lack of effective sanctions to ensure the serious enforcement through the contract. Most of the processing businesses buy through intermediaries (traders, agents), leading to the situation of buying, selling, and price-squeezing on farmers, but not bringing it under control. Also, economic contracts in association relationships are not really guaranteed, and lack of sanctions to strictly enforce the contract. Furthermore, the method of implementing the linkage does not have the equality of interests between the parties. Therefore, the operation of the link model between processing enterprises and pharmaceutical manufacturers is not genuinely stable and effective.

- The role of the four factors in the development of the herbal value chain is misty: Participants in the herbal value chain are not yet clear, especially the roles and the link between boards (including Farmers, Entrepreneur, Scientist and State) are ineffective. They have not determined their role and have not yet promoted their role in the chain yet.

+ The position of pharmaceutical producers is still low in consumption channels and the benefits of the chain mainly belong to the processors and traders. In spite of the effective analyzing, but the ratio of VAT per employee is much lower than that of processors and collectors, since farmers have to spend a lot of efforts to take care of as well as collect medicinal herbs, while agents have to spend a lot of money to invest in input materials (collectors, processors, retailers).

+ Currently, there are several households that have been planting golden camellia and Indian mulberry trees in the locality, due to the effectiveness of the previous planting households. Most of them plant according to the trend, not according to the plans of the locality at the commune or district, lack of basic skills, which most likely will lead to redundancy of raw materials, if there is no link to form a value chain to attach the role of enterprises, especially processing enterprises.

3.3.3. The cause of the limitations

- Producing local medicinal herbs, lacking advertising policy and marketing, searching for big consumption markets (pharmaceutical companies) … The product is mainly raw and difficult to attract high-income and luxury customers. There are no big companies pioneering in cooperating with farmers to purchase raw materials, ensuring that farmers have a stable consumption market, attaching production, process and consumption to value chains.

- The consumption through products of herbal growing households through traders is easy, but is often price-squeezed, the bumper crops “chorus”, devaluation, no buyers, or the status of the product is not harvested but left in the field. In addition, the production process is not consistent, leading to a heterogeneous quality in the source of input, so it is very difficult in the next stage of consumption of enterprises.

- The poor technical and economic infrastructure in production and process has affected the development of pharmaceutical production in the value chain. Since a concentrated and large-scale pharmaceutical production area has not been established yet, it is difficult to attract the attention of large processing enterprises. As the small scale of production, simple processing technology, the product is difficult to compete in the market and it is impossible to consume all the medicinal resources provided by farmers. On the other hand, there is no regulations forcing the Company to purchase raw materials in the province for processing, the Company has a right to import input materials in cheap and sufficient places, without infrequently purchasing and preprocessing before putting it into processing (Quang Ninh Pharmaceutical and Medical Equipment Company). In addition, some small businesses with outdated processing technology and small scale cannot process all raw materials although they have signed contracts with farmers (Dong Bac Pharmaceutical Plantation, Production and Processing Ltd). This is a paradox that should be resolved soon by all levels and branches to support both businesses and farmers.

-Some herbal products have not been well-known for their true use; hence, they are mainly sold to Chinese traders. If traders do not buy, people stop producing (golden camellia) or exploiting (cinnamon, star anise, etc.)

- Production capacity of farm households is still limited, mainly following the crowd, and they do not know market analysis and forecast, but only look at positive signs of the market to produce. Farmers are not sure about the benefits of value chain production and totally do not know how to link together to create strength, as well as to link with processing enterprises is the basis for improving production efficiency, turning the production of medicinal herbs into a huge production industry.

- Regulations, policies, especially policies of encouraging the development of contract production are not synchronous and are insufficient to link the interests of producers of raw medicinal herbs to the processing enterprises. The regulations and legal bases are not strong enough to handle contract breaches, and to respect commitments in economic contracts between processors and raw material producers.

3.3.4. Some problems need to be solved to develop the pharmaceutical value chain in Quang Ninh province:

Price and consumption market problems:

Prices of medicinal products are yet expensive, endured by the competitiveness between other products from other localities, from importing products with the same use (for example, to treat diabetes but there are too many products, makes it difficult to compete on price, utility, and quality). Consumers, especially province-outsiders, do not really know the true value of medicinal products and they are not ready to buy due to the high price, as well as the competitiveness and undistinguished replicas because these products are non-labeled and non-copyrights ... This leads to difficulty of consumption of herbal products, loss of trust and devaluation.

The problem of vertical, horizontal alignment and multi-board alignment in

production

Horizontal alignment is the link between farming households to become cooperative groups or cooperatives that need to be implemented to create the movement of growing medicinal plants specialized in large fields, facilitating technology transfer as well as consumption of traders' products. However, in this connection, if medicinal herbs & other fruit trees (sugar-apple, litchi) are competing for land, it is important to clarify the effectiveness of each crop, it is important for farmers to make decision on planting fruit trees or medicinal plants

Vertical alignment is the link between factors in the value chain. Now, in Quang Ninh, the value chain of golden camellia and Indian mulberry is formed, but the link is quite loose. There is no common voice of people in the chain; the contract for product consumption is not protected by law; there is no sharing of market information, and it has not created trust among factors in the chain. In order to promote vertical alignment for sustainable development, Decision 80/2002 / QD-TTg is an important document, facilitating the development of vertical alignment and emphasizing the important role of product sales contracts.

The problem affects the small export and import market of herbal products from China

The problem of producing - processing - trading of medicinal herbs in Quang Ninh in particular and in Vietnam in general has a great influence from China: The purchase price of medicinal herbs; the low price processing technology is mainly imported from China; the medicinal seed varieties; the extraction and refining of herbal products are also from China. Quang Ninh has a border gate with China; therefore, many kinds of medicinal herbs are bought by Chinese traders, then brought back to the country, extracted the essence and brought to the market for sale in Quang Ninh at very low prices, making medicinal herbs in the province are very difficult to compete. For the pharmaceutical industry, the export and import through official channels are regulated, but traders prefer the unofficial route because it is faster and brings to higher profits.

Problems of responsibility of factors in the value chain of medicinal plants

Chain production of medicinal herbs requires very high responsibility for the participating factors, with strong and continuous interaction. In fact, the development of chain production has many limitations, the factors have not actively linked together to produce in chains, limiting the added value of each product. Once the chain has been formed, each element in the chain has not paid attention to the common goal but still does at their own discretion, due to the lack of binding regulations, as well as the limited capacity to operate the chain.

Based on the results of analyzing the current status of the development of the herbal value chain and on the opinions and goals of pharmaceutical development of leaders at all levels and the views after theoretical research and practical survey on the development of the medicinal value chain in Quang Ninh province, the author proposes solutions on the development of the medicinal plant value chain is based on the principle of ensuring the viewpoints and development goals of the medicinal plant value chain in Quang Ninh province, which are practical, feasible and systematic. In order to effectively implement these solutions, in each solution, the author gives specific activities to organize and to deploy. These solutions are an important basis for state and department management agencies to pay attention to research, direct and apply in practice, so as to build and develop the production of medicinal plants in the value chain in the shortcoming time and to contribute to the successful implementation of the province's socio-economic development goals.

4. Discussion and Conclusion

Quang Ninh has a lot of advantages in natural conditions for producing medicinal herbs. Beside natural, socio-economic conditions, The government of Quang Ninh province has properly paid attention to the process of medicinal herb production, especially the value chain through OCOP program. Over the past years, many medicinal herbs have been invested and produced by people, as well as by businesses: Ming Arelia, Gac, Five-leaf Ginseng, Oriental Motherwort, Star Anise, ... However, the development of chain medicine production is still very limited, mainly producing according to market signals. Local people and businesses do not know how to link production to create a product value chain.

From a comprehensive analysis of the current status of the medicinal plant value chain development in Quang Ninh province, the author conducts a full analysis of factors affecting production development in the value chain, finding that in addition to subjective factors The other important factors are still the factors that inhibit the development of production of medicinal plants in the value chain: The actors participating in the chain are not fully aware of the benefits of linking production. chain, local authorities are also confused in the organization and management of production in the value chain ... Local authorities at all levels are very interested in developing medicinal plants to exploit potential local strengths, but there are no specific solutions and appropriate policies to promote the production of medicinal plants in the value chain. Although there are specific policies: Supporting seeds, capital, infrastructure for businesses, processing equipment ... but that level of support is not strong enough for the agents to be capable of developing production. value chain.

The author proposes some recommendations as follows:

(1) For people directly involved in the production and trading of medicinal herbs

For growers of medicinal herbs: Medicinal herbs are crops with much higher efficiency than rice and some other crops. However, the consumption market is narrower, because medicinal herbs are not essential goods, serving daily consumption like rice and some other fruit trees. The consumption of medicinal herbs in Quang Ninh depends a lot on traders, especially traders from China, for some of the most popular herbs today: Cinnamon, Camellia, Wild Indian Mulberry … so that medicinal plants growers must:

- Absolutely comply with the local production planning, avoid following the movement so as not to fall into the chorus of "good season, falling prices" as in the past time for some agricultural products in the country as well as some pharmaceuticals. whether that happened in Quang Ninh.

- Use medicinal varieties and genetic resources suitable for each soil type under the guidance of scientists or specialized agencies to have the best product quality and increase the value of added value.

- Maintain credibility in the process of buying, selling, transporting goods, interacting with other actors in the chain to reduce costs and increase the value of actors in the medicinal value chain.

- Apply new technologies to production, increase the use of probiotics in pest control, reduce the use of chemical fertilizers and pesticides, ensure the soil, water and health environment for themselves. and community.

For pharmaceutical processors and traders: Medicinal materials are fresh, raw products, the processing and preservation are very important, it is necessary to carefully study the processing technology and look for markets to consume the products. Before signing a product sale contract with the producer, especially the farmer, avoid a case where the contract has been signed, but the processing capacity cannot meet the raw material source of the producer, causing loss of trust, especially the confidence of farmers in businesses, is difficult to regain. Processors need to proactively propose and cooperate with scientists, in order to find suitable processing technologies, to create products of higher quality, and at the same time, analyze usage. This is true of medicinal herbs, thus creating the consumer's interest in medicinal products.

(2) For state management agencies at district and lower levels

It is necessary to clearly analyze the effectiveness of medicinal plants and some other local crops so that the people can see the benefits of developing medicinal plants. At the same time, increase propaganda so that people can see the benefits of linking in production, especially horizontal linkage (farming households together to have appropriate production scale, easier to consume products).

Be more proactive in advising Departments, branches as well as the Provincial People's Committee to have a specific and detailed plan for each type of medicinal herbs with strengths of the locality, creating favorable conditions for production enterprises. and processing medicinal herbs in the area so that they together with medicinal plant growers can perform the role of production and processing, while maintaining the development of the business, contributing to improving income for local people.

(3) For departments, branches of the province

In order for the pharmaceutical industry to develop properly with the current potential and strengths of the province, the role of relevant departments and agencies to advise the Provincial People's Committee is very important, namely:

- The Department of Planning and Investment is in charge of coordinating with the Department of Agriculture and Rural Development, the New Rural Construction Board to advise the Provincial People's Committee: Develop long-term plans and make plans for each specific period to continue to improve. and develop the Ba Gio and Tra Hoa Vang medicinal value chain, form medicinal value chains by region as proposed in the solution, and at the same time build a binding mechanism for actors in the value chain, PPC signed the issuance to attach their legal responsibilities in the value chain operation.

- The Department of Agriculture and Rural Development, the New Rural Construction Board coordinates with the Agricultural Extension Center to organize training, training, and guidance on the production method according to the value chain for each individual medicinal ingredient; Actively build a coordination mechanism between actors participating in the value chain, submit to the Provincial People's Committee for signature and issue as a basis for value development of new medicinal plants.

- The Department of Industry and Trade presides over and coordinates with the Steering Committee of the OCOP program to advertise and market pharmaceutical products widely to the market outside the province, in order to seek output for the product. Without an output market, production cannot be expanded, and the links in the chain cannot function.

(4) For Provincial People's Committee

- It is necessary to have policies to invest and upgrade equipment for a number of pharmaceutical processing establishments to ensure the processing of all raw materials produced by farmers, and to process high quality products. , diversifying products, towards convenient products.

- Continue to research to have strong enough land policy, planning, compensation for site clearance, in order to upgrade the scale of factory construction, waste treatment to the environment for pharmaceutical processing establishments. materials in the early stage of establishment and operation.

- Strengthen advertising and marketing products outside the province and internationally so that consumers know more about medicinal products. At the same time, together with businesses, investors actively seek output markets for both raw materials and products processed from medicinal herbs.

- Issue a coordination mechanism between actors in the chain, in order to attach responsibilities and benefits of actors in the chain. Each actor participating in the chain, when violating the regulations, it is necessary to have an appropriate handling mechanism to maintain the sustainability and cohesion of the actors in the chain.

THE APPROACH OF ECOLOGICAL-SOCIAL REGION TO ADAPT TO CLIMATE CHANGE

Dr. Ha Huy Ngoc
huyngoc47ql@yahoo.com
Dr. Tran Thi Tuyet
tuyettran.iesd@gmail.com
Institute of Human Geography, Vietnam Academy of Social Sciences, Hanoi, Vietnam

Abstract

In the face of the threat of the climate change to all of territories, aspects of living and producing. The States have strongly focused on work of adaptation to climate change from recognizing in legal system to practical deployment solutions aiming at steadily minimizing negative influences of climate change to development progress of territory on the basis of different research results. However, achieved results have been restricted, the territories are still struggling against unpredictable happenings of weather and extreme phenomena. Therefore, in order to proactively adapt to climate change is necessary to have effective solutions on the basis of reasonable approaches; in particular, the approach of social-ecological region with core that is to analyze mutual relationship among ecosystems, social system in internal region, inter-region would provide bases to ensure the scientific, objective to propose the most effective adaptation solutions.

Keywords: *climate change, adapting to climate change, approach of ecological-social region*

1. Introduction

The impacts of climate change (CC) are prevalent and deepen the complexity and severity of extreme phenomena through changing the relationship between natural systems and social systems in all development regions and domains. In particular, development activities depending on natural resources are increasingly exposed to risks, facing challenges to maintain and develop.

To gradually overcome the above difficulties, the Party and the State have issued and implemented many adaptation solutions, including structural and non-structural solutions on the basis of different research results. However, the achieved results still exist many limitations and shortcomings, as territories and communities are still facing many difficulties and pressure from unpredictable happenings of weather and natural disasters. Therefore, to proactively adapt to climate change, it is required to have a systematic and synchronized solution based on an integrated territorial approach; in particular, the approach of social - ecological region with core that is to analyze mutual relationship among ecosystems, social system in internal region, inter-region would provide scientific, objective information to propose adaptation solutions with the spirit of "*respect and utilization of nature*".

2. Method

The main methods used in this article are the review of domestic and foreign research documents and the method of statistical and descriptive analysis.

Along with data sources related to climate change manifestations and scenarios; impacts of climate change and natural disaster on socio-economic areas in Vietnam; etc. were collected from the Ministry of Natural Resources and Environment, General Department of Water Resources, General Department of Natural Disaster Prevention and Control, and General Department of Statistics for the period from 2011 to 2020.

3. Results

3.1. Social-ecological regions

The approach of social-ecological region is one of the tools for effective territorial management through the study of the mutual relationship between human and nature, which emphasizes that human is an inseparable part from nature (Berkes & Folke, 1998); social-ecological research results by territory are an integrated scientific basis, thus determining the specificity of ecological funds, spatial resources, and society in regional stratification; objective scientific bases in the active inclusive development and adaptation to climate change for any territories.

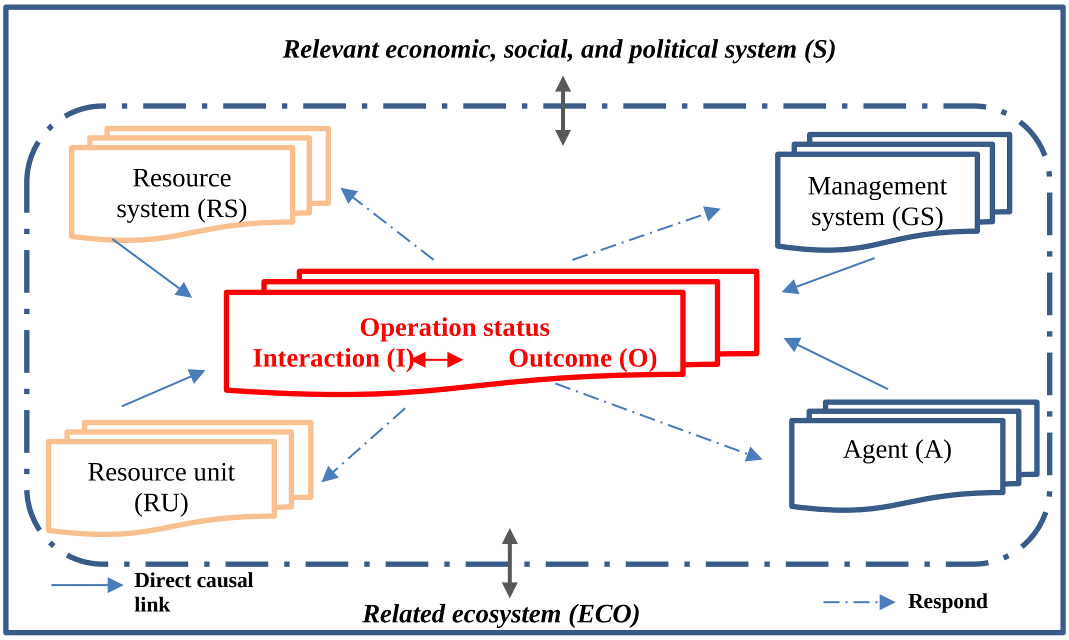
In our country, the concepts of regions and territorial zoning have been used in research works and legal documents with a defined scale depending on different management criteria and objectives. For example, with regard to geoscience, Hoover (1984) and Le Ba Thao (1998) stated that "the region is a territorial part of one or more countries with different geographic features, levels of socio-economic development, structured and operated as a system in mutual relationship among the country and other regions"; According to the Law on Planning 2017, "the region is a part of the country including adjacent municipal provinces and cities directly attached to river basins or bears the similarity in natural, socio-economic, historical, population, infrastructure conditions and interactive relationships which create lasting connections with each other"[88]. The region is a geographical space with the unity of the peer relationship among constituent elements, creating products with specific characteristics regarding nature, economy, society and environmental security (Ngo Doan Vinh, 2003).

The 70-80s of the 20th century witnessed the appearance of the approach of social-ecological region in research. This is the proposed interdisciplinary and multidisciplinary approach to overcome the singularity of the territorial approach, moving towards the integrated approach, the system of constituent factors, including bio-geo-physical units and

[88] Article 3, the Law on Planning was passed by the 14th National Assembly in November 2017 and came into effect on January 1, 2019.

related social organizations of the system (Glaser, Krause, Ratter and Welp, 2008; Elinor Ostrom, 2009); SES findings are more comprehensive, widely applied in resource management, sustainable development of territories in the world with an analytical framework of social ecosystems, including four core components: resource system (RS); resource unit (RU); management system (GS) and agent (A); common components and the interactions among them will appear related sub-attributes. This is a general oriented framework - tangible structure combined with different theories of politics, institutional economics, and anthropology (Ostrom, 2009).

Figure 1. Analytical framework for the sustainability of social-ecological systems



Source: Elinor Ostrom, 2009

The framework of social-ecological analysis has been applied in some research of our country; accordingly, the approach of social-ecological region in the zoning is a variation of the human ecosystem, emphasizing the social element with the connotation of a complex and unified system of both human and nature, which constitutes with a bio-geo-physical unit and associated social and institutional factors (Truong Quang Hoc and Hoang Thi Ngoc Ha, 2016); in terms of sustainable development, the social-ecological region is considered a possible space within the administrative territory of many localities (Mai Trong Nhuan, 2018), this understanding has improved the political will, short-sighted vision during term of office, and local interests of the subjects involved in planning.

From the above concepts, it can be understood that *the socio-ecological region is an area with similar ecological conditions (geography, natural resources, environment), socio-economic and cultural characteristics, along with the institutional system and regional governance. At the same time, there is an interactive and interdependent relationship between the natural system and the socio-economic, human and institutional systems, creating the uniqueness of the territory.*

The connotation of the approach is quite consistent in terms of: i) A functional system, which interacts regularly in a climate-resilient and sustainable manner; ii) A system exists in a defined space and time, whose structure, functions and organizational levels interact with each other; iii) A combination of important resource types (natural, socio-economic and cultural resources) developed and used by a complex of both ecological and social systems; iv) A constantly changing complex system with continuous adaptation (Truong Quang Hoc and Hoang Thi Ngoc Ha, 2019). Each social-ecological region has its own territorial characteristics, which is mainly reflected through the following factors:

Regional-institutional characteristics: Regional characteristics are objective factors defining regional institutions, thus, regional governance regulations are subjective factors. Regional institutions are institutions at the regional level that only exist to serve the governance of that region. For example, the Mekong River Delta has to rely mainly on water resources of the Mekong River; therefore, it requires an institutional connection to effectively manage and share water resources (Bui Quang Tuan, 2018).

Regional-economic characteristics: Each region has different resources for economic development. With a diversified river system and ecosystem, the Mekong River Delta has the potential and advantages for economic development of fisheries, fruit, rice, etc.

Regional – cultural and social characteristics: Culture and society play an important role in creating regional characteristics, which is reflected in the relationship between human and nature through cultural knowledge about dealing with the natural environment. At the same time, the accessibility to social resources such as support networks, cooperation mechanisms, participation in mass organizations, etc. is an opportunity to access scientific and technical resources, finance, information, etc. to adapt to climate change. Agricultural livelihoods associated with rivers are predominant in rural areas in the Mekong River Delta; however, this kind of livelihood is susceptible to natural disasters, drought, saltwater intrusion, riverbank and coastal erosion if there is no appropriate adaptation measure.

Regional – environmental and natural capital characteristics: Ecological region characteristics have direct and indirect impacts on the environment where humans live. The environment in the Mekong River Delta is associated with rivers and water, so residents' life is attached to the sea and alluvial grounds. However, climate change, natural disasters, and extreme weather have changed the living environment, migration and livelihoods of some community groups.

3.2. Approach to social-ecological regions in climate change adaptation: The case in Vietnam

In the process of human evolution and development, there is no natural system without human intervention, and at the same time, no social system lacks natural elements. The result of this interaction is the formation of social-ecological systems with closely related components to evolve together. Therefore, enhancing resilience according to the approach of social-ecological system for each specific locality and region is considered as a strategic solution for sustainable development in the context of climate change. (Truong Quang Hoc, Hoang Thi Ngoc Ha & Nguyen Tien Truong, 2015). This is emphasized by the following characteristics:

i) Clarity due to close, sustainable interactions and resilience of bio-geo-physical and social-economic factors, natural disasters, and climate change.

ii) Is established by defined spatial and temporal scales; structure with specific forms and functions; and hierarchical connectivity with two-way relationships (top-down and bottom-up).

iii) Is constituted by a set of important resources (natural capital, ecosystems, economy, society and culture, infrastructure, science and technology, finance, etc.) with linking flows governed by the integration of social and ecological system factors;

iv) Dynamic complex systems with the capacity to adapt flexibly (based on community and ecosystem). Therefore, this is a suitable territorial unit for implementing planning orientation based on its potential and comparative advantage (Pérez-Soba & Dwyer, 2016).

With these preeminent features, in recent times, the approach of social-ecological region and enhancing resilience has been widely applied in many countries around the world for sustainable development in the context of climate change (Holling & Walker, 2003; Resilience Alliance, 2007; WB, 2010; United Nations University, 2014). In Vietnam, research on resilience and adaptation to climate change based on social-ecological system has been conducted by domestic and foreign researchers with the support of international organizations (Truong Quang Hoc, Vo Thanh Son, 2008; ACCCRN – Vietnam, 2010; Truong Quang Hoc, Hoang Thi Ngoc Ha 2016; Shaw, 2013) with the principle that man is the center of the ecosystem, which means: i) People are the most powerful factor influencing the ecosystem, and ii) Ecosystem conservation activities must ultimately be directed towards and providing human social welfare (Millennium Ecosystem Board, 2005). As for social-ecological systems, the adaptation process is more complicated because of human intervention and human factors; thereby, it is likely to reduce or increase the resilience of the ecosystem as well as of the whole system.

a. Resilience of the social-ecological systems

Resilience: is a term commonly used in many different sciences, expressing the ability to recover or adapt well when faced with challenges in the course of existence and development. (Masten & Coatsworth, 1998; Darity, 2008). For such system defined as a set of elements, its parts interrelate, interact with each other and form a coherent whole; the system's resilience is the ability to self-reset its balance when faced with external impacts, demonstrated in the following states:

(i) Physical resilience

A physical system has a certain degree of resilience depending on the nature and structure of the whole system and each of its components, such as the resilience of a construction work depends on the construction planning and design with the appropriate calculation with the load capacity of the constituent elements (Truong Quang Hoc, Hoang Thi Ngoc Ha, Nguyen Tien Truong, 2015).

(ii) Ecological resilience

Ecological resilience is a term first proposed in 1973, expressing the stability, balance, and capacity of the ecosystem to self-regulate against external influences (Holling C.S. and Walker B. 2003; Lance H. Gunderson, 2000). Ecological resilience is maintained by fundamental structural processes on a number of scales, renewable sources, improvement, and biodiversity functions; is the process of changing metabolism in accordance with the environmental conditions. In fact, maintaining renewable capacity in a dynamic environment provides an ecological buffer that protects the system from natural and human impacts; resilience is not a single process but a response of the entire ecosystem with different levels of spatial and temporal scale; therefore, researching and learning about resilience capacity will be the basis for managers to make appropriate decisions in using and exploiting ecosystem service values towards sustainability and adaptive governance. (Lance H. Gunderson, 2000; Donald AF et al., 2019).

(iii) Resilience – adaptability

Resilience and adaptability are closely related, taking place intertwined within the system, demonstrating the system's sustainability against external factors. In fact, resilience – adaptability are the abilities to effectively maintain integrity, integrity, and reduce vulnerability in response to changing contexts. The above relationship shows that in order to ensure an effective response to external impacts, it is necessary to reinforce the system's resilience and adapt to changing conditions in a way that is in harmony with nature and human (Mark R., 2010).

(iv) Social resilience

Social resilience is the capacity of human and community to cope with and adapt to external impacts through environmental, policy and social changes based on four factors: (i) the components making up the system (individuals, communities); (ii) relationships (interactions between components – social relationships such as family, community, membership of associations or clubs, participation in decision making); (iii) innovation (external solutions and responses: R&D, new technology, knowledge, and skills); (iv) continuity: system characteristics maintained over time (shared traditional values and knowledge) (Adger, 2000; Truong Quang Hoc et al., 2015).

(v) Social-ecological resilience

Social-ecological system is the link between human and nature, in which human is the product of interaction between ecosystem and social system. This interaction is also known for a number of terms, such as human-environmental integration system, socio-ecology, or socio-ecology, which is formed based on factors influencing the system's resilience. For example, many factors such as water cycle, fertilizer, crop and climate diversity, etc. strongly affect the system, leading to different results. Diverse human activities in many different sectors affect and, at the same time, depend on the resilience of terrestrial, aquatic and marine ecosystems. In addition, many human activities, especially in terms of institutions, science and technology, can have a strong impact on increasing/decreasing the resilience of the whole system (Truong Quang Hoc et al., 2015).

b. Assessment of the resilience to the climate of the social-ecological system

There are many different approaches applied to assess the resilience of the social-ecological system to climate impacts. These approaches can be based on an assessment of the capacity of territorial capital to form livelihood modes, such as natural capital, financial capital, physical capital, human capital and social capital; in which, identifying the components of the ability to recover and adapt (hence the intervention points in the resilience management system) is the primary objective of the assessment (Resilience Alliance, 2007). Assessment of the resilience of the social-ecological system requires an interdisciplinary approach with the participation of relevant sectors on the basis of prioritization and the ability to appropriately integrate experiences and knowledge to put forwards solutions ensuring the totality on the basis of key factors in the interactive relationship of the social-ecological system, including: adaptation for change; Diversified development for reorganization and renewal; combination of different types of knowledge to cope; creating opportunities for self-organizing towards social-ecological sustainability (Folke & Berkes, 2003; Truong Quang Hoc et al, 2015). From the above viewpoint, the resilience and adaptation of the social-ecological system to climate change will be based on the following five factors:

(i) Infrastructure and facilities to maintain and develop the essential needs of human and production.

(ii) Society – culture: population, labor, education, health, social capital/social network, community willingness to participate, community knowledge, culture of dealing with nature.

(iii) Economy: income, employment, assets, finance-accumulation, budget subsidy.

(iv) Environment – nature: intensity/frequency of natural disasters, ecosystem/natural capital, land use.

(v) Institutions: risk management, knowledge management, agency coordination, policy integration, environmental policy, risk management (Shaw, 2013).

c. Social-ecological climate change adaptation in Vietnam

With diverse social-geographical features, the impacts of climate change in our country clearly show territorial characteristics. However, the scale and scope of the impacts of climate change are increasing strongly, exceeding the independent coping capacity of each individual locality. Therefore, it is necessary to have the connection and integration among localities and regions in responding to climate change. The National Target Program to Respond to Climate Change emphasizes the notion that "responding to climate change is conducted on the principles of Sustainable Development, ensuring systematic, integrated, inter-regional factors" (Prime Minister, 2008).

Table 1. The severity of climate change and natural disasters to several regions in Vietnam[89]

	Natural disasters	Northwest	Northeast	Red River Delta	North Central	South Central	Central Highlands	South East	Mekong River Delta
1	Storm	4	4	4	4	3	2	1	1
2	Tropical depression	4	4	4	4	4	-	1	1
3	Flood	4	4	4	4	4	4	3	2

Source: National Target Program on Climate Change, 2008; Institute of Hydrometeorology & Climate Change, United Nations Development Program, 2015; and author group update, 2018.

In principle, each locality/region itself has a certain specificity, a certain environmental load capacity, a certain resilience to climate change, depending on territorial location, capacity and adaptive resources. For example, the coastal area, which is influenced by both the law of the continent and the sea, forms diverse sources of capital for socio-economic development, but is also subject to the under pressure of natural and human laws, such as impacts of climate change leading to degraded coral reefs, with changes in climatic conditions leading to a decline in fisheries resources, thus affecting the productivity and yield of fishing and farming products.

The Mekong River Delta is assessed as one of the regions severely affected by climate change, including an increase in droughts. Drought occurs on a large scale with

[89](4) Very serious, (3) Serious, (2) Moderate; (1) Trivial, (-) Not affected

increasingly serious impacts affecting production, mainly due to the decline of water resources and lack of moisture reserves, This leads to the degradation of capital sources, which are the basis for people's livelihood activities, especially rural residents – those are vulnerable but have difficulty in recovering from a disaster due to limited drought adaptive resources and conditions, making it difficult to change livelihoods; challenges affecting the results of the national target programs, such as sustainable poverty reduction, new rural construction, etc.

Thus, climate change is increasing the complexity and severity of the impacts through changing the relationship between the natural system and the social system; considered as one of the main limiting factors in territorial development. However, responses to climate change, managed by administrative territory, have not taken into account inter-provincial and inter-regional climate change resilience (Nguyen Song Tung et al., 2017). Therefore, climate change adaptation based on social-ecological regions will bring about the following benefits:

- The suitability level of socio-economic conditions and natural resources, ecological environment for each sub-region.

- The ability to develop the sub-region's comparative advantages, potentials, and strengths.

- Promoting the historical values, indigenous knowledge, and cultural values of the community in adapting to natural disasters and climate change.

- Maintaining the sustainability of the natural capital system and flexibly respond to socio-economic risks and climate change.

- Enhancing connectivity among localities and between localities with centers (nuclear – economic drivers) and infrastructure development connecting localities within the region (Institute of Development Strategy, 2018).

- The scale of the sub-region will be consistent with the organization and management capacity of the local government, as well as the regional connection in responding to climate change among localities.

The results of practical research combined with analysis of framework for approaching social-ecological systems shows that the flexible customization of assessment indicators in accordance with specific territorial conditions, the results of implementation satisfying the practical requirements of several subjects, in different impact contexts, it can be used to answer questions related to the rational territorial management of policy makers, especially linkage, mutual relationship among factors through integrated analysis of development resources. This comprehensive and systematic research result will provide the most objective and scientific view of the research object and territory; thus, it is the basis for proposing proactive solutions to effectively adapt to unusual, extreme and unpredictable changes such as climate change. In particular, the application of theoretical analytical frameworks and functional zoning results according to the social-ecological approach is the spatial basis for the application of effective territorial development and management solutions through collective learning the territorial factors according to natural ecosystems and social systems. In other words, it is necessary to apply research results, evaluate ecological potential, spatial potential and social-cultural characteristics of the territory, conduct functional zoning on the principles of contingency, relative homogeneity, regional relationship, ensuring sustainable territorial development to create a scientific basis for the development orientation and spatial planning in accordance with the development priorities of each particular territory on the basis of ensuring the load-bearing capacity of nature. Additionally, the knowledge, cultural identity, and management capacity as well as ensuring feasibility in the implementation process should be taken into account.

4. Discussion and Conclusion

Climate change has seriously affected the coping resources of the territory, especially coastal deltas – which are influenced by both ocean and continental laws. Therefore, to proactively adapt to climate change, it is necessary to have appropriate solutions on the basis of a systematic and integrated territorial approach. In Vietnam, there are many territorial research projects with different approaches. However, with the increasingly complex impacts of unpredictable happenings of weather, it is required that territories must regularly update and apply a variety of appropriate research directions in order to maximize their potential.

The approach of social-ecological region is considered as an effective one with thinking about territorial specificity combined with comparing similarities and differences with other territories. This approach has been applied by many countries in adjusting the harmonious relationship between man and nature in order to seek solutions that both ensure sustainable development and well adapt to the increasingly unusual happenings from inside and outside the territory, including climate change. In fact, it has been shown that adopting a natural-social interdisciplinary approach will contribute to elucidating ecosystem responses, including adaptation to human impacts through livelihoods and socio-economic development. On the contrary, in terms of society-humanism, if the natural-social approach is not used, the exploitation of biodiversity resources will be ineffective and unscientific. That is when we do not comply with the social-ecological resilience threshold while allowing people's livelihood and economic activities to destroy the environment and deplete resources.

Note: The article is completed within the topic sponsored by the National Science and Technology Development Fund, doi 507.01-2019.301: Research on a policy framework for proactively adapting to climate change in the Mekong Delta from the approach of social-ecological region.

SUSTAINABLE AQUACULTURE IN NAM DINH PROVINCE: PROBLEMS AND SOLUTIONS

Dr. Bui Thi Van Anh

vananh1509@gmail.com

Institute of Human Geography, Vietnam Academy of Social Sciences

Abstract

In recent years, aquaculture in Nam Dinh province has been proven as an advantageous field of production with high socio-economic efficiency, contributing to job creation and increasing income for the people. The output of aquaculture increases every year, contributing to the development of the whole province's economy. However, at present, aquaculture in Nam Dinh province is facing a number of challenges and difficulties, such as management and planning of land for agriculture and aquaculture; the insufficient source of aquatic breeds (shrimp breeds) that has not been of quality control, environmental pollution problems in aquaculture and so on. These shortcomings affect productivity, quality, efficiency and the sustainable development of the industry. In the coming time, to have a sustainably developing aquaculture, Nam Dinh province needs radical solutions for the aforementioned problems.

Keywords: *Aquaculture, problems, solutions, Nam Dinh.*

1. Introduction

Aquaculture is a production activity based on the integration of available natural resources (sea surface, river water, ponds, low-lying fields, billabongs, lagoons, climate, etc) with the system of aquatic organisms (mainly fish, shrimp and other aquatic products) with direct human involvement. This activity in Vietnam includes the farming and cultivation of freshwater, brackish and saltwater aquatic products with the main forms namely intensive, semi-intensive, extensive and improved extensive farming; farming in cages on sea, river, lagoon or coastal water surface; mollusc farming; farming in ponds, lakes, lagoons; farming in low-lying fields and rice fields.

Nam Dinh is a coastal plain province in the south of the Red River delta, with three major estuaries: Ba Lat, Ninh Co and Day. Every year, a large amount of alluvium, organic matter and mineral salts come from rivers and deposit in the coastal area. With a coastline of 72km long, over 90,000 ha of fertile alluvial land and over 17,000 ha of land with water surface, Nam Dinh has a huge advantage for the development of exploitation and aquaculture. Over the past years, Nam Dinh has strongly developed aquaculture in both freshwater and brackish areas with a sharp increase in aquaculture production each year, contributing to job creation, income growth, and attraction the investment from many economic sectors in Vietnam and from other contries, contributing to the economic development of the locality. However, at present, aquaculture in Nam Dinh province is facing many challenges, such as: the conversion of the areas with inefficient rice or salt production into aquaculture areas; sources of aquatic breeds, environmental issues in aquaculture, product consumption, especially in the context that the Covid-19 pandemic has a significant impact on productivity, quality and efficiency and the sustainable development of aquaculture. Therefore, the sustainable development of aquaculture requires long-term strategic solutions based on scientific research results with an overview and sustainable approach.

2. Method

2.1. Research data

The paper uses databases from relevant agencies of Nam Dinh province, published plans and reports, and Nam Dinh's statistical documents related to aquaculture.

2.2. Research method

- Methods of collecting, processing and analyzing documents: The data collected from reports related to aquaculture of the Department of Agriculture and Rural Development of Nam Dinh province, main website of Nam Dinh newspaper, Nam Dinh province allow the researcher to have accurate assessment for the current situation in the area of the study.

- In-depth interview method: Subjects of in-depth interview are officers from the Department of Agriculture and Rural Development in Hai Hau district and Nghia Hung district, Nam Dinh province and some aquaculture farmers in Nam Dinh province.

3. Results

3.1. Current status of aquaculture in Nam Dinh province

Total aquaculture production in 2020

According to the report on the results of aquatic production in 2020 and the implementation of production tasks in 2021 of the Department of Agriculture and Rural Development of Nam Dinh province, the total aquaculture production in 2020 of the whole province is estimated at 170,490 tons, equal to 102.4% of the year plan and increasing 6.32% (+10,142 tons) in comparision with the previous year, of which aquaculture output reached 114,182 tons, equal to 102.41% of the year plan and increased 8.14% (+8,594 tons) compared to the previous year; exploitation output reached 56,308 tons, equal to 102.38% of the year plan and increased 2.8% over the previous year. The total production value of aquatic products in 2020 is estimated at 9,900 billion VND (current prices) and 4,900 billion VND (constant prices 2010), in which exploitation reaches 1,626 billion VND, farming reaches 3,274 billion VND. Overally, it accounts for about 33% of the structure of agriculture, forestry and fisheries [1].

Aquaculture area in 2020

* *Freshwater aquaculture:* the farming area is 9,800 ha, no increase compared to 2019; production reached 56,672 tons with an increase of 12.4% compared to 2019. In which:

- *Traditional fish farming (carp, mud carp and grass carp):* The farming area reached 9,400 ha; output is 38,600 tons, increased 11.8% compared to 2019.

- *Red snapper farming:* The farming area is 240 ha; the output reached 1,680 tons with an increase of 11.04% compared to 2019. In some places, the polyculture of red snapper and whiteleg shrimp achieved good results.

- *Giant snakehead farming:* With fast growth rate, stable consumption market, it continues to be chosen by many farmers. The farming area is 60 ha; production reached 1,290 tons with an increase of 9.2% compared to 2019.

Some special aquatic species with high economic value such as shortshell turtle, frog, eel, loach, large edible snail, hybrid catfish, etc which are commonly farmed by local people bring high income for farmers.

* *Brackish and saltwater aquaculture:* The farming area is 6,500 ha, increasing 85 ha compared to 2019. The output reached 57,210 tons with an increase of 4.2% compared to 2019. In which:

- *Brackish water shrimp farming:* The farming area reached 3,400 ha; brackish water shrimp production reached 7,280 tons, increasing 21.5% compared to 2019, reaching 98% of the plan. In which, tiger shrimp farming area is 2,400 ha, tiger shrimp production is 2,450 tons, increasing 3.64% in comparision with 2019. Whiteleg shrimp farming is still invested by localities with increasing level of intensive farming. In 2020, the farming area of whiteleg shrimp was 1000 ha with an increase of 60 ha compared to 2019; production reached 4,200 tons with an increase of 31.1% compared to 2019.

- *Clam farming:* the commercial clam farming areas has expansed stably with the farming area of 2,165 ha, the output of clam reached 39,500 tons with an increase of 4.05% compared to 2019.

- *Sea fish farming:* This is a species with high economic value and is increasingly being focused in brackish areas. In 2020, the area of sea fish farming was 615 ha; the output reached 5,210 tons, equal to 92.5% compared to 2019, due to the low price of fish at the beginning of the year, farmers released later than the previous year.

It can be seen that Nam Dinh's aquaculture has developed dramatically both in freshwater and brackish water farming areas. The cultured species are increasingly diversified, in which shrimp, four-eyed sleeper and bivalve molluscs (clams) are the main species which are focused on promoting development by Nam Dinh aquaculture, aiming to reorientation of restructuring of the aquaculture sector. To be specific, clam is identified as one of the main cultured species under the Provincial Agricultural Sector Restructuring Scheme towards increasing added value and sustainable development. To accomplish that goal, in recent years, the commercial clam farming areas of the province have been strictly controlled to European standards; to satisfy domestic consumption demand and raw materials demand of factories to process and export clam products to the European market. Clam farming, therefore, has created jobs, raised incomes and enriched many coastal households.

Production and supply of aquatic breeds

Nam Dinh province has a wide tidal flat, favorable for clam culture development and hatchery production. The seed supply source for clam farmers in the province mainly comes from natural collection and local production. With good quality and high survival rate, clam breeds produced and collected in the province do not only serve the needs of farmers in the area but also are consumed in provinces and cities namely Thai Binh, Hai Phong, Quang Ninh and so on. Clam farming and breed production has brought high income for many households in the coastal districts. Currently, the province has more than 100 hatcheries (producing saltwater and freshwater breeds). The people have mastered the breed production technology of many cultured species such as mollusks, four-eye sleeper. The quality of breed produced locally is increasingly guaranteed and trusted by the people.

According to a report by the Department of Agriculture and Rural Development of Nam Dinh province, production and nursing establishments in the province have focused on building infrastructure to meet production conditions. Up to now, 49 establishments have been inspected and granted certificates of eligibility for production and nursing (30 establishments will be granted in 2020). Condition maintenance checks have been conducted in accordance with regulations.

As a result, in 2020, the output of aquatic breeds of all types is estimated to reach 13,585 million with an increase of 10.23% compared to 2019. In which, freshwater seed production will reach 970 million, mainly traditional fish. The citizens have Access some cultured species such as eel, loach, Thai frog, large edible snail produced at the Special Aquatic Breeding Center and a number of facilities in Nghia Hung district. The brackish breed production continued to thrive, concentrating in coastal communes of Giao Thuy and Nghia Hung districts with main species namely clam, mussels, tiger shrimp, sea crab, four-eye sleeper etc. Brackish water breed production in 2020 will reach 12,615 million, equaling 111.11% compared to 2019.

3.2. Some current problems raised in aquaculture in Nam Dinh province

3.2.1. The prolem of management and planning of aquaculture area

From 2017 to 2020, Nam Dinh province has converted more than 2,871 ha of paddy land at the foot of low-lying fields or fields contaminated with salt and alum to concentrated aquaculture or switched to rice cultivation combined with aquaculture to have high economy efficiency. Specifically, the area switched to rice cultivation combined with freshwater fish farming is nearly 2,709 ha, of which in 2017, nearly 266 ha were converted; in 2018 nearly 566 ha; in 2019, over 1,095 ha; by 2020 more than 781 ha[90] will be converted..

According to statistics of relevant agency, the whole Nam Dinh province has about 16,150 ha of water surface which has been converted to effective aquaculture. For areas where previously ineffective rice, sedge, and salt production areas, the people who converted to aquaculture received support from the province in building technical infrastructure for production. The whole province has 44 transformed projects, of which 32 projects have achieved economic efficiency many times higher than pre-transformation. The farming method in the project areas has been shifted towards the establishment of intensive and semi-intensive farming areas. However, realizing that the profits gained from whiteleg shrimp farming, many households havespontaneously converted their unplanned areas to culturing whiteleg shrimp. Due to spontaneous and unplanned development, many farms do not meet the conditions of technical infrastructure, such as: storage ponds, settling ponds, water supply and drainage systems and so on. Shrimp ponds are interspersed with salt fields and vegetable fields; therefore, it is difficult to apply technical measures, especially in dealing with problems arising from water quality and disease. On the other hand, the electricity system serving the farming areas is incomplete. Shrimp farming must share the irrigation system with salt and vegetable cultivation, so there is no separate irrigation and drainage system. Many farmers lack knowledge of science, technology and experience, so diseases on white leg shrimp arise complicatedly, causing significant impacts on the economy and the farming environment.

3.2.2. The problem of breed sources and quality of aquatic breeds

For clam breeds production: The current challenge for the local clam breed production is that most of the hatcheries are small and produce by experience, therefore, the output is unstable and the quality is non-uniform. Aquatic breeds production infrastructure is self-invested by households and has not received the proper attention and support from the State, thus, has not yet ensured standardization; is vulnerable to weather and natural disasters related damages.

---

[90] http://baonamdinh.com.vn/channel/5085/202010/tich-cuc-chuyen-doi-co-cau-cay-trong-tren-dat-trong-lua-kem-hieu-qua-2540435/

In addition, some aquatic breeds that cannot be domestically produced and have to be imported from China, have been interrupted and cannot be imported over the past time due to the impact of the Covid-19 pandemic, such as: garrupa, sea bass, red snapper... slowing down the farming season; Mollusk breed production in the first few months of the year faced many difficulties in importing and selecting quality original broodstock, leading to unqualified produced breeds.

Forthe main cultured species with high economic value, the second biggest demand is whiteleg shrimp, Nam Dinh province has not actively produced seed on the spot... The current source of shrimp seed is mainly from the Southern provinces, seed quality is hard to control, cost and loss rate during the transportation is high. In order to overcome difficulties and limitations in the aquatic breeds production, the Department of Agriculture and Rural Development of Nam Dinh province and related sectors are proceeding to implement supporting programs for hatcheries to upgrade technical infrastructure, employ new production technologies to meet the demand for farming, especially major breeds farming.

3.2.3. The problem of waste discharge in aquaculture and the risk of environmental pollution

Currently, industrial shrimp farming, intensive and semi-intensive shrimp farming areas in Nam Dinh province are thriving, associated with increased productivity, significant economic value. However, it will always carry potential risks of causing environmental pollution if businesses and farms do not follow the waste management process. Many for-profit shrimp farms in the province tend to make the most of their farming area and do not reserve enough area for settling ponds to treat shrimp farming water before discharging it.

In 2020, the province brackish water shrimp farming area reached 3,400 ha; the production reached 7,280 tons, increasing 21.5% compared to 2019, reaching 98% of the plan. In which, tiger shrimp farming area is 2,400 ha, tiger shrimp production is 2,450 tons, increasing 3.64% in comparison with 2019. Whiteleg shrimp farming is still invested by localities with increasing levels of intensive farming. In 2020, the farming area of whiteleg shrimp was 1000 ha with an increase of 60 ha compared to 2019; production reached 4,200 tons with an increase of 31.1% compared to 2019. [1]..

Reality shows that although industrial shrimp farming is well-developed in Nam Dinh, present concentrated shrimp farming areas have not had a separate water supply and drainage system, this is also one of the factors that put pressure on the environment. According to research by Le Thi Thanh Thuy, Nguyen Hong Son, Do Phuong Chi, Tran Quoc Viet, Bui Thi Lan Huong, Do Thi Thu Ha (2017) *The current status of shrimp farming water quality in coastal areas of Nam Dinh and Quang Ninh*, the current status of shrimp farming water quality in coastal areas of Nam Dinh and Quang Ninh provinces is mainly polluted with organic matter, such as: P, K, DO, NH$, TSS and Coliform. Especially in the post-culture wastewater, the contents of the above indicators are all high. According to research results, most of the shrimp farming areas do not have their own water supply and drainage systems planning, the water supplied to the aquaculture areas is shared with the irrigation system for agricultural production. On the other hand, the wastewater after farming is not treated and discharged into the canal system of the region, polluting the water quality in shrimp farming area, mainly organic pollution. In addition, the link between farming households in the region is not yet close, especially, the sense of responsibility in disease treatment is limited, leading to the spread of disease to the farmed shrimps [2].

Nevertheless, intensive shrimp farming brings profits, contributing to jobs creation in coastal localities. However, in reality, the lack of planning and people who do not comply with the regulations on seasons, farming density, disease prevention, wastewater treatment, or for-profit purposes tend to make the most of the farming area without reserving an area for settling pond to treat wastewater before discharging into the environment, increase the production without caring about waste disposal ... has seriously polluted the aquaculture environment. Chemical abuse for water cleaning purposes and antibiotics abuse to treat shrimp diseases not only have a negative impact on the production environment but also affects the surrounding environment. In addition, the farming households and aquaculture establishments are not aware of improving ponds, wastewater treatment, industrial shrimp sludge. In fact, the sludge in aquaculture (industrial shrimp farming, intensive shrimp farming, industrial pangasius farming...) contains food sources of residual, decomposing rotting, chemicals and antibiotics, minerals such as Diatomite, Dolomite, Sulfur, and toxic substances in alum soils. These substances could not only spread diseases to other households that use the polluted water sources for farming but also cause direct contamination of groundwater, surface water and indirectly affecting the living environment of the surrounding residents.

3.2.4. The problem of aquaculture output

The current reality shows that the logistics and service system of Nam Dinh is still small and have not yet met the purchasing, preserving, and processing demand, thus reducing the value of seafood products; processing and exporting seafood remains limited, mainly for domestic consumption, there has not a product chain with export value.

Due to the impact of the Covid -19 pandemic, the prices of fresh seafood of all kinds in the domestic market plummeted, bringing many hardships upon the people. For seafood export, according to the Department of Agriculture and Rural Development of Nam Dinh province statistics, in 2019, seafood exporting businesses exported through small quotas to China about 3,000 tons of goby, 40 thousand tons of exploited aquatic products, 200 tons of fresh shrimp; about 6,000 tons of clams exported to Europe, Japan, and Korea. However, from the beginning of 2020 up to now, most seafood products of exporting businesses were stored. In the domestic market, social distancing causing many difficulties regarding raw materials to seafood processing businesses, leading to higher production prices and reduced output of goods consumed due to reduced domestic consumption demand. In addition, China's border trade policy of not importing seafood products through unofficial channels, but via official ones, along with EC's issuing of a "yellow card", costing seafood exporters to Europe more money and time due to goods detained for inspection.

3.3. Some policies recommendations to develop aquaculture in Nam Dinh towards sustainability

Based on the results of analysis on the current status of aquaculture in Nam Dinh province, the article proposes a number of recommendations to develop sustainable aquaculture ensuring harmony between socioeconomic and environmental development, including:

Firstly, perfecting the legal policy on state management for aquaculture, step by step bringing aquaculture establishments to comply with the law on production conditions, quality assurance, and food safety and hygiene, in accordance with the standards of the international market. Building and perfecting the quality control system for aquaculture materials (seeds, feed ...); at the same time, speeding up the socialization of quality control and testing materials used in aquaculture.

Secondly, strengthening the State management on environmental protection by authorities at all levels; agencies involved in the enforcement of the Law on Environmental Protection for aquaculture and seafood processing establishments. In particular, improving the appraisal capacity, reports on environmental impact assessment of investment projects, as well as strictly comply with the process of preparing and evaluating environmental impact assessments in accordance with the law. Strengthening the State management of product and goods quality, food safety and hygiene, building and protecting copyrights, and protecting trademarks.

Thirdly, the planning for aquaculture development should be based on ecological zoning, development of technical infrastructure for water supply, drainage, and waste treatment for industrial, and intensive aquaculture... in order to meet the requirements of resources, infrastructure, contributing to environmental sanitation, disease prevention, and specified environmental standards. At the same time, investors in aquaculture farming and processing have to focus on investing and operating centralized collection systems, properly classifying industrial and domestic solid waste; managing, storing and transferring hazardous solid waste in accordance with regulations, as well as developing a centralized wastewater treatment system, waste gas treatment system ensuring environmental standards.

Fourthly, investing in infrastructure, scientific and technical innovation for aquaculture. Increasing investment in science and technology, research and development and production of quality mollusks, step by step proactively meeting local demand for breeds, creating an active position in production.

Fifthly, fostering trade promotion for local seafood products to reach major markets. Supporting and connecting associations and businesses to be the direct subjects carrying out joint activities on trade promotion, developing seafood consumption markets for major seafood products. Building distribution networks, directly sign contracts with food supply organizations, distribution centers, supermarkets of large markets. Promoting the formation of distribution channels for domestic aquatic products from producers and firms to markets and supermarkets through a system of wholesale markets and large fishing centers.

4. Discussion and Conclusion

Over the past years, aquaculture in Nam Dinh province has gained several achievements and certain development in many fields. The district's aquaculture has achieved many good results with a sharp increase in aquaculture production compared to 2019.

The current situation of aquaculture in Nam Dinh province remains spontaneous and unsustainable with rapid increase in the value of aquaculture production, yet ineffective area planning, aquaculture seed production has not kept up with the development requirements, the waste discharge in aquaculture is likely to cause environmental pollution, and the problem of product consumption is also facing difficulties in the context of the Covid-19 pandemic.

In the coming time, in order to develop aquaculture in Nam Dinh province toward sustainability, it is necessary to synchronously implement solutions to facilitate the district's aquaculture to become a strong economic sector of the province, contributing to improve income, protect workers' health in aquaculture and processing businesses and protect people's health.

Notes: The article is part of the research results of a ministry-level topic: *The attitude of Northern coastal area residents towards the current exploitation of coastal natural resources;* Office of Vietnam Academy of Social Sciences presides over and PhD. Bui Thi Van Anh is in charge.

GREEN ECONOMIC DEVELOPMENT - CHALLENGES FOR VIETNAM

Dr. Dong Thi Ha
dongha.neu@gmail.com
MA. Vu Thi Thanh Huyen
huyenvt47@gmail.com
Faculty of Economics - National Economics University, Ha Noi, Vietnam
Nguyen Ha My
hamy.nghm@gmail.com
I16 International Bachelor Degree Program (IBD@NEU), National Economics University, Ha Noi, Vietnam

Abtract:

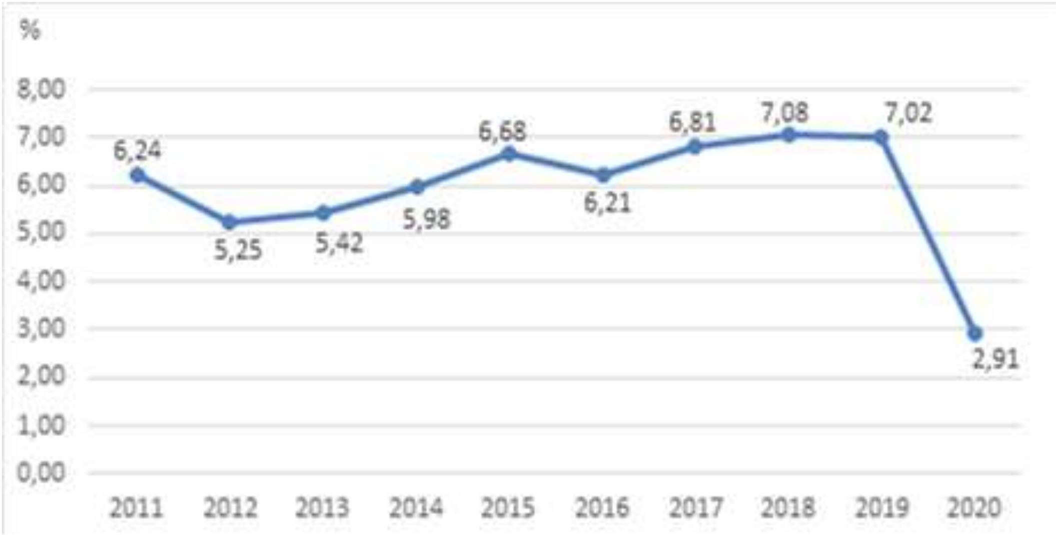
Green economic development is an indispensable trend that is being concerned by countries around the world, aiming to protect a clean and sustainable living environment. In Vietnam, the concept of a green economy has been mentioned in recent years and there are many policies to develop a green and sustainable economy. Green economy is a combination of 3 factors: economy - society - environment. Sustainable green economy is the activities that generate profits or have benefit values, aiming to develop the life of human social community. At the same time, these activities are Eco-friendly, if these three factors reach equilibrium, sustainability will be satisfied. With the advantage of being located in the tropical and monsoon region of Southeast Asia, with the abundance of solar and wind energy, and with the rapid growth of organisms, this is an opportunity for Vietnam to participate in millennium target programs towards "Green Economy".

Besides such favorable opportunities for green economic development in Vietnam as the consensus of the world, the support and assistance of countries and international organizations in the world, these are all in joint efforts to mitigate and adapt to climate change on the basis of "Green Economy". It is necessary to recognize the challenges to guide development.

Key words: *Green economy, sustainable development, environment, challenges*

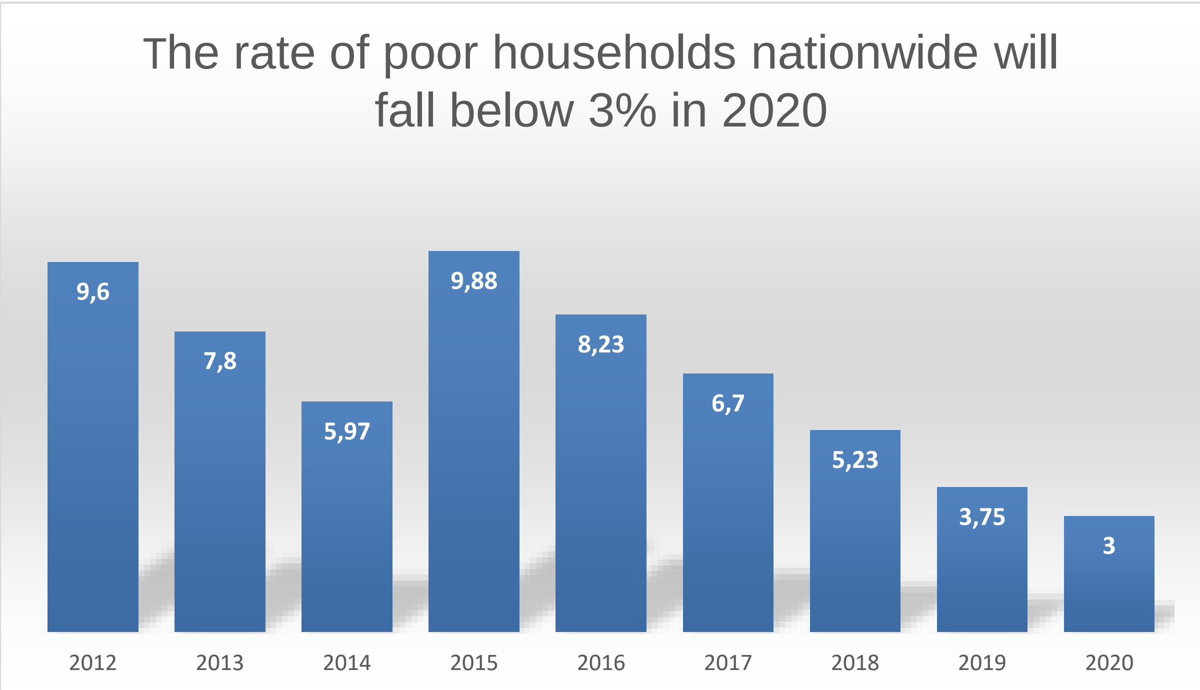
1. Introduction

Vietnam’s economic growth has witnessed positive aspects for being continuous, stable and inclusive in which beneficial to the whole society. The average growth rate of gross domestic product (GDP) in 2017 reached 6.81%/year, in 2018 reached 6.7%/year, in 2019 reached 7.02% and in 2020 reached 2.91%.



GDP growth rate in the period 2011 – 2020

In addition, before the negative impacts of the Covid-19 pandemic, although GDP growth in 2020 reached the lowest rate during the 2011-2020 period, it was a success for our country to be listed in the group of countries with the highest the growth rate in the world. Vietnam reduced the poverty rate from nearly 60% in the 1990s to less than 3% by 2020. This is the great success and pride of Vietnam.



Estimated percentage of the poverty rate from 2012 to 2020

Vietnam has a strong aspiration that by 2035 the country will become a modern industrial country towards prosperity, creation, equity and democracy (according to the World Bank Governance Indicator, Vietnam Estimated figures for Voice and Accountability is quite low – around -1.38 in 2019). Experiences from many countries show that green economic development is an indispensable trend. In order to implement a green economy, one of the motivating tools is to protect the environment, develop clean production technologies and clean energy, which are aimed at rapidly achieving sustainable economic growth.

2. Methods

This paper uses the methodology of dialectical and historical materialism; Using the main research methods in economics including methods of statistics, analysis, synthesis, expert, data analysis and processing...

The paper also collects data related to it from secondary documents such as textbooks, books, reports on socio-economic development, green economic development in general, and Vietnam in particular, etc.

The research uses the method of synthesizing and analyzing information, documents, reports of competent agencies, Ministries and branches on issues related to the research field.

3. Results

3.1. Green economy and green economic development trend in Vietnam

There are many different definitions of green economy, in which the definition of the United Nations Environment Program (UNEP, 2011) in the book "Towards a green economy - Road map for sustainable development and poverty reduction" is most cited by scholars in Vietnam: "A green economy is one that enhances people's well-being and improves social justice, at the same time, significantly reduces environmental risks and ecological deficiencies. To put it simply, a green economy has a low emission level, efficient use of resources and it moves towards social justice". Up to now, the concept and perceptions about green economy are vague as there are many different interpretations. Western countries define the green economic model; developing countries move towards green growth strategy. Regardless of the approach, concepts are consistent that a green economy consists of three pillars: economic development (economic growth, employment); environmental sustainability (carbon energy reduction and natural resource depletion...); social cohesion (ensuring the goal of poverty reduction, equality before the opportunities created by the green economy, providing a healthy living environment). Thus, there is a close relationship between green economy and sustainable development, in which the concept of a green economy comes after, associated with climate change. Green economy not only includes economic goals, but also more importantly, extends social and ecological goals. In fact, a green economy is also sustainable development, more specifically, it is a way of expressing sustainable development in the context of climate change, with a lot of emphasis on environmental resources. In the green economy, environmental resources are considered as the decisive factor in economic growth, improving the value chain, bringing stability and long-term prosperity. Sustainability in environmental resources, response to climate change is considered as the focus of the green economy. The concept of "green economy" does not replace the concept of "sustainable development", but it is increasingly being recognized as a suitable model as the foundation for sustainable development. In other words, a green economy is an economic strategy to achieve sustainable development goals.

In terms of awareness, understanding what is a "green economy" today in Vietnam is still very new, requiring research and widespread dissemination of knowledge among leadership circle, policymakers, businesses and people. Without adequate awareness, social consensus will not be achieved, so it will be difficult to implement. A green economy associates with the use of renewable energy, low carbon, green growth, investment in restoring ecosystems, solving livelihoods in association with environmental restoration. In fact, production technology in Vietnam today compared to the world is mostly obsoleted technology, it consumes a lot of energy. Therefore, changing new technology to suit the green economy will be a big challenge if there is no help from high-tech countries around the world. In many rural and mountainous areas, people's livelihoods still face many difficulties.

Regarding the mobilization of capital for the implementation of the goal of "Building a green economy", although Vietnam has escaped the threshold of a poor country, the national accumulation compared to developed countries is still too low. This has a significant impact on the implementation process towards "Green Economy".

Moreover, the current policy mechanism towards the implementation of the "Green Economy" in Vietnam is quite ambiguous, while in the world, new approach has just been proposed. The review, amendment and supplementation of relevant policy mechanisms to suit the new development model in the direction of restructuring the economic sector and moving towards the "green economy" is a great challenge.

Although Vietnam has a policy towards a green industry that consumes less energy and limits polluting production, the implementation is still sporadic and asynchronous due to the lack of a clear development strategy and planning towards green in this area. This is also the general situation for other areas of the economy.

The existence and development of more than two centuries of traditional economics shows that this theory has put too much pressure on the natural world and its resources. Current economic growth is reaching a level of more devastation than the creation of real wealth, leading the world to a great economic recession, severe ecological crisis and climate change. What the world has been going through forces us to rethink about economic development goal. The current economic development poses a great challenge for nations towards improving the quality of life, meeting social needs and ensuring a sustainable environment.

A green economy with low-smog and green industrial areas, using new eco-friendly energy sources, green belts, and large-scale eco-tourism areas to re-establish a balanced ecosystem, is a common development trend of all countries in the world.

In Vietnam, the trend of green economic development is only at the starting point. With the advantages of latecomer, we can completely develop a comprehensive green economy, towards sustainable development, achieving the harmonious goal among economic enhancement, social security, and environmental protection.

3.2. The situation of green economic development in Vietnam

- ***Negative impacts from climate change on the economy***

Vietnam is one of the few countries severely affected by climate change (CC), also suffered many negative impacts from natural disasters and epidemics. According to calculations, in the 2002-2010 period, the lowest nationwide damage caused by natural disasters was 0.14% of GDP (in 2004) and the highest was 2% of GDP (in 2006).

On average, in the past 15 years, natural disasters have caused a loss of about 1.5% of GDP annually. According to the climate change scenarios of the Ministry of Natural Resources and Environment (2012), by the end of the twenty-first century, if the sea level rises 1 meter, it may directly affect the life and livelihood of about 20% of the population and losses can be increased up to 10% of GDP per year.

The Climate Change Vulnerability Research Report (2012) of DARA International Organization also showed that climate change could cost Vietnam about $15 billion per year, equivalent to about 5% of GDP. If Vietnam does not have a timely response, climate change damage will be estimated to reach 11% of GDP by 2030.

Vietnam's economic development will inevitably generate a large number of emissions in the near future. Harmonization of domestic priorities with international efforts to reduce greenhouse gas emissions is essential and beneficial to the country's green growth direction.

- ***Green economic development policy***

Recognizing the impacts of climate change on people's lives over the past years, Vietnam has had many green economic development policies. The XII Congress of the Party reaffirmed the policy of "rapid and sustainable development" and green economic development: “Ensuring rapid and sustainable development on the basis of macroeconomic stability and continuously improving productivity, quality, efficiency and competitiveness. Harmonious developing between breadth and depth, focusing on deep development; developing knowledge economy, green economy. Economic development must be closely linked with social and cultural development, environmental protection, and proactive response to climate change. Ensuring national defense and security, maintaining peace and stability in order to build the country".

In 2004, the Prime Minister issued Decision No. 153/2004/QD-TTg on the strategic direction of sustainable development in Vietnam (Vietnam Agenda 21). The strategic direction for sustainable development in Vietnam clearly stated that the priority activities in the economic field are the implementation of "clean industrialization" and the building of a "green industry".

In 2012, the Prime Minister issued Decision No. 432/QD-TTg approving the Vietnam Strategy for Sustainable Development for the period 2011-2020, which clearly stated: "Sustainable development is a cross-cutting requirement in the national development process; combining closely, reasonably and harmoniously economic development with social development, protecting natural resources and the environment, ensuring national defense, security, social order and safety"; and "Science and technology are the foundation and driving force for the country's sustainable development ...

In the Vietnam Sustainable Development Strategy for the period 2011-2020, it also clearly stated the tasks for this period, including the "Development and implementation of a green growth strategy, ensuring economic development towards low carbon; Using energy economically and effectively; Developing clean energy, renewable energy to ensure national energy security ...

In order to implement the policy of sustainable development and green economic development, the Prime Minister issued Decision No. 1393/QD-TTg dated September 25, 2012 approving the "National Green Growth Strategy. period 2011-2020 and vision to 2050". This is the first and comprehensive strategy on the field of green economic development in Vietnam, in line with domestic conditions and catching up with the general trend in the world.

On August 26, 2016, the Government issued Resolution No.73/NQ-CP approving the investment policy of 21 Target Programs for the 2016-2020 period, including the Target Program to respond to climate change and green growth. The goal of the Program was to simultaneously implement solutions to adapt to the impacts of climate change and mitigate greenhouse gas emissions, ensuring the safety of human lives and property; Strengthening the capacity of human and natural systems to adapt to climate change; Green growth and enrichment of natural capital become the main trend in sustainable economic development; Restructuring and perfecting economic institutions towards greening existing industries and encouraging the development of economic sectors using energy and natural resources efficiently with high added value.

The program also set a specific goal to strive until 2020, which was to plant and restore 10,000 hectares of coastal mangroves, watershed protection forests to adapt to climate change, absorb 2 million tons of CO_2 per year and create stable livelihoods for the people. By 2020, reducing the intensity of greenhouse gas emissions by 8% -10% compared to 2010 level; reducing energy consumption as a percentage of GDP from 1% to 1.5% per year; building a Center for research, application training and green building technology transfer in Vietnam with an area of 50 hectares. Developing action plans on green growth at the sector, regional and local levels ...

It can be affirmed that Vietnam clearly sees the role of sustainable and green development and has made great efforts to devise many programs and plans for implementation. Currently, production technology in Vietnam compared to the world is mostly old and outdated technology that consumes great energy, therefore, changing new technology to suit the green economy is a big challenge without the help of high-tech countries around the world. Besides, in many rural and mountainous areas, people's livelihoods still face many difficulties.

Although Vietnam has escaped the threshold of a poor country, the national accumulation compared to developed countries is still too low, which significantly affects the implementation of a green economy. Moreover, the current policy mechanism to implement a green economy in Vietnam is almost unclear, while the world has just proposed an approach. Reviewing relevant mechanisms and policies, amending and supplementing them to suit the new development model in the direction of restructuring the economic sector and towards a green economy is a great challenge for Vietnam.

3.3. The challenge of green economic development for Vietnam

Since 2000, Vietnam has become acquainted with the trend of green economic development in the world, a small number of green energy projects have been implemented in experimental form. After a period of finding out and learning from other countries' experiences on green economic development, Vietnam researched and implemented the 3R project (Reduce, Reuse, Recycle), foreign experts considered the research process and result to be theoretically good Following the development of green energy of countries around the world, at present, Vietnam has started implementing bio-energy projects ...

With the advantage of being in the tropical monsoon area, with abundant solar and wind energy, and with fast growing organisms, these are an available advantage for Vietnam to participate in millennium target programs towards building a "green economy" of sustainable development. Along with the advantages in developing a green economy in Vietnam are difficulties and challenges.

Reality shows that environmental pressure has threatened Vietnam's long-term sustainable growth. Over the past years, the achievement of growth has been partly based on large trade-offs for environmental issues the rapid depletion of resources is a problem of great concern. Environmental pollution from industrial and urban wastewater leads to serious health risks, especially for children in areas around Hanoi and Ho Chi Minh City. In the future, Vietnam is one of the most vulnerable countries to climate change, in which the population and economic activities concentrated in the Mekong River Delta region bear the highest risk. Risks also rise due to increased energy consumption and heavy reliance on coal-fired power. In recent years, the increase in greenhouse gas emissions of Vietnam has been high in the world.

Environmental problems pose as much a threat to long-term growth as productivity challenges. If Vietnam continues to pursue the current growth model, by 2035 these problems will be more serious, in which the process of industrialization and urbanization will further deplete land, water and energy resources. One lesson learned is that the quality of air and water environment is not only important for ecological issues and life quality in general, but also for increasing income. Vietnam is facing the following challenges:

First, Depletion of natural resources: Vietnam depends more on natural resources than most other countries in the region. This is most evident in the labor structure. About 50% of the workforce depends on agriculture or land in various forms. Poor agricultural development policies exacerbate soil erosion, destruction of primary forests and biodiversity, such as in the Northwest and Central regions. Erosion contributes to increase the frequency and severity of floods for agricultural land and downstream populations.

Much of the mangrove protection forest has been destroyed, according to World Bank estimates, with annual losses of 34 million USD. Overexploitation has depleted coastal fisheries, threatening the livelihoods of hundreds of thousands of people. Agricultural output has risen sharply but overuse of land, fertilizers and pesticides. Without regulations and strict controls, in the next 20 years there will be fierce competition for arable land, more and more forest lands will be converted to agricultural purposes and so those precious resources will be increasingly depleted.

Secondly, the deterioration of environmental quality: The quality of soil, water and air has worsened significantly. Water pollution has become more serious, especially in areas near Hanoi and Ho Chi Minh City. Air quality has also decreased due to increased use of fossil fuels for electricity generation, industrial use and transportation. Low air quality causes high rates of respiratory diseases among children under 5 years old. Due to low air quality, an estimated 4,000 premature deaths per year are related to coal-fired power. In urban areas, environmental pollution caused by domestic and industrial wastewater has poisoned water sources, adversely affecting economic activities, although not fully evaluated, the impact on human health is very serious.

Thirdly, risks due to climate change: Climate change aggravates the consequences of unsustainable natural resource use and environmental degradation. Vietnam is one of the countries most heavily affected by climate change due to its geographic location, a dense population of lowland areas, and the economy is heavily dependent on vulnerable industries because of climate change. For example, the recent typhoon No.10 has caused heavy damage to some Central provinces, the total damage is estimated at 11,283 billion VND, killing and injuring hundreds of people.

Projections of precipitation, temperature and sea level indicate that areas with high density and economic importance face great risks. The threats from climate change indicate the need for an informed approach to demographic, socio-economic, political and natural ecological factors in resource allocation decisions, coordination in planning and using land and other resources. To mitigate the risks posed by climate change, climate-resilient development is needed.

Fourthly, Energy consumption is increasing: Energy use in Vietnam is growing faster than in any other country in the region, mainly due to increased electricity consumption. According to current trends and policies, the density of coal used for electricity generation will increase from 32% in 2014 to 54% in 2030, while about 60% of coal used for electricity production will have to be imported. Vietnam's energy consumption intensity is also among the highest in the world, one of the main reasons is inefficient energy use.

Fifthly, our economy lacks supporting industries and high-tech industries that use energy and resources efficiently, and environmental economics such as: Environmental industry, environmental services, waste reusing and recycling industry, waste energy production, renewable energy, production of goods, products meeting environmental standards, organic agricultural products...

Although we have had mechanisms and policies to encourage and promote the development of eco-friendly economic sectors, the implementation process faces many difficulties in terms of capital, technology, and unstable output, competitive advantages, and low profits, therefore, we have yet to form economic sectors strong enough to effectively solve the current environmental problems.

4. Conclusion

Economic development poses a great challenge for countries towards improving the quality of life, meeting social needs and ensuring a sustainable environment. A green economy with low-smog, green industrial zones using new energy sources that are eco-friendly, green belts, and large-scale eco-tourism areas to re-establish a balanced ecosystem is a common development trend of all countries in the world. In Vietnam, the trend of green economic development is only at the starting point. With the advantages of a latecomer country, Vietnam can completely develop a comprehensive green economy, towards sustainable development, achieving the harmonious goal of economic growth, ensuring social security, protecting environment.

BENEFITS OF CIRCULAR ECONOMY: FROM THEORY TO IMPLEMENTATION IN THE WORLD AND THE PROBLEMS TO VIETNAM

Dr. Nguyen Thi Phong Lan
phonglan2018npa@gmail.com
Institute of Economics, Ho Chi Minh National Academy of Politics
MA. Nguyen Thi Kim Ngan
kimngan.monre@yahoo.com
Institute of Strategy, Natural Resources and Environment Policy

Abstract

Various studies have shown the theoretical benefits of circular economy. The circular economic development has shown that such benefits have been realized in many different countries. Vietnam advocates a circular economic development in order to gain many benefits from different aspects of socio-economic life and to have certain advantages and disadvantages. The article studies how different circular economy models in the world and in Vietnam have been implemented and what benefits have been obtained.

Key words: *Circular economy, the benefits of circular economy, linear economy*

1. Introduction

Since the 1990s, the concept of circular economy in the context of modern societies, enhanced standards create many factors that have a negative impact on the health and ecosystems as well as pose many dangers. harmful to the environment and development. Until now, there are many different expressions of menstrual cough.

The World Economic Forum (EEA, 2017) said that: The weekly economy is purely an industrial system that is restored or recreated according to ideas and designs. It replaces the final concept with recovery, conversion to use. quantitative regeneration, eliminating the use of toxic chemicals, loss of usability and return to organisms, and cross-target design waste removal of material, products, systems and business models.

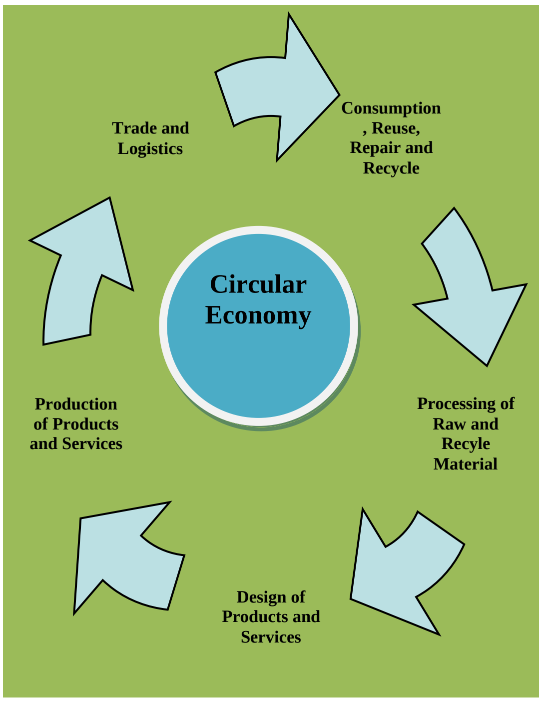
Ellen McArthur's hand defines a circular economy (Ellen MacArthur Foundation, 2013): "Looking beyond the current model of artisanal mining, a circular economy fulfills the goal of redefining growth, focusing on activities that bring about It extends the economic activity of gradually leaving the work of enjoying resources and designing waste out of the system. , Model week to complete construction of economic, automatic and social capital. ”.

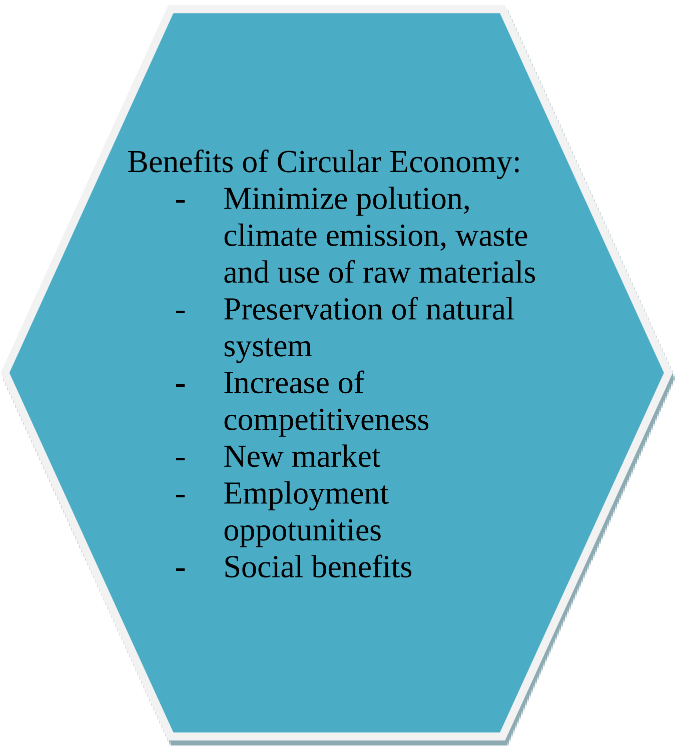
Thus, circular economy (CE) is the design, production and service activity that sets the goal of prolonging the life of matter and eliminating negative impacts on the environment, thereby minimizing the harming the quality of life through recycling solutions, using recycled input materials to save on natural resources. It is also about managing and rationally using renewable resources, managing waste by recycling to optimize value on the principle that the longer materials and resources are used, the more value we can get from us.

In comparision with circular economy, a linear economy that computes as a flow, transforms natural resources into basic materials and products and then sells information through a series of value-added steps, tends to sell as much as possible, leading to a waste of using the resources of other sources of finance even on three sources.

In linear economy, goods are produced from natural resources, sold to the market, consumed and then on-site eliminated. A linear economic model that leverages resource exhaustion and produces a relentless page quality. The economic model completely replaces the online economy with the aim of minimizing waste and protecting the environment. In the completed economic model, the enterprise applies a closed and production cycle, the alternative contaminants because they are discarded, wasted and polluted the environment, will become raw materials for new products to emerge.

Report of finish Environment Institute (Annukka Berg and others, 2018) showed the key components of circular economy and its benefits as following:





The article researches on the benefits of the circular economy that are manifested in many different areas of productive life such as in the agricultural sector, in the protection of the environment, and on the corporate and the whole national economy. From there, the research team also presented the advantages and disadvantages of implementing circular economy in Vietnam.

2. Method

Circular economy is a relatively new field in terms of theory and practice. Countries do not have adequate regulations on the implementation of circular economy. Therefore, the article is mainly based on qualitative method, review and description of documents.

The author from the National Academy of Politics used a qualitative method, a descriptive review of the literature to search for theories about the benefits of the circular economy that have been mentioned many times in the studies of other countries in the world.

The author from the Ministry of Natural Resources and Environment use empirical research methods to compare and search in the implementation of circular economy models in the world. At the same time, this method also raises problems for the development of circular economy in Vietnam in the coming time.

3. Results

Practice circular economy in the world

Around the world, the circular economy has a huge impact on economic development. The 2016 report by the Ellen MacArthur Foundation and the United Nations Conference on Trade and Development (UNCTAD) shows that India will generate $ 218 billion in economic value added by 2030 and nearly triple the figure by 2050 when applying the principles of circulation in three areas: city and construction, food and agriculture, vehicle manufacturing and mobility. Likewise, in China, the circular economy makes goods and services cheaper, reducing fine dust emissions by 50%, greenhouse gas emissions by 23% and traffic congestion by 47% by 2040.

Circular economy helps the world save 4,500 billion USD by 2030, Europe alone can save 600 billion EUR (about 660 billion USD) per year. (European Commission, 2018a).

The European Union moves towards the circular economic model as one of the pillars of the EU 2020 strategy and applies the principles of cyclic economics as part of the sustainable development strategy, which defines the take various actions in the European Union's Action Plan for the Circulatory Economy, aiming to make all waste a resource. As a result, new industries focus on recalling, cleaning, and reusing old products to produce new ones.

The EU proposes to define a primary material yield goal to measure the amount of value created per unit of raw material or product. Based on GDP related to raw material consumption, this figure will be set at 30% by 2030. This package also includes a legislative proposal to review waste targets including recycle targets. Recycling 70% of municipal waste, 80% recycling of packaging waste and bans any recyclable goods landfill. (European Commission, 2018a).

By the end of 2018, there were 34 countries in the world taking the first step in laws and policies to promote a circular economy. In cities around the world, city governments are becoming an incubator of ideas that can deliver broader policies and can inspire action in both the public and private sectors. Sweden is one of the leading countries in the world for waste management and recycling. The waste is recycled and used for purposes such as biogas and energy. Sweden has now become a waste importer with more than 2.3 million tons of waste being imported each year. Thanks to people's awareness of environmental protection, government encouragement as well as an efficient garbage collection system, the proportion of recyclable waste of households has increased from 38% in 1975 to 99% today. Only 1% of the waste goes to landfills.(European Commission, 2014.)

Toronto collects organic waste from households in the city and turns it into biogas that can fuel trucks or be used for heating. In New York, city governments promote capital recycling initiatives by extending the life of products by recycling, reusing, and adopting a sharing economy.

Reality of the circular economy in Vietnam

In Vietnam, circular economy is concerned to some concepts, such as: Sustainable production and consumption; green supply chain; green consumption… Reality shows that the circular economy is the best way to break the long-standing relationship between economic growth and negative environmental effects.

In the agricultural sector: Currently, the country has nearly 200 farmers and dozens of cooperatives are also benefiting from this link between farmers and businesses. This number will increase when the 4F Farm - Food - Feed - Fertilizer (4F) Complex Project includes: Raising organic pigs, producing bio-products, producing organic feed. and organic fertilizer production is gradually being formed on an area of 15 ha in Phong Dien district, Thua Thien Hue province. The four plants in this complex will form a closed cycle from livestock to farming, from crop to soil. In which, the bio-safe and organic pig farm with an area of 2ha is the first completed item of the 4F biosafety livestock complex project.

Circular eonomy with products produced through the farm form is considered an inevitable development trend to promote the efficient and sustainable development of rural agriculture. The Garden-Pond-Stable (VAC) model and the Garden-Pond-Booth-Biogas (VACB), Garden-Pond-Stables-Forest (VACR) model have been applied by many localities across the country. VACB is a solution to help overcome irrationality in waste management, rational use of agricultural residues, to return soil fertility. Safe handling of animal wastes, renewable energy creating fuel sources for living against environmental pollution and contributing to reducing emissions, reducing greenhouse effects causing climate change.

In the operations of enterprises, many new production and business models that tend to get closer to the circular economy in the private sector have been implemented quite successfully like the model of eco-industrial parks in Ninh Binh, Can Tho. and Da Nang, saving 6.5 million USD / year; models of processing aquatic by-products; Vietnam Packaging Recycling Alliance (PRO).

The foreign-invested sector plays an active role in promoting the circular economy in Vietnam through recycling plans for waste and by-products with state-of-the-art and advanced waste treatment processes transparency control. Nestlé Company produces unburnt bricks from boiler waste, processes fertilizers from non-hazardous sludge and uses milk cartons for ecological roofing. Nestlé also plans to recycle and reuse 100% of its product packaging by 2025.

Heineken Vietnam has nearly 99% of waste or by-products reused or recycled, 4/6 breweries use heat energy from renewable energy and fuels, and do not emit carbon. Unilever Vietnam implements a program to collect and recycle plastic packaging and sort waste at source ...

In June 2019, 9 pioneering companies to found the Vietnam Packaging Recycling Alliance (PRO Vietnam) include: TH Group, Coca-Cola Vietnam, Friesland Campina Vietnam, La Vie, Nestlé, Nutifood, Suntory PepsiCo Vietnam Nam, Te tra Pak and Universal Robina Corporation.

In the textile and garment industry, parts of the rags are recycled by the enterprise into new fabrics and clothing and clothing products created using a portion of this recycled fabric are labeled circular economy products. Parts such as coffee bean grounds and pods are utilized and produced into standard coffee cups and are also labeled circular economy products.

4. Discussion and Conclusion

Numerous studies point to various benefits of the circular economy. Altogether, some of the following benefits can be found:

- Circular economy is about reducing greenhouse gas emissions, positively impacting ecosystems and combating overexploitation of natural resources, increasing the sustainability and efficiency of land use in agriculture. The circular economy reduces the use of raw materials, optimizes agricultural productivity and reduces negative externalities caused by the linear model, avoids greater pollution caused by the production of materials.

The transition to a circular economy is the process of responding to climate change adaptation requirements. This is an adjustment process aimed at minimizing negative effects of the linear economy, creating a long-term resilience, and is the pathway towards a low-carbon economy, especially in heavy industries. Recirculating economic development could halve carbon dioxide emissions from industry by 2030, compared with 2018 levels.

- Benefit from protecting natural systems, especially in the agricultural sector.

The European model of the recirculating economy in agriculture has the potential to reduce the use of man-made fertilizers by 80% and thus contribute to the natural balance of the soil. Land degradation causes an estimated 40 billion US dollars in damage annually worldwide, and there are potential costs such as increases in addition to fertilizer use, loss of biodiversity and loss of unique landscapes. While the demand for raw materials will increase due to the increase in world population and consumer demand, activities in the recirculating economic model use less raw materials by focusing on extending the cycle. of raw materials. A pathway towards a low carbon economy, especially in heavy industries. Recirculating economic development could halve carbon dioxide emissions from industry by 2030, compared with 2018 levels. Europe's agricultural cyclical model is likely to reduce usage by 80%. Fertilizers are artificial and thus contribute to the natural balance of the soil. Land degradation causes an estimated 40 billion US dollars in damage annually worldwide, and there are potential costs such as increases in addition to fertilizer use, loss of biodiversity and loss of unique landscapes.

- The circular economy creates high economic growth potential. Through resource-efficient use, businesses have the opportunity to produce cheaper by offering products and services with multiple use functions. When compared to the linear extraction of common raw materials, the circular economy model has the potential to lead to greater material savings. While the demand for raw materials will increase due to the increase in world population and consumer demand, activities in the recirculating economic model use less raw materials by focusing on extending the cycle of raw materials.

Employment benefits: The development of the cyclical economic model could bring more local jobs to primary and semi-skilled jobs. An August 2018 study on circular economy performance suggested that 50,000 new jobs could be created in the UK and 54,000 in the Netherlands. (European Commission, 2018a)

- The benefits of increasing competitiveness of businesses and the economy: For businesses, the circular economic model helps businesses become more flexible, increasing their ability to cope with changes from supply of raw materials, reducing the amount of raw materials, increasing recycled materials, thereby creating new profits. The circular economy also creates a demand for new services for businesses to seek business opportunities. New services that may arise are collection logistics and support of end-of-life products introduced into the system, product marketing services and sales platforms that facilitate the longevity of the product longer, reproducing parts and components and refurbishing products or services provide expertise.

From the corporate perspective, the circular economy also brings a new perspective on the relationship between markets, customers and natural resources, thereby contributing to the promotion of new innovative business models, disruptive technology for higher business growth through cost cutting; reduced energy consumption and CO2 emissions; supply chain strengthening and resource conservation. The circular economy is a distinctly different business model, forcing companies to rethink everything from how products are designed and manufactured to their relationship with customers. The preeminence of the circular economy is to help businesses do business well, while moving towards a zero-emission economy and protecting the environment, thereby solving the long-standing relationship between economic growth and its negative effects to the environment.

There are some problems in the circular economic development in Vietnam:

First, the implementation of a circular economy in Vietnam has a number of basic advantages. Vietnam is continuing to perfect the socialist-oriented market economy institution, transforming from a linear economy to a circular economy with many new business models based on the innovation of public science. technology and policy reforms contribute to rapid and sustainable economic development. The circular economic development policy is mentioned in the Politburo's Resolution 55-NQ / TW of February 2020 on the orientation of Vietnam's National Energy Development Strategy to 2030, with a vision to 2045. In which, it is affirmed to give priority to developing renewable energy, develop power plants using waste and waste to protect the environment and develop a circular economy. The Resolution of the XIII Congress of the Party continues to affirm the policy of "building a green economy, a circular and environmentally friendly economy" and "building roadmaps, mechanisms, policies, law, to form and operate a cyclic economic model ”, the revised Environment Law 2020 lawizes the regulation of the circular economy. With the development of science and technology and the fourth industrial revolution, the circular economy associated with high technology, along with the promotion of digital transformation will be a great opportunity to explore and discover many awards. methods to improve the efficiency of natural resource use. Circulating economy will also reduce the pressure of resource shortages, environmental pollution, large amounts of waste, especially plastic waste. This contributes to the implementation of the sustainable development goals (SDGs) and the response to climate change, the reduction of greenhouse gases, which are recovered almost completely and not emitted into the environment. Therefore, circular economic development will receive the consensus of the whole society.

In addition, from an enterprise perspective, the circular economy brings a new perspective on the relationship between markets, customers and natural resources, thereby contributing to promoting innovative business models. new, disruptive technologies for higher business growth through cost cutting; reduced energy consumption and CO2 emissions; supply chain strengthening and resource conservation. The circular economy is a distinctly different business model, forcing companies to rethink everything from how products are designed and manufactured to their relationship with customers. The preeminence of the circular economy is to help businesses do business well, while moving towards a zero-emission economy and protecting the environment, thereby solving the long-standing relationship between economic growth and its effects. negative to the environment.

Second, the implementation of the circular economy in Vietnam has many difficulties and challenges. Vietnam's biggest challenge in adopting a recirculating economic model is the cost of recovering value from waste. The cyclic economy is a closed model when using this cycle's waste for the new cycle's input. In Vietnam, the amount of waste is forecast to double over the next 15 years. The rate of waste recycling in Vietnam is less than 10% of the total amount of waste. This is a small percentage compared to other countries that have been implementing cyclic economic models. The amount of plastic waste and plastic bags nationwide currently accounts for about 8-12% of domestic solid waste. If on average about 10% of plastic waste is not reused but completely disposed of, the amount of plastic waste and plastic bags discharged into the environment is approximately 2.5 million tons / year. The high rate of waste makes it difficult to manage, collect and recycle waste resources.

In addition, the current economic system in Vietnam is moving towards the demands of a linear economy. When making economic decisions, enterprises prioritize to consider market signals, not pay much attention to positive or negative externalities factors to society and the environment. Circulating economy business models are more difficult to develop, as most investors are still working on linear economic logic. Many companies still have goals that focus on short-term value creation, while the cyclical economic model is the one that creates long-term value.

The next difficulty comes from consumer perception about the use of products in the circular economy in Vietnam. In many countries, CE-labeled products are actively supported by consumers, while in Vietnam there are also many products made from by-products, scrap, and recycled materials ... but it has not been "certified" and the market's reception is still very limited.

Legal and infrastructure conditions for the circular economic development are lacking, making it difficult for the implementation of new business models. The circular economy requires a product creation strategy from the outset, designing items to last as long as possible, and planning to bring raw materials back into the economy later. Achieving this will require a large investment in collection, sorting and recycling infrastructure. Demand for recirculating and alternative products remains small. There is a lack of qualified specialists with technical or information technology and communication knowledge. The GDP index does not consider social and environmental factors, and does not encourage value creation in both of these areas.

Therefore, to promote circular economic development for sustainable development of the country, in the coming time, it is necessary to perfect the legal system and policies to promote a circular economy, reduce dependence on natural resources. course for growth. It is necessary to build a database on the circular economy associated with the digital economic transformation and the fourth industrial revolution. Promote cooperation and linkages between economic sectors and social organizations in building a circular economy in Vietnam, in which the Government plays a leading and tectonic role. Propagating for all people to change their thinking about growth, improving the quality of life, production and business associated with environmental protection

CULTURE EDUCATION OF RESPO1 NSIBILITIES TO THE NATURAL ENVIRONMENT FOR STUDENTS IN THE INTERNATIONAL PROCESS

MA. Trinh Thi Kim Thoa

ttkthoa@ictu.edu.vn

Department of Basic Sciences, University of Information & Communication Technology, Thai Nguyen University, Vietnam

Abstract

In the context of Vietnam's extensive international integration, the problem of environmental pollution is becoming more and more urgent. On the basis of clarifying the content of "cultural behavior towards the environment", the article states the importance of educating "cultural behavior with the natural environment" for students in the current period and proposes some of this important awareness educational content for students.

Keywords: *Cultural behavior with the natural environment, Cultural education in dealing with the natural environment, Students, International integration.*

1. Introduction

The process of integrating into the world economy has brought about positive and negative changes in all aspects of socio-economic life in countries around the globe - including Vietnam. Besides global issues such as climate change, hunger eradication and poverty alleviation, etc., in Vietnam "Environmental pollution has been slowly improved; environmental pollution in many places is very serious, especially in some craft villages and river basins; handling of environmental violations is not serious. The awareness of environmental protection of a part of people and businesses is not high. Many natural ecosystems, especially forests, wetlands, and marine vegetation, have decreased in both area and quality. Forest protection is still inadequate, deforestation and forest fires are still ongoing. Many precious species and genetic resources are in high danger of extinction. It is still difficult to overcome the consequences of environmental pollution left by the war" [2, pages 258-259]. The issue of cultural education to deal with the ecological environment for students - the future owners of the country, is inevitably set forth, has an urgent meaning, and makes an important contribution to the development of the land sustainable Vietnam.

In the future, students are a high-quality human resource; is the force that determines the development of society and nation, and is also the subject of great influence by the natural and ecological environment in the development process of the country. Therefore, the education of cultural awareness towards the environment for this force helps them realize their responsibility in building and protecting the natural environment. The environment as well as educating the people about environmental protection in general and students in particular, from the perspective of nature, the ecosystem has been approached by researchers for many years. There are many new ways of thinking, new approaches and new contributions such as the concept of the environment, the cultural environment, the environmental culture, the interrelationship between the natural environment and the man-made environment (cultural culture). culture - society ..), how people behave towards the natural environment..., which refers to the education of students' awareness of protecting the natural and ecological environment. On the basis of inheriting these results, we focus on studying the issue of educating students to behave culturally with the natural environment, thereby proposing a number of cultural education contents. respond to the natural environment for this object.

2. Method

The article uses methods of analysis and synthesis, comparison, statistics, collection and processing of secondary information, assessment, forecast and decision.

3. Results

3.1. The concept of "cultural behavior with the natural environment"

- Cultural behavior

Behavioral culture was formed when civilization developed at a certain level in order to express how people behave towards nature, towards society and towards themselves. Assoc. Prof. Do Long in "Psychology with behavioral culture" said that: “Behavioral culture is a system of attitudes and behaviors determined to handle human-to-human relationships on legal and ethical grounds in order to accelerate the development of the community and society”[6]. Some authors believe that behavioral culture is a way of behaving, is an expression of the philosophy of life, way of thinking, and way of acting of a community of people in dealing with and dealing with relationships between people and people. nature, with society, from the micro (family) to the macro (human world). In the study "Culture of behavior of Hanoians with the natural environment", author Nguyen Viet Chuc said that: behavioral culture includes ways of relationships, attitudes and actions of people towards the natural environment, to society and to others. [1]

Thus, it can be understood in a general way that behavioral culture is the behaviors, behavioral patterns, and standards of behavior in the behavioral relationship between people and different objects expressed through language, behavior, lifestyle, psychophysiology… Behavioral culture is a constituent part of culture. That is the system of values and standards that regulate the behavior of each individual in the community.

- Natural environment

In 1981, the United Nations Educational Organization (UNESCO) gave the following definition of the environment: Environment includes all natural and man-made systems in which people live and work themselves to exploit natural or man-made resources to satisfy their needs.

In Article 3 of Vietnam's Law on Environmental Protection: Environment includes natural and man-made material factors that are closely related to each other, surround people, and affect life, economy and society. society, existence, development of humans, organisms and nature.[8]

- Culture of dealing with the natural environment

The culture of dealing with the natural environment is the harmonious behavior of people with nature, the harmony with nature, the adaptation to the living environment to regulate their life rhythms in order to protect and build the natural environment. building a better environment.

3.2. Degradation of the natural environment in Vietnam today – consequences of human behavior towards the natural environment

After 35 years of implementing Doi Moi, Vietnam has achieved great achievements in all fields, creating many outstanding marks; in which the economy grew continuously, becoming one of the fastest growing economies; people's material and spiritual life is constantly being improved; health and health care quality is enhanced; national defense and security have been consolidated and stabilized; external relations, international integration are increasingly extensive and effective,...Along with the process of socio-economic development, environmental pollution and environmental incidents are increasing, seriously affecting people's lives. This is the consequence of human behavior towards the natural environment.

- Declining forest resources and biodiversity

Over the course of development, forest cover in Vietnam has decreased rapidly and the quality of forests in forested areas has been excessively reduced. Previously, the entire country of Vietnam was covered with forests, but only in the past few decades, forests have been severely degraded. The national forest area has decreased significantly, since 1943 there was about 43 percent of the natural forest area. By 1995, natural forests had been encroached on, converted to use purposes and over-exploited, the area is only 8.25 million hectares. In recent years, the total forest area tends to increase to 41.5 percent in 2017, but most of the increased area is planted forest [7]

Some localities have high forest cover in the Northern Midlands and Mountains, North Central Coast and Central Highlands, such as Yen Bai province 62.8%; Tuyen Quang 64.9%; Bac Kan 72.1% (the highest in the country); Quang Binh 67.0%; Kon Tum 62.3%.

The biological resources of species in our country, like in the world, are decreasing day by day. According to the Red Book of the International Union for Conservation of Nature, if in 1996 there were only 25 endangered species of animals in Vietnam, by 2014, this number had reached 188 species. In Vietnam, according to statistics of the Ministry of Natural Resources and Environment, there are currently 4 extinct animal species, 5 extinct species in nature, 48 very endangered species and 113 endangered species, 37 very dangerous plant species. level, 178 endangered species. The number of breeds and strains of animals and plants cultivated for agricultural, forestry, fishery, medical production... has disappeared quite quickly, among these there are many precious varieties.

The main reason leading to the above situation is natural disappearance and over-exploitation; Climate Change; environmental pollution from the use of pesticides, plastic products... and invasive species. In which, urbanization, deforestation, agricultural development are the main causes causing nearly 75% of the terrestrial environment to be changed, causing species and ecosystems to decline.

- Land degradation

Soil degradation is a common trend in large areas of land, especially in mountainous areas, where the ecological balance has been seriously disrupted due to the lack of forest cover. Salinization, acidification and marshification on an area of millions of hectares in the plains are also the main causes of stagnation of the production capacity of the land. Vietnam has nearly 25 million hectares of sloping land (76 percent of the natural land area) with many limitations for agricultural production, of which more than 12.5 million hectares of bad land and over 50 percent of the delta area are "land problem". The phenomenon of desertification in Vietnam is also quite serious, concentrated mainly in the narrow sandy strips stretching along the central coast, concentrated in 10 provinces from Quang Binh to Binh Thuan with an area of about 419,000 ha and in the plains. by the Mekong River with an area of 43,000 ha. In the northern mountainous provinces, where there are still many bare hills and mountains, floods are causing landslides, erosion and degradation to arid deserts. In the past 40 years, the process of desertification due to mobile sand has been very serious, especially in regions with particularly hot and dry weather in the dry season, with low average annual rainfall, such as in the south central coastal provinces.

The impact of land degradation and reduction of arable land makes our country facing great challenges to solve many serious problems of soil environment, in order to ensure food safety and survival. of the whole nation with nearly 100 million people by the year 2020.

- Air pollution

Over the past few decades, Vietnam's economy has developed rapidly with an average GDP growth of about 7% and now Vietnam has become a middle-income country, with over 10,000 USD/person by 2020. The urbanization process is increasing rapidly with about 22% of the urban population. However, with the increasing urban population, the growing industry, the increasing waste of environmental pollution, especially air pollution.

The main sources of urban air pollution include transportation, industries, handicrafts and construction activities. Pollution levels of dust and harmful emissions in many places exceed the allowable standards many times, especially in some big cities such as Hanoi, Ho Chi Minh City, exceeding the allowed standards by 2-3 times. Hanoi has up to 237 days/year of poor air quality, 21 days of bad air quality and one day of hazardous air quality. Hanoi is listed as one of the ten most polluted cities in the world (according to Tien Phong Electronic Newspaper, March 4, 2016).

- Water pollution and water security issues

In recent years, the depletion of water resources in the system of rivers and reservoirs across the country is taking place more and more seriously. In urban areas, an estimated 15 million m3 of solid waste is generated each year – about 80 percent coming from households, restaurants, markets and commercial areas. In big cities with many industrial zones such as Ho Chi Minh City, Hanoi, Binh Duong, Hai Phong, Dong Nai, water pollution is quite serious. In Hanoi, the amount of wastewater generated is about 1.2 million m3/day, far exceeding the design level of 509,000 m3/day and night of wastewater treatment stations that have been put into operation (approximately 50 percent of wastewater volume need to be treated), the actual amount of wastewater treated is only about 20 percent.[4]

3.3. The importance of educating students on how to behave with the natural environment

The years in the university lecture hall are the period when students are not only more perfect in psychology but also accumulate knowledge and life capital. Students must actively make decisions about attitudes, actions and take responsibility for themselves instead of receiving regular guidance and protection from their families. Students will absorb and accumulate specialized knowledge, and at the same time expand their opportunities, create and develop their intellectual potentials, live a new life more actively, establish relationships They participate in the socialization process, participate in the socialization process…and after a short period of time, they participate in the whole process of creating and protecting their living environment in a defined space from family to living area, work and your sphere of influence. The education of a sense of cultural behavior with a good environment will greatly influence students' understanding of the environment properly; make students aware of the consequences of wrong/illegal actions or less likely to be affected by the environment. Not only that, well-educated people will stay away from illegal, thereby being well aware of their rights and responsibilities towards society, contributing to the sustainable development of the country.

Currently, environmental pollution and climate change are becoming a big challenge for both humanity in general and Vietnam in particular. Environmental pollution and climate change seriously affect all aspects of human life; comprehensively change the process of development and global security such as: food security, water security, energy security,...; affecting social, cultural, diplomatic and commercial safety issues in countries. Vietnam has been identified by the IPCC (Intergovernmental Panel on Climate Change) as one of the five countries that are and will be most affected by climate change. The gloomy picture of the natural environment in our country as well as in the world recently has clearly reflected the lack of awareness of human responsibility to nature. In order to form and develop a sense of environmental protection, we need to educate the culture of dealing with the environment. This is considered an important and long-term political task; need the correct orientation, unity of the Party and State, the cooperation of the whole society. Cultural education on environmental behavior for young people and students as an activity in ideological work, therefore, is always closely associated with important political goals and tasks. Cultural education in dealing with the environment is a process to form and affirm good personality qualities in students in relation to nature, and also a process to help students stay awake and aware. and competent in combating anti-environmental counter-propaganda trends. In the past time, a number of reactionary forces, taking advantage of some environmental instability, have carried out propaganda attacks with many exaggerated, distorted, anti-positive, counter-valued and counter-cultural contents to inciting young people, causing confusion and oscillation, and reducing confidence among young people and the entire people about the orientations, guidelines and policies of the Party and State towards the environment. Therefore, education on environmental behavior for students contributes positively to affirming the correctness and science of environmental propaganda activities according to the Party's orientation. Educating students on environmental behavior, helping young people not only have high qualifications, a firm political ideological stance, but also be responsible for the community and sustainable development. of the future of mankind.

Educating students on environmental behavior is of great significance, in order to promote the aggressive role of students on all fronts in the cause of national construction and defense. Through the activities of the Ho Chi Minh Communist Youth Union and the Student Union, promote the education of cultural awareness of living environment for students and young people through skills education activities. soft; volunteering activities, competitions, cultural, artistic and sports activities; through the examples of outstanding youth in the country as well as young environmental activists around the world….Other mass organizations cooperate to create favorable conditions for students to visit and learn about the living environment in Vietnam. a broader, different and richer scope, thereby not only helping students to understand more, better and more fully about the environment, but also have the opportunity to "live with others", with the environment to learn from. that cultivates humanistic principles and values in environmental behavior.

Thus, educating students on behavior culture at universities is important not only for the purpose of comprehensive education of the new generation, but also for spreading educational meaning to the whole society especially in responding to climate change and protecting natural resources.

3.4. Proposing some content of cultural education to behave with the natural environment for students

In order to educate students about environmental behavior, the educational content needs to be built appropriately. Students have the ability to acquire general theoretical and scientific knowledge, and at the same time have the ability to systematize knowledge and be highly creative. If environmental education for preschool children, primary school students mainly through stories, poetry, games; educate junior and senior high school students through simple and individual lessons; Through specific activities, cultural education on environmental behavior equips them with broader, more general and profound knowledge, more intrinsic, especially students majoring in environmental science. school with orientation to work and research in the field of environment.

Firstly, students need to be educated to have a scientific and complete understanding of the human living environment; the function and role of the environment (function is the living space of the community of people and organisms; the function of containing the resources necessary for life and production; the function of storing waste and self-cleaning; function of storing and providing information to people) [5, pages 11-15]; about challenges at many levels (in the spatial scale from the locality where you are studying and living to the national, regional and global scale), the harsh environmental impacts that are present on human life; on how to deal with the community's common living environment responsibly and equally; about the "price" to pay if people behave unkindly and unkindly to the environment in terms of law, morality, and quality of life in both the present time and the near future.

At universities, core courses in any field of humanities, social sciences, natural sciences, earth sciences, life sciences... can participate in equipping students knowledge about the environment and orientation of attitudes towards the environment, for the environment in all aspects and activities of human life. It can be from words, words, ways of writing, how to interact with each other directly, indirectly between people; consumption style of everyday items to the way of production, labor, travel and enjoyment, life satisfaction in both spiritual and material aspects... Therefore, in construction program of each subject as well as the entire program of the whole course, educators need to pay attention to the education of "a sense of cultural behavior with the environment" for students, considering this an important goal, throughout in the education and training of the young generation in the new context.

Secondly, students need to be educated to be aware of the reality of soil, water and air pollution, depletion of forest resources, marine resources, urban pollution, and rural environmental pollution. , ... and the impact of climate change is seriously threatening the existence and development of society; understand the underlying cause of the situation. Through teaching activities, by methods and forms of active scientific education, with each specific lesson, teachers lead and analyze, and orient learners to have the right awareness of the subject. : The inevitable causal relationship between the exploitation and use of the ecological environment by humans and the impact of the ecological environment on human life. This is an important basis to form in learners a sense of self-consciousness about their own position and role in relation to the ecological environment, establishing awareness and correct actions in the practice of transformation activities nature.

Thirdly, students need to be educated about the values standards in the relationship with nature in accordance with the times. In the context of the socialist-oriented market mechanism and the integration of the world economy in our country today, the issue of environmental culture education for Vietnamese students needs to be based on a Ecological ethical standards aim to regulate each person's individual behaviors through which people must have a sense of responsibility, attach themselves to the ecological environment, consider the benefits of the ecological environment to be the main ones. benefits for themselves and the community. This system of ecological ethical standards and values is the unification of the objective needs of society, the voluntary and active activities of people in the rational exploitation and use of natural resources. natural resources and environmental protection.

At present, some basic standards need to be emphasized in relation to behavior with nature:

- Maintain a green - clean - beautiful living environment in personal and community life

- A civilized and thrifty lifestyle

- Building a green growth model (production according to environmentally friendly advanced technologies; effectively exploiting resources, switching from large-scale exploitation to in-depth exploitation, limiting the use of resources) non-renewable energy, combining processes that protect biodiversity and ensure the resilience of nature)

- Promote the spirit of self-discipline, voluntariness, conscience and responsibility in all life activities, complying with the Law on Environmental Protection; proactively equipped with skills and ready to coordinate actions in problem solving [3, pages 126-127].

In the context that the quality of people's living environment tends to decrease to a level of concern because of the increasing violation of these important principles and values in dealing with the environment, the Educating all people, including students and young people, in these principles and values of humanity is very important. This requires that education in general and higher education in particular, when building a moral value system for the young generation, must pay attention to these principles and values in all human activities with respect to the living environment.

Fourthly, students need to grasp the basic guidelines, lines and policies of the Party and State on environmental issues, advanced international books and newspapers on environmental ethics education. ... In addition, it is necessary to build projects for students and seek financial sources, organizations to link and support in the process of designing ideas to protect the natural and social environment. the country integrates widely and deeply into the international socio-economic life, in the digital age with its preeminent, the connection - association - coordination between scientists, educational researchers, etc. cultural education to behave with the ecological environment becomes favorable. Through the activities of association and cooperation in research, exchange of experiences with individuals and international scientific organizations, the lecturers are in charge of cultural education to behave with the ecological environment for students. Students have the opportunity and conditions to exchange, learn and acquire experiences in ecological ethics education of countries, regions and international organizations in order to improve the quality and effectiveness of the teaching and learning process. ecological ethics education for pupils and students; connecting and sharing information, capturing the current situation of ecology and environment in the world, in the region and in the country, ..

Through educational methods and different forms of educational organization, the teacher - as a guide for learners to access necessary ecological knowledge, learn and research about responsibility in the process of maintaining and protecting the current state of the ecological environment and developing the ecological environment in the area of residence, of Vietnam and the world, etc.

4. Discussion and Conclusion

On the basis of approaching the problems of the natural environment of Vietnam today and the role of students in the development of the country in the future, the article has clarified the author's point of view on the sense of behavior. culture with the environment; The importance of educating students about culturally behavior with the environment and the contents that need to educate students about cultural behavior towards the environment.

THE GRASSROOTS POLITICAL SYSTEM – A KEY FACTOR IN THE SUSTAINABLE DEVELOPMENT IN ETHNIC MINORITY AND MOUNTAINOUS AREAS IN VIETNAM AT PRESENT

MA. Luong Thanh Duy

vnluongduy@gmail.com

Academy of Politics, Hanoi, Vietnam

Abstract

The sustainable development of Vietnam's ethnic minority and mountainous areas is a developmental process based on economic growth associated with progress and social justice, this contributes to use reasonably the natural resources and protecting the ecological environment, it also is a key factor for improving quality of life for the ethnic minority communities. However, the state of sustainable development in ethnic minority and mountainous areas of Vietnam is still inadequate and limited which is main cause of these problems due to lack of fully promoting the role and responsibility of the grassroots political system for sustainable development of ethnic minority and mountainous areas. Therefore, the key factor that need to recognize properly about the role and implement all of comprehensive solutions to promote the role of the grassroots political system in the sustainable development of ethnic minority and mountainous areas in Vietnam at present, thereby improving the quality and developing the sustainable social economy in this area.

Keywords: *Sustainable development; The grassroots political system; Ethnic minority and mountainous areas.*

1. Introduction

The sustainable development in Vietnam's ethnic minority and mountainous areas are a major strategy that throughout the developmental process. In developmental process follow the socialist-oriented market mechanism, the sustainable development of ethnic minority and mountainous areas has not only gained the enormous achievement but also confronted many challenges. Specially, Industrial Revolution 4.0 and the fierce resistance of the hostile forces have affected strongly on the facets that need to find the realizable solves to determine the roles, functions and tasks of the Political System at all levels in the sustainable development in ethnic minority and mountainous areas, this is a fundamental requirement in the current period.

There are many scientific studies on sustainable development, especially sustainable development of ethnic minority and mountainous areas such as: The State study by Nguyen An Ninh (2018): Studying state management models about the ethnic policies in some countries around the world and lessons have learned for Vietnam; Management of social development in ethnic areas and ethnic minorities in our country by Nguyen Lam Thanh published in the Legislative Research, March 2018; Organizing the political system - the central issue in building fast-growing, sustainable institutions in Vietnam of Ta Ngoc Tan, published in The Journal of Political Theory, January 2019... However, lack of the specific studies on the role of the grassroots political system in the sustainable development in ethnic minority and mountainous areas in Vietnam, this article is the basis for clarifying the theoretical and practical issues of sustainable development in ethnic minority and mountainous areas; thereby proposing the significant solutions to promote the role of the grassroots political system in the sustainable development in ethnic minority and mountainous areas in Vietnam.

2. Method

This article used a comprehensive approach to collecting and summarizing the recent studies and reports related to this topic. All data was collected base on the second-party data provided by state management agencies such as: General Statistics Office of Vietnam; Committee for Ethnic Minorities; Party ministries and local governments to shed light on the role of the grassroots political system in the sustainable development in Vietnam's ethnic minority and mountainous areas.

3. Results

3.1. State of the sustainable development of Vietnam's ethnic minority and mountainous areas in recent years

Vietnam's ethnic minority and mountainous areas account for three-quarter of the country's area that is key residence where have 53 ethnic minorities with over 14 million people. This is an essential area of defense, security and external affairs; that is the place where there are many mineral resources, diverse dynamic and plant ecosystems; there are over 14 million hectares of forests which are aquatic water sources associated with national hydropower projects that both providing electricity and providing production and living water at the lower land. Sustainable development in Vietnam’s ethnic minority and mountainous areas is part of the country's sustainable development, it exists inseparably and basing on the national sustainable development strategy. This is the development process which is based on the economic growth associated with progress and social justice, using reasonably the natural resources and protecting the ecological environment contribute to establish and protect the fatherland.

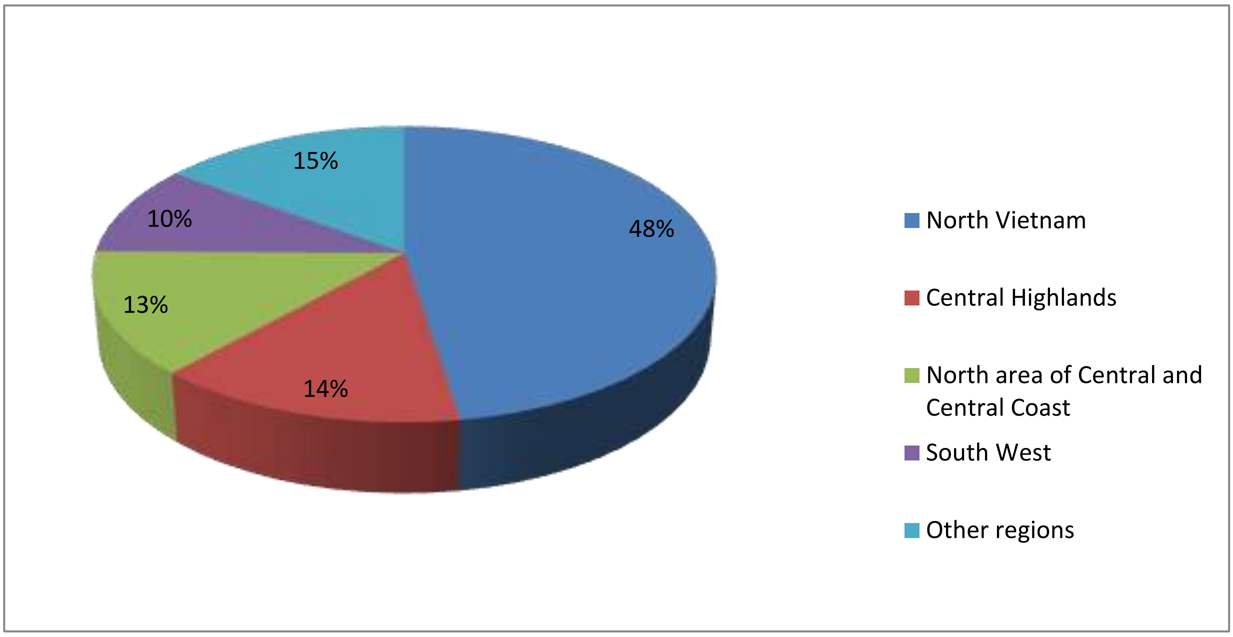

Chart 1: Distribution of Vietnam's ethnic minority population by region (Unit:%)

Source: Committee for Ethnic Minorities - General Statistics Office, Results of investigations to collect information on the socio-economic situation of 53 ethnic minorities in 2019, Statistics Agency, Hanoi, 2019

Perceiving precisely about the position and importance of the sustainable development in ethnic minority and mountainous areas. In recent years, Vietnam's the Party and State have had many comprehensive strategies and policies link to solve problems that are both basic, urgent and significant to create the sustainable socio-economic development in this area. The opinions and guidelines of Vietnam's the Communist Party determined: "Developing comprehensively all of facets such as the politics, economy, culture, society and security - defense at the ethnic minority and mountainous areas; attaching economic growth to solving social problems and implementing effectively the national policies; caring about training and fostering human resources, especially the ethnic minority cadres; preserving and promoting the traditional values and cultures in the common development of the Vietnamese ethnic community"[91]. Implementing this policy, the Vietnam's Government has promulgated the specific policies and plans for each period such as: Orientation of Vietnam's Sustainable Development Strategy (2004); Ethnic work strategy to 2020 (2013); The Millennium Target for ethnic minorities associated with the goal of sustainable development after 2015 (2015); National target program for sustainable poverty reduction for the period 2016 - 2020 (2016); The National action plan for the Implementation of the 2030 Agenda for sustainable development (2017) has promulgated with aims: "Maintaining the sustainable economic growth link to implement the progress, social justice and ecological

[91] Communist Party of Vietnam (2003), Documents of the *7th* Conference of the IX Central Committee, National Politics Publishing House, Hanoi.

environment protection, effectively natural resources use and management, proactively respond to climate change; ensuring that people expose their potentials, participating and enjoying equally the developmental achievements; building a peaceful, prosperous, democratic, just, civilized and sustainable Vietnamese society"[92]. In order to successfully achieve this overall goal, the 2030 Agenda has identified 17 specific goals, therein 15/17 goals related to ethnic minority and mountainous areas including 5 economic goals, 6 socio-cultural goals and 4 ecological environment goals.

In recent years, Implementing the Party and the State's guidelines and policies about sustainable development, Vietnam's ethnic minority and mountainous areas have developed comprehensively and solidly. The economic growth rate of ethnic minority and mountainous areas is quite high, reaching an average of 7% and increasing gradually every year that higher than the national average, therein the Northwestern provinces increased by an average of 8.4 % per year, the Central Highlands increased by an average of 8.1 % per year, the Southwest increased by an average of 7.3% per year[93]. The economic structure shifted in the right direction, initially forming agricultural - forestry production areas such as coffee, tea, rubber, pepper, medicinal plants, trees for timber and out-of-wood products... The infrastructure of ethnic minority and mountainous areas gradually completed and associated with the socio-economic development of each region lead to meet the needs of the people. Number of poor households in poor districts and the difficult communes decreased rapidly, people's quality of life markedly improved in recent years. The grassroots political system of ethnic minority areas is strengthened, and promoting effectively. The National defense and security maintained, it ensured the social and political stability. The national unity is increasingly reinforced and strengthened. The ecological environment was protected and developed harmoniously. However, Vietnam's ethnic minorities and mountainous areas are still the most difficult areas where are the lowest quality of human resources and the slowest socio-economic development. This is place that can access to the lowest basic social services, the high rate of poor households. Therefore, the effectiveness of the sustainable development process has represented significantly challenges for the political system at all levels. Specifically:

In the domain of economics, although this domain has gained many achievements but the economic scale in ethnic minority and mountainous areas in Vietnam has been still limited and the fundament of agricultural production still depends on natural characteristics; transferring of economic structure is slow, many developmental sectors are not

[92] The National Action Plan for the Implementation of the 2030 Agenda for Sustainable Development (Promulgated together with the Prime Minister's Decision *No. 622/QD-TTg on May 10, 2017).*

[93] The overall plan on socio-economic development in ethnic minority and mountainous areas for the period 2021-2030 (Promulgated together with *Resolution No. 88/2019/QH14 on November 18, 2019 of the National Assembly)*

commensurate with the potential. The cost of producing and circulating the goods is large that should be very difficult to attract social resources to invest in socio-economic development affect to the sustainable development. According to the results of the database about the state of the socio-economic of 53 ethnic minorities in 2019, there are 5,266 communes in ethnic minority and mountainous areas, therein 1,957 communes in zone III and 20,139 villages outside communes in Area III are difficult. The proportion of employees work in the agricultural sector accounts for over 80%, technical infrastructure was still low and it did not meet the needs of socio-economic development. In 2019, there are still 54 communes without roads connecting to the commune center and the district center; 9,474 villages without hardened roads; 3,400 villages without electricity; 4,355 schools have not been solidification; 1,148 communes without marketplaces; 1,749 communes without cultural houses; 7,072 villages do not have cultural houses or community activists. The ethnic minority and mountainous areas of Vietnam are having the highest of poor households in the country, the average income rate of ethnic minority households in many places is only 40-50% of the average income in the region; the proportion of population is 14.7% but the poverty rate accounts for 55.27% of the total poverty households of the country. There are 9 provinces with a poverty rate of over 90%; 4 provinces have a poverty rate of 70% - 90%. There are some ethnic minority groups that the high percentage of poor households up to 70-80% such as O Du, Co, Kho Mu, Xinh Mun, La Ha, Khang, Mong and Xo Dang.[94]

In the domain of socio-culture, the ethnic minorities have approached and enjoyed the basic socio-cultural services lower level than the national average, there are about 21% of ethnic minorities over 15 year old who could not read fluently the Vietnamese and about 30% of ethnic minority pupils have not yet attended school hat the right age; The level of access to medical services is still difficult, the rate of issuance of health insurance cards is high but the rate of medical examination and treatment is still low, the percentage of pregnant women who received regular examinations is 71%, the rate of childbirth at home is 36.3%, the proportion of malnourished children are 32%; nearly one-third of ethnic minority households have not approached to sanitation water; 15.3% of ethnic minority households stay in temporary homes, especially 14 ethnic minorities have a temporary housing rate of nearly 50%; 2/3 of ethnic minority households do not have sanitation factories.[95]

In the domain of natural resources - environment, Vietnam’s ethnic minority and mountainous areas are mainly alpine, border, divided terrain and harsh climate. This is the place where is the worst infrastructure in the country and affected by the climate changes and environmental incidents such as landslides in the provinces of Uncle Central and Central

[94] Committee for Ethnic Minorities - General Statistics Office, Results of investigations to collect information on the socio-economic situation of 53 ethnic minorities in 2019, Statistics Agency, Hanoi, 2019.

Coast; floods, flash floods in northwestern provinces; droughts in the Central Highlands...These are taking place seriously and unpredictably. The root of these problems was the decrease of forest resources because of the excessive logging and deforestation for industrial land, the nomadic habits of the ethnic minorities. The illegal mining of some minerals such as gold, tin and building materials has polluted the environment. The development of under-calculated hydropower works has had the negative effects on ecological environment issues, disrupting ecological balance, changing the flow and affecting the social stability, labor, employment, life and living space of villages in ethnic minority and mountainous areas.

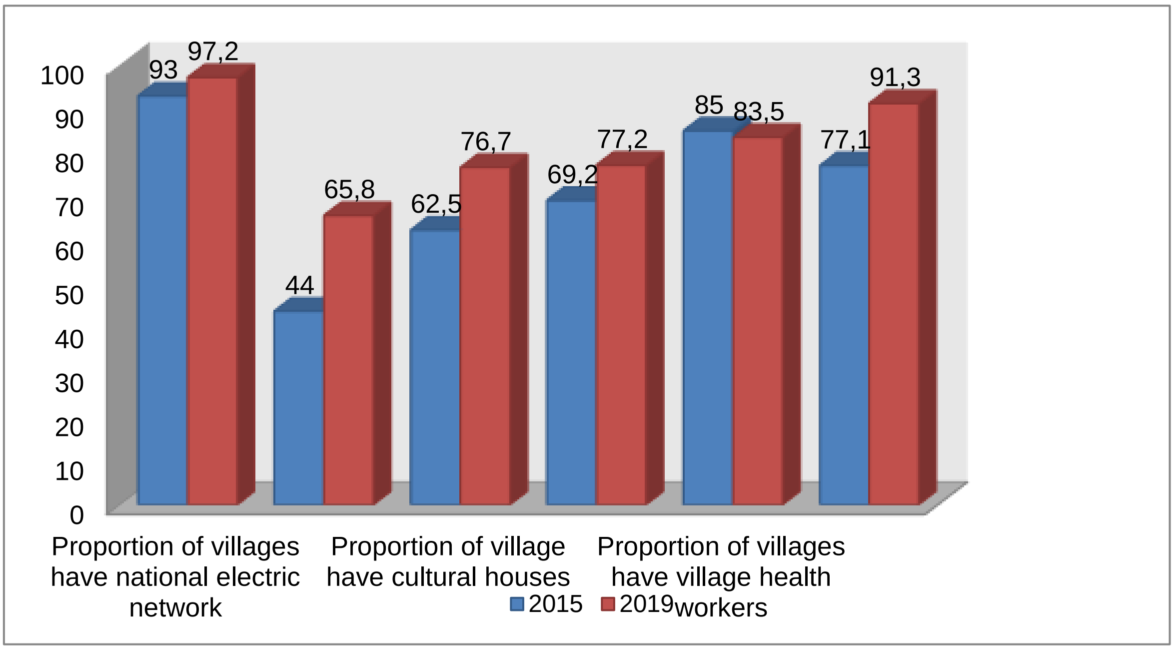

Chart 2: ***Some indicators about state of the socio-economic of 53 ethnic minorities in 2015 and 2019*** *(Unit: %)*

Source: Committee for Ethnic Minorities - General Statistics Office, Results of investigations to collect information on the socio-economic situation of 53 ethnic minorities in 2019, Statistics Agency, Hanoi, 2019.

The results showed that the situation of sustainable development in ethnic minority and mountainous areas in Vietnam in the recent years. Although the important results have achieved but there are still many difficulties, challenges and disadvantages about economy, culture - society and ecological environment. There are many causes that lead to this situation, but the subjective causes are the main. It is: establishing, managing and monitoring the policies to support socio-economic development in ethnic minority and mountainous areas are overlapped; the resources are scattered; lacking of determine clearly about responsibilities of all levels and sectors lead to use the low investment that impacted to exploit inefficiently the local’s potentials, advantages and the internal forces in ethnic minority and mountainous areas. In particular, the role of the grassroots political system about sustainable development at the ethnic minority and mountainous areas has not really been fully promoted; the leader, organizer and supervisor's ability is still weak and inevitable; staff's awareness, responsibility and qualifications is still limited and not meet the practical requirements; there have not been many significant measures to promote the role of elements (party organizations, governments and socio-political organizations) in sustainable development that greatly affected the quality and efficiency of sustainable development at ethnic minority areas and mountainous areas in Vietnam at present.

3.2. The grassroots political system and its role in the sustainable development of Vietnam's ethnic minority and mountainous areas at present.

The political system in Vietnam is a socialist political system consisting of the Communist Party of Vietnam, the State of the Socialist Republic of Vietnam and socio-political organizations. All of organizations are operated according to the mechanism and relating with each other in order to strengthen the leadership role of the Party, managing effectively of the State and ensuring the power belongs to the people. Vietnam's political system holds the entire system of practical social powers from the political power, the state power to other powers in society including the establishment, organization and supervision's powers to perform the developmental system in general and the sustainable development institutions in particular. Therefore, the effective implementation of sustainable development can only occur when there is a good, reasonable and effective political system.

In the political system of Vietnam, the grassroots political system is the last level that is established in communes, wards and towns. The whole apparatus of the grassroots political system includes: The Party at grassroots level; the government at grassroots level; The Fatherland Front and socio-political organizations of the people at grassroots level. These elements are closely tied together and forming a political system in each administrative unit, operating according to the principled functional relationship: The Party leads, the administration manage and the people master. Accordingly, the Party at grassroots level lead comprehensively by the resolutions, orientating the central tasks, selecting the staff, inspecting and supervising the implementation of resolutions of the People's Councils and People's Committees and examining to conduct the State's policies and laws. The government at grassroots level (People's Councils and People's Committees) where implement the State's legal policies according to the statutory jurisdiction, directly managing and managing the society to maintain security and political stability, organizing the performance of socio-economic tasks, improve people's quality of life. The Fatherland Front and other socio-political organizations at grassroots level participate in managing in their localities and supervising the implementation of policies and laws of the people's councils, people's committees, party members and staff; propagating and mobilizing people to comply with the Party's guidelines, the State's policies and laws.

In ethnic minority and mountainous areas, the grassroots political system is established in commune-level administrative units. According to the Prime Minister's Decision No. 33/2020 on November 12, 2020 about the criteria for the division of ethnic minority and mountainous areas in the period 2021-2025, commune-level administrative units of ethnic minority and mountainous areas are communes with the proportion of ethnic minority households in the total number of households living in communities from 15% or more. Accordingly, there are 5,468 commune-level administrative units (51 provinces, cities and 548 districts) belong to ethnic minority and mountainous areas in Vietnam. Currently, the grassroots political system in ethnic minority and mountainous areas is being built and solidly consolidated. On average, each commune has 20 cadres and civil servants, of which more than 90% of commune-level cadres and civil servants are ethnic minorities. All commune-level cadres and civil servants have professional qualifications, leadership capacity, and management capacity up to standards as prescribed.

Source: Committee for Ethnic Minorities - General Statistics Office, Results of investigations to collect information on the socio-economic situation of 53 ethnic minorities in 2019, Statistics Agency, Hanoi, 2019.

The grassroots political system plays a very important role that decide the success or failure of the implementation of the Party's guidelines and policies and the State's laws. The grassroots political system directly leads, directs and organizes the implementation the objectives of socio-economic, defense and security at the locality. The study about the role of the grassroots political system in the sustainable development of Vietnam's ethnic minority and mountainous areas is essential that contribute to clarify the functions, tasks, powers and effects of Party organizations, governments and socio-political organizations in performing the tasks about the economic and social sustainable development and environment in ethnic minority and mountainous areas in Vietnam at present.

According to the opinion's Marxism - Leninism, there is anything or phenomenon that exists in reality, it has a certain connection and playing the important role in the movement and development of one or another group of things or phenomena. As a result, things and phenomena reveal attributes, establishing their existence and distinguishing between them and other things and phenomena. Thus, the role is objectively established by the social position of each subject in the system of social relations and specific activities. The same subject, manifesting its role will be different when the social relations, the domain of activity and purpose are different.

The role of the grassroots political system in the sustainable development of ethnic minority and mountainous areas was formed based on the socialist legal relations, it was established by the Party and the State of Vietnam base on the system of opinions, guidelines and policies of the Communist Party of Vietnam and the Constitution and laws of the State. The Communist Party of Vietnam always determines and implements the sustainable development of ethnic minority and mountainous areas as the responsibility of both the political system at all levels and branches, especially the political system in the area where inhabited by ethnic minorities. Vietnam's Constitution 2013 also clearly defines the roles and responsibilities of the Party organizations, governments and socio-political organizations in the country's economic-social development, environment and defense-security as well as ethnic minority and mountainous areas. In addition, the Law on Government's Organization and the local's organizational rights; the directives and recommendations of the Party; The National Assembly and the Government also defined the roles and responsibilities of the political system about sustainable development at all levels. On that basis, it stipulates the functions, tasks and powers of the grassroots political system, creating the objective legal position to perform the tasks of sustainable development in general and sustainable development in ethnic minority and mountainous areas in particular. The role of the grassroots political system in the sustainable development of specific ethnic minority and mountainous areas will be represented below as follows:

Firstly, the grassroots political system is a force to directly propagate to increase the cadres, party members and people's awareness about the guidelines and policies of the Party and the State of Vietnam in the sustainable development of ethnic minority and mountainous areas. This is an important role of the grassroots political system in the sustainable development in ethnic minority and mountainous areas, because the sustainable development's policies of ethnic minority and mountainous areas can only be achieved effectively when the staff, Party members and people have perceived exactly about the sustainable development's role, importance, content, requirements and measures in developing the locality's economy, socio-culture, environment and defense and security. Therefore, the cadres, party members and people should be propagated to increase their awareness through the activities of the grassroots political system , especially propagating and mobilizing the people. Accordingly, all of the Party and the State and organizations' opinions, guidelines and policies about sustainable development will be fully communicated to each cadre, party member and people that help them to properly realize to identify clearly responsibilities in performing the sustainable development goals in their localities.

Secondly, the grassroots political system is the subject of the sustainable development goals' leadership, management, direction and organizing the implementation in ethnic minority and mountainous areas; taking care of improving the quality of life for ethnic groups in the area. This is the most important role that decide on the quality and efficiency of the sustainable development process in ethnic minority and mountainous areas. In fact, promoting the role of the grassroots political system in the sustainable development of ethnic minority and mountainous areas is the process that change the policies, directions and measures related to the sustainable development's core contents into the practical results through the state apparatus's organized activities and the widespread participation of organizations, units, families, individuals and the whole society to realize the goals and policies set. In this process, the grassroots political system plays the significant role that both as the subject of leadership and management as well as a key force in the implementation of economic, cultural - social, environmental and defense and security objectives in the area, contributing to improve people's quality of life and developing a comprehensively and sustainable locality

Thirdly, the grassroots political system is an important force in coordinating and participating in the implementation of the sustainable development's programs and projects of the central, local and other organizations in the area belong to their managemental scope. This is an important role of the grassroots political system in the sustainable development at Vietnam's ethnic minority and mountainous areas at present, because the real implementation of sustainable development's policies shows that there are many Ministries, branches and political systems at all levels participating in the establishment, management and monitoring sustainable development's policies in ethnic minority and mountainous areas. This leads to the majority of policies being formulated and implemented according to the requirements and responsibilities of each Ministries and branches that lacking of general coordination, thereby creating the duplication, dispersion and lacking of connection between policies. While the sustainable development policies are implemented at the specific locations. Therefore, the participation and coordination of the grassroots political system is essential, especially supervising the implementation of economic, social and environmental developmental programs and plans in the area belong to the managemental scope. From there, ensuring sustainable development policies are implemented in the most effective direction and contributing to improve the practical benefits to the Party, government and local people.

Fourthly, the grassroots political system is the nuclear of national unity, creating the social consensus; maintaining the social and political stability; establishing the prosperous areas to create the foundation for the process of the economic and social sustainable development, environment in ethnic minority and mountainous areas. Maintaining the social and political stability, enhancing the social consensus and uniting the whole people is both a goal and a prerequisite for the sustainable development in ethnic minority and mountainous areas in Vietnam. This shows the important role of the grassroots political system in the sustainable development in ethnic minority and mountainous areas in Vietnam at present. Through the performance of functions and tasks of the grassroots political system, especially the leadership and management of the Party, government and people's organizations; propagating and mobilizing people to organize the production, preserving and developing of national cultural characteristics, solving social problems that arising in the area, especially ethnic and religious issues; organizing the struggles with the hostile forces. This will contribute to maintain the social and political stability, strengthening the solidarity of the whole people and making the socio-political establishment stronger and stronger. Moreover, this will also create the favorable conditions for the process of the economic and social sustainable development, environment at the ethnic minority and mountainous areas in Vietnam at present.

Thus, the grassroots political system plays an important role in successfully deciding of the economic and social sustainable development, environment, defense and security in ethnic minority and mountainous area. In fact, the construction, consolidation and promotion of the role of the grassroots political system in ethnic minority and mountainous areas has achieved many important results. People's lives of ethnic minorities have had positive changes. However, the role of grassroots political system in ethnic minority and mountainous areas has not been effectively promoted. Its has not yet made a fundamental and breakthrough change in the rapid and sustainable development of the economy, society and environment. In the current context, facing to the high requirements of the sustainable development in ethnic minority and mountainous areas and impacting of the Industrial Revolution 4.0. Besides, the fierce resistance of hostile forces and the complexity of the ethnic minority issues that need to find the comprehensive solutions to promote the role of the grassroots political system for the sustainable development in ethnic minority and mountainous areas, contributing to The Socialist Republic of Vietnam’s solid protection in the current situation.

3.3. A number of solutions to promote the role of the grassroots political system in the sustainable development in Vietnam's ethnic minority and mountainous areas present.

In the development orientation to 2030, the Communist Party of Vietnam determined: "Continuing to strongly innovate about thinking, establishing and perfecting the regulations of the economic and social sustainable development, environment, the social and political stability, promptly removing the difficulties and problems; promoting all potentials and resources create the new motivations for the fast and sustainable development of the country"[96]. Besides, considering the strengthening and promoting the role of the grassroots political system at the ethnic minority and mountainous areas is an important solution for the sustainable development of ethnic minority and mountainous areas.

At present, promoting the role of the grassroots political system in the sustainable development in ethnic minority and mountainous areas in Vietnam is the comprehensive policies and measures. In order to improve the quality and efficiency perform the functions and tasks of each element in the grassroots political system in ethnic minority and mountainous areas. Accordingly, promoting the role of the grassroots political system in the sustainable development in ethnic minority and mountainous areas in Vietnam, the basic solutions will be represented below as follows:

Firstly, Increasing awareness and responsibility of the grassroots political system for sustainable development in ethnic minority and mountainous areas of Vietnam at present. In order to implement this solution, it is necessary to strengthen the propagating and education of Marxism - Leninism, Ho Chi Minh Ideology, the Party and the State's opinions, guidelines and policies about sustainable development in ethnic minority and mountainous areas for cadres and party members in the grassroots political system. Establishing the right motivations, attitudes and responsibilities for staff, especially the key staff in the grassroots political system in the sustainable development of ethnic minority and mountainous areas of Vietnam at present.

Secondly, establishing and consolidating regularly the powerful grassroots political system in the ethnic minority and mountainous areas. Focusing on strengthening a pure grassroots Party, enhancing leadership's ability for the organizations in the grassroots political system; strengthen the State management, improving the organization's capacity to implement the tasks of the economic and social sustainable development, the social and political stability; promoting the role of the Fatherland Front and socio-political organizations in propagating, and mobilizing people participate in implement the sustainable development policies in the area.

Thirdly, coordinating closely between the grassroots political system and the upper political system and other locality's forces for the sustainable development in ethnic minority and mountainous areas in Vietnam at present. Accordingly, the political system at

[96] Communist Party of Vietnam, Documents of the 13th National Congress of Delegates, episode 1, National Politics Publishing House, H.2021, p.114.

all levels from districts, provinces and central levels must perform their managemental functions, tasks and powers. Moreover, promoting the advantage conditions about all aspects perform effectively the grassroots political system's policies about sustainable development at ethnic minorities and mountainous areas. Especially, promoting the role the district-level political system in directing and operating the tasks that should link to reality.

Fourth, finalizing the legal prescribes about the functions, tasks and powers of the grassroots political system for the sustainable development in ethnic minority and mountainous areas of Vietnam at present. Accordingly, it is necessary to review the system of relevant laws and regulations, adjusting and finalizing the current regulations, focusing on research and promulgate the regulations about the functions, tasks and powers of the grassroots political system for sustainable development. Especially, coordinating to implement and supervise the programs and projects in ethnic minority and mountainous areas.

4. Discussion and Conclusion

Sustainable development in ethnic minority and mountainous areas is an important mission of the Party and the State of Vietnam. In fact, the sustainable development in ethnic minority and mountainous areas has achieved the positive results by the efforts of all levels, contributing to changing the aspects in ethnic minority and mountainous areas. However, the grassroots political system is coping with the great challenges that have to find the appropriate solutions face to these issues. Therefore, promoting the role of the grassroots political system for sustainable development in ethnic minority and mountainous areas is objectively required, it is necessary to implement synchronically the solutions such as increasing awareness and responsibility of the grassroots political system; strengthening and establishing a powerful political system in ethnic minority and mountainous areas; closely combining the grassroots political system with the upper political system and other forces in the area; finalizing the legal prescribes about the functions, tasks and powers of the grassroots political system are important solutions contribute the sustainable development of Vietnam's ethnic minority and mountainous areas.

HIGH QUALITY HUMAN RESOURCES - KEY FACTOR ENSURES THE SUSTAINABLE AGRICULTURE DEVELOPMENT IN VIETNAM NOWADAYS

MA. Can Anh Vu

ngocvu9091@gmail.com

Academy of Politics, Hanoi, Vietnam

Abstract

In the present period, developing the sustainable agriculture has become the main concern all of countries in the world. In Vietnam, Party and State have perceived the importance of sustainable development, establishing the opinions of sustainable development into the resolutions, strategies and socio-economic developmental plans in general, agricultural development in particular. Government established system of the total solutions to develop sustainable agriculture, especially high-quality human resources that play significant roles in developmental strategies. The article generalized the state of agricultural production in Vietnam in recent years. Base on analyzing the role of high-quality human resources for sustainable agricultural development, the article proposes some of the essential solutions to develop high-quality human resources to meet the requirements of sustainable agricultural development in the international integration in Vietnam nowadays.

Keywords: *High quality human resources, agriculture, sustainable development, human resources.*

1. Introduction

Agriculture is the specific domain that play particularly important role in socio-economic development, contributing to ensure national defense security and raising the national position in the international arena. The development of agriculture and rural areas has been identified by the Communist Party of Vietnam as a strategic missionto meet the requirements of industrialization and modernization of the country.

Nowadays, many countries are confronting with the competitionofthe scientific and technological revolution (especially the Fourth Industrial Revolution) that ismore and more fierce in the worldwide globalization and international integration period. Besides,the opportunities and advantages of developing in agriculture, Vietnam is also facing the difficulties and challenges in this competition. In this context, Vietnam's agriculture needs to change to adapt and develop sustainably to achieve these targets. Therefore, developing high-quality human resources is one of the breakthroughs and key issues that determines the industrialization, modernization of agriculture, developing Vietnam's agriculture follow themodern and sustainable way.

2. Methods

The article used anoverall and comprehensive approach to collect and summarizethe last studies and reports that related to this topic. All of the data wascollected based on second-level data by a number of organizations such as the Communist Party of Vietnam, the Ministry of Agriculture and Rural Development, and the General Statistics Office.

3. Results

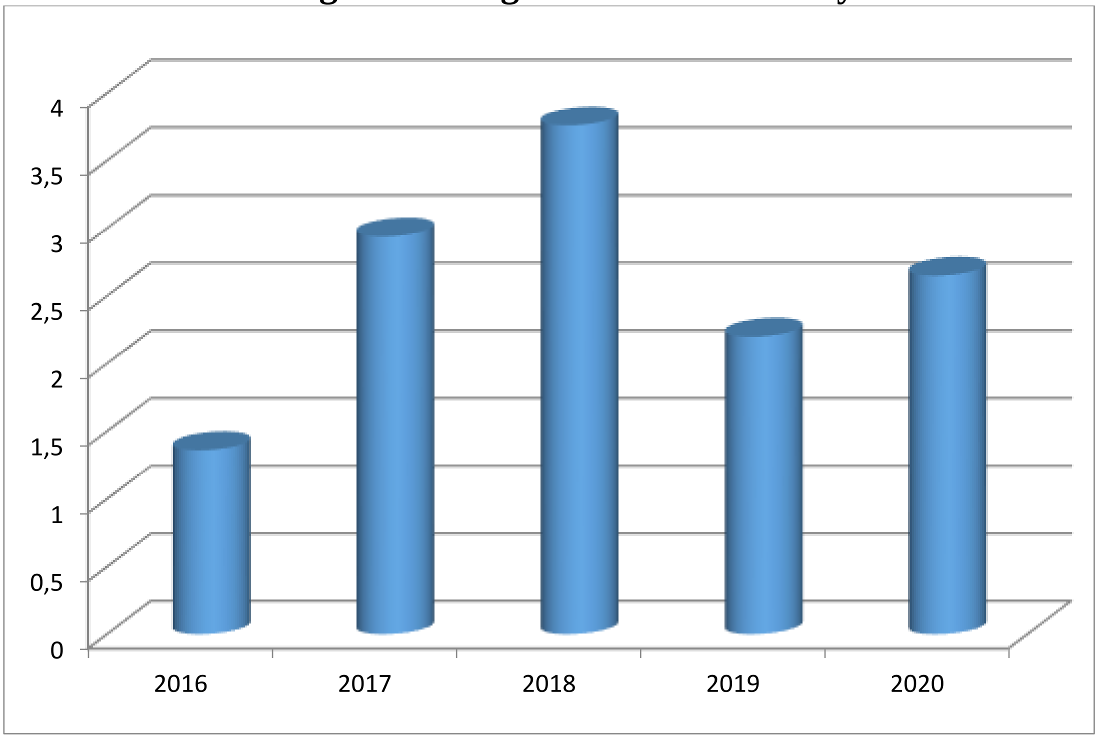
3.1. Overview of the situation of agricultural production and human resources agriculture in Vietnam recently

Vietnam is the developing country; agriculture is still one of an economic field that has made an important contribution to the socio-economic development in Vietnam. Over 35 years of conducting the comprehensive national innovation, under the attention of the Party, the State, Vietnam's agriculture has gained the huge achievements. The rate of average growth reached about 3.5% per year that wasthe high rate in Asia in general, Southeast Asia in particular. After a prolonged period of provisions shortages, Vietnam has gradually become one of the powerful countries about exporting of agricultural products in the world. During the period 2008 - 2017, the GDP growth rate of Vietnam's agricultural sector reached an average of 2.66% per year.

In 2020, In the context of the difficulty and complex numerous problems happened not only in Vietnam but also many countries in the world, especially the impact of the Covid-19 pandemic, Vietnam's agriculture still maintains a growth momentum of 2.65%, the total exported turnover reaches 41.2 billion USD[1]. Vietnam's agricultural consumption market is expanding, the structure of production is more efficient and associated with the market demand. Many productive models were applied high technology, organic agricultural production that were deployed to bring many great values of goods. The internal structure of agriculture shifts towards promoting advantages, relating to market demand and adapting to climate change. Agricultural development has been associated with the effective exploitation of natural resources, reducingthe environmental pollution and solving the social problems such97as employment, economic restructuring, ensuring national food security. On the international level, Vietnam's agriculture is gradually participating strongly in the process of integration and globalization; the quality of lifein many rural areas changed; the material and spiritual life of the citizen in most rural areas is improving.

[97]Ministry of Agriculture and Rural Development (2020), *Summary report on implementation of agricultural and rural development plans in 2020 and implementation of the plan in 2021*, Hanoi.

The agricultural growth rate over the years



(Source: analyzed from the General Statistics Office: Report on socio-economic situationyears 2016, 2017, 2018, 2019, 2020).

Although Vietnam's agriculture has gained the remarkable achievements but the quality, sustainability and method of agriculture develops still exist many limitations andinadequacy. The growth rate of the agricultural sector is unstable, the competitiveness is still low and promoting resources for production development is not high (the growth rate in the years from 2016 to 2020 about 1.36%, 2.94%, 3.76%, 2.2% and 2.65%, etc.). Transferring about the economic structure and innovating of production method in agriculture is slow, the small and scattered production is still popular; the productivity, quality and added value of many itemsare low, economic structure and labor in rural areas are still shifting slowly. Lack of planning for developing agriculture and rural, socio-economic infrastructure is still weak, the environment is increasingly polluted; the capacity to adapt and deal with natural disasters is still limited. The material and spiritual life of a part of rural people is still low, the proportion of poor households is unsustainable, especially in ethnic minority.

There are many reasons leading to these limitations, but the most basic reason is that our country's agricultural human resources are still limited and inadequate. As a developing country, the scale of human resources in the agricultural sector accounts for a large proportion of the total human resources of the Vietnamese economy. Along with the development of the country, human resources in agriculture will decrease in both quantity and proportion in total human resources of society. When the number of human resources in the agricultural sector is decreasing, the requirements for capacity, qualifications, qualities and skills of the remaining human resources must be higher to meet the requirements of accelerating industrialization and modernization. of agriculture and rural areas. This is the objective law of the process of industrialization and modernization of the country.

However, the proportion of employees that have the agriculture's technical qualifications is still low when people compared to the labor market's needs. Results of vocational training and job creation for rural workers, especially in areas where agricultural land is recovered, are still limited. The proportion of sustainable jobs increases slowly, unstable jobs, temporary jobs are still quite high; The young workforce tends to move away from agriculture and rural areas. The limitations on the qualifications of human resources in agriculture directly hinder the process of transferring and applying the achievements of modern science and technology and advanced techniques into production.

In the next years, theworldwide backgroundandAsia zone is predicted to continue to be complicated, unpredictable: slow economic growth; the commercial wars amongthe economic powerful countries; the trend of increasing the use of technical barriers and the method about commercial defenses increase to protect domestic production; the fourth industrial revolution is impactingstrongly to many aspects; the Covid-19 pandemic has erupted and spreading in important export markets of Vietnam's agriculture, forestry and fisheries. China, EU and the US had to take the preventive measures that have caused of the disruptions to the global supply chain;… Facing the new pressures,developing the comprehensiveagriculture towards sustainability becomes a strategic goal that our Party and people are determined to implement. The Resolution of the 13th Congress of the Party determined: "Continuing to effectively implement the policy of agricultural restructuring, agricultural development, rural economy associated with new rural construction towards ecological agriculture, modern rural areas and civilized peasants"[2]. In order to construct and develop a smart agriculture, international integration, climate change adaptability, value-added raising and sustainable development need to perform drastically andsynchronize many solutions, in which the development of high-quality human resources is identified as a significant strategic which plays a key role in the decision.

3.2. The role of high-quality human resources in the sustainable agricultural development in Vietnam present

The sustainable agricultural development is a developmental model thatis associated among agricultural growth and the natural environment, poverty and the habitat of farmers as well as rural people. Developing the sustainable agriculture and constructing a new rural need to ensure the effective economic development, a fair society and protect the natural environment. Accordingly, the role of high-quality human resources in sustainable agricultural development in Vietnam is presented in some key aspects such as:

Firstly, the high quality humanresources of agriculture are the management of the vital forces, exploiting and promoting effectively resources for the sustainable agricultural development.

Manplays the significant role of the developmental strategy, as well as the subject of development. In the process of production, humans are not only a constituent factor but also a decisive factor in the exploitation, use, protection and regeneration of other resources. In fact, all of natural resources, technical facilities, and technical science are limited, itcan only promote the effect through the roleof human resources. There are many potential and advantages about geographical conditions, natural resources, technical science and labor ... to develop a tropical agriculture towards the modern in Vietnam. However, the process of exploiting, use and promote those potentials depends on the qualities and capacity of the workforce in this field. High-quality human resources are workforce whichwere trained basically and professionally withthe high technical qualifications. They are a vital forcein studying and evaluating the potentials; determining strengths and the advantages to comparewith agricultural development of each region in the country. Thence, managers advise and propose the appropriate strategies for rural agricultural development.

In recent years, Vietnam's resources are severely impaired, the process of the fast industrialization, modernization and urbanization lead to the area of agricultural land to be increasingly shrinking; the natural resources are exploited indiscriminately leadingto declines,ecologicalimbalances. In addition, the amount of groundwater, aquaticresources,forest resources are seriously threatened from over-exploitation and unplanning ....The agriculture's high-qualityhuman resources with their capacity and qualifications are the core force inidentifying the effects of exploiting resources in the agricultural production activities and rural economy. From this basis, managers propose the solutions and directions forremediation;proposing the policies for exploiting the local advantages. The productivity of labor, crop productivity, livestock, income and benefits of workers will be guaranteed and increasedwhen the agricultural advantages are exploited and used effectively.

Secondly, high-quality human resources in agriculture are a leading force in promoting the research and applyingthe achievements of modern science and technology to production. From there, improving productivity, quality, efficiency and competitiveness, and developing agriculture to meet the requirements of international integration.

Nowadays, the strong development of the modern scientific and technological revolution, especially the Fourth Industrial Revolution that is opening up the great opportunities for the development in the numerous sectors, especially agriculture. Many countries consider to apply the high technology for agriculture as a breakthrough to move from low-value-added agriculture to high-value-added knowledge-based agriculture which is also an important solution to successfully restructure in the agricultural sector. InDocuments of the 13th National Congress of Delegate Vietnam's Party determinedthe main task in the agricultural development in the period of 2021 - 2025 as that: "Developing the agricultural goods should concentrateon the large-scale plansfollow the modern path, applying the high technology, value-added improvement and sustainable development"[3].In order to achieve the goal that State proclaimed we need toconduct the researches, apply and transfer the achievements of advanced technical science into agricultural production. This process gets fast or slow, achieving the high or low efficiency depends on the role of high-quality human resources, especially science and technology staff in the field of agriculture.

High-quality human resources are a prerequisite condition for promoting the development and applyingabout the science and technology in the agriculture, especially the professional agricultural sector. In fact, high-qualityhuman resources have been making outstanding contributions in the fields of state management, research and transfer of science and technology in agriculture in the whole country. The livestock crops have strongly developed base on the technical advances of science and technology such as the "3 reduce, 3 increase" system in rice intensive cultivation; the application of GAP, HACCP, ISO processes ... has a great effect on improving product quality.

Thirdly,high-quality human resources in agriculture are an important force contributing to ensuring food security, maintaining socio-political stability, improving the material and spiritual life for employees in agricultural and rural areas in Vietnam nowadays.

Food security is a critical issue thatis not only problem in the immediate future but also a long-term strategic issue of worldwide in general, Vietnam in particular. In recent years, Vietnam's agriculture has been impacted by the difficult andcomplex condition of the epidemics but Party and State have improved the maximum role of agricultureas a "platform" and "lifes up" for the country's economy.In the past, Vietnam had to import the food but it has become a major food export in the world today which contribute significantlyabout the country's economic development. To achieve those important results, it is impossible not to mention the role of high-quality human resources which were trained professionally with the basic knowledge and skills, they are also the core force for promoting the process of restructuring our country's agricultural sector towards improving the added value. Moreover, promoting the strong application of advanced technology and techniques to production, improving productivity and quality of agricultural products, developing agriculture in response to climate change, contributing to ensuring national food security, stabilizing the socio-economic situation for the country to continue to develop.

In the coming time, the worldwide political situation often has unpredictable uncertainties, climate change and increasing thecomplex situation of the epidemic has impacted significantly on agricultural production, but problem of the national food security is being impacted directly. The agriculture'shigh-quality human resources need to promote their role in forecasting the demandsof domestic food and exports. From there, managersestablish the plans in adjusting the activitiesof production, promoting industry restructuring, preventing and minimizing the effects of epidemics and weather on efficiency ofproduction, investing all resources for agricultural development, contributing to ensuring national food security in all situations.

High-quality human resources also play an important role in contributing to the opportunities of jobs, incomes lead to improve the material and spiritual life for employees in the field of agriculture. In fact, the area of cultivated land is decreasing, labor productivity and the infrastructure conditions is still low in the agricultural and rural areas in Vietnam.Therefore, the agricultural workers' life is still lower than urban areas. Unemployment and lacking of work still remain potential in agricultural and rural areas, especially theneedy areas. Due to the process of industrialization and urbanization lead to number of agricultural labor transfer from the countryside to cities for finding employment, this created the pressures on urban areas and arousing many negative social phenomena. On the other hand, the process of switching to the market mechanism led to a small part of farmers lack of land, they have to employ on the land previously owned by them. The differentiation of rich and poor in agricultural and rural areas is increasingly acute and pressing.

High-quality human resources in agriculture with a team of managers, scientists, agricultural entrepreneurs and farm owners have an important role in advising, proposing the appropriate plans and exploiting maximally the potentials and advantages of each local region. When the advantages are exploited and used effectively, the productivity of labor, crop productivity, livestock will be increased, the income and benefits of workers will be guaranteed to be higher and higher. In addition,high-quality human resources also play an important role in researching, and developing the cooperation programs; supporting farmers in production, preservation, processing and consumption of products, vocational training, improving qualifications for farmers, attracting farmers to work at high-tech agricultural production enterprises ... contributing to the chances of employment, raising incomes and improving the lives of workers in agricultural and rural areas.

Fourthly, high-quality human resources in agriculture play the important role in protecting the ecological environment of agricultural and rural areas in our country nowadays.

The development of agriculture and rural areas associated with ecological environment protection is an important objective in restructuring the agriculturedevelopmental project as the important criteria of the National Target Program for new rural construction in Vietnam present. Implementing the above policies requires promoting the role of many organizations and forces, in which high-quality human resources play the significant role.

The agriculture'shigh quality human resources which are managers, experts, scientists, skilled workers have an important role in evaluating and effectively determining the effects of resource extraction (land, water, biodiversity, minerals)in activities of agricultural production to ecological balance.Thereby advising and proposing the specific solutions for the developmental programs and the projects. Supervising and checking the level of pollution and therisk of environmental pollution affect to nature and agricultural products to identify solutions to limit and minimize to the environmental pollution. Moreover, high-quality human resources are also the core forces in the development of organic agriculture, ecological agriculture, high-tech agriculture which contributing positively to the protection of the ecological environment.

In recent years, all of countries is being impacted by the global warming and natural disasters which are increasing seriously. In addition, the epidemic situationis complicated on a huge scale which impact to the crops, livestock and humans. Thus, the number of pesticides used in agriculture will increase every year. Using products of the unknown pesticidesharm seriously agricultural production and people's lives, polluting the ecological environment. Therefore, a team of experts, scientists and agricultural managers need to research and propose appropriate solutions to raise the people's awareness in using the safe of fertilizers and pesticides such as: encouraging farmers to produce and use quality pesticides and herbs, expanding the application of technical advances;the programs about improving cultivation andproducing the safe crops ... to adapt to climate change and protect the ecological environment.

3.3. The basic solutions to develop high-quality human resources to meet the requirements of sustainable agricultural development in Vietnam nowadays

Firstly, improving awareness about the role of high-quality human resources for sustainable agricultural development in Vietnam nowadays.

This is the most important and decisive solution relate to the quality of high-quality human resource development to meet the requirements of agricultural and rural development in Vietnam today. The Party, State, ministries and people need to be aware of rightly the challenges about the quality of agricultural human resources in Vietnam in the context of globalized competition and the development of the modern scientific and technological revolution. Without improving the professional skills of workers through training, it is impossible to improve labor productivity in this field and therefore we cannot compete on the quality of agricultural products. These are responsibilities and duties of all levels, sectors and society, especially agriculture and rural development.

Secondly, innovating the state management about the development of high-quality human resources meets the requirements of sustainable agricultural development.

Perfecting and improving the capacity, effectiveness and efficiency of the management apparatus on human resources development of the Agriculture and Rural Development Sector. Clearly define between state management functions and career activities. Strengthening decentralization, improving the autonomy of human resources training institutions. Implementing the planning of a network of high-quality human resource training institutions for the agriculture and rural development sectors nationwide, fitting with the development orientation of sectors, regions and localities in agriculture and rural areas. Innovation in training management goes hand in hand with the innovation of recruitment and use of high-quality human resources after training. Implementing the State's policies and having appropriate policies and mechanisms to develop high-quality human resources in agricultureincluding the contents of the working environment, employment policies, incomes and living conditions ... at the same time, there is a policy to prioritize and attract students to study agricultural and rural development disciplines and trades.

Thirdly, innovating the activities of training high-quality human resources in agriculture towards modern way, fitting with reality to meet the needs of rural socio-economic development in Vietnam.

Improving the quality of training, on the basis of enhancing the conditions to ensure the quality of training, especially the quality of human resources towards the output standards that fit with the needs of using high-quality labor in agriculture and rural areas. Innovating about training methods that meet the diverse needs of students and the development needs of each field of agriculture, forestry and fishery according to different levels. Connecting training institutions with production facilities in agriculture and rural areas, in order to improve professional skills for post-training students. Standardize teachers in higher education institutions and colleges to improve the quality of training of highly qualified human resources in the field of agriculture and rural development.

Focusing on improving the qualifications of technical staff and managers; there are many policies to attract high-tech labor resources. Training and retraining for people to access and use machinery and equipment in preservation, preliminary processing of agricultural products and processing of agricultural products. Strengthening the development of information technology systems, improving awareness about the policies of the Party and the state.Especially, applying new scientific and technological advances are highly applicable. Goverment need to encourage agricultural enterprises to apply high technology in some key products, creating conditions to entice theinvestmentsof inside and outside the province. Enlisting funding from programs, projects, integration, concessional loans from development banks, science and technology funds in combination with budget funds for agricultural and rural development to invest in infrastructure for production development, receiving technology application transfer, vocational training, technical training for high-tech agricultural production areas.

Fourthly, improving the effectiveness of vocational training for farmers before the development of the modern scientific and technologicalrevolution.

Training on the basis of the real needs of the farmer, linking training with job settlement for workers. Relating to vocational training programs with new rural construction programs. Reviewing the list of training occupations for re-approval to suit the labor demands of enterprises and the requirements of the labor market, fitting with the new rural construction planning, meeting the task of restructuring sectors and sustainable poverty reduction on the basis of thoroughness and serious implementation of the motto "vocation is only trained when people are identified really about employment and post-apprenticeship income".

Programs and training materials should be built flexibly and closely with reality; organizing about vocational training through many flexible and appropriate forms. In addition, training and fostering necessary knowledge and practical skills, it is recommended to focus on fostering knowledge and soft skills on labor law, labor safety, business knowledge and starting enterprises in competitive conditions of market mechanisms,... Closely attach the review and determination of the list of training occupations with the vocational orientation and advice for employees to choose. There are active methods to solve the output for agricultural products. Creating the favorable conditions for employees to borrow production and business loans and creating chances about jobs after studying to promote the effectiveness of teaching and apprenticeships.

4. Discussion and Conclusion

The sustainable agricultural development is an objective inevitabletrend, it also is adevelopmental goal of many countries in theworld. In Vietnam,the potential and advantages for agricultural development are still great. However, if people want those potentials become the reality and the developmental agriculture to become an important spearhead in theeconomy, we need to invest comprehensively in the development of high-quality human resources. High-quality human resources inagriculture with a team of management leaders, scientific and technological staff, entrepreneurs and workers who are professional training with the high technical qualifications, good professional skills, good health and good qualities will be the main motivation and the key factor ensuring the comprehensive development of Vietnamese agriculture in the direction ofmodernity, efficiencyand sustainability in the current conditions of international integration.

hoabui@gmail.com
Academy of Politics, Hanoi, Vietnam

Abstract

Developing military science and technology potential to adapt to the Fourth Industrial Revolution requires a well-rounded strategy in which human resource training in military science and technology takes priority over other factors. Improving the quality of advanced human resource training in military science and technology is not only a mission to develop military science and technology potential but also an essential requirement to reinforce military strength, fulfilling the requirements for the process of building and defending the Socialist Fatherland of Vietnam in a new state of affairs. The Fourth Industrial Revolution has significantly influenced all-round process of education and training, especially advanced human resource training in military science and technology.

Keywords: *High quality human resources, Fourth Industrial Revolution*

1. Introduction

The Fourth Industrial Revolution is no longer a new trend, and indeed it is happening. This revolution clearly has a sharp impact on every social aspect including the matter of improving the quality of human resource training in military science and technology. Building a "revolutionary, formal, high-skilled, modernized" military in the context of the Fourth Industrial Revolution requires a well-rounded strategy in which advanced human resource training in military science and technology takes priority over other factors. Education and training strategy in the armed forces during the period 2011-2020 is determined: "Training the advanced human resource of the armed forces has a strategic meaning in the process of building a revolutionary, formal, high-skilled, modernized Vietnamese National Army. This in part determines the success of building and defending the Socialist Fatherland of Vietnam in a new state of affairs."[98]

[98] Ministry of National Defense (2013), *Strategy of developing education and training in the army during the period 2011-2020*, enacted with Decision no.2523/QD-BQP passed by Minister of National Defense on Sept. 15th, 2013

2. Methods

The article used an overall and comprehensive approach to collect and summarize the last studies and reports that related to this topic. We mainly use statistical methods, synthesis and secondary data in this article research.

3. Results

Advanced human resource training in military science and technology is an interconnected, unitary process which is mainly manifested in its quantity, forms, divisional structure, training contents, and capability to enable a sustainable, long-term employment of those trained individuals for the goal of nation-building and defense. Each mentioned factor either directly or indirectly influences the quality of human resource in military science and technology. Among those factors, however, recruitment process serves a decisive role. If the recruitment process produces an outcome of below required standards, the wanted post-training results will hardly be obtained. Hence, to work towards the goals, contents, and requirements of improving the quality of advanced human resource training in military science and technology, the process of recruitment must be appropriately appreciated. In fact, in recent years, the number of applicants for different majors is relatively high, yet the overall quality of applicant pool remains low. This problem impedes the process of improving the quality of advanced human resource in military science and technology nowadays.

Other than recruitment process, factors, such as training goals, program contents, training methods of each specialization and each study level, play an integral part in influencing the quality of human resource in military science and technology. K. Marx stated: “Altering human’s mutual instincts to make humans possess knowledge and tactful habits in a specific profession, meaning to become a full-grown and distinctive worker, necessitates a certain level of education”[99]. To attain a certain level of knowledge and ensure continuous enhancement of human resource in military science and technology, all the factors relating to training process must be considered, for example: training goals, contents, methods, investment in modernizing infrastructure, and attractive benefits for advanced human resource in military science and technology. To be more specific, in the current situation, to improve the quality of advanced human resource training in military science and technology regarding the adaptation to the Fourth Industrial Revolution, in our opinion, some main matters, as following, need to be addressed:

First, military technology institutes need to standardize goals and clarify training motto accordingly to the objective requirements for improving the quality of human resource in military science and technology nowadays.

Current training goals and requirements of military technology institutes are: Educating military engineers, cadres, technicians to have decent work-related understanding,

[99] K.Marx(1867), "Capitalism", K.Marx & F. Engels - complete works, vol.23, p.285. National Politics Publisher, 2002.

strong political mind, ability to think independently and creatively; Undergraduate level, graduate level, and military talents; In-depth work-related knowledge and ability to fulfill appointed responsibilities. Based on the general goals, each specialization taught at military technology institutes is materialized to reach specific sub-goals in accordance with the quality, capability, and knowledge required for the respective positions that will be occupied by those trained groups upon graduation. Throughout the process of standardizing goals, the relationship between goals of the whole training program and goals of each specific period, each study level, each school year, and each specialization must be harmonized; Simultaneously, the process should comply with current developing strategy of the armed forces: "revolutionary, formal, high-skilled, modernized."

Process of standardizing training goals must meet the requirements of integrating and outcome of undergraduate level being equivalent to that of national standard, suiting with each study level, specialization, and typical characteristics of training young cadres, high-quality cadres in the domain of military science and technology. Standardizing training goals must direct towards creating and developing young human resource which has enormous potential and adaptive capability to keep pace with the development of science and technology revolution, especially military science and technology nowadays. Indeed, this is one of the important factors for the process of building a "revolutionary, formal, high-skilled, modernized" army in the context of the Fourth Industrial Revolution. Accordingly, human resource training goals must include the requirement for a well-rounded basic understanding, yet an in-depth knowledge of the specialization. Besides, other matters, such as political and moral qualities, professional motives, are also main contents and ultimate goals that should be strived for in standardizing training goals for advanced human resource in military science and technology at the present.

Standardizing training goals needs to rest on cognitive basis and are able to resolve conflicting aspects such as: conflict between comprehensiveness and intensiveness; conflict between meeting short-term demand and meeting long-term demand; conflict between adjusting quantity and advancing quality of human resource; conflict between reality as well as potential existing during training process and ultimate goal which is ensuring the success of training human resource in military science and technology with sufficient quantity, appropriate structure, and high quality. This way, drawbacks deeply rooting in human resource training in military science and technology can be adequately addressed, thereby facilitating the adaptation to the Fourth Industrial Revolution.

As a matter of fact, apart from conventional functions and responsibilities of researching, mastering, and developing military science and technology, the crew of cadres and technicians also has to deal with many complex and sophisticated situations in the real world. This fact entails the need for required knowledge level of the staffs to be reflected in training goals standardization, taking into account the fundamental core, systematization, persistency, and the possibility of changes in reality to make appropriate adjustments or complements if necessary.

Motto of human resource training in military science and technology nowadays is "hands-on learning", "theory is consistent with actuality", "a close relationship between school and military units is fostered." Therefore, a proper apportion among theory and practice, politics, military, and technical skills is crucial for the coherence not only between theorical knowledge and practical experiences but also between knowledge of military science and technology and knowledge of other necessary fields. Within the context of the Fourth Industrial Revolution, science and technology in general and military science and technology in particular are climbing the ladder and achieving major breakthroughs, laying a firm foundation for further development in almost all military elements. A sound foundation of modern science and technology will bring about many potentials for military arms and equipment. This, accordingly, leads to the demand for transforming the process of advanced human resource training in military science and technology these days. The resolution of the Party Central Committee XII's 5th Conference emphasized on "growing human resources, especially high-quality one, and seizing the opportunities and accomplishments of the Fourth Industrial Revolution."[100] This is, indeed, a wise strategy of our Party. In modern war, payrolls of combatant arms are fundamentally lean and highly mobile; Also, the battleground is expanded, making it more difficult to recognize the boundary between battlefront and home front. Combat operations have also significantly changed. Collaborative combat and independent combat are tightly combined thanks to modern communication system. Strategies, command system, and combination of different types of military weapons and equipment have sharply altered. Perspectives on combat space, time, objectives, and strategies are considerably changing as well. These altered factors have deeply influenced the process of advanced human resource training in military science and technology. V.L. Lenin asserted that: "…modern war as well as modern techniques require high-quality human resource. Without land forces and marine forces, along with creative ideas and consciousness, victory in the modern war is unattainable."[101] Thus, training process in military technology institutes these days must be built based on the practical military conditions. This is the only philosophy to be considered accurate in standardizing goals and requirements for advanced human resource training in military science and technology nowadays.

Second, continue to update training programs for advanced human resource in military science and technology and thereby aim at a well-rounded, firm, and in-depth development.

Training syllabus regulates system of vital knowledge for learners. This is one of the most important matters in advanced human resource training in military science and technology to adapt to the Fourth Industrial Revolution. As we all know, the nature of the

[100] Vietnam Communist Party, Document of the 5th Conference - Central Committee XII, Office of Party Central Committee, Hanoi, 2017, p.54.

[101] V.I.Lenin (1905), "Hai cang Lu- thuan that thu" , V.I.Lenin-complete works, vol.9, Progress Publisher Moscow. 1979, p.191

Fourth Industrial Revolution is relying on the foundation of digital technology and mingling with smart technologies, therefore resulting in the arrivals of new jobs, technologies, and techniques. This phenomenon arises not only in the general workforce but also in the domain of military science and technology. Thus, it is required that military engineers be equipped with the latest knowledge, skills, and qualities to keep up with new demands in practice. To meet this requirement, it is recommended to quickly complete training syllabus in an open and integrating way while speedily scrutinizing and properly arranging the contents included in the training syllabus. Moreover, it is essential to focus on leading fields which greatly affects the development of military science and technology in the context of the Fourth Industrial Revolution.

When updating training syllabus, training capability and demands need to be accurately determined with a concentration on developing plans and forecasting future demand for human resource in different fields of the armed forces. Under current circumstances, training syllabus need to acknowledge the importance of improving education and training quality in accordance with regional and international standards, thereby bringing about positive transitions in advanced human resource training in military science and technology.

Update on training syllabus needs to rest on practical requirements of current military activities and learners' abilities and requirements, thus ensuring lean, modern, practical characteristics as determined in our Party's ideology: "Quickly transforming education procedures from mainly providing knowledge to thoroughly developing learners' capabilities and qualities; hands-on learning; theory is consistent with actuality. Education and training development must go along with demands for economic and social developments, nation-building and defense, science and technology enhancement, requirements for human resource and workforce development"[102]. Training syllabus needs to equip learners with both knowledge and skills that are suitable with the fast changes of the Fourth Industrial Revolution, especially changes in military science and technology. Training programs must aim at developing both capabilities and qualities of learners, thereby ensuring harmonious combination of moral, rational, physical, and artistic aspects; providing education with regard to becoming an ethical person, obtaining fundamental understanding and vocational knowledge; Particularly, teaching duration for foreign languages, information technology, and technology needs to be extended appropriately. Open-training programs must be carried out in such a way that is flexible and compatible with the fast changes of the Fourth Industrial Revolution. Also, training programs need to focus on the close relationship between "theory and actuality", "link between school and military units" … This way, education is worth to be considered a priority in implementing plans and programs of economic and social development, as our Party determined: "Transforming

[102] Vietnam Communist Party, Documentary of the 12th National Party Congress, Office of Party Central Committee, 2016, p.114-115.

education and training both fundamentally and comprehensively; improving the quality of human resource; promoting research, development, and applications of science and technology; maximizing leading, central role of education, training, science and technology in our country's transformation and development progess.[103]

However, updating syllabus for advanced human resource training in military science and technology is a complex problem these days. This complexity directly derives from conflicts arising during training process, in which the major conflict is between the fast augmentation of humankind knowledge, particularly improvements in military science and technology, and limited time for training. To settle this conflict, the problem arising in the process of updating training syllabus is the need for a fundamental, systematic, and in-depth resolution. Therefore, under current circumstances, training syllabus update needs to be coupled with the current requirements for army's development, particularly military science and technology's development, and to be suitable with prevailing trends of education development both nationally and globally. Most importantly, training syllabus update for advanced human resource training in military science and technology needs to be well-rounded and practical with a concentration on systematic, unitary, flexible, and modern characteristics. Some other problems emerging during the process of updating training syllabus are: scrutinizing, eliminating overlaps in different subjects and modules; determining the accurate volumes of fundamental knowledge and specialization's knowledge; new subjects and new problems need to be researched fundamentally and systematically so as to, then, be added to the syllabus; rectifying adverse trend of prioritizing only specialization's subjects over other scientific subjects and vice versa.

Third, acknowledging the importance of modernizing education and training's methods, investments, and improvements in military technology institutes to energize learners.

Accompanying training syllabus update's progress, a crucial factor contributing to the improvements of advanced human resource training in military science and technology under the influence of the Fourth Industrial Revolution is transformation in education and training's methods. Teaching methods these days are required to focus on teaching learners to study and think independently; Particularly, encouraging self-study and life-long study among learners is very important. This means that we have to "continue to quickly modernize teaching methods; encourage positiveness, proactiveness, and creativity among learners when it comes to knowledge and skills application; change the habit of passive learning and memorization. The emphasis should be teaching and encouraging independent study and thinking, thereby equipping learners with the abilities to absorb new knowledge and skills by themselves"[104]. Under the strong influence of the Fourth Industrial Revolution

---

[103] Vietnam Communist Party, Document of the 12th National Party Congress, National Politics Publisher, 2016, p.77.
[104] Vietnam Communist Party (2013), Document of the 8th Congress - the 11th Party Central Committee, Office of Party Central Committee, Hanoi,p.128-129.

on all social aspects including military science and technology, humankind knowledge is rapidly gaining in numbers. Therefore, the essence of advanced human resource training in military science and technology must be instilling in learners the abilities to think logically, synthesize, and apply absorbed knowledge in practice. Professors must inspire learners to be proactive in studying and researching so that learners can devise new findings and effectively address new problems without rigidly sticking to outdated methods. Professors also need to trigger and nurture both critical thinking and creativity of learners; In return, learners must be surrounded by a creative environment because only in such environment can learners' potentials of consciousness and practice be maximized. Under prevailing circumstances, the effectiveness of advanced human resource training in military science and technology is not measured by the volume of delivered knowledge but mostly by the development of creative ability, logical thinking, adaptive ability, and the ability to apply acquired knowledge in military practice. Military technology institutes need to provide military engineers and cadres with decent infrastructures for the purpose of promoting self-study and avoiding being left behind by the current state of technology explosion.

Aside from transforming teaching methods, upgrading teaching facilities is also an important factor to exploit full benefits of currently available resources. Apparently, modern technological facilities have become an inevitable element of modern education system in the prevailing situation. Hence, the process of advanced human resource training in military science and technology requires gradual investments in modern facilities, coupled with carefully considered alternative of upgrading equipment which is directly involved in technical specialization of each study level and each major.

Fourth, completing system of policies and procedures for training and developing advanced human resource in military science and technology.

This is one of the crucial factors generating direct motivation for continuous improvements in advanced human resource training in military science and technology of our country nowadays. Our Party has determined that: "Completing institutions for developing, applying science and technology, education and training, human resource, especially high-quality human resource"[105]. With the passage of time, our Party, nation, and army have passed many proper institutions and policies, favorably influencing the process of advanced human resource training in military science and technology. However, during the progress of implementation, the existing policies exhibit some drawbacks and fail to exert expected effects. As a result, improving quality of advanced human resource training in military science and technology requires not only regular adjustments and complements but also complete, appropriate institutions and benefit schemes for in-charge staffs.

4. Discussion and Conclusion

In the forthcoming years, it is necessary to continue to rigorously implement

[105] Vietnam Communist Party, Document of the 5th Congress - the 12th Party Central Committee, p.54.

"Proposal of ameliorating and developing military teaching staffs". In the short term, training and re-training teaching staffs, taking on different forms, should be further advanced. In arranging and appointing teaching cadres, people with decent abilities and qualities are prioritized to effectively nurture the potentials of this group. Functional departments, together with military units, elect officers who possess adequate abilities and teaching skills, to receive trainings for changes in work position, from working in military units or factories to working as lecturers. Selections of lecturers among outstanding students are prioritized. Furthermore, it is beneficial to establish partnerships with other universities and military technology institutes to recruit students graduating from technology specializations with decent abilities, qualities and are willing to work for military institutes in the long term; expand joint training networks; send outstanding cadres, lecturers, and students abroad to enhance their technical knowledge …

The works of completing institutions and policies for training advanced human resource in military science and technology need to be carried out simultaneously in all aspects such as: career orientation, education and training's quality, development policies, working conditions and environment, along with benefit schemes' policies and military home front policies … Especially, employment and benefits must be concentrated on to generate motivation and encourage positive attitudes towards continuous improvements in all aspects among students of military technology institutes. Proper, effective policies regulating scientific research activities should be implemented; Excellent research proposals should also be offered well-deserved rewards.

In conclusion, the Fourth Industrial Revolution has significantly influenced all-round process of education and training, especially advanced human resource training in military science and technology. Therefore, improving the quality of human resource in military science and technology entails education and training's process to be transformed with adaptation to the Fourth Industrial Revolution. In other words, the progress of building a "revolutionary, formal, high-skilled, modernized" army under the context of the Fourth Industrial Revolution largely depends on the exploitation of human resource, especially advanced human resource training in military science and technology these days.

ECONOMIC ACTIVITIES AND ENVIRONMENT IN KACHIN STATE, MYANMAR

Prof. Dr. Seng Aung

sengaung@gmail.com

Geography Department, Myitkyina University, Kachin State, Myanmar

Abstract

This paper is consideration toward sustainable economic management for development and natural resources conservation to bring green, clean environment and stability of climate situation, recommendation bring to the peoples to keep rivers and forests of Kachin State. The damages such as social, environmental are throughout the state by the extensive and unsustainable mining includes problems to river ecosystems, mercury contamination, deforestation and social disintegration. A major aim is to focus on environmentally harmful and unsustainable resource extraction and to contribute knowledge and experience for development of the local people and the environment. Any mining, gold, amber and jade mining brings immediate wealth for some, but has serious long-term problems for people and environment. Today, the majority of the world's population lives in urban areas. Before the industrial age, cities for commercial trade and administration, but people resided in rural areas, engaging in mining, subsistence agriculture etc. Advances in technology from the industrial era created a highly productive sector: manufacturing. The focus shifted to meeting the needs of modern life but economic activities still depend upon natural environment. It needs to be highlight for sustainable development goal.

Keywords: *clean environment, conservation, development, sustainable economic management.*

1. Introduction

Kachin State, (343799.999 sq. miles) is made up of beautiful snow capped mountains, tropical and subtropical evergreen forest, and borders with India's Arunachal Pradesh State on its west, China's Yunnan Province on its east, and Tibet in the far north. Total population in Kachin State was 1,689,441, male 878,384 and 811,057 female (2014 census, Census Report Volume 3– A (Kachin). Urban population was **1,642,841** and rural population was 1,050,473 in Kachin State (census 2014). The headwaters of the Irrawaddy River and ice capped are unique landscape of Asian countries, are found in Kachin State. The N'Mai Hka and Mali Hka give birth to the Ayeyawady River. A wide range of ecosystems, through to high alpine areas a diversity of wildlife and numerous extraordinary species of plants, some of great medicinal value (Seng Aung, 2006). Appropriate levels of properly regulated mining and hydroelectric development could provide an important lift to the economy, though hydroelectric investment often involves the importation of workers rather than jobs for the local labor force. Amber, gold, precious stones, jade and other minerals are extracting. The mining sector is a major source of economic activity in Kachin State. The mining operations have been criticized for the extensive environmental damage they cause, as well as for the working and social conditions of mine workers and the affected neighboring communities. Many social problems such as alcoholism, drug addiction and gambling result among migrant workers separated from their families.

2. Method

The data obtain is based on a variety of sources, including interviews, field works, internet search, social medias and literature reviewed of mining-related documents. The interviews were carried out with knowledgeable people from Kachin State over a time. Interviewees were local miners, mining developers, local leaders and people working in mine areas. Research in Kachin State was conducted all time. There are many questions and answers concern with environmental observing and health studies, and from people who are willing to participate.

Field observation and interviewed aged old people and literature review are carried out. Documentary photographs are taken to be used qualitatively and descriptive research technique is used. Collective discussions at the community dialogues in the villages along with the face to face meetings with different stakeholders at the township level gold mines that included key persons from relevant goal mining and workers that provided information on how working in different gold mining areas.

3. Results

Gold mining

According to MIMU, 2020, organizations active in Kachin State were a total of 64 agencies reported activities in Kachin state: 42 are engaged in development-focused projects (273 village tracts/towns), 11 are engaged in support to other vulnerable groups. Some projects of each sector in Kachin were as follow -

s. No	Sector	No of project	No of Township
1	Agriculture	4	9
2	Environment	3	3
3	Mine action	2	2

Source: MIMU 2020, page 3.

Gold mining operate along all the major rivers, Mali Hka, NMai Hka, Chindwin and also on-land where virgin forest areas. The main mining centers appear to be along the Irrawaddy River north of the state capital Myitkyina and the areas Hukawng Valley/ Tanai Township and the Chindwin River, Dabi Hka and Nambyu Hka rivers.

Since the 1990s, transformed to Market Oriented Economy local small scale the artisanal mining has been replaced by companies' mechanized mining and more environmental destructive practices. These include riverbed mining with bucket and suction dredges as well as hydraulic mining of river banks and large open pits and shaft mines. Make way for mining and setting of necessary infrastructure on land more and more areas are major drivers of deforestation in Kachin State. Together with the mining activities, mercury utilization in the mining areas has increased. Unsustainable methods of mining that effect increasingly in large areas of land and are spreading, cyanide leaching, as the most easily accessible alluvial gold is depleted and deposits deeper in the ground and in hard rock are exploited.

Kachin State is well-known as rich areas of biological diversity. The natural resources conservation is local, regional and international level of importance.

The logging and gold mining has already caused incalculable loss of biodiversity in the rivers and forest ecosystems. Gold mining is taking place in the headwaters of the Irrawaddy. It threatens the ecosystem of the entire river basin and along with it the livelihoods of about 20 million local people (recited by PKDS, 2004). By its very nature gold mining is unsustainable and highly disruptive to the areas in which it takes place and of the downstream environment. Practically effective conservation and adequate environmental protection laws and proper law enforcement are needed.

Mining wastes is discharged directly into rivers and onto land including agricultural areas, the same time mercury used in the mining process are effected on spreading areas by mining operation moves on. Engine oil used to run machines and waste from mining flow to rivers and valley cause the pollution effect in agricultural lands. Mining chemicals will continue to take its toll on biodiversity and human health. Aside from the obvious pollution, mining causes physical and chemical structural changes to rivers which can cause ecological damage. Rivers are diverted for riverbed mining operations, while water blasting of sediments destroys riverbanks. These structural changes result in the loss of many riverine habitats for fish species. They also affect the direction and speed of the water erosion which has already led to unusually low water levels in flooded areas and increased flooding in others.

Planning for the short and long-term considerations in the Kachin State is desperately needed. The mining of gold in Kachin State is earning enormous profits - but at tremendous lost to the environment. Local communities do not benefit from the business but instead suffer from environmental degradation. They are frequently deprived of clean water and farm land, and of access to resources that formerly provided their livelihoods. The economic conditions that gold mining cause great inequality and poverty. The uneven development of ethnic areas and widespread corruption has exacerbated the situation.

The mining often deepens poverty and it creates numerous social problems, such as drug and alcohol abuse, prostitution, gambling, loss of community identity and ethnic conflicts. Mining areas are also breeding grounds for malaria and sexually transmitted diseases (PKDS 2004). The gold mining industry as it is operated in Kachin State exposes local people and migrant workers to serious long-term risks from mercury poisoning. According to PKDS 2004, miners and local people are often poorly educated to access information on the threats posed to their lives and health from pollution by mining agents, so dangerous handling of mining chemicals is commonplace. Working conditions for miners are not at all safe extremely difficult to improve. Poorly equipped divers work exceptionally long hours under water directing the hoses of suction dredges. The loose sides of current and abandoned mining pits constantly threatens to bury mine workers and locals under landslides and have already allegedly caused many deaths. Accidents on the turbulent rivers have become more frequent as the number of vessels has increased. The anchor cables of dredges and the dredges themselves are obstacles for traffic on the river. Mining activities in Kachin State have already taken an unacceptably high toll in lives of locals, workers and people traveling along the rivers.

Hukawng Valley: Hukawng, isolated valley in Kachin State. The abundant watershed rainforests of the upper Chindwin (Tanai Hka River) and gold mining activities gold containing sediments deposited by annual floodwaters can be found on the banks of all the tributaries of the Tanai Hka. There are Nam Byu, Shumbwi Yang, Kap Dup, Wanpala, Dalu, Daga,Ting Kok and Nam Gawn major gold mining areas. The natural deep forests are turned into denuded, muddy wastelands of tailings pools and rock piles. The miners are mostly migrant workers from other pleases of Myanmar.

The Mali Hka River is one of the main centers of mining activities in Kachin State. At some places the river is wide enough to allow river bank mining. Before the gold boom, the villagers along the Mali Hka made their living through rotational farming, forest cane (rattan) gathering, and some small scale gold panning. Now most locals work in mining related activities and thousands of outsiders have come as migrant workers. The numerous social and environmental problems these villages face are repeated in many other areas of Kachin State where mining for gems, gold, amber and illegal logging cause a temporary boom. As sustainable local livelihoods have changed to dependency on gold mining, communities have become less self sufficient, particularly in food. In this way, mining has caused communities to become less viable in the long term. Dependence on prostitution and drug dealing, drug abuse and the spread of HIV/AIDS and other diseases are part of the reality.

Deforestation is a major concern since the trees of the surrounding forests are being cut to clear land, for the construction of mining camps, fuel wood or simply to make space for mining. Sewage from the mining sites contaminates the rivers. Many people do not understand that the river is polluted, and continue to take their drinking water from the river (PKDS, 2004).

Gold mines on the N'Mai Hka River, around Chipwi Township are still being major mined. Magyeng Yang is a mining-affected village in the Chipwi region. The Chipwi region is severely deforested from gold mines abandoned over ten years ago.

Hpakant jade mine

The product of Kachin State is best known for is its jade and most of the jade extracted in Myanmar comes from Hpakant. The important jade mines are located in Hpakant township of Mohnyin District (Tawhmaw, Longkin and Houngpa). Annual production figures have exceeded 32,000 tons in recent years with a total value of some US$2 billion, most of it being exported to China (UNDP, 2015). Other important mineral products are amber, gold, copper, iron ore and gems.

Hpakant, is internationally famous jade mines which also produce gold as a secondary product. In the 1980s, the area surrounding Hpakant was destroyed rapidly after the period 1988 with the increase of mining. Hpakant has experienced massive expansion of roads, business activities, and migration. More than 500,000 people were living in Hpakant by 2001(PKDS, 2004). Most are migrants from the whole Myanmar and from China.

Gold and the environment

Mass containing acids, finely crushed rock material, toxic heavy metals, and chemicals like cyanide can be observed. It is difficult to store this harmful waste. Tailings of waste rock and sand mixed with leftover mercury are straight into the rivers and valleys. In addition to pollution from the dumping of tailings and chemical can cause acid mine drainage due to gold is mined from rock ore that often contains high levels of sulphur as contact with air and water and produces sulphuric acid. This acid then dissolves heavy metals like cadmium bound up inside the rock, which then pollutes the environment. There is no scientific research about pollution caused by acid mine drainage in Kachin State to any effort to clean up waste rock or restore water quality and clean environment. Many of the most massive deposits are depleted and the areas from whence the minerals extracted are poisoned wastelands (PKDS, 2004).

There is no land rehabilitation in evidence of gold mining areas that the rehabilitation of mined out areas is not taking place as required by environmental law. Companies often leave old dredges behind in order to save environment and massive disturbance of the natural landscape.

Gold and social impacts

In Kachin State mining is taking place suffer from a wide range of social problems at the jade mines of Hpakant and other mining areas and spreading throughout the state. The problems such as mercury poisoning or drug, lose identity, the village loses, loss of interested in agricultural practices. The gold mining economy often profits people for outsider rather than locals. Many people lose their land due to gold mining, when the companies to whom they have given concessions force villagers to give up their land.

Education is often neglected as many children are tempted to earn quick money in the gold mining areas. Rising commodity prices, increasing the migration and labour in mining areas. Local indigenous people who work in the mining related business may lack any knowledge of the disease or its prevention at special risk for health. There is an absence of decent medical care and health education. Varieties of narcotics drug abuse spread of HIV/AIDS and other infectious diseases. Hpakant also is one of the human Trafficking industry area in the Kachin State.

Biodiversity

Of about 600 species of rhododendron world wide, around 260 are to be found in Kachin State (PKDS 2004). Numerous plant species were described by Kingdon-Ward, one of the first western scientists to explore Kachin State (1921-1952), among them the black orchid (Paphiopedilum wardii) a species endemic to the area north of Putao. A World Conservation Society (WCS) sponsored expedition found 38 different orchid species during a short survey to the Naung Mun area, Putao district in 1998. The valleys contain some of the last remaining extensive tracts of primary evergreen lowland forests in the region. Centuries old teak trees that have been spared the chainsaws and axes due to geographical and political inaccessibility can still be found in some areas. 84.2% of Kachin State's total land area is covered with forest. Ecozones of Indo-Himalaya and Chino- Himalaya, is creating an environment of extremely high biodiversity. As part of the Mizoram-Manipur Kachin rainforest eco-region, the area is home to 149 mammal species, among them the threatened takin (Budorcas taxicolar), eld's deer (Cervus eldii), red panda (Ailurus fulgens), leopard (Panthera pardus), gaur (Bos gaurus), elephant (Elephas maximus) and Malayan sun bear (Helarctos malayanus). There are 580 birds species have been counted – which is more than for any other eco-region in Southeast Asia (MIMU, 2020).

The highest number of amphibian and reptile species, the Irrawaddy dolphin, Hukawng Valley, the biggest tiger populations in Asia. Pidaung Wildlife Sanctuary (1917/18), the Hkakabo Razi National Park (1996) and the Indawgyi Wetland Bird Sanctuary (1999), are an important step towards nature conservation. Unsustainable practices like gold mining and related logging and hunting continue in many protected areas are major problem.

Agriculture

Agriculture can certainly provide a living for farmers and people but at a relatively low level unless technology, farmer support, infrastructure and marketing improve. Tourism might provide some additional potential.

The main crop in Kachin state is rice/ paddy and about 660,000 acres in 2010/11, up from 431,000 acres in 2005 (Proximity Designs, Myanmar, 2016). Other crops with about a tenth as much area each are peanuts, fruits, vegetables and rubber. There are many other crops with much smaller areas planted. Some of these are grown on land not used for rice and some on rice land when monsoon rice crops are not being grown. There might altogether and generously be 900 thousand acres that are cultivated by smallholders.

A farm extension evaluation in Kachin state in 2003 found that paddy yields could be doubled from 40 to 80 baskets an acre at low cost, so net income could be 40 baskets an acre.

There are also gather fish or forest products and to work for wages when farm labor demands are less pressing. Increased jade mining have created more wage opportunities. Income is doubled from other crops, it was well below the income from nonfarm wages.

If farm sizes remain below five acres for most households, the income from farm operations alone is not enough and incomes from nonfarm activity.

Most people (65%) in Kachin state live in rural areas and most of these rely directly or indirectly on agriculture.

The deforestation is bound to cause environmental problems which are hampering smallholder agricultural progress. The presence of well-paid work in jade mines, gold mines and other nonfarm jobs makes agriculture and likely productivity levels less attractive, but it is essential. There are opportunities to improve farming methods, outputs and incomes at a reasonable cost and these needs to be implemented.

The economy of Kachin State is predominantly agricultural. Kachin's agriculture is much less intensively developed than in the Regions of the Ayeyarwady basin to its South. Nevertheless, Kachin produces considerable quantities of rice, corn, groundnuts, pulses and beans, sugarcane and vegetables. A number of eradication programmes has helped to replace opium-poppy as an important crop. There are also good conditions for freshwater fisheries and livestock, common in many areas. The forests produce teak and hardwood, as well as charcoal, bamboo and resin. A number of industries are associated with these products, such as sugar mills and rice mills. Weaving and blacksmithing are important cottage industries.

The river ecosystem

In the river ecosystems habitats having plenty of fertile and diverse, providing homes for birds, mammals, reptiles and amphibians as well as many types of fish, shellfish and other aquatic creatures. Gold mining associated pollution from mercury and cyanide, acid mine drainage, toxic tailings, diesel and engine oil is a severe threat to wild flora and fauna. The potential for mercury to have toxic effects on Irrawaddy dolphins may be high, metals probably settle in higher concentrations in the river channel. Analysis of mercury content in fish samples, areas with the highest mercury pollution were the confluence of the Mali Hka and the N'Mai Hka and the Irrawaddy downstream of the Chindwin confluence (recited by PKDS, 2004). These findings suggest that overall mercury levels are probably higher in Irrawaddy tributaries due to intensive gold mining activities and reduced dilution capacity in these smaller rivers. Ecological impacts, such as bioaccumulation of pollutants, directly in the mining areas as well as further downstream towards the delta area.

More research needs to be carried out. Gold mining brings about a complete structural environmental, social and economic change and affected rivers ecosystems. The pits and shafts of gold mining also cause erosion and again silting as the soil runs into streams and rivers. Landscape changes like river beds, shallow water levels, shift in sedimentation areas and increased riverbank erosion cause floods every rainy season. As mining techniques like sluicing and hydraulic mining in the natural river system have reportedly increased the danger of flooding and droughts. With around 84% forest cover, deforestation inevitably is a side effect of the gold mining process in Kachin State. Forest has to be cleared to make space for mining sites is bringing further deforestation and destruction local communities facing with rising commodity prices and increases the pressure on natural resources and climate change affects and poverty in areas. This cycle of goal mining is results in socioeconomic and environmental often depletion in Kachin State. The rubbish, spilt fuel and sewage from mining camps further pollutes the environment severely threatens Kachin State's river ecosystems and associated watersheds.

4. Discussion and Conclusion

4.1. Discussion

The result of this paper is an important study to gather information about how the lives of people living and working in Kachin State. The findings will provide key information for stakeholders in the government to plan for future local economic activities and environmental conservation and sustainable development in the state, and to address challenges and gaps. The importance of the study lies in the fact that the views expressed are from both sides of the positive and negative impacts.

The study expressed problems and recommendations focusing on the economic activities and environment. The findings share government officials at the State level to further understanding of their perceptions and experiences regarding the functioning of administration at the gold mining areas in township level and support to lower level mine workers.

The study is appreciation for increased environmental allocations particularly for education and health to the local level, and the resultant improvements. More decisions making in how methods are allocated and plan could make bottom up planning and local people centered development.

To prevent serious erosion and biodiversity lost need to be considered in virgin forest areas and in areas along riverbanks. Because of their remarkable qualities and large number unique species, the forests of Kachin State deserve world heritage protection status – including the N'Mai Hka old growth fir forests and the forests of the Hukawng Valley. Dredging operations should be strictly monitored. Dredging operators should be compelled to restore streambeds to their natural topography, not create waterway hazards. Anchor cables and dredges should not be placed where they endanger boats or rafts. Immediately stop the discharge of untreated mining wastes into rivers. Remedial and mitigation treatment should also be carried out. This should be strictly enforced by law, and with mining companies obliged to put up funds in advance to cover the full costs of clean-up in the event of toxic waste spills in mining areas.

Cyanide use should be either prohibited or strictly regulated, due to the impossibility of safe containment. The sale of mercury should be strictly regulated, and all sales should carry safe handlings and health advisory warnings in relevant local languages. Conduct research on specific effects of mercury pollution in Kachin State is important. This is urgently needed both in Kachin State and in downstream areas, concentrating on the human impacts already experienced in Kachin State. Testing should for contamination of shellfish, fish and weed species may also be necessary.

The large scale increase of illegal migration into mining areas should be managed.

The widespread hunting, electric fishing and consumption of wildlife by people especially by migrant gold miners and timber workers need to be ended.

Employ locals, transfer technology: Foreign-owned dredges allowed to remain in operation should be obliged to employ and train local people to ensure that local people have a fairer share of the economic benefits. Training should include minimizing environmental and social impacts. An environmental law on mining in particular is urgently needed in order to introduce effective legal measures to prevent and mitigate further environmental damage and social fallout and should effectively notified of the environmental protection laws.

Make environmental and social impact assessments by the implementation of laws that cover all potential significant impacts should be carried out.

4.2. Recommendations

To provide improved healthcare services for miners and the general population suffering from pollution effects require affordable, skilled medical treatment and specific medicines. A greater proportion of state revenues should be allocated to enough healthcares, including primary health education.

To provide information on health impacts of mining activities.

To inform local people about the impacts of mining and risk mitigation through the school and medical systems.

Warning signs and advisories in local languages need be put up in appropriate places in mining areas. Medical staff and community health workers need be trained.

Dialogue between all stakeholders, the ethnic nationalities will make possible the effective long-term protection of the environment and more sustainable use of natural resources in the country.

Develop and express clear conservation help research the environmental problems. More information needs to be collected on people need to know the reasons the damage is taking place. It is very important to know what local people think can be done to solve the problems.

Become more active on conservation issues and join all people and who have been taking steps to protect themselves from gold mining destruction.

Aim to increase environmental awareness amongst community, environmental education materials should be produced and distributed to locals suffering from impacts of mining and deforestation, climate change as well as to the decision makers on all levels. People in both the local and international level need to share information about to decreases in fish and wildlife numbers, the increase of water pollution, the spread of deforested and disturbed areas, the extent of fertility and topsoil loss, and resources.

Come up with development alternatives ways of right livelihood (e.g. agroforestry, herbal medicine research and production, food processing, cultivation of cash fruits and rattan cane, hardwood trees, orchids, etc.) are important.

Restore mining areas affected by their activities to their original condition for covering mined areas with layers of soil and topsoil, reforestation and permanent containment of heavy metal and acid contaminated water is needed.

Educate mine overseers and workers on safety: Training on basic and improved methods of handling toxic substances and the use of safety equipment should be compulsory for mining operations.

Research cooperation, development and transfer of new safety equipment and technical solutions to mitigate social and environmental impacts is needed from international environmental groups for those actively working to protect environment, sustainable livelihoods.

4.3. Conclusion

In summary, several examples of good work and good approaches that need to be acknowledgement. The township development planning process requires clear guidelines in the needs of participatory planning and a clear statement of selection criteria need to be linked to the annual planning cycle. The contact detail of the individual responsible for the project is also important to have institutional economic activities and environmental arrangements in gold mining areas of Kachin State. Research for local populations related to economic functions, environment, management, infrastructure, logistics, and private sector would be replaced on unsustainable gold mining economy and impacts on environment in Kachin State. Deeply studies on protection, livelihood, agricultural, seasonal flood and climate change, appropriate economic activities for urban population need to be explored in Kachin State.

All local people face similar kinds of challenges in their local economy and improving access to basic functions. Poor infrastructure, problems of resource allocation, awareness and public private participation to reforms for advancing development are needed in Kachin State. At the same time, an important start will make on developing the necessary management systems to support participatory development, as well as the creation of improvements in health, education, sustainable management on economic functions. The voices that need to be heard for development goal to solve problems and challenges that will the new directions and effective ways in the State.

Strengthening local economic activities and environmental awareness through the committees and administration to provide services and reduce poverty and improve socioeconomic functions for local people. The reestablishment for sustainable economic and environmental management in village level committees would go to the way to opportunities for people's participation in development.

Abstract

Payments for ecosystem services (PES), also known as payments for environmental services (or benefits), are incentives offered to farmers or landowners in exchange for managing their land to provide some sort of ecological service. They have been defined as a transparent system for the additional provision of environmental services through conditional payments to voluntary providers. These programmes promote the conservation of natural resources in the marketplace. This paper introduces PES scheme for local people at villages in Bolikhamxay Province, Lao PDR. It first gives an overal picture of PES at provincial level before going to details of local community willingness to pay to participate in PES schemes in the region.

Keyword: *payment for ecosystem services, contingent valuation method, community livelihood, willingness to pay*

1. Introduction

Ecosystem Services (ES) are benefits that humans obtain from natural and cultivated environments. For example, hydrological services can be obtained through river flow regulation, flood control or protection against soil erosion. ES are threatened worldwide, in a variety of ways, by human activities. In response to such threats, the concept of Payments for Ecosystem Services (PES) has been proposed as a simple scheme to reward land users who adopt practices that generate ES, hence promoting sustainable land use (Mayrand et al., 2004).

Lao DPR is currently undergoing a rapid increase in hydropower development. There is currently up to 3.800 Megawatts of generation in operation, and predictions are that generation capacity may increase to 12,500 Megawatts by 2020 (Ministry of Energy and Mines). Ecosystem intact upstream catchments are important for these hydropower projects as they provide a range of watershed services such as reduced sedimentation, water flow regulation, improved water quality, and reduced damage due to floods and associated debris.

Upland areas that make up hydropower catchments are often occupied and farmed by people who have lived in these areas for many years. While traditional widen farming practices have been largely sustainable, and conducted at low intensities in the past, increasing populations and demand for agricultural commodities, as well as road construction leading improved access for agricultural traders, is leading to reduced fallow lengths and deforestation through pioneering shifting cultivation, often for non-traditional species such as maize for export to international animal feed markets. Negative impacts of this trend include reduced farming land productivity, insecure livelihoods and reduced NTFP availability for local people, and a reduction in the watershed services that hydropower projects depend on. There is a need for mechanisms to ensure that catchments are managed sustainably for both watershed services for hydropower projects and for the needs of local communities. Payments for Environmental Services (PES) schemes have been suggested as one potential option.

This paper studies the demand for PES of local people at villages in Bolikhamxay Province. It first gives an overal picture of PES at provincial level before going to details of local community willingness to pay to participate in PES schemes in the region.

PES at study area – Bolikhamxay Province

Social - economic characteristics of study area

Bolikhamxay Province, situated in the central of the Lao PDR, is characterized by the Annamite Mountain Range stretching east to Vietnam, and the Mekong River and Thailand to the west. The Annamite Mountains in the east are blanketed by semi and wet evergreen forests and are home to a high number of endemic species. Western part of the province is largely covered by drier semi-evergreen forests of a type that is more widely distributed in Indochina and contains varied habitat including grasslands, wetlands, and limestone karst.

Bolikhamxay province is primarily covered with forest (57.9%) composed primarily of mixed deciduous forest and evergreen forests. The evergreen forest occurs primarily in the east of the province close to the Annamite range along the Vietnamese border. Plantation forest, mainly rubber and acacia, are found in the flatter areas and represent nearly 1% of the total forest cover. The Regenerating Vegetation describes fallow lands, both young and old, that can also be non-mature forest plantation areas or stable bamboo forest.

There are Protected Forest Areas such as; The Nam Kading NPA, Phou Sithone ESCA, Nhot Nam Mouand PPF and Nacheng PES are mostly covered by mixed deciduous forest in similar proportions (Figure 2.1). The Phou Chom Voy PPA has the highest forest cover of any of the protected areas; half of the protected area is covered in evergreen forest while an additional third is covered by mixed deciduous forest. The Nam Gnouang South Protection Forest Area is a combination of the THXP reservoir, agricultural land, perennial grassland and mixed deciduous forest on its west side. The Khamkhuna PES area has nearly 37% of its area covered by regenerating vegetation suggesting it may be the most disturbed of all the protected areas.

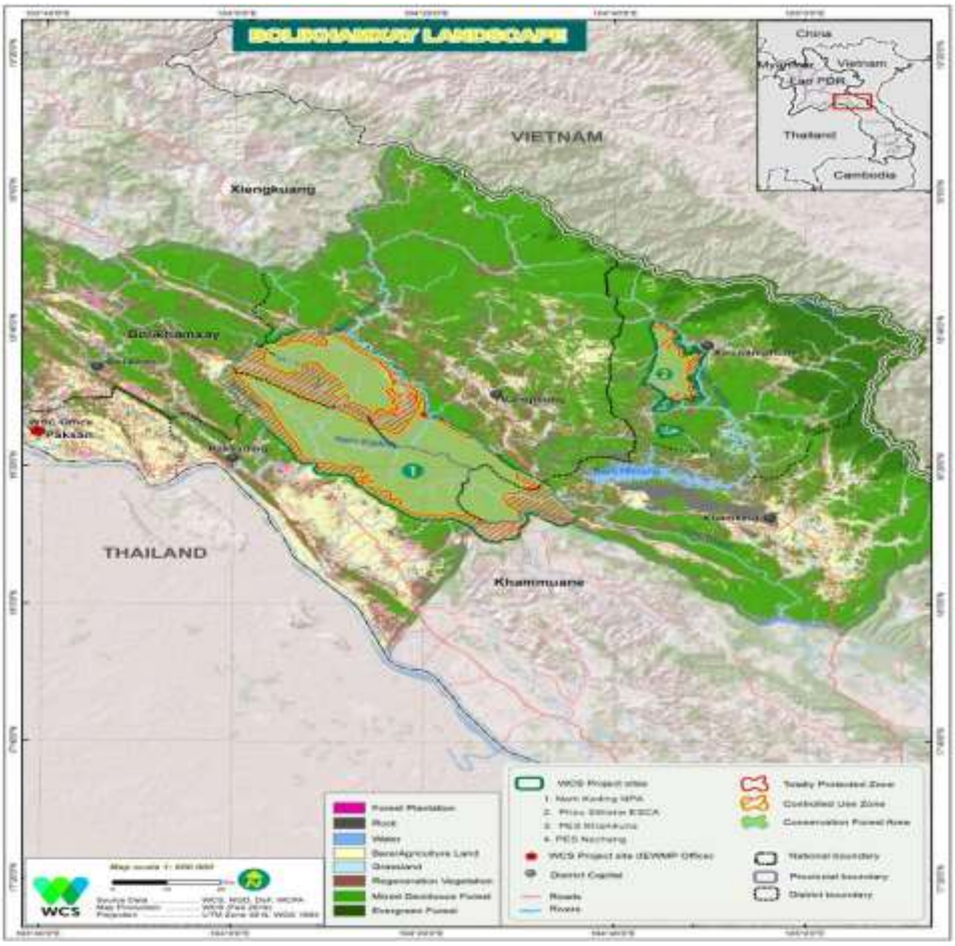

Figure 2.1. Location of the Study

The human population of Bolikhamxay is highly diverse, with several tribes from 3 major ethnic groups: Tai-kadai group, Khmuic group that encompasses Khamu and Pong, and Hmong group, totalling over 200,000 people. Population densities are, however, incredibly low with only 18 people/km^2. Around the protected areas where WCS is involved (Nam Kading and Phou sithone), community livelihoods rely on upland farming systems that are based on paddies, swidden agriculture, natural ecosystems and the services they offer, such as the provision of food, medicines, fuel, and non-timber forest products (NTFPs) that are both consumed and sold to help generate rural incomes.

Introduction to ecological services in the study area

Nam Kading NPA was created in 1993. With little villages located inside the NPA and given the difficult access to the core area, the forests remained in good state of conservation. In 2005, began support to the Nam Kading NPA Management Unit, providing technical assistance, intensive biodiversity monitoring, outreach to communities, ecotourism training and law enforcement. Nam Kading NPA is currently witnessing the development of the Nam theun 1 hydropower project, increasing pressure over land for agriculture, and significant hunting related threats. Although large fauna was present, it has disappeared or became scarce (Gaur, big cats, elephants and primates).

Since 2019, Provincial Authorities are engaged in the management of the NPA through integrated management of the Protected Area, that includes revision of the management plan, Spatial planning and land management, Law Enforcement and patrolling, capacity building of the personnel assigned, awareness campaign and Biodiversity monitoring. Approach adopted is to support rural communities in and around Nam KAding NPA to develop their livelihoods through ecotourism, non-timber forest products and village incentive funds. Finally, WCS is facilitating the Public Private Partnership between the Hydropower Company and the Government in order to sustain long term financing mechanism to the NPA.

2. Method

2.1. Models of non-market value evaluation

The parametric model is to calculate the willingness to participate for improving the forest environmental quality into the original state as if no degradation has occurred. In addition, the parametric model allows the integration of the socio-economic characteristics into the WTP function. Good understanding on how the WTP changes by individual characteristics allows surveyvers to understand the validity and reliability of the CVM method, then broaden the results of survey sample generally. Moreover, if the relationship between the independent and dependent variables in the WTP function complies with the theoretical models, the reliability of CVM will increase. The parametric model consists of two parts which are: estimating the WTP dominant function and from that function, calculating the WTP from the regression coefficients. Step 1 involves estimating the WTP function or Random Utility Model.

This model was initiated by Haneman (1984) and later developed by MacFaden. In the case of CV, there are two options. Indirect utility function of the j^{th} person is expressed by equation

$$u_{ij} = u_i(y_j, z_j, \varepsilon_{ij}) \qquad (1)$$

i = 1 is the post-improvement environmental condition (as before the degradation) or the final state, i = 0 is the current state (degradation after the incident or pollution or deforestation). The factors that affect the utility of jth person including: y_j, which is the income of jth household, z_j is the m-dimensional vector of the socio-economic characteristics of jth household, and ε_{ij} are other dominant factors but not observed. $u_{ij} = u_i(y_j, z_j, \varepsilon_{ij})$ shows the variation of utility from the current state to the improved state.

More specifically, when the environmental quality increases from q0 to q1 , the utility will change from $u_0(y_j, z_j, \varepsilon_{0j})$ to $u_1(y_j - t_j, z_j, \varepsilon_{1j})$

Based on this model, jth person has an "acceptable" answer with an X level tj if result of the utility of the improvement program minus the cost is over the utility of the current state:

$$u_1(y_j - t_j, z_j, \varepsilon_{1j}) > u_0(y_j, z_j, \varepsilon_{0j}) \qquad (2)$$

However, the surveyors will not be able to observe the random bias of the preference but can only predict the probability of acceptance. The probability of an acceptance is the probability that the person thinks he or she will be better with the proposed scenario, even with any X level, to u1> u0. For jth person, this probability is

$$\Pr(yes_j) = \Pr(u_1(y_j - t_J, z_J, \varepsilon_{1J}) > u_0(y_j, z_j, \varepsilon_{0j}) \qquad (3)$$

Equation 2.3 is the basis for analyzing selected behavior and can be used for non-parametric estimation but too wide for the parametric model. Two more models are required. Firstly, the function form of của $u_{ij} = u_i(y_j, z_j, \varepsilon_{ij})$ must be selected. Secondly, the distribution of ε_{ij} needs to be defined. Since then, the above equation can turn into:

$$u_i(y_i, z_j, \varepsilon_{ij}) = v_i(y_j, z_j) + \varepsilon_{\mathrm{IJ}} \qquad (4)$$

Indirect utility are the sum of deterministic parts and transformations.

$v_i(y_j, z_j) = v \ (y_j, z_{j,} q_{ij,})$ with the integration of environmental factors. Therefore, 2.4 can turn into:

$$\Pr(yes_j) = \Pr(v_1(y_j - t_j, z_J) + \varepsilon_{1j} > v_0(y_j, z_J) + \varepsilon_{0j} \qquad (5)$$

$$\Pr(yes_j) = 1 - F_\varepsilon[\,-(y_j - t_j, z_j) - (v_0(y_j, z_j))] \qquad (6)$$

Equation 2.5 is the starting point for the WTP function in which the most common form is linear.

In experimental terms, in order to estimate the parameter WTP function, it is necessary to use the method of estimating maximum likelihood. The sample size T and Ij = 1 if the answer is accepted. The likelihood function is turned into:

$$L(\alpha, \beta | y, z, t) = \prod_{J=1}^{T} [\emptyset\left(\frac{\alpha z_J}{\sigma} - \frac{\beta t_J}{\sigma}\right)]^{I_J} [1 - \emptyset\left(\frac{\alpha z_J}{\sigma} - \frac{\beta t_J}{\sigma}\right)]^{1-I_J} \qquad (2.16)$$

$$lnL(\alpha, \beta | y, z, t) = \sum_{j=1}^{T} I_j \ln\left[\emptyset\left(\frac{\alpha z_j}{\sigma} - \frac{\beta t_j}{\sigma}\right)\right] + (1 - I_j) \ln\left[1 - \emptyset\left(\frac{\alpha z_j}{\sigma} - \frac{\beta t_j}{\sigma}\right)\right] \qquad (7)$$

for probit.

$$lnL(\alpha,\beta|y,z,t) = \sum_{j=1}^{T} I_J \ln\left[\left(1+e^{-\left(\frac{\alpha x_J}{\sigma}-\frac{\beta t_J}{\sigma}\right)}\right)^{-1}\right] + (1-I_j)\ln\left[1-\left(1+e^{-\left(\frac{\alpha x_J}{\sigma}-\frac{\beta t_J}{\sigma}\right)}\right)^{-1}\right] \quad (8)$$

for logit.

$\ln\left(\frac{M_j - t_j}{M_j}\right)$ is standard income. Parameter vector {∝/σ,β/σ} can be estimated by running the binary model on the matrix data $\left\{z_j, \ln\left(\frac{M_j - t_j}{M_j}\right)\right\}$, thereby allowing to calculate the average value of WTP.

$$E_\varepsilon\left[WTP_j\right] = M_j\left[1-\exp\left(-\frac{\alpha}{\beta}z_j + \frac{1}{2}\frac{\sigma^2}{\beta^2}\right)\right] \quad (9)$$

2.2. Data collection

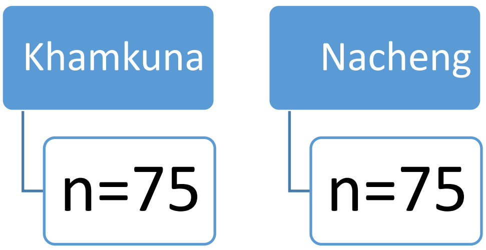
Selecting the survey sample

According to the General Statistics Office (2016), the population in the 2 villages in the study area is about 1,180 people (on average, each village has about 590 people). With an average population of 5 people / household, the total number of families is about 236 households. The study uses the following Moore formula (2003) to estimate the number of survey samples:

$$n = \frac{N}{1+N\times e^2}$$

In which: n is the sample size, N is the total number of households in the population, e is the accepted tolerance.

With e = 0.05 (the estimated error is 5%) and for a total of 236 households, the estimated number of samples to ensure reliability is n> 148. In this study, n = 150 households were chosen. To ensure the representation of each villages in the province, stratified samples were selected, in which the cluster was selected according to administrative units. N-There are 2 villages with relatively equal population so in each village, researchers will select 75 households for interview. The total number of research samples is therefore allocated as follows:



In each village, randomly selected 75 households were interviewed. Thus, each village will have 75 questionares, according to the structure below:

- At least 38 households are related to agriculture;
- There are 15 or at least 10 households involved in forests and forest-related activities;
- The rest households may be in other occupations such as office workers, civil servants, and small service traders.

Develop and test the questionnaire

When using the CVM method, the questionnaire is a key tool in collecting information and data for evaluation. In this study, the questionnaire was also built according to the standard procedure of Diamond (2000) including these steps:

Focus Group Discussion - FGD

In order to develop a questionnaire appropriate to the research conditions, two two group discussions were conducted during 2020 in the study area.

The first group discussion was conducted with state and professional management agencies in the province (Forest Protection Department, Provincial local goverment, commune and village staff, DONRE). The purpose of this group discussion is to provide a forum for managers and experts to discuss relevant issues to develop a questionnaire. The second group discussion was conducted with 150 households in Khamkuna village and Nacheng village.

Pre-test

Pre-test are an important step to gather information to complete content, format, structure of the questionare as well as enhance the skills of surveyvers. As for CVM, pre-test also plays an important role in deciding how to ask WTP questions (related to data processing model), determine the official received amount levels and participation methods

This study has conducted 02 pre-tests in Khamkuna and Nacheng. All surveyvers conducted interview to assess the actual conditions, advantages and disadvantages in the survey. Then, there are feedback to adjust the questionnaires on the format, questions, words and the order of the questions. A total of 50 local people in 3 provinces participated in the pre-test.

At the pre-test, open-ennded questions were used, in which people were informed about unused values and forest degradation were asked about WTP levels to prevent such degradation through a forest management and protection scheme. WTP levels are self-considered and stated by the people. The result was 9 levels (X): 1,000,000 kip, 1,500,000 kip, 1,700,000 kip, 2,000,000 kip, 2,500,000 kip, 3,000,000 kip, 3,500,000 kip, 4,000,000 kip, 5,000,000 kip / household.

Selection of non-market values and X levels

After FDGs and pre-tests, the study identified the most important non-market values for people (mentioned, consciousness, emotions, knowledge, understanding and beliefs of the people), include:

- The values of forest and forest protection to villagers' living and livelihood
- The values of materials reduction due to forests degradation and environmental problems
- The value of mental harm caused by degradation of forest

From the results of surveys in FDGs and pre-test, the cumulative probability of 5 levels X is 1,500,000 kip, 2,000,000 kip, 2,500,000 kip, 3,000,000 kip and 3,500,000 kip is 87% of the total number of selection. Other levels, although some people are willing to accept them, are very few, and when considering the correlation between household income that is willing to accept this level, it is inappropriate because these households have moderate income but the project offers too high or too low X. X levels of 1,000,000 VND, 1,700,000 kip, 4,000,000 kip and 5,000,000 kip are not used.

3. Results

3.1. WTP estimation model

The level of participation of Khamkuna and Nacheng people for improving forest environmental quality is estimated through models corresponding to the type of binary questionnaire (Yes or No for WTP - dichotomous questions).

For the binary questionnaires, the thesis used two model to estimate the WTP level for PFES participation of households.

The first is a parametric model that analyzes the impact of socio-economic factors of the respondents on the probability of accepting a certain received amounts (X), from which calculate the average WTP level of samples.

The second is called a non-parametric model based on the probability distribution willing to participate with a value level series (X) to estimate the expected value of WTP in that distribution (Bateman 1998).

The second model was used to estimate WTP for auction-type questionnaires. The model estimates the individual's WTP level based on the probability distribution in the certainty of participation in a predetermined value chain selected by the individual (Mc Connell, 2002, Wang, 1997).

The distribution of questionnaire samples in each village is summarized in the table below:

Table 4.1: The sample distribution rate for each village

Village	Binary question	
	Amount	**%**
Khamkuna	75	50
Nacheng	75	20
Total	**150**	**100**

Source: Processing from survey sample (2020)

3.2. WTP estimation in parametric model

The paper used a Random Utility Model (RUM) to estimate household WTP (called parametric model). The theoretical and economic basis of this model is presented in the previous section. Empirically, the thesis uses the Binary Logistic regression model and the Maximum Likelihood estimation to estimate the expected value of the WTP levels to improve the quality of forest (non-market value loss turned to the previous level, before degradation). At the same time, thesis analyzes the factors affecting the ability to participate at different levels of X.

03 models were estimated corresponding to three different sample data groups to find the range of WTP expectations. Dividing into different models also allows consideration of the differences in willingness to participate between villagers in each village and the overall model.

Table 4.18: Describe the WTP estimation model

Number	**Model**	**Explaination**	**Sample size**
1	A	Overall model	150
2	B	Khamkuna model	75
3	C	Nacheng model	75

Source: Processing from survey sample (2020)

There are 150 survey samples in this model of which 127 are used for estimation. Of the samples not used for estimation, 17 answered "not ready to participate", 6 answered unclear whether they were willing to participate or not. Carson (2003) identified these patterns as "objectionable". The investigated subjects did not agree to participate because they seemed to be opposed to a certain aspect of the investigation. These questionares were rejected for processing to estimate WTP. Thus, 127 questionnaires will be processed in the final.

The empirical model estimates WTP as a probability function of household participation to improve the quality of forest environment and preserve forest values. The probability of being willing to participate at a given X level of any observation takes the form:

$$\textbf{Pr (Yes)} = a + \boldsymbol{\beta 1} * \mathbf{Xi} + \boldsymbol{\beta 2} * \mathbf{SEXi} + \boldsymbol{\beta 3} * \mathbf{AGEi} + \boldsymbol{\beta 4} * \mathbf{MARRIEDi} + \boldsymbol{\beta 5} * \mathbf{EDUi} + \boldsymbol{\beta 6} * \mathbf{MEMBERi} + \mathbf{b7} * \mathbf{INCOMEi} + \boldsymbol{\epsilon}\mathbf{i}$$

- a is blocking factor
- βi is the regression coefficient of the independent variables (including X and other

household socio-economic characteristics)

- ϵi is the impact of other variables not listed in the model on the probability of participating at a given X level

Table 4.3: The variables in the WTP estimation model

Variables	Explaination	Coding
Pr (Yes)	Probability to participate at a certain level X to improve the quality of forest as before the deforestation and degradation	Willing to participate = 1 Not willing to participate = 0
X	The X level is set in the questionnaire and asked if people are willing to participate at that level (1000 kip / year).	Set at these valus: 1.500, 2.000, 2.500, 3.000 và 3.500 (1000 kip)
SEX	Gender of respondents	Male = 1 Female = 0
AGE	Age of interviewees (years old)	Continuous variable
MARRIED	Marital status	Married =1 Not married=0
EDU	Education level (years of schooling)	Continuous variable
MEMBER	Number of members in household (person)	Continuous variable
INCOME	Household income (thousand kip / month)	Continuous variable

EDU	.045**	.041	.035
MEMBER	.148*	.082	.065
INCOME	.023**	.021	.017
Intercept	0.756	27503.912	1.195

Source: Processing from survey sample (2020)

Note: ***: significant at the error of 1% . **: significant at the error of 5%. *: significant at error of 10%.

- Thus, in all models, the coefficient of the variable X is positive and significant at the error of 1%. This is in line with the theory that the higher the level of X is, the higher the probability of being willing to participate.

- INCOME variable in the models are positive but only significant at 5% error in all three models for overall and Khamkuna, Nacheng. Thus, in all these models, household income affects the willingness to participate in order to improve the quality of forest. Specifically, when the household income increases by 1 million kip / month, the probability of participating at a given X level increases to 2.2; 1.4 and 2.3% respectively in the overall model and research villages.

- EDU variable is also significant and positively correlated in all three models at 5% error. This means that as the level of education increases, the probability of being willing to participate and accepting a given X level also increases to improve non-market values from the latter to the pre-deforested level. When the level of education or the number of schooling increases by 1 year, the probability of participating at a given X level increases by 8% in the overall model.

- MEMBER is significant at the 5% error in the overall model. In this model, the number of people in the household affects their willingness to participate to improve the quality of the forest environment. When families have more people benefiting from better forest environmental quality, they are more willing to participate to improve and maintain the living and livelihood of their family.

- The remaining variables such as SEX, AGE, and MARRIED are not statistically significant and have no significant effect on the probability of accepting given X levels.

The average WTP was estimated from the results of the regression model following the procedure proposed by Haab and McConnell (2000). The average value of WTP for improving forest quality from the level after a deforestation and degradation to the initial level as before that of each parametric model is calculated according to the theoretical formula in the previous section and presented in the following table.

$$E_{\varepsilon}\left[WTP_j\right] = M_j\left[1-\exp\left(-\frac{\alpha}{\beta}z_j+\frac{1}{2}\frac{\sigma^2}{\beta^2}\right)\right]$$

Table 4.7: WTP Estimation from the parameter regression model

No.	**Model**	**WTP expected value (1000 kip)**
1	A	2.427
2	B	2.309
3	C	2.545

Source: Processing from survey sample (2020)

According to the estimation results, the average value of WTP in the overall model (for all observations) is 2,427,000 kip/ household. This value is different for each different model. In particular, the average WTP in Khamkuna is 2,309,000 kip (in model A) and in Nacheng village is 2,545,000 kip (in model B).

4. Discussion and Conclusion

This report aims to review PES implementation in Lao PDR and estimate the willingness topay of local community to participate in PES schemes in Bolikhamxay province. The Government of Lao PDR has shown strong interest in the PES mechanism. The main constraint in Lao PDR is not the legal issue itself, but rather the lack of human and financial capacity to implement PES. Thus, payment coming from local communities is of much critical. According to the estimation results, the average value of WTP in the overall model (for all observations) is 2,427,000 kip/ household. This value is different for each different model. In particular, the average WTP in Khamkuna is 2,309,000 kip (in model A) and in Nacheng village is 2,545,000 kip (in model B).

Understanding local people's decision processes is an essential precondition for designing effective and efficient PES programmes. The model used here show the willingness-to-consider decision from the subsequent enrolment decision, providing fresh insights into how tiered policies can facilitate participation in PES programmes. For farmers willing to consider PES, the model reveals factors deterring enrolment that can be overcome with higher payments. A small boost in compensation to farms with these traits could increase the total acreage enrolment from participants and some non-participants who will consider enrolling in PES.

Abstract

In the economic market expansion of Dao People in the Nothwestern Vietnam, the Community-Based Tourism plays an important role for that. Dao People in several local fields have joined the tourism market. Inside, Dao People in Sa Pa district of Lao Cai province is the earliest participating community-based tourism development and archives the most positive results. By the long-term field survey in Tả Phìn Village, Sa Pa district, this article is not only the depth of analysis of social network roles in community-based tourism, but also it provides more holistic view of Dao People who have used their cultural capital to economic market expansion.

Keywords: *Economic anthropology ; Social Network ; Dao People ; Community-Based Tourism ; Cultural Capital.*

1. Introduction

Community-Based Tourism is commonly understood as a type of tourism that travelers are experiened "ba cùng”: eating , staying , and activity together with native’s family. Community - based tourism create a close-knit relationship between tourists and local communities, in the other hand, the indigene who are not only eligible object for passive visiting, they are also the part of the tourism process, from market access, organization provides tourism service and tourism management in region and closely associated with community-based tourism” (Nguyen Thi Huong 2011, 3). Community-based tourism is broadly understood as a type of cultural ecotourism, it takes "flora, fauna and cultural heritage of local people as attractive points" (Nguyễn Duy Thuy 2019). As analysis of the role of cultural capital in community-based tourism or cultural ecotourism development, (Hà Hữu Nga 2020, 6) has emphasized both aspects of the cultural community capital, individual cultural capital, institutional culture capital and social networks. And considered it is a form of "exploitation and use of the cultural capital responsible for decrease in negative aspects of ordinary tourism to the environment and cultural integrity enhancement of local people.

Tourism in Sa Pa had over one century of development. The 1903 milestone opened for tourism, in 2003, Sa Pa district organized a celebration "100 years of sa pa". However, according to jean michaud and sarah turner (2006), tourism appeared later in sa pa, at least after 1909. Sa pa tourism grew strongly in the 1920s, 1930s and early 1940s but this trend was interupted by the Resistance war against France (1946 - 1954). In the early 1990s, it started returning after vietnam decided to allow international visitors to sa pa (1992). Sa pa tourist tourism has been actually "explosive" and has helped Sa Pa to rehabilitate dramatic economic success since 1993. Sa pa became as "little Da Lat" in the north and was the destination that the major of tourists desired to visit.

The Dao People involved in activities of community-based tourism was quite early, but only these activities flourished for over a decade when the number of visitors to villages grew and tourism services as well as some tourism products of The Dao were known by people. Among four The Dao's villages which are conducted the field survey by author. As result, there are three The Dao's villages that involved in the development of community-based tourism in different levels. The group of The Dao has 3 household take part in community-based tourism in Giang Ta Chai hamlet, Ta Van village; The group of The Dao has 7 households join community-based tourism in Can Ho A hamlet, Can Ho B hamlet, Suoi Thau of Ban Khoang village, The group of The Dao in Ta Phin village has 34 households participate in community-based tourism.

Ta Phin is the locality with the Dao who involved the most powerful economic development in Sa Pa. community-based tourism at Ta Phin appeared in the late 1990s, originally only one household to receive guests at home. And in the last decade, this number has increased rapidly. Currently (2020), the commune has 43 households involved in community-based tourism, including 34 Dao household, 6 Hmong households and 3 Kinh households. Ta Phin is admitted by Lao Cai province as one of the eight key tourist destinations of Sa Pa, this locality connected to numerous different routes to serve tourists. In 2018, Ta Phìn greeted around 19,000 tourists, including 8,000 international visitors. Revenue from activities of community-based tourism has increased. Specially, the expansion of community-based tourism created strong impacts on other professions in which are most crucial to make handicraft or pharmaceutical production activities a faster development.

Summary, other ethnic minority communities in Sa Pa, the Dao people has seized opportunities when tourism booming to participate in the local tourism market in its own way to focus on community-based tourism. The tourism activities of the Dao people are associated with their cultural capital, especially they have used social networks to effectively develope tourism . Thus the analysis of social networks in the development of community-based tourism is also a way to understand the use of the cultural capital and market economic development of this community.

2. Method

When it comes to community tourism development, cultural capital is an important theory to approach. According to Bourdieu (1986), cultural capital exists under three primary states:

1 - Embodied state, which are cultural elements that are embodied through its subject, i.e. people, are existing and lasting elements in the minds and bodies of cultural subject. In other words, cultural capital in the embodied state is the national potential of people and the ability to apply cultural elements to create value in the process progress. Cultural capital in the embodied state the state of expression is a system of cultural factors manifested through the human factor.

2 - The objectified state is a system of cultural elements in the form of objective existence outside of human, is the material form of cultural capital such as books, tools, houses, equipment, machinery ... or intellectual and spiritual products such as trace, the practice of realization of theories or criticism of theories ... is also cultural capital in an objectified state. Cultural capital in an objectified state can be the product of the visible individual or community that is used to exchange and rotate to create value.

3 - Institutionalized states are cultural elements that organize into stereotypes, shape the existence and functioning of cultural elements based on those stereotypes. Bourdieu's notion of cultural capital was later further developed by Robert Putnam (1993; 2000) and Francis Fukuyama (2001). According to these scholars, cultural capital is the physical and intangible assets involved in the production process to create material wealth for society. If Bourdieu considers cultural capital as the personal property of each person, Putnam and Fukuyama consider cultural capital as individual and collective assets. "Although there are differences in considering cultural capital is a personal (Bourdieu 1986) or collective asset (Putnam 2001), researchers have a consensus of viewing cultural capital as a resource. It is characterized by social networks, experience, skills, value systems, codes of conduct, beliefs, reciprocal relationships and a component constitutes the cultural context of a expansion program which can create conditions for creativity and changes " (Nguyen Van Chinh 2020, 6 - 7).

Previously, there have been several researchers who concerned cultural capital in Vietnam (Tran Dinh Dinh 1996, Tran Huu Dung 2002; Bui Hoai Son 2008). But most authors analyze the concept or participate in a few expert areas without setting the possibility of applying it to development research, which is understandable since imposing Bourdieu's concept of cultural capital on specific research in Vietnam needs to consider many issues. As Ha Huu Nga (2020, 3) emphasized: "In his theoretical projects, Bourdieu has exploited several economic terms to analyze the processes of cultural and social reproduction, in which different types of capital tend to be passed down from generation to generation. Bourdieu, however, has gathered all available cultural capital into individuals, and it is misleading to use his "cultural capital" conceptual heritage. In addition, in the context of personal-biased Western culture, the way of conceptualizing cultural capital associated with individuals can have certain analytical advantages. However, with community-rich Oriental cultures, the concept of "cultural capital" must be adapted to this new context. According to Ha Huu Nga (2020), the concept of cultural capital "basically associated with the concept of environments and habits" so as to be in line with the Vietnamese research context, it is necessary that "besides western personal cultural capital, we will supplement and seek to exploit more "cultural capital" heritage associated with the community".

To fit his goals, in this article, the concept of cultural capital is understood in a broad sense including the types of capital that Bourdieu has analyzed. This is also understandable when culture, understood in a broad sense, covers both economies, society, institutions, symbols, and human ... Accordingly, cultural capital is understood as physical and intangible resources, personal or community manifestations, which can rotate and participate directly or indirectly in economic processes to create benefits for humans. Thus, cultural capital in a broad sense can consist of 4 basic states: personal cultural capital, community cultural capital, socio-cultural capital, and social network. In particular, social networks play an extremely important role in the development of community-based tourism A social network is a concept created by JA Barnes, a British anthropologist in the mid-twentieth century and then this concept was applied and developed by several social scientists into an important concept and popular framework analysis in social research since the mid-1970s. Barnes considers relationships as friends, ancestry, and transitions of those relationships (It's mean that relationships always expand and people belong to the network will have a transitional relationship with each other) making the community become a network and govern many activities of the individuals as well as the community itself so he called it the social network (Barnes 1954). Another aspect, the social network is understood as a synthesis of relationships, connecting factors, and cohesive institutions of individuals, groups, organizations, and communities formed to share benefits as well as responsibilities in exploiting resources for economic development.

To approach research on social networks in community-based tourism development of the Dao people in Sa Pa, we have conducted a long-term field study for some communities in 3 communes including Ta Van commune, Ban Khoang commune, and Ta Phin commune.

In which, Ta Phin commune is the primary research area. The research process began at the end of 2007 and lasted for many years with many countryside trips. From 2016 to 2020, four long-term field surveys were conducted. Phase 1 in March 2016; phase 2 in September and October 2017; Phase 3 in March and April 2018, and phase 4 in October 2020. The heart of the countryside trips focused on understanding the role of social networks and, more broadly, cultural capital in the development of a market economy in general, with concetrating on the community-based tourism is essential. It is hypothesized that social networks play an essential role in the development of community-based tourism. The process of community-based tourism development of the Dao is also the process of building and applying social networks to economic progress.

The most crucial method in fieldwork for data gathering is in-depth interviews. We conducted 43 in-depth interviews to create a data system related to the research topic. Interviews focused on their gender relationships and perceptions, moreover, their thoughts about gender in specific family contexts and circumstances, at different ages and jobs. In addition, to have more multi-dimensional discussions, we conducted six group of discussions in the study area on topics related to gender, the market economy, and cultural capital. Each discussion usually has 6 - 8 people participating in wide dicussions on different topics set by the consultant. Besides, we pay much attention to the participatory observation method. Stories related to many of the problems that we experienced during our countryside research were recorded and discussed with each other through each countryside study (Bui Minh Hao, 2018).

3. Result

The above section mentions the social network as an element of personal cultural capital applied in the development of community tourism of households. This section focuses on further analysis of the Dao community-based tourism social network in Sapa. This network includes the production of spaces, social relations, and regulated institutions, affecting those relationships between Dao community tourism-related subjects. These social networks are between the Dao people doing community tourism together, between the community tourism workers and the Dao people who do not do community tourism, between the Dao people and other community members doing community tourism, between the Dao people doing community tourism with tourism companies and between the Dao people and the local tourists. And also the Dao's online social networks are related to the development of community tourism or sexual service networks, which are very discreet.

3.1. Social network in Dao community: support and competition in community tourism development

In the Dao community, there be two different networks of relations. First of all, there is a network of Dao people taking part in community-based tourism activities. Those who in the commune often have relationships with each other to varying degrees. They compete in both specialty activities but also support and share from experience to resources.

Between Dao people, there are rarely any criticisms of other families' services or conditions in tourism activities. They help each other when one family have large groups of guests that alone can hardly perform well the services. Families are still willing to support by sharing food when needed to serve tourism. And they also share some slight risks while running a business. On October 17th, 2020, a family in Sa Xeng village was ordered by a partner to prepare 5 sets of Red Dao Herbal Baths for 5 tourists. But after boiling the water and mixing the medicine, the partner contacted again to report because of bad weather, they could not bring guests in. At that moment, a nearby family of tourists shared 4 of their family's visitors for the one who had made bath pills to help not to waste their herbal mixture. Similar stories are also shared by many families. Recently, households doing community-based tourism have gathered together in cooperative to share resources and support each other in the development process. Particularly, Ta Phin commune currently has 3 cooperatives operating community-based tourism, which are Red Dao Community Cooperative, Giac Mo Do Cooperative and Community-based Tourism Cooperative. The largest concentration is the Community-based Tourism Cooperative, which was established in 2019 and currently has 40/43 households participating. This cooperative organizes training programs for individual members on tourism skills, expense management, seeking to approach tourism companies and diversify related activities. In cooperatives, the price of services shall be agreed upon and not to be auctioned for competition. Besides, it is divided into groups such as homestay group, transportation group, herbal bathing service group, tour guide group and traditional specialty group. The cooperative organizes for families to participate in activities when tourists arrived and deducts about 10% for the general fund. The Dao community in different localities still has some relationships to support each other. A family doing community tourism in Ta Phin is willing to introduce their visitors to a family doing community tourism in Ban Khoang or Ta Van, Ban Phung if visitors need to go to those localities. Naturally, it is not true to say that there is no competition among Dao people involved in community tourism. They are constantly improving the quality of their services and expanding their social network to attract more visitors than other families is a form of competition with each other.

The second strong relationship is between Dao households doing community tourism and Dao households that do not do community tourism. They have cooperation in several jobs related to community tourism development. Many families do not operate in community tourism but regularly provide food, sell bath medicines, medicinal plants to households doing community tourism. Households doing community tourism in addition to buying materials are also willing to accept the sale of brocade items to other households. This is a form of sales at different prices in the same community. With the same product, if they sell it to tourists, they would take a higher price when selling or sending to households as tourists to sell to guests. And these households usually sell at a higher price of 20-25%, even with foreign visitors can be 50% to 100% higher to make a profit. This not only appears in each Dao community but in many other communities, there is such a division. Because in the social network of a community, besides the price of goods and services, it is also added to some other values. People who trade for-profit and they try to maximize profits when meeting strangers outside the community, but do not seek profits or make very few words in their communities. This was also analyzed by Jean Michaud [2010] in the case of the commercial network of the Hmong community in Bac Ha district, Lao Cai province.

Thus, in the Dao community, whether participating in community tourism or not, there are certain relationships with each other. It is a relationship for the parties to have interests and share and support each other in the development process.

3.2. Social network outside the Dao community: access to information and connection of the tourism market

This is a network of relations between Dao people and partners as well as customers in community tourism.

It can be divided into the following social relationship groups: Dao people with other groups participating in community tourism activities; Dao people with travel businesses and tourism management agencies; The Dao people with the tourists.

The level of participation in community tourism activities of Dao people in the surveyed localities varies. In Ta Phin, the Dao people were the main force for community tourism activities alongside the Hmong and Kinh people. In Ta Van, the Giay people are the main force for community tourism activities, while the Dao people have only a few households participating. In Ban Khoang, the Dao and Hmong people began to enter community tourism activities and the Dao people had the advantage but not clearly. In Ban Phung, Thanh Kim, only a few households are remodeling their homes to participate in community tourism activities.

The relationship between the Dao people and the Kinh, Hmong, and Giay groups when taking part in community tourism activities shows both competitive and cooperative aspects. In Ta Phin, the Dao people were the first group to participate in community tourism and accounted for the largest proportion today. The Hmong and Kinh people have been involved in this field in recent years. The cooperation between the Dao and the Hmong, Kinh people in community tourism activities, although not as close as between the Dao people, but also has a certain connection. Dao and Hmong households buy bath medicines from other Dao households to serve the needs of visitors. The Dao also sent some goods such as brocade to the Hmong, the Kinh households to sell to visitors. The Kinh people sold to Dao households some other necessities from cooking oil, salt, some other types that they bought from the downstream. The Hmong also sell vegetables, chicken, fish to Dao households to serve visitors. Community tourism activists in these localities also work together on a price-homing basis. No household is priced out to compete on price. And that is also the foundation for them to work together in some other ways. Even if families welcome guests without a service, these groups can also support each other. Therefore, 6 Hmong households and 3 Kinh households in Ta Phin basically also have good relationships with 34 Dao households and community-based tourism activities. But that relationship is not as close as the relationship between Dao or Hmong households. If the cooperation is more dominant, the competition between these groups in community-based tourism development is more closed and implicit. The competition is mainly based on the investment as well as the development strategy of different families. Kinh people focus on receiving tourists who need to go to the countryside to eat, bathe but in the same style as the downstream people, they choose to stay in Kinh households. The dishes, the way of cooking or equipment, tools in the room are also modern, similar to the motels, hotels downstream.Meanwhile, the Dao and Hmong people focus on serving visitors who want to explore and experience the local culture. Households are also always looking for ways to access the market and expand investment to compete with other families on a consistent price basis. In other localities, this relationship is similar despite manifesting it to varying degrees depending on the development of tourism there. Relations with tour operators are an important issue in community tourism development. This is the original relationship to reach visitors of households. And almost every family involved in community tourism also has certain relationships with tour operators. However, the relationship with more or less business and how close they are depends on the social network of that family.

Table 1. The level of relations of Dao households in Ta Phin doing community tourism with tour operators

Level of relationship with tour operator	**Number of households**	**Percentage (%)**
None	3	8,9
1-2	18	52,9
3-5	8	23.5
Over 5	5	14,7
Total	**34**	**100,0**

Source: Author's Field Survey in October, 2020

Most of the participants in community tourism activities in Ta Phin have relationships with tour operators. Only 3 households have entered this field in nearly 3 years and are still being completed, so they have not created many relationships. They welcome guests mainly through the introduction of friends, relatives, the sharing of some households and also participation with community tourism cooperatives. The most effective families doing community tourism are often those who have the most relationships with tour operators. Although there are people who have been involved in community tourism for less than 4 years, there is a network of relationships with travel companies and regularly has 7-8 companies to cooperate and exchange to greet guests. There is a case of a woman who previously worked as a guide for several travel agencies. Then, when she came to investing in community tourism development, she was able to apply and expand relationships with travel companies to access the market. But such cases are not much. Most families also cooperate with 1-2 companies to pick up guests when conditions are available. And often a tour operator also has partnerships with many households doing community tourism to meet the needs of visitors. Maintaining good relationships with travel agencies or tour guides is an important issue, a skill that community travelers need to grasp to thrive. "If they introduce their guests to me, I also have to respond to them with many things. It's about being close, sharing, or giving them gifts that we have. Maybe even share with them a portion of the profits that we make. Because everyone's a business person. They feel happy and comfortable, new guests introduce themselves. Otherwise, they will introduce to other houses" [Women, Dao people, Ta Phin commune, interviewed on 23/10/2020].

And the last relationship in this network is of course the relationship between the Dao people and visitors, i.e. the relationship between the subject of community tourism development with its customers. The first one to do community tourism, of course, is friendliness. To receive guests, especially those who stay, participate in experiences, explore local culture, the host must be friendly and have regular interactions with visitors. The Dao people are relatively open-minded, even strangers from elsewhere. It is easy to meet, get acquainted and chat with visitors. Not passive as many people thought, the Dao people in Sapa also actively interact with guests. Whenever tourists come to the locality, many Dao people have picked up from the car door to sell hawkers. Maybe the number of goods they sell is not much, but they actively talk, share with visitors naturally. Many street vendors show their perseverance when they can spend the entire session going out, chatting with visitors but the goal of selling goods or not is still uns warranted. Most Dao families doing community tourism are interested in the strategy of developing social networks through visitors to their homes. Every time they welcome guests, after chatting, sharing, eating, staying, or participating in experiential activities, they also save visitors' information. From email address, phone number and now Facebook, Zalo address,... They make friends and are ready to take photos to share with each other. Thereby, on the one hand, they create prestige with visitors through an increasingly close relationship, on the other hand, they also take that image and relationship to promote themselves. They chose visitors as an important link in the "oil slick" campaign to expand their social network and access to the tourism market.

3.3. Online exchange network and proactive access to the tourism market

Currently, to develop tourism, the use of information technology is an important factor. Technology information networks are increasingly playing an important role in the creation and operation and development of various social networks. The use of information technology networks to sell or develop brands and services is becoming a strong development trend. The era of online trade and exchange of goods and services is mentioned by many people.

Community tourism needs to spread with a large social network beyond separate cultures or social groups, so online social networks are of great value. In the past, almost all details related to a tour were often provided by tour operators. Nowadays, almost everyone when preparing for a trip takes to the internet to search for information about the place and services they need. From there they can actively contact the supplier directly or through the tour operator. Therefore, online social networks become an important meeting point between households doing community tourism and tourists.

Previously, Dao people doing community tourism in Sapa contacted tourists mainly through travel companies, by phone, or email. Currently, they can contact visitors directly through social networks such as Facebook, Zalo, or from information on websites, Fanpage that they participate in. The most important of which is probably facebook's social network. Facebook appeared in the Dao people in Ta Phin around 2010 and the first use of community tourists. Initially, they learned how to join facebook's social network thanks to a few people from tour operators, tourists, and children who went out to study for work on nick support as well as user guides. Initially, only a few families with computers could join. But increasingly, the more popular smartphones are, the more convenient it is to join social networks. The Dao people in Sapa mainly use smartphones of Vivo, Sam Sung, Oppo because these phones are quite soft, take beautiful photos and big machines are easy to use. Investing an amount of 3-5 million can buy a beautiful phone, take photos, and film well back into the internet conveniently so many people can use it. The main users are young men and women (from 16-30 years old), women participating in activities such as community tourism, sales, commune officials, or have gone out to work. Middle-aged and older men do not use these social networks, except for some who have time to go out to work. Of the 34 community-traveling households, all joined facebook's social network. And in families, children of youth also use. Dao people still mainly use according to personal pages, have not formed groups or fanpage to introduce products. Currently, some people are asking to find ways to form groups to promote tourism activities as well as online sales.

On the personal Facebook page of community travelers they also regularly take photos when there are visitors to stay or take medicine and eat. They took pictures with guests, put them on their page. Please both Facebook of guests to connect and tag them both to promote their home travel activities. They also regularly update their activity information, introducing some goods such as bath pills, dishes, cultural activities, or facilities to serve visitors. When someone needs it, they ask to text or call them directly to talk. Many people know how to design their Facebook's fanpage so that it is beautiful and highlight the phone number so that anyone in need can easily contact. People who are close to each other often share each other's posts to expand the connection to help each other. To better understand the Social Network of the Dao people in Sapa via Facebook, I surveyed the usage status of some specific cases.

The first was a 65-year-old woman who worked as a community tourism, trafficking in bath medicines and some medicines. She was a pioneer in the development of community tourism in Ta Phin. Since 2008, she has been using a computer and was set up a Facebook account by a student to make friends. But it wasn't until 2011, when she used her smartphone, that she was interested in the social network and applied it to economic business. Currently, her Facebook page has 1372 friends, including about 100 Dao friends in Ta Phin, 400 friends who are Dao people elsewhere, about 300 friends who are ethnic people in Lao Cai, the rest are people elsewhere, are acquaintances, customers used to have business relationships, researchers or people who work at travel companies (about 15 people make friends) and many who have never known. In her family of 10 people over the age of 16, 8 people are using Facebook social network. But she alone is used to contacting, message customers, and carry out business transactions. Others use it to play. She connects with others who work in community tourism or the drug trade to capture information, promote and support each other. They haven't formed groups yet, even though they know how to watch some fanpage, but it's for entertainment, not for product promotion or customer search. A few years ago, a film crew came up here to film an introduction to bath medicine, about Dao's travels, and they filmed many scenes about her. So she asked for the footage to be posted on her Facebook page. Thereby many people contacted her to buy bath pills, book travel services. And now, about 30% of the revenue from her family's travel activities with the sale of bath medicines is related to business relationships from this social network.

The second case was a 31-year-old woman, doing community tourism, selling bath pills and brocade. His Facebook now has 3745 friends, including more than 150 Dao friends in the commune, about 500 dao friends elsewhere, and about 500 friends who are ethnic minorities in Lao Cai. This person has many years of working as a tour guide, so he has wider social relations than others in the village. Every day, this person often posts on his Facebook page many activities related to business from welcoming guests, embroidery brocade, or going to get medicine. Images and clips, quite diverse should be of interest to many people. And through these activities, the social network of this person was expanded, making the family one of the families doing community tourism as well as selling brocade, the most effective bath medicine, and the highest turnover in Ta Phin commune.

Or SAPANAPRO also considers online social networks such as Facebook, Zalo as an important advertising information channels. The company also sets up its website to contact visitors to sell its products. Increasingly, online social networks are strongly impacting the development of Dao community tourism in Sapa.

3.4. Sexual service network: closed market but not closed

Talking about tourism development in Sapa, Jean Michaud and Sarah Turner (2006) were very interested in prostitution and considered this as a realist associated with tourism development in many places, not only in Sapa. The authors believe that the sexual services network has become an important factor in tourism development, that even though like it or not, we must accept when visitors are in need and there are people involved in sexual services in a variety of ways. The Love Market is considered by the authors as a method of organization of some indigenous people in relation to extramarital sexuality. Regarding this issue, Nguyen Thi Huong (2011: 125-127) also analyzed more about sexual issues in community tourism. Herein, this author analyzed activities related to sex tours as well as the locals' notions regarding sexual problems. And this author's field survey of the Dao community in Ta Phin also confirms that community-based tourism here has no sexual services. Although there are tourists who have sexual needs during local tourism, people do not accept it because it is contrary to the customs and marriage culture of the locals.

Indeed, travel is an activity that enjoys sightseeing and is also associated with eating, interaction. Therefore, sex becomes an issue that many people are interested in. Sexual needs in travel are always present to many people, especially men, although women are no exception. In Sapa, every time male tourists leave their cars, they are often have invited for sex services by motorbike taxi drivers or taxi drivers.This is relatively common at night, when the delegations have finished drinking and have needed something to entertain, they can actively seek supply thanks to the introduction of the receptionist at the hotel, or motorbike taxi drivers, taxi drivers. When asked about this issue, a male tourist is not afraid to say: "Having come up here to enjoy, not only eat and drink, you should experience more to see how the mountain girls are... The simplest way to find it is to ask the receptionist to show you a place or call a motorbike taxi driver to take you there. They have many acquaintances, so it is easy for them to make profits by collecting transportation and even tips from sexual services for each referral." [Men, Kinh people, working in Hanoi, interviewed on 03/4/2018]. According to those who work in saunas, massage areas in hotels, it is common for sexual needs to be men who go on group vacations or come up here working for a short time. They followed the group to the sauna, massage area, to relieve themselves after having some drinks. Here, they meet female employees and ask about sexual services. If both suppliers and demand meet and make a deal, then they will go elsewhere to trade. The subjects of sexual labor, in this case, are largely women from other localities who come here to work. There are some local women involved but limited. Besides groups seeking sex services, Sapa also has many sexual relationships in travel such as couples going on vacation, road trip groups,... In these groups, there are both men and women, so sex is mostly between the subjects who go together rather than with those who work on the spot.

Sexual services in Vietnam are considered illegal and severely sanctioned for women who work as prostitutes. So, almost everywhere, sexual services networks operate underground, very closed. Because if they're found out by the authorities, they'll be sanctioned. However, in that secrecy, it is very open to many objects. Because only when it open and is, there will have exchange and transaction. The network of motorbikes, taxis, or many hotel receptionists has an entire phone list of some sex workers to introduce visitors when they need it. Naturally, in order to get contact information or be led to a sexual service point, visitors also pay for these people an amount of money and their behavior has not been counted against the prostitution organization because they provide information and have not necessarily organized this activity. Currently, with the explosion of information technology, visitors can also find information and contact sex workers directly from websites provided or social networks such as Facebook, Zalospe, especially Zalo network with searching tools. Visitors can search, make friends, and communicate with each other. If they meet the right people and make a deal, they'll meet. It also proves that sexual services in Sapa are more common than the numbers that the authorities have to reckon. And although sexual services are inherently closed, with an underground network, it is also very open because travelers can search easily through different clues.

In that context, whether the Dao community-based tourism in Sapa has anything to do with sexual services and how relevant it will be an important question, but it is difficult to answer obviously. Because this is a sensitive issue and is not easy to research in the local culture still strictly extramarital sexuality behavior. In localities surveyed about Dao community-based tourism, sex-related services are not acceptable. Households that do community-based tourism have said they are neither involved nor accept such services. Several local visitors had asked about the issue and the host made it clear there were none. "They must go out to town for their need because we don't do that here and no one will accept it.", he said. In the past, heterosexual visitors to community tourism households were not allowed to sleep together, even if they were mates. If the landlord allowed them to share a room, they also do not accept sexual behavior in their home. Recently, however, community-based tourism homes have been prevented from making private rooms smaller and more discreet, with some couples still allowed to stay together. But basically, the Dao people do not accept the sexual behavior of visitors to his house. And perhaps this is also a reason that young couples in the down the country when going to Sapa often choose to stay in motels and hotels in the town rather than in homestays in the villages.

The group of people most likely to be involved in sexual services is the guide. It can be said that around the 2010s and earlier, the Dao people in Sapa took part in the tour guide quite a little. Compared to Hmong or Giay people, the number of Dao guides is quite modest. But over the past decade or so, the number of Dao women participating in the tour guide group has been increasing. Among those involved in tourism activities, guides are the ones who face the problem of sexual services the most because they are most exposed to visitors. And some have become the object of travelers contracting sexual needs. Although it is difficult to discuss this issue directly, in fact, there were some Dao women who, after joining as guides, then became single mothers. Some people have left the locality to go elsewhere to work and get married to live elsewhere. They were supposedly involved in sexual services by others and sometimes stigmatizing. “Being a guide is quite complicated, as visitors are also diverse. Some people are polite and kind, and some have money, so they have sexual enticements and demands. Both Westerners and Vietnamese. And many young girls who have not resisted money had fallen into the path of prostitution. By doing that, you will have money to shop and play, but if you let others know, you will be hated. Many people have had to leave elsewhere to get married and continue their life.” [Dao women, Ta Van commune, interviewed on March 27, 2018].

4. Discussions and conclusions

The wider social network is that cultural capital is an important and decisive factor in the community-based tourism progress. In the process of developing community-based tourism, the Dao people in Ta Phin have used their social network quite effectively. They promote the values of social networks in the community, social networks outside the community, and online social networks through scientific and technological means to develop tourism. The social networks have helped the Dao people access the tourism market and constantly promote their tourism image, thereby attracting more tourists. In addition, they also promote cultural capital sources into economic development in a more proactive, positive, and effective way.

Developing community tourism of the Dao people in Ta Phin and asking an crucial attack in the process of applying social networks, exploiting cultural capital for socio-economic development. It is limitation of cultural conflicts that occurs between groups with ties through the different network, which is the harmonization of the advantanges of participating in development social networks to develop. Besides, there is the interaction and promoting community cultural values, access to state-of-the-art development resources from the global process and information technology, especially, the development of human capital, but energy development, and access to community development sources. Thereby, developed community-based tourism in Ta Phin and for us learning how to use social networks, promoting cultural capital in socio-economic development. It evokes many methods and paths in economic development associated with promoting resources inherent in the traditional culture of communities.

Abstract

DSM is a set of tools and practices taken by utilities to influence the amount and/or timing of customers' energy demand in order to use electricity most efficiently. DSM decreases the cost of meeting customers' energy needs through increased investment in end-use energy efficiency and load management. Demand-side resources can reduce or postpone investment in generation, transmission, and distribution capacity, and decrease fuel consumption, and improve environmental quality. DSM also reduces emissions of acid rain related pollutants and damaging greenhouse gases. DSM also has been demonstrated to be a fast, inexpensive, and effective way to address power shortages without hurting productivity. China's very large opportunity to increase energy efficiency is one of its most promising untapped optionsa. This experience lessons can be learned *for Vietnam.*

Keywords: *DSM programs, Energy efficiency, Fuel substitution, Load Management Experience, EVN.*

1. Introduction

By modifying the level and timing of electric consumption by end-use customers, DSM offers important tools to balance the operation of electric power systems. DSM can enhance the total social benefit of the power system, improve the safety and stability of electric grid operation, and ultimately lower the cost of electric service. China has substantial DSM experience and achievements, which have generated obvious social and economic results. DSM programs to date have focused on the following three goals:

Load management. Load management is one of China's main DSM programs. Load management's objective is to adjust the load curve by (a) clipping the peak load, (b) increasing the valley load, or (c) moving peak loads to off-peak hours. Load management has been pursued though pricing reform (mostly TOU and interruptible pricing), information, and the application of new technologies. It has reduced peak capacity demands and flattened the overall load curve in many locations. A major tool in load management has been TOU pricing: power prices have been increased in the peak period and reduced in the off-peak period. This guides consumers to adjust their production schedules and to employ off-peak storage techniques such as ice-storage air conditioners and heat-storage electric boilers. Large industries have been encouraged to modify their maintenance schedules and their daily and weekly work schedules. All of these steps have flattened the load curve.

Energy efficiency. Economic and environmental benefits have been achieved by adopting a number of policies and measures to encourage the use of efficient equipment such as energy-saving lamps, adjustable-speed motors and water pumps, and high- efficiency transformers, among others.

Fuel substitution. Local governments have formulated policies to replace coal-burning facilities with more efficient and less-polluting technologies such as heat-storage electric boilers, gas boilers, and electric furnaces in urban areas and at tourist attractions. Although these policies were pursued to improve local environmental conditions, significant efficiency improvements were achieved.

This discussion of China's DSM experience is divided into a load management section and an energy efficiency section. This is because China has much more experience with load management and because the barriers to load management and energy efficiency are very different, as are the needed policy responses.

Like China, Vietnam is experiencing unprecedented economic growth, which averaged 8.2 percent annually from 1992 to 1997. During this same period, energy demand grew 30 percent faster than GDP, and electricity 70 percent faster. The ability of Vietnam to continue to meet such an aggressive economic growth rate will require substantial expansion of the electric power sector as well as aggressive demand reduction efforts.

2. Method

Load Management Experience

China has a long history of experience with load management. Recent experience with load management to address the power shortage has been especially successful, and has reduced the number, severity, and duration of wider power outages while improving system load factors. Load management strategies have focused on rapid implementation of TOU pricing, adoption of interruptible tariffs, and deployment of energy storage (cooling and heating). Efforts have been aimed at reducing peak load and shifting use from on-peak periods to off-peak periods. In essence, the new concept of load management involves a kind of "cooperative partner" relationship between the electric power consumers and the electric power corporations.

As shown in Table 1, government action reduced peak load by over 10 GW in selected provinces in 2003. But, as discussed below, only about 30 percent of the peak load reduction, or 3 GW, was due to DSM. While this is a significant achievement, as described in more detail later, California and the Pacific Northwest in the United States achieved far greater savings in response to a less serious power shortage.

Table 1: ***2003 Peak Load Reductions***

Province	Peak load reduction (MW)
Jiangsu	2,800
Zhejiang	1,400
Shanghai	1,700
Guangdong	2,250
Hubei	1,000
Hunan	700
Hebei	250
Total	10,100

Source: Study Team

The remaining 7 GW of reduced demand was essentially rationing imposed by government orders, requests, or advice to enterprises to modify work schedules, maintenance schedules, and production schedules.

Over the past 10 years, China's DSM efforts have produced significant economic and environmental benefits. The savings are summarized in table 2.

Table 2: China's DSM Results (1990–2000)

Electricity savings (TWh)	130.4
Peak load shifting (GW)	3.8
Peak load reduction (GW)	36.5
Coal saving (millions of tons)	58.6
SO2 emission reduction (million of tons)	1.33

Source: Study Team

Note: The average investment of coal plant units is $605 per kW.

DSM experiences at the provincial and municipal level are described more fully below.

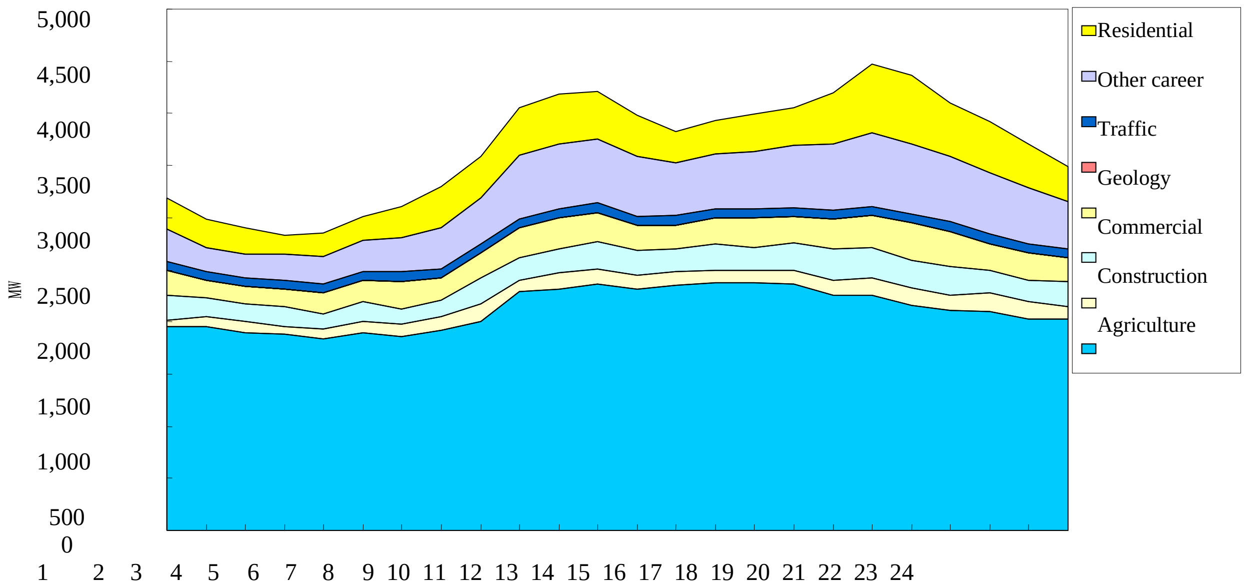
Beijig

In the past 10 years, the electric load of Beijing city has grown steadily and rapidly. The peak load increased from 3.01 GW in 1992 to 4.47 GW in 1996, a growth rate of 10.4 percent annually. Peak load has grown faster than electricity sales so the annual load factor decreased from 86.81 percent in 1992 to 82.31 percent in 1996. Much of Beijing's DSM efforts have been aimed at the declining load factor.

Before developing peak load management measures, Beijing carried out a survey to determine the customers' consumption patterns. The results are shown in figure 1. The survey revealed that in 1996, industrial consumption accounted for over 55.43 percent of the total power in Beijing (winter typical load curve). Industrial customers accounted for 51 percent of the system's morning peak load and around 50 percent of the evening peak load. Residential and commercial customers accounted for about 16 percent of total load and their load factor was about 60 percent. After 1996, Beijing was able to obtain substantial additional load shifting from these three customer classes.

Figure 2 shows the effect of load management on Beijing's load factor. The actual load factor has been maintained at about 81 percent from 1997 to 2003. The figure also shows what the load factor would have been without the load management activities. If DSM were not taken into account, the load factor would have decreased to 76.59 percent in 2003.

Figure 1: The Structure of the Load Curve of Beijing in 1996



Source: Study Team

In order to capture the peak-shifting potential, the following measures were used from 1997 to 2003:

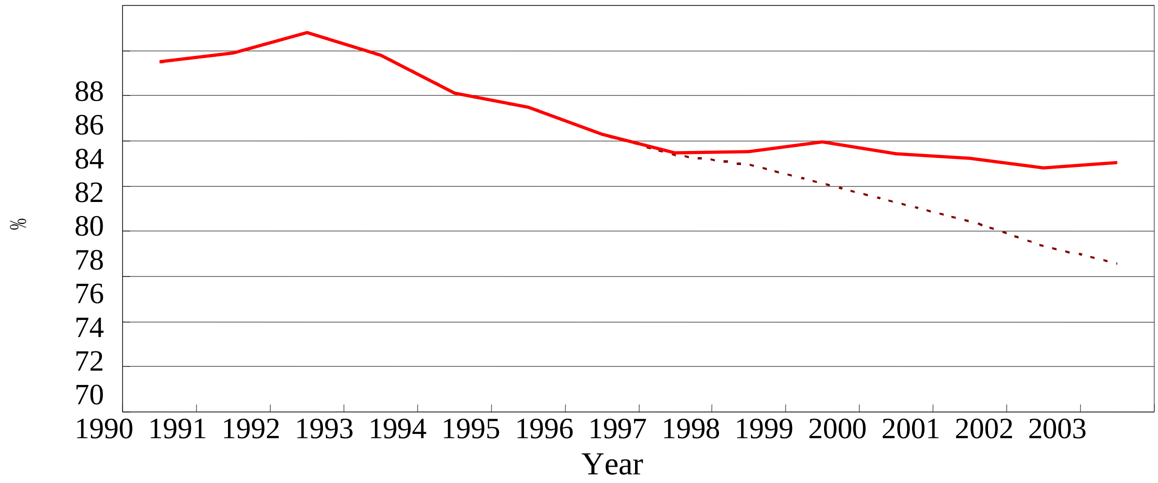
- widening the price difference between on- and off-peak periods

- helping enterprises arrange their production plans rationally (for example, maintaining and testing machines should be arranged in peak-load time)

- setting interruptible load protocols with industry customers, first on a pilot basis, then on a more widespread basis

- implementing special policies for energy-storing equipment such as ice-storage air conditioners and heat-storage electric boilers.

Figure 2: Beijing Actual and Forecasted (Excluding DSM) Load Factor



Source: Study Team

After implementing the above measures, more than 50 MW of peak load was shifted to off-peak periods in 1997, and another 50 MW in 1998. Valley-period sales increased by more than 150 GWh in the two years.

The investment in the peak-load shifting was $1.46 million in 1997 and $0.69 million in 1998. The benefits were about $3 million in saved generation capacity costs per year.

Other DSM accomplishments in Beijing include:

- **TOU.** By the end of 2003, 77,431 consumers representing 61.69 percent of total consumption were on TOU prices. Compared to 2002, the proportion of valley consumption increased 0.75, and the proportion of peak consumption dropped 0.81. About 700 MW was shifted by TOU prices. In April 2004, the Beijing Development and Reform Commission decided to widen the difference between the peak and valley tariff. During the summer, the off-peak price will fall 11 percent, and the on-peak price will increase between 5.5 percent and 20 percent.

- **Energy storage.** Beijing has now added 443 ice-storage air conditioning units and heat-storage boilers. These devices have reduced peak load by more than 300 MW.

- **Promoting electric heating.** Beijing encourages the use of electric-storage space heating to reduce the direct consumption of coal in the city. By the end of 2003, 23,175 residential customers had installed storage heat units in more than 9 million square meters of living space. These units consumed 221 GWh, of which 149 GWh or 67.36 percent was off-peak.

- **Using interruptible tariffs.** Beijing Distribution Company has interruptible load protocols with major enterprises such as Capital Steel Corporation, Special Steel Corporation, and Yanshan Chemical Industry Corporation. About 100 MW of peak load may be shifted per year.

- Load control at Electric Load Management Center. The Wireless Electric Load Management Center in the Beijing Grid has been playing an important role in balancing power supply and demand. The facility has the potential of connecting over 5,000 locations. In 2003, 1,600 locations with 2,800 MW of load were connected, and about 500 MW, or about 6 percent, of Beijing's total load could be directly controlled.

The Beijing DSM projects were successful primarily because they focused on peak load management, which is generally easier to implement than other DSM programs. In many cases, load management can be accomplished with properly designed and progressive tariffs, such as TOU and interruptible tariffs. Yet load management programs are largely short-term responses that do not exhaust the cost-effective demand- side potential. Beijing may now turn its practical experience with load management towards developing DSM programs that result in long-term reductions in demand through efficient end-use technologies.

Jiangsu

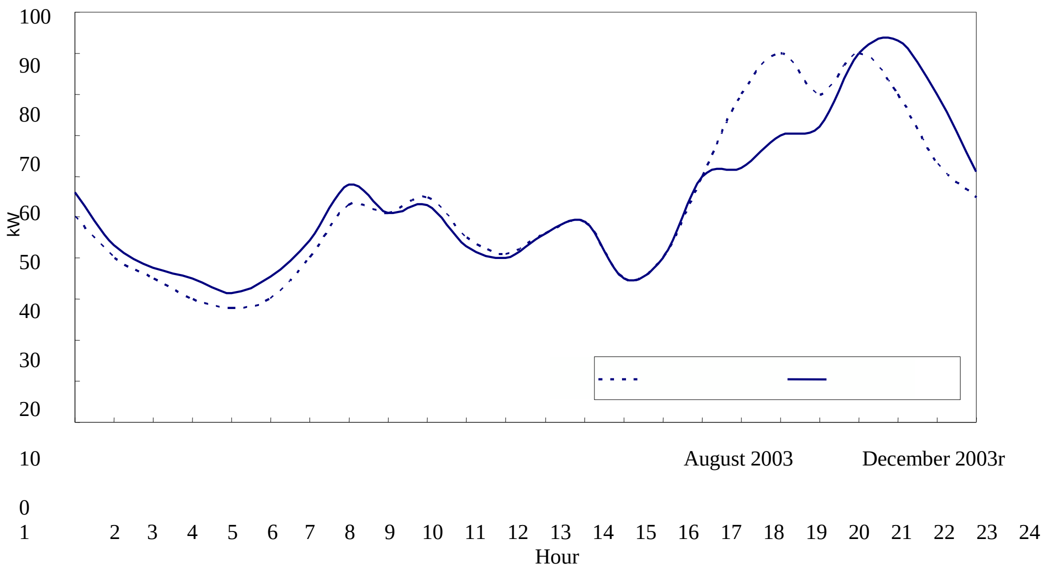
Jiangsu Province has gained a great deal of DSM experience in the past two years. As a result, DSM is now playing an important role in addressing the power shortage. In 2003, the gap between demand and supply in Jiangsu was 3,890 MW. To address this shortage, the government and power corporation implemented the following DSM measures:

- industrial facility maintenance scheduled to reduce peak period use
- business shut-downs and vacations rotated (956 MW)
- interruptible tariffs (780 MW)
- voluntary shifted load (592 MW)
- TOU prices (see figure 3)
- load control system—Electric Load Management Center (475 MW).

Beginning in August 2003, TOU prices were offered to residential consumers on a voluntary basis. The price for the residents who do not use TOU is $62.88 per MWh. TOU prices are $66.51 per MWh on-peak (8:00–21:00 Beijing time), with a valley price of $36.28 per MWh (21:00–8:00 Beijing time).

The utility incurs the cost of a new TOU meter, about $30. By the end of 2003, about 750,000 families selected TOU. The proportion of peak consumption and valley consumption has been changed to 55:45 from 64:36. Figure 3 shows how the load curve of these customers has changed. The time of peak load was deferred about 2.5–3 hours, and about 20 percent of peak load was shifted (about 100 MW) to off-peak periods.

Figure 3: Load Curve Changed By Using TOU —Summer 2003



Source: Study Team

Together these measures reduced peak load by 2,800 MW. Demand, however, still exceeded supply by about 1,090 MW, so the load control center imposed curtailments on some customers.

Additional experience in Jiangsu includes the following:

- From October 1999, industrial TOU prices were applied to six large industries representing 83.12 percent of the total industrial consumption in 2002. The on/off-peak price difference was 3:1. (The difference was widened to 5:1 in July 2003). The peak load reduction from this action was about 600 MW. The load factor in Jiangsu increased 0.18, 1.57, 1.12, 1.00, and 1.47 percent from 1999 to 2003 respectively (The load factors were 79.19, 79.37, 80.94, 82.06, 83.06, and 84.53 from 1998 to 2003 respectively).

- About 30 percent of the total peak load in Jiangsu in these years is due to air conditioners. Jiangsu Power Company has invested about $7.2 million to spread the use of ice-storing air conditioning. The ice-storing cooling reduced peak load by about 70 MW per day in 2003. For example, Nanjing Yuhua Distribution Company has installed ice-storing air conditioning and heat-storing boilers. The result is that 750 kW can be shifted from peak to off-peak periods. This has saved the company $37,850 in power costs.

- Interruptible tariffs have been made available to some industrial consumers, mainly the steel corporations. Customers are compensated $0.12 per kWh for interruptions. In 2002, 5 steel corporations took part in the program. Consumers were interrupted 15 times in 10 days for a total of 28 hours. The power corporation paid them $950,000 for these interruptions, and peak load was reduced by about 400 MW. In 2003, 12 steel corporations took part in this project, and peak load was reduced by about 800 MW. This program could be considered a buy-back program where the utility buys back the energy at a given or negotiated price. Wholesale markets are not yet operational but the price paid here may be a proxy for the market price.

- In 2002, Jiangsu implemented about 65 DSM projects, including ice-storage air conditioners, heat-storage boilers, green lighting, and variable-frequency speed controls at high-consumption industries. The enterprises invested $75 million, with government providing about $5 million as an incentive. The projects reduced peak demand by 100 MW and reduced energy use by 280 GWh. Industrial power costs were cut by $25 million per year.

- Communication with about 237 industrial customers (in steel, chemical fertilizer, and electrolysis industries) resulted in rescheduling industrial maintenance schedules. Peak load was reduced by 66 MW. In addition, some customers agreed to reschedule their day off from Sunday to Saturday or from weekend to weekday.

- By the end of 2003, each city had built an Electric Load Management Center.

These centers monitor and can control the use of about 20,000 industrial machines with a total monitored load of about 11,230 MW and 4,590 MW of demand under control. For example, the Electric Load Management Center of Nanjing Distribution Bureau was built in 1997 at a cost of $8.6 million. The annual operating cost of the center is $240,000 per year. The Center allows Nanjing to monitor 2,430 MW, or 71 percent of the district's total load. The Center has direct control over 600 MW, or 18 percent of the maximum load. In 2003, the Center shifted enough demand to avoid serious outages.

- Energy-intensive consumers pay a capacity charge and an energy charge. The capacity charge is either based on actual demand or the transformer capacity. If the customer chooses to be charged on the basis of actual demand they will have an incentive to control peak use. For example, Nanjing Steel Corporation used a computer control system to limit their maximum demand to 50–70 MW (the transformer capacity is 90 millivolt-amps). Their power cost was reduced by about $500,000 per year.

In total, Jiangsu's DSM efforts reduced peak demand by about 2,000 MW in 2002 and 3,000 MW in 2003. These efforts saved about $1.21–$1.81 billion of investment in new coal plants. Annual energy savings are about 2,300 GWh, equal to about 1 million tons of coal and 23,000 tons of sulfur dioxide.

3. Results

China has a great deal of experience with energy efficiency, although most of this experience is not directly within the utility sector. For example, from 1981 to 1990, China spent 4.5–6.5 percent of the total energy investment budget on energy conservation each year. Significant energy savings have been achieved through these investments, which began in 1981 and were aimed mainly at industrial boilers and energy-intensive industries such as steel, cement, and chemicals.

China also has gained some excellent experience with energy efficiency from working with private energy efficiency services. China, with assistance from the World Bank, has been involved in developing the energy service company (ESCO) model of delivering energy efficiency services. As of June 2004, the three ESCOs have entered into 315 energy performance contracts with aggregate investments of over 95 million USD. Their businesses are successful and growing rapidly.

These ESCO projects have demonstrated that, like other countries, China has large amounts of cost-effective energy efficiency potential, but also that China has similar barriers to energy efficiency. Other countries have found many remaining barriers to ESCO-led efficiency programs, and that power utility and government support has been necessary for broad ESCO success.

China's utility-related energy efficiency experience is much more limited than its experience with load management. In the early 1990s, China conducted a number of studies aimed at energy efficiency but the recommendations were not implemented. For example, a 1992 study found that the DSM programs alone could reduce electricity use in Hainan by 21 percent in 2000, with savings of $200–$400 million.

In recent years, several energy efficiency programs have been implemented, such as Green Lights in Hebei and Jiangsu and variable-speed drives in industrial applications in Jiangsu. But their deployment has generally been limited in scope.

It will be very difficult to implement DSM more broadly in Vietnam without the adoption of new policies. The critical task in Vietnam is to identify the policies that are needed to allow DSM to have a role in the reformed power system. This is especially important now because Vietnam's power sector is in the process of reform. In some respects, Vietnam's power sector is like a centrally planned industry where command-and-control approaches to increasing investment in DSM work best. In other respects, the power sector is becoming a market-driven industry where more market-oriented DSM policies will be needed. This paper identifies and recommends that the government of Vietnam consider a number of near- and long-term policy options to encourage DSM. Some of these policies rely on regulations, standards, and other measures that could be considered command-and-control mechanisms. Other policies rely on illuminating true costs and incentives so that the market will lead to the lowest-cost solution.

The generation business has been unbundled from the transmission and distribution business. However, if the reform process fails to accommodate the potential of demand-side resources in its structure and rules for power sector reform, Vietnam will overlook an important mechanism in the pursuit of efficient and sustainable economic development. The good news is that senior leaders in Vietnam are interested in DSM and as a result, new regulations on strengthening DSM have been issued.

Vietnam is facing a serious power shortage, which is making power sector reform even more difficult. The lesson learned by public officials and utility managers in other countries that have faced shortage conditions is that solving the shortage with a supply-side-only approach may be possible, but relying heavily on DSM can solve the problem faster, at a lower cost, and with less pollution.

As described in this paper, there are still some barriers to implementing DSM in Vietnam. Vietnam's power sector reform and reform plans must remove these barriers to DSM. The following policy recommendations would support reform efforts while reducing barriers to DSM.

4. Discussion and Conclusion

The World Bank estimates that in a business-as-usual scenario, the power utility, Electricity of Vietnam (EVN), will face a threefold increase in demand over the next 10 years, from 25,700 GWh in 2000 to more than 77,400 GWh by 2010, with annual demand growth of 10 to 13 percent. Generationlevel peak power demand is also projected to increase from the 1999 level of 5,700 MW to about 16,000 MW by 2010. Meeting this demand through supply-side resources alone would require a capital investment of about U.S.$18 billion (GEF 2003).

In the current context of our country, with the rapidly increasing demand for electricity along with socio-economic development, DSM plays an increasingly important role in the overall solution to ensure the balance of electricity supply and demand, contributing part to ensure sustainable economic growth and conservation of national fossil fuel resources. It should be affirmed that a basic tenet of DSM is that the cost to save one kWh of electricity will be cheaper than the cost to provide an additional 1 kWh of electricity by building a new plant. This is especially meaningful for our country when investment in electricity development is requiring huge annual capital needs that may exceed domestic investment capacity.

THE IMPACTS OF POWER SECTOR REFORM ON DEMAND-SIDE MANAGEMENT

Nguyen Minh Cuong

nmcuong.htd@gmail.com

Thai Nguyen University of Technology, Thai Nguyen University, VietNam

Abstract

Reform of the electric industry in other countries and states has had substantial impacts on investment in demand-side resources, both positive and negative. But only in those places where explicit policy care was given to DSM did the reforms have beneficial consequences for the electric system and its customers. A recent study by the IEA's Demand-Side Management Program examined how power sector reform affects DSM. The study found that typical power sector reforms do little if anything to reduce the barriers to DSM and that many reforms, such as Vietnam's separation of generation from the grid, actually increase the barriers to DSM. The IEA study also found that the "...overarching policy barrier that affects all electricity industry structures ...is the lack of regulatory or legislative attention and interest in energy-efficiency issues." This content lists seven major effects restructuring has had on DSM internationally, including energy efficiency.

Keywords: *DSM , IEA, Grid, Regulators and Policymakers, Restructuring.*

1. Introduction

In the electricity sector, more than 30 years of international experience shows that, under the right circumstances, electric utilities can effectively deliver large-scale, cost-effective energy efficiency programs. To assure that electric utilities have a major role in delivering DSM and energy efficiency, proven policies and practices must be adopted that make successful delivery of energy efficiency services a profitable part of the utilities' business.

In Vietnam, VECP and CEEP are both new agencies. Today, their DSM-related responsibilities are still evolving, and many are shared. Adoption of the policy recommendations contained in this report may be the responsibility of one or both agencies.

The DSM policy recommendations are divided into short term and long term options. There is no clear line between these two categories of actions. Judgment has to be used to focus on the short term recommendations that are aimed at the current power shortage. The longer-term recommendations, while not requiring immediate attention, are the important steps needed to assure sustainable power sector reform. Given the severity of Vietnam's current power shortage, long-term policies are less urgent. However, they are critical to the avoidance of a future shortage and therefore action on them should not be put off for long.

Because Vietnam's experience in implementing load management is already comparatively strong, only two major recommendations relating specifically to load management are made: (a) reforming prices and (b) incorporating demand response in spot-market design and market rules. These are both very powerful tools.

The creation of open and competitive markets for electricity will not reduce the historic barriers to efficiency investments, and some of Vietnam's planned power sector reforms will create new barriers. This is a special concern for Vietnam because the potential for cost-effective DSM including energy efficiency is so substantial. Without increased investment in energy efficiency, unconstrained and very rapid growth in electricity demand threatens Vietnam's environmental, economic, and social sustainability goals.

2. Method

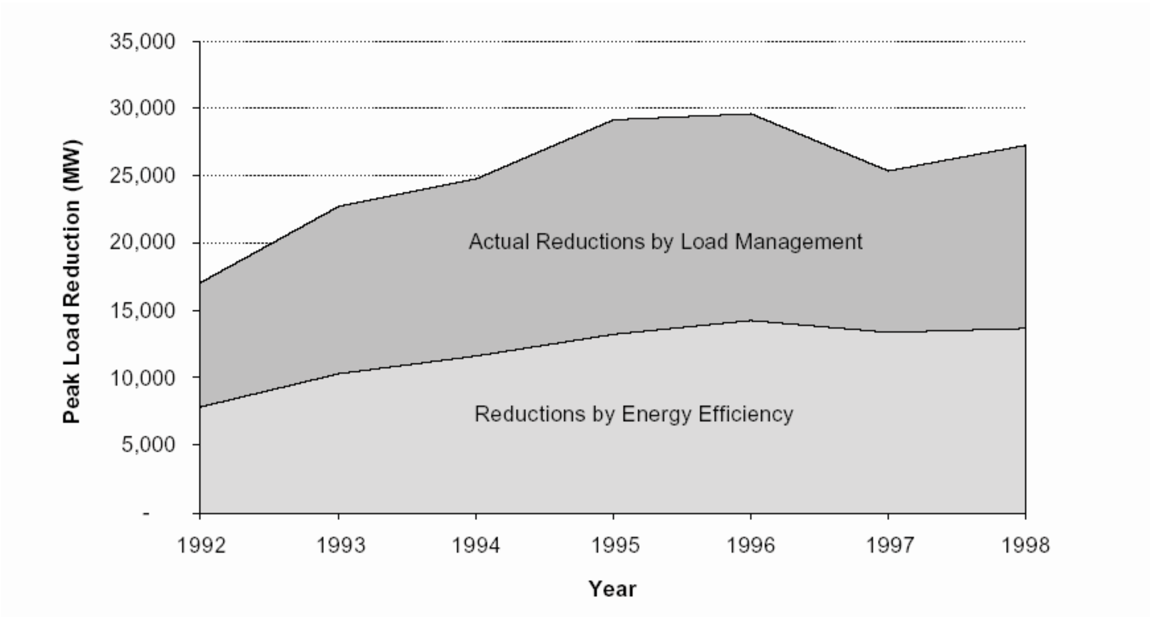
Regulators and Policymakers Shifted Attention and Focus from DSM to Restructuring

Prior to restructuring, interest in DSM was to a large extent driven by regulatory and policy-maker support for DSM. In the United States, Integrated Resource Planning (IRP) and the experience of a few leading states showed regulators and others that DSM could produce large economic and environmental benefits and could avoid the need to build unpopular and polluting generating plants. This focus yielded substantial policy support for DSM and led to steadily increasing utility investment in DSM and energy efficiency. When the nation's attention turned to restructuring, regulators and utilities focused on issues such as stranded cost recovery, retail access, and the rules for new investment. Uncertainty about who would make new investments and how the costs of new investments would be recovered led to a substantial drop in utility investment in all areas, including DSM and energy efficiency.

Total spending by utilities in the United States on DSM declined by nearly 50 percent between 1993 and 1998. In 1993, utility spending for all DSM (efficiency and load management) totaled \$2.7 billion. At that time, based on the utilities' announced plans, the U.S. Department of Energy projected a 20 percent increase in DSM spending to about \$3.5 billion by 1998. Instead, spending dropped to \$1.5 billion, a decline of 45 percent in four years, and a reduction of 57 percent when compared to the trend line of 1991–93.

Reduction of utility-sponsored DSM programs between 1994 and 1999 dramatically reduced the contribution such programs could have made to meeting both energy needs and peak demands since then. By 1993, DSM-related peak load reductions were growing by about 4,000 MW per year. However, after 1995, progress stalled and total peak load reductions remained virtually flat until 1999.

Figure 1: Peak Load Reductions from Efficiency and Load Management in the United States



Source: Cowart, 2001.

In 2000 and 2001, power crises mounted in California and the western United States, and reserve margins narrowed in the eastern United States. As a consequence, demand-side resources received renewed attention and policy makers restored much of the funding that had been cut back in prior years.

Focus Shifted from Planning To Markets and Choice

Proponents of restructuring worldwide believed that retail competition would include innovative offerings by retailers and ESCOs that would overcome the barriers to DSM and energy efficiency. It is important to understand that this has not been the case in any electricity market in any country. The market and regulatory barriers to DSM, especially to efficiency, still remain in restructured systems. In fact, by separating previously integrated utility functions, and exposing power suppliers to short-term price pressures, many restructuring plans have actually increased the barriers to DSM.

Unbundling the Utility Also Unbundled the Benefits of DSM

DSM programs produce generation, transmission, and distribution savings. Worldwide, prior to restructuring, utilities could compare these combined savings to the cost of DSM when deciding whether a DSM program was cost-effective. However, power sector reform in some countries and some U.S. states separated generation from transmission, distribution, and retailing in ways that dispersed the DSM cost savings among two or more separate entities. DSM that would have been cost-effective to a vertically integrated utility might now not be cost-effective to any single industry participant.

Resources such as energy efficiency (which produces savings in generation), distribution, and transmission are disadvantaged in restructured markets that do not allow participants to capture all those values simultaneously. The separation of generation from monopoly transmission and distribution service is necessary to create fair and competitive generation markets, but it has undermined DSM. The challenge has been to find restructuring options and mechanisms that will capture the benefits of both restructuring and DSM.

Restructuring Increased Disincentives for Power Supply Company Investment in DSM

Separation of generation from transmission and distribution creates smaller companies with lower earnings that magnify the disincentives for grid company investment in DSM. For grid companies net revenue losses (revenue loss minus variable cost reduction) resulting from DSM are essentially the same as was before restructuring. But after separation, the net revenue loss has to be absorbed by a smaller utility total level of revenues and earnings. The same net revenue loss on a smaller level of earnings accentuates the revenue-losing aspect of DSM.

One of the many DSM strategies implemented by regulators prior to restructuring was the increased use of sophisticated meters and pricing options. Many larger customers were required to install real-time or other advanced metering and were required to be on TOU prices. These prices reflected the cost of producing and delivering power at different times and different places. With restructuring and retail access, these customers were free to choose among competing suppliers, or (in most states) to choose a simplified "default service" plan. Customers were no longer required to be on any particular price structure. Many of these customers preferred the certainty of fixed prices to the more efficient TOU prices they were previously required to take. Thus, although the expectation of many was that restructuring would lead to innovative pricing, retail competition helped many customers avoid the price volatility of generation markets, and dampened their interest in load management options that could provide benefits to the grid as a whole.

Increased Price Volatility Encourages Load Management

Many restructured markets have experienced much higher levels of price volatility. Where restructured markets have exposed customers to this price volatility, customers have responded in a variety of ways. Some have changed to suppliers that offered stable prices and some have invested in load management options.

Retail Access Has Increased Prices for Some Industrial Customers

In many countries and some U.S. states, industrial customers were given preferential prices below market prices. Restructuring in some places resulted in the loss of these subsidized prices and industrial prices increased. Industrial customers' responses to higher energy prices have included increased investment in DSM and energy efficiency. It is thus important that restructuring plans provide for technical and financial assistance to energy-intensive industries, to lower their costs and improve their competitiveness.

3. Results

In order to effectively implement DSM programs as well as energy saving programs according to the set goals, it will not be possible to successfully implement them without the synchronous coordination between implementing agencies and management agencies. competent state management together with a clear DSM and energy saving legal framework. Therefore, in the coming period, the issues of policy and mechanism that need to be considered and implemented soon are:

- Completing the legal framework for DSM power demand management activities;

- Promulgating documents guiding current Laws and Decrees related to electricity demand management activities;

- Develop appropriate mechanisms, policies and energy tariffs to ensure the goal of energy conservation, and encourage economical, efficient and rational use of all forms of energy;

- Develop mechanisms and policies to gradually establish a financial fund to ensure the successful implementation of the contents of the DSM programs;

- Develop and issue energy efficiency standards for equipment used as a basis for the recognition of energy-saving products. Strict monitoring and inspection mechanisms for the quality and efficiency of energy use of equipment;

- Organize a network of energy saving and efficient management and use to provinces and centrally-run cities.

In order to implement DSM programs effectively and sustainably, it is necessary to conduct research towards the establishment of a Public Benefit Fund (PBF) including spending on DSM activities: The establishment of a Benefit Fund can be considered. public benefits in Vietnam on the basis of fees included in the electricity price. The PBF will spend a small part on DSM activities. Lessons learned on success in DSM activities and energy saving in countries around the world show that the allocation of capital from the PBF fund for DSM activities should be assigned to the Electricity Regulatory Authority to supervise the implementation.

The establishment of a Public Interest Fund will be an important basis to ensure the successful implementation of the DSM program and save energy because it must not only ensure adequate resource allocation, but also force agencies to establish and implement a rigorous project lifecycle management approach to keep DSM budget and energy efficient. International experience shows that regular energy efficiency assessments are the basis for recognizing the energy-saving achievements of DSM and energy-saving plans and the evidence against which key planners The policy further allocates resources for DSM activities and saves energy implementation.

If the peak cutting efficiency and energy savings of DSM and energy saving programs are a quantifiable resource, equivalent to the energy supply, it can help policymakers to devise incentives, regular control and quantification of program results. It is necessary to create a closer link between DSM programs and energy saving programs: In our country today, energy saving programs implemented by the Ministry of Industry focus more on construction and develop institutions to encourage mechanisms for energy saving implementation such as supporting energy audits, setting minimum energy efficiency standards and energy stamping regulations; promotion and public awareness raising.

The current DSM program implemented by EVN focuses mainly on equipment - mainly customer equipment such as lighting equipment and electrical appliances. The lack of synchronization between energy saving programs and DSM will likely create a “policy loophole” with many DSM and energy saving opportunities being missed.

Institutional setting up of DSM and energy saving programs in Vietnam: In the past, DSM programs were often implemented by power companies because of the financial benefits brought from the reduction of peak load demand. instead of having to add new supplies.

In the current period, when the electricity industry is in the process of reforming in the direction of strongly separating power generation, transmission and distribution functions along with the development of the electricity market, international experience has shown that found that an independent agency responsible for implementing DSM programs would be essential and highly effective.

There are several conclusions that can be drawn from international experience with restructuring and DSM:

- The expectation that the power sector will be reformed leads to significant reductions in existing DSM programs or makes it very difficult to implement such programs.

- Power sector reform will not address energy efficiency or DSM unless the government adopts specific policies that make them a part of the restructuring process.

- Separation of the grid from generation makes it more difficult for any one entity to see the full value of energy efficiency. A single buyer, however, retains the incentive to capture all of the generation, transmission, and distribution value of DSM, provided that buyer has the proper regulatory incentives and policy support to do so.

- Markets deliver what they are designed to deliver. If the market is designed to deliver energy efficiency, it will. If it is not designed to deliver energy efficiency, it won't.

- To solve these problems, explicit action will need to be taken by decision makers. In the final chapter, an integrated set of policies that will promote cost- effective DSM investment in a reformed Vietnames power sector is recommended.

4. Discussion and Conclusion

When applying DSM the revenue of Powers may be reduced and due to the investment cost for DSM, that will lead to electricity price increase. The DSM program usually saves customers electricity bills, but this only seems to be true for high-capacity customers as it is likely that the amount of electricity avoided due to reduced power consumption is higher than the amount paid due to an increase in electricity prices. . With regard to customer objections to the DSM program in terms of price effects, to address this issue Powers need to develop extensive proposals that address the needs of price-sensitive customers and try experience DSM programs where the customer pays the full cost of the program through loan mechanisms.

Power shortages can lead to poor decision making that has negative long-term economic and environmental consequences. For example, power shortages have led to decisions to delay or waive environmental rules and to the acceleration or construction of uneconomic power plants. Many countries, including the Philippines, India, and Indonesia, have entered into expensive long-term power contracts that caused lasting economic and political problems. Signing overly expensive contracts is not unique to developing countries. One of California's responses to the power crisis was to sign numerous long-term contracts, mostly with new gas-fired plants. As the crisis passed, the contracts were widely seen as being far too expensive.

DSM responses, on the other hand, can help meet electricity demands and provide reserve margins without adding to stresses on already-burdened transmission and distribution systems. By lowering demand at customer sites, rather than relying solely on new central-station generation, DSM allows grid companies to concentrate their capital resources on the most pressing grid upgrade requirements, while deferring other upgrades, lowering the cost of distribution, and improving reliability in many locations Energy efficiency investments can behighly targeted. For example, Commonwealth Edison, the utility serving the U.S. city of Chicago, targeted aggressive energy efficiency investments to neighborhoods where load growth was straining overloaded distribution systems. Other systems have put more emphasis on efficiency measures that have benefits for high peak load (targeting, for example, commercial lighting and air conditioning). In other cases, as in Brazil or the Pacific Northwest during drought conditions, the goal was to save energy in all hours, leading to a number of DSM resource choices. The lesson here is that there are many kinds of DSM resources and they can be strategically deployed to meet system needs in a variety of ways.

As the case examples above make clear, utilities and government agencies in California achieved dramatic savings from aggressive DSM efforts in 2001–02. Agencies in the Pacific Northwest and in New York also achieved significant savings and system improvements. In contrast, Brazil's response to the crisis was hampered critically by the relatively weak experience of utilities and government agencies in delivering efficiency services to customers.

Abstract

Mekong Delta key economic region (KER) was established in 2009, including 4 provinces and cities: Can Tho city, An Giang province, Kien Giang province and Ca Mau province. Mekong Delta KER has been assigned to the important role of a growth pole and development center of the big region of Mekong Delta. Using the method of calculating the component and aggregated sustainable development indicators, this study shows that the KER's development in general and the economic development in particular in recent years has only reached a relatively sustainable level, even less sustainable in terms of internal sustainability, spillover effects as well as regional connectivity. A number of recommendations for sustainable economic development and promote the role of the Mekong Delta KER in the coming years was proposed, focused in new mechanisms and policies to further improve the investment and business environment; human resources development; application of advanced science and technology in production; FDI attraction; building and upgrading infrastructure; promoting economic structure change; integrating climate change issues into development plans and strategies.

Key words: *sustainability, sustainable economic development (SED), Mekong Delta key economic region (KER)*

1. Introduction

Since 1997, in order to meet the actual needs of the country's development, Vietnam has selected a number of provinces and cities with favorable conditions for development which were capable of facilitating competitive advantages and become the leading growth for establishment of key economic region (KER) in order to promote the developing process for those regions, thus, it will play an important role in growth for the national economy (Prime Minister, 1997).

There are four KERs in Vietnam, they are: the Northern Vietnam, the Central Vietnam, the Southern Vietnam and the Mekong Delta KER. The Mekong Delta is the most recent KER of Vietnam which was established in 2009 according to the Decision of the Prime Minister, including 4 provinces and centrally-run cities: Can Tho City, An Giang Province, Kien Giang Province and Ca Mau Province. (Prime minister, 2009).

The Mekong Delta is located at the southernmost part of Vietnam. The Delta, consists of 12 provinces and 1 city directly under the central government, is a big region accounting for 12% of the area and 19% of the population of Vietnam (The Government, 2017). As the "nucleus" of the Mekong Delta, the Mekong Delta KER is determined to play as a major center in rice production, farming, fishing and seafood processing, making a great contribution to the export of agricultural and aquatic products of the whole country, playing an important role in biotechnology transfer, providing seeds, technical services, processing and exporting agricultural products for the whole Mekong Delta region. The KER is also a big center of energy and tourist service, a “bridge” for regional economic integration and an important location in national defense and security (Prime Minister, 2014). Thus, the sustainable development of the Mekong Delta KER in general and its sustainable economic development in particular, is very important not only to itself but also to the Mekong Delta region and other regions of the country due to its role as a growth pole with spillover effects.

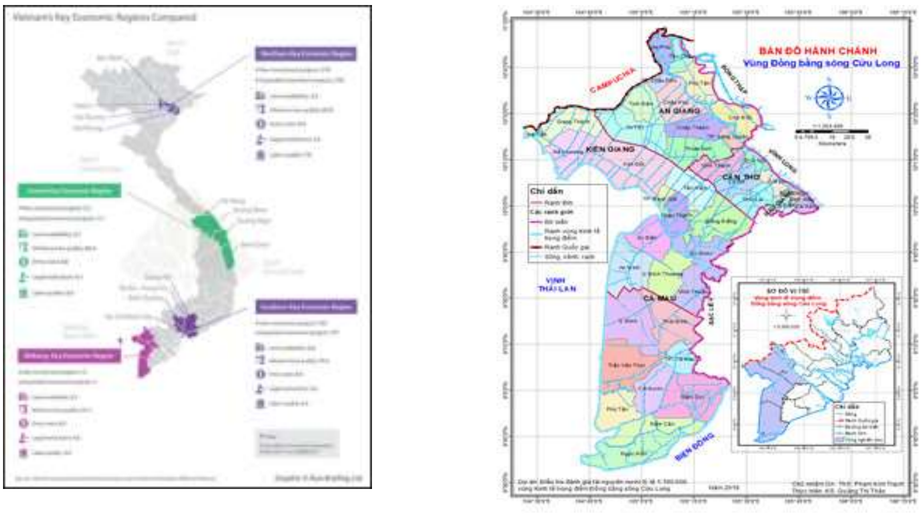

Figure 1: Vietnam’s Four Key Economic Regions and Location of Mekong Delta Key Economic Region

However, there are still questions that need to be studied on whether the economic development of the Mekong Delta KER has been really sustainable, whether or not the KER can promote its role as a growth pole and its impact on the Mekong Delta region as well as on the country's economy.

This research paper aims to assess the sustainability in economic development of Mekong Delta KER in the period 2016 – 2019, propose a number of recommendations for sustainable economic development and promote the role of the region in the coming years.

2. Research Method

Method to calculate the indices of sustainability

Being the important growth pole, the leading of economic development of the Mekong Delta region and the whole country, the sustainable economic development of the KER has to meet the requirements of internal sustainable development of the region, spillover effect and economic connectivity. Thus, assessment of the sustainability in economic development of the KER should be a combination of indicators which represent the above stated requirements.

In this research, we applied the aggregate index following the approach of UNDP (Charles Humana, 1991), and Nguyen Minh Thu (Thu, 2013). The indicators will be divided into three main groups: Internal sustainable development (I_{bvnt}); Spillover effect (I_{lt}) and Regional economic connectivity (I_{llk}). The procedure and method to calculate the indices follows the steps as showing in Figure 2, which are (1) Calculating individual indicator using the indicators of the statistic indicating system for sustainable development, (2) Calculating 3 component indicators correlating with 3 groups of statistic indicators for sustainable development, and (3) Calculating the aggregate index of sustainable development on the average basis.

Indicator 1	Indicator …	Indicator n	Indicator 1	Indicator ...	Indicator n	Indicator 1	Indicator ...	Indicator n
↓	↓	↓	↓	↓	↓	↓	↓	↓
Index 1	Index …	Index n	Index 1	Index ...	Index n	Index 1	Index ...	Index n

↓ I_{bvnt} : Component index of Internal Sustainability

↓ I_{lt} : Component index of Spillover Effect

↓ I_{llk} : Component index of Regional Connectivity

↓

Aggregate Index of sustainability in economic development of Mekong Delta KER

Figure 2. Procedure and method to calculate the indices of sustainability

The Aggregate Index of sustainability in economic development is calculated by the following formula:

$$i = \sqrt[3]{i_{bvnt} \times i_{lt} \times i_{llk}} \qquad (2.1)$$

Sustainability is assessed by a scale from 0 to 1 as follows:

$I \leq 0.2$: Very unsustainable development

$0.2 < I \leq 0.4$: Unsustainable development

$0.4 < I \leq 0.6$: Relatively sustainable development

$0.6 < I \leq 0.8$: Fairly sustainable development

$0.8 < I \leq 1.0$: Sustainable development

The indicators are selected from the sets of indicators of UNDP, CSD, "Set of indicators for assessment of local sustainable development from 2013 to 2020" and "Set of indicators of Vietnam's sustainable development statistics", which are appropriate for the objectives in "National Green Growth Strategy" and "National Strategy on Climate Change"; including the specific indicators as shown in Table 1.

Note that, in the indicator system, there are indicators that positively reflect the increase in the level of sustainability (social labor productivity, GRDP, contribution to the country's GRDP, etc.); On the contrary, there are indicators that reflect the negative/ opposite direction of sustainability (damages caused by natural disasters, poverty rate, etc.). Some indicators have radial values that represent sustainable optimal values (unemployment rate, etc.); In addition, there are a number of limiting indicators, that is, if a certain value is not reached, sustainability requirement is not meet (GRDP per capita compared to the country's GDP per capita, GRDP growth rate compared to the national average, economic density. etc.,).

For the positive, negative and radial indicators, we employed the min-max standardization method (used by the United Nations to calculate the HDI and by Vietnam to calculate the provincial PCI) to convert the values of the indicators into separate index that give values in the range (0÷1). The formulas for calculating the indicators are as in Nguyen Minh Thu's research (Thu, 2013), as follows:

$$I = \frac{\text{Real value} - \text{Minimum value}}{\text{Maximum value} - \text{Minimum value}} \qquad (2.2)$$

$$I = \frac{\text{Ln (Real value)} - \text{ln (Minimum value)}}{\text{Ln (Maximum value)} - \text{ln (Minimum value)}} \quad (2.3)$$

$$I = \frac{\text{Maximum value} - \text{Real value}}{\text{Maximum value} - \text{Minimum value}} \quad (2.4)$$

$$I = \frac{\text{Ln (Maximum value)} - \text{ln (Real value)}}{\text{Ln (Maximum value)} - \text{ln (Minimum value)}} \quad (2.5)$$

$$I = 1 - \frac{|\text{Real value}| - |\text{Median value}|}{|\text{Maximum value}| - |\text{Median value}|} \quad (2.6)$$

Where:

- Formula (2.2) applies to the positive indicators when the actual indicators usually just reach a certain level and there is no significant difference if compared by space and time. Relative value regularly have limited variation from 0 to 100%.

- Formula (2.3) applies to the positive indicators when the actual indicators usually increase without limitation and there is often a significant difference among the levels.

- Formula (2.4) applies to the negative indicators when the actual indicators usually just reach a certain level and there is no significant difference.

- Formula (2.5) applies to the negative indicators when there is a significant difference in the indicators of actual research.

- Formula (2.6) applies to the radial indicators.

The values will be determined respectively as follows:

- Maximum value: determining based on the maximum possible limit of the indicator. For indicators that are unknown or do not have any guidance on sustainability limits, the maximum value will be the trend value: the maximum value of the indicator in the research period.

- Minimum value: determining based on the minimum possible limit of the indicators. In other cases, the trend value is selected as the minimum value of the indicator in the research period.

- Median value: For the indicator that has information about the proclaimed optimal value, the median value is selected as that value. In the other cases, each indicator will be selected appropriately to its characteristics.

For other limiting indicators such as Gross Regional Domestic Product (GRDP) compared to the average country's GDP, the growth rate of GRDP compared to the national average, GRDP per capita compared to the national average. These indicators have to reach a limit value to be sustainable. Thus, if any indicator that have real value greater than the limit value, then I = 1, means sustainable development; if any indicator that have real value less than the limit value, then I = 0.2, means very unsustainable.

Table 1 presents the ways to define the indicators' values in this research.

Sources of Data

The data used in the analysis and calculation of the indices of sustainability is from statistics of the General Statistics Office of Viet Nam (GSO), Statistic Office of Can Tho, Kien Giang, Bac Lieu and Ca Mau Provinces; the reporting of Ministry of Agriculture and Rural Development, UNDP and Vietnam Chamber of Commerce and Industry (VCCI). The data is in the time period from 2016 to 2019.

Table 1: Indicators to assess the sustainability of economic development in the Mekong Delta KER

	Indicator	**Unit**	**Maximum value**	**Minimum value**	**Limit value**	**Formula**
	Internal sustainability					
1	GRDP	Billion dongs	Trend value	Trend value		(2.2)
2	GRDP growth rate/ national GDP growth rate	Times			1,5	Limit
3	GRDP per capita/ national GDP per capita	Times			1	Limit
4	Poverty rate (multidimensional approach)	%	Maximum value: 100	Minimum value: 0		(2.4)

5	Labor productivity	VND mil. per person	Trend value	Trend value		(2.3)
6	Trained workforce for aged 15 and over	%	Maximum value: 100	Minimum value: 0		(2.2)
7	Unemployment in the working age	%	Trend value	Median value: 3		(2.6)
8	Damage caused by natural disaster	VND bil.	Trend value	Minimum value: 0		(2.5)
9	State budget deficit / GRDP	%	Trend value	Trend value		(2.4)
10	Production value of scientific and technological activities	VND bil.	Trend value	Trend value		
	Spillover effects					
11	Working force	Person	Trend value	Trend value		(2.2)
12	FDI by registered capital	USD mil.	Trend value	Trend value		(2.3)
13	Economic density	VND mil./km^2	Trend value	Trend value		(2.2)
14	Net migration rate	%	Trend value	Minimum value: 0		(2.4)
	Regional connectivity					
15	Volume of goods transported	Thousand tons	Trend value	Trend value		(2.2)
16	Number of passengers carried	Thousand people	Trend value	Trend value		(2.2)

3. Results

In 2019, the population of Mekong Delta KER was 6,061,000 people, accounting for 36% of the Mekong Delta's population and 6.9% of the country's population. The population density of 367 people/km^2 which was lower than the average population density of the

Mekong Delta, but it was nearly 1.4 times higher than the national average. An Giang and Kien Giang were the provinces with the largest population, accounted for 31.4% and 28.4% of the Mekong Delta's population, respectively.

The statistics of 2019 have shown that the per capita income of provinces in the KER had increased over the years; However, Can Tho was the only province that had the per capita income of VND 4.713 millions/ month, higher than the average income per capita of the whole country which is VND 4.295 millions/ month. Other provinces’ income per capita were lower than the national average: An Giang (VND 3.841 millions), Kien Giang (VND 4.079 millions). Ca Mau province’s income per capita was even lower than the average of the whole Mekong Delta (VND 3.214 millions compared to VND 3.886 millions).

Provinces in the KER had annual contribution to the state budget increasing over the years. However, the contribution of provinces in the Mekong Delta KER was still very limited when compared to other KERs. In 2019, the Mekong Delta KER contributed only 4.71% to the total budget revenue from provinces of the country. For details, Kien Giang contributed 1.95%, Can Tho contributed 1.62%, An Giang contributed 0.77 % and Ca Mau only contributed 0.37% to the whole country’s state budget. The total budget revenue of the 4 provinces in Mekong Delta KER in 2019 reached VND 73,037 billions, it was just 17% compared to the contribution of Ho Chi Minh City and 27.7% compared to Hanoi City.

In the period of time from 2016 to 2019, although the region's labor productivity tended to increase rapidly, it did not meet the stated requirements. Statistics have shown that Can Tho was the only province that had a higher labor productivity than the national average (VND 133.42 millions/worker/year compared to VND 110.5 millions/worker/year). Other provinces’ labor productivity were lower than the national average: Kien Giang (VND 101.29 millions/worker/ year), Ca Mau (VND 91.01 millions/worker/ year), An Giang (VND 52.81 millions/worker/ year). It was reported that the standard of labor, science and technology of provinces in the region, except for Can Tho that still had many limitations which led to low labor efficiency and productivity compared to the national average.

In recent years, the economic development results of provinces in the Mekong Delta KER and the whole Mekong River Delta region have not met the requirements, the economic indicators of the KER are still lower than the national average and disproportionate to its economic potential and its role as the motivative region and the leading of the country's economic development.

The data on economic development - also be used to assess and calculate the sustainability in economic development of provinces in the Mekong Delta KER, are collected and summarized by the researchers as shown in Table 2.

Table 2. Statistics for economic development in the Mekong Delta KER

Items	2016	2017	2018	2019
GRDP, VND Billions				
Can Tho	67,270.78	73,448.88	83,215.97	91,471.49
An Giang	65,464.53	70,719.78	78,152.97	84,459.60

4. Discussion and Conclusion

In the recent years, the assessment has shown that the development of Mekong Delta KER was impressive in general. The level of sustainable economic development of the whole region increased from 0.44 points in 2016 to 0.54 points in 2019. However, the economic development of each provinces in the region as well as the whole region was still not really sustainable, both in the internal aspect and leading role/ spillover and connectivity aspect in the development of the Mekong Delta region.

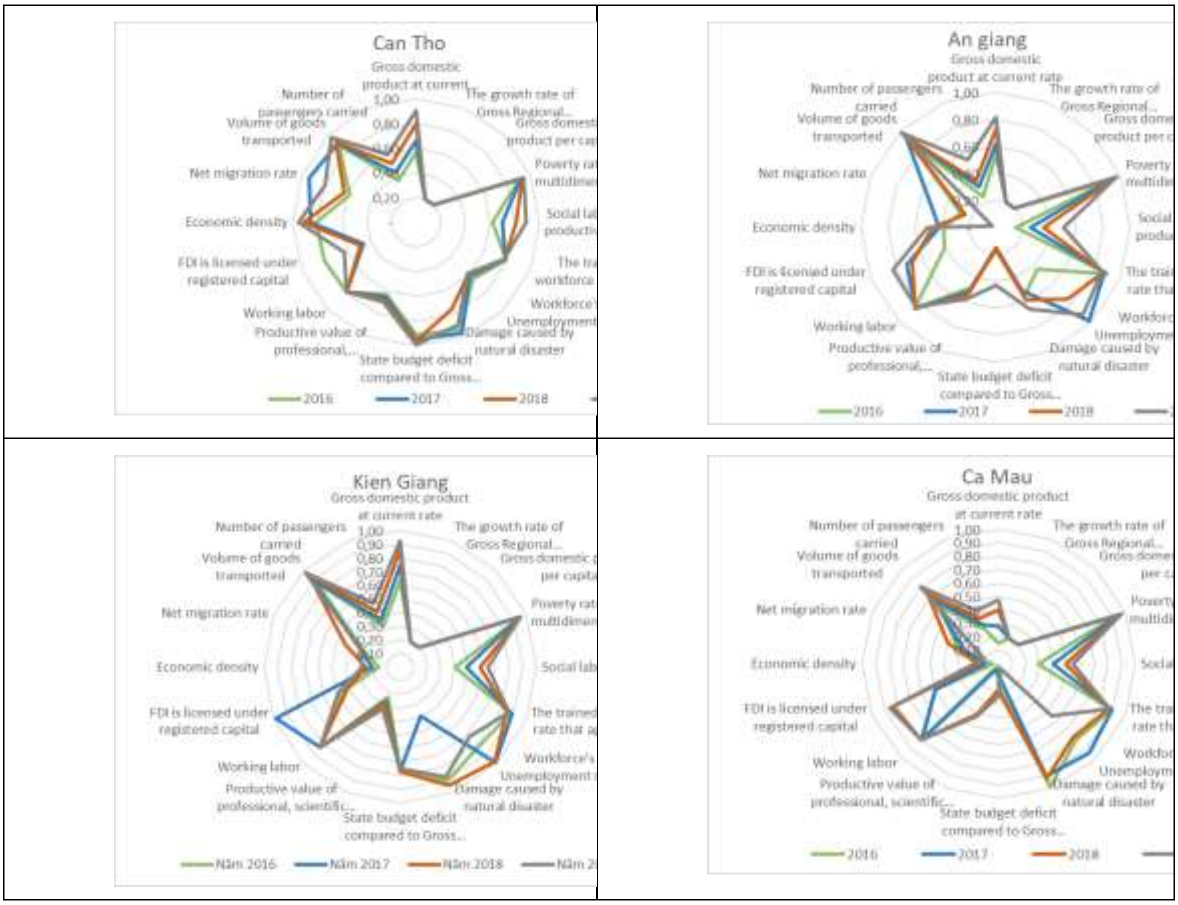

Figure 2. Assessment indices of SED of provinces in Mekong Delta KER

There is clear differentiation among provinces in the region, especially, Can Tho and Kien Giang cities always tend to lead in the general economic development of the region. From 2016 to 2019, Can Tho's economic development level towards sustainability has always remained at 0.6-0.8, which is at fairly sustainable development level. However, the development of other provinces could only have been maintained at a relatively sustainable level, especially, from 2016 to 2017, Ca Mau has just maintained at the level of unsustainable economic development (0.32 and 0.36 points). In this period, thus, the economic development of the region is relatively sustainable with 0.44 - 0.53 points at best.

In recent years, the internal sustainability indicator of Can Tho and An Giang have a steady increased; Kien Giang and Ca Mau, on the other hand, continue to slow down in 2019 – since Ca Mau was severely affected by natural disasters, salinization, and landslides in 2019. According to the General Statistics Office, in 2016, the whole region lost about VND 279.62 billions due to natural disasters. In 2019, it was up to VND 44,933 billions. Especially, Ca Mau suffered the loss of VND 44 trillions at least.

Can Tho was the only province with GRDP per capita and GRDP growth rate higher than the national average, otherwise, other provinces were lower. Especially, An Giang is only 70% of the country's GDP per capita. Similar to labor productivity indicators, only Can Tho had a slightly higher productivity than the national average (1.1 times), other provinces were lower. Number of trained labors has increased over the years in provinces, though they were lower than the national average. Especially, provincial statistics have shown that the number of trained labors in 2019 was lower than in 2018, thus, this index only reached the relatively sustainable level.

For the index of spillover effect, the assessment results have shown that Can Tho and Ca Mau are the provinces with the improving spillover effect in recent years. Mean while, other provinces were slow down. Especially, in An Giang, the component index of spillover effect decreased from 0.5 points to 0.32 points, from relatively to unsustainable development. During the research period, Can Tho was the only provinces with immigration rate higher than migration rate. This matter has partly shown the weak attraction of provinces in the region compared to others in the country.

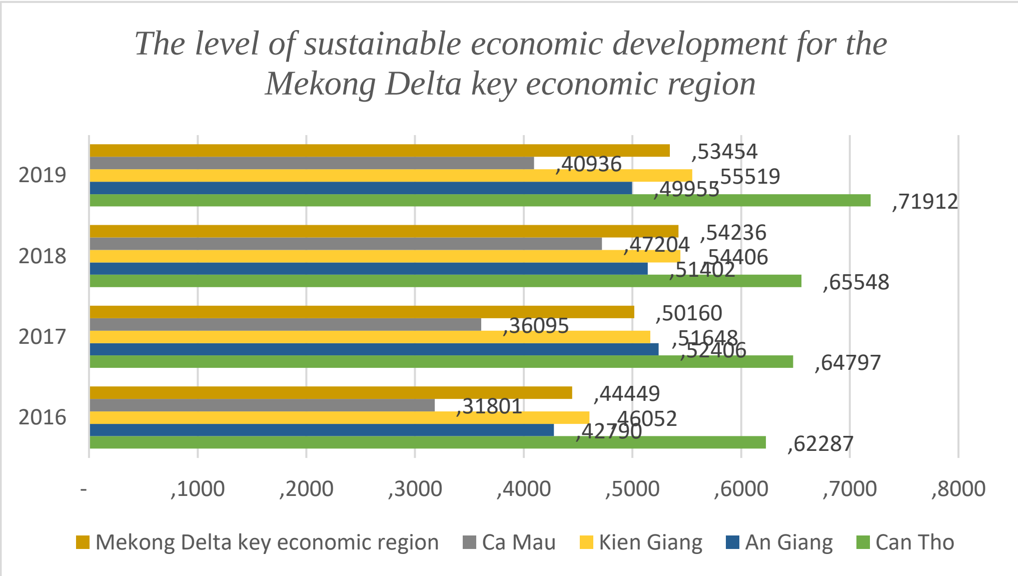

Figure 3. The level of SED for the Mekong Delta KER from 2016 to 2019

The index of regional connectivity also had a differentiation among provinces in the region. In recent years, Can Tho and Kien Giang had this index increased; on the other hand, An Giang's and Can Tho's index had decreased. Moreover, the index of regional connectivity was only calculated according to the number of people and goods transported, which did not fully reflect the connectivity among provinces in the region.

The imbalance has shown not only in provinces but also in interior of each provinces in the region. Figure 2 has shown the imbalance in sustainability among the separate indices in each provinces and their interior. In Can Tho, for example, a number of indicators have shown a high level of development that is fairly sustainable and sustainable, such as: the poverty rate (multidimensional approach), the labor productivity and the damage caused by natural disasters while indicators, the GRDP growth rate compared to the national average and GRDP per capita compared to the national average were low. In Ca Mau, the indicator of damage caused by natural disasters was at an extremely unsustainable level (loss of over VND 44 trillions in 2019 caused by natural disasters); or the net migration rate, the growth rate of GRDP compared to the national average, GRDP per capita compared to the national average was at a below/ very unsustainable level while the index of poverty rate (multidimensional approach) was high, accounting for 2.52%, that was just higher than Can Tho City (2.2%) and lower than An Giang (2.63%) and Kien Giang (4.59%).

Although the economic development of provinces in the Mekong Delta KER has achieved many important achievements, people's living standards have been increasingly improved, but there are still many inadequacies. Internal sustainability issues of each province tend to be precarious and differentiated. Can Tho city is a "symbol" in the economic development for the whole region but it has not really shown its important role. Moreover, the assessment has also shown that the economy of the region is not really sustainable, highly depended on external factors such as natural disasters and climate change and it lacks regional connectivity which has shown the indicators that are very high. Otherwise, in other provinces, they are very low and vice versa.

In the scope of the study, in order to ensure sustainable economic development of provinces in the KER in particular and the Mekong Delta in general, a number of solutions/ recommendations are proposed as follows:

(1) Solutions to ensure internal sustainable development:

- Review, supplement, adjust and develop new mechanisms and policies to further improve the investment and business environment;
- Enhance the investment to human resources development towards high-quality labor force;
- Promote investment in the application of advanced science and technology in production;
- Adjust the master plans and plans for sector development in line with climate change context;
- Take advantages of climate change financial and policy incentives, invest in technology improvement, process innovation in industrial production, reduce greenhouse gas emissions and protect the environment through NAMA, CDM, etc.
- Develop and update action plans to respond to climate change according to climate change and sea level rise scenarios announced and will be announced by MONRE in order to minimize and take measures to respond to climate change, sea level rise and other extreme

weather phenomena;

- Integrating climate change issues into development plans and strategies of sectors and localities in the region.

(2) Solutions to promote spillover effects

- Promote FDI attraction for suitable projects, especially rural infrastructure development projects;
- Continue to invest in upgrading infrastructure, creating favorable conditions for the development of trade, transportation and trade within and outside the region, increasing the level of regional connectivity;
- Continue to promote economic structure change in the direction of reducing the proportion of the agricultural, forestry and fishery sectors to the industrial, construction and service sectors;
- Strengthen training and development of trained human resources and high-quality human resources for economic sectors inside and outside the region, and at the same time adopt policies to attract and improve the quality of human resources in science and technology. policies for the technology application sector;

(3) Solutions to improve regional connectivity

- Strengthen cooperation in industrial development, training, healthcare, tourism, scientific research and technology and labor transfer between localities in the region and other localities in the country, especially Ho Chi Minh City;
- Build synchronous infrastructure, ensuring trade and regional linkages taking into account climate change issues;
- Upgrade and expand roads in districts with economic development potential and high volume of goods transport to provincial level roads. Upgrade and expand existing roads, upgrading inter-commune roads to district level roads…. to ensure smooth transportation/ circulation to all localities in the Mekong Delta;
- Develop and implement plans for economic cooperation for comprehensive socio-economic development among provinces, enterprises inside and outside the KER.

AN OVERVIEW OF CLIMATE-SMART AGRICULTURE MODELS' REVIEW AND EVALUATION PROCESSES: A CASE STUDY IN THE SOUTH CENTRAL COAST

PhD Candidate. Le Huy Huan

huanlh@neu.edu.vn

Faculty of Environmental, Climate Change and Urban Studies, National Economics University, Vietnam

Abtract

Adverse weather conditions and further climate change have had a strong impact on food production systems. Accordingly, the promotion of climate-smart agriculture (CSA) models is an approach to achieve sustainable development in agriculture, ensuring food security in the context of climate change. This study aims to (1) review the evaluation processes, categorize CSA models from different stakeholders to arrive at a common and appropriate consensus process; (2) indicate the basis for selecting suitable potential CSA models in each specific production condition; (3) applied to the review and identification of existing CSA models in the South-Central Coast. Research methods including desk research, field investigation, and expert consultation were used to achieve the research objectives. The results show that there are 18 potential CSA models in the South Central Coast that meet the requirements of a CSA model. However, in order to have a basis for proposing the replication of these models, detailed assessments are required to determine the effectiveness of the models and their suitability with local production conditions and resources.

Keywords: *assessment, climate change, CSA model, process, review, selection criteria*

1. Introduction

According to FAO (2010), an agricultural model is considered to be climate-smart (CSA) when it contributes to increasing the following three capabilities of agricultural production systems: (i) Adaptability respond to climate change (CC), ensuring productivity and income even under adverse climate change; (ii) Mitigation capacity: the ability to reduce the risk of CC occurrence and to reduce CC levels, by reducing or eliminating greenhouse gas emissions (GHGs), or recovering GHGs from the atmosphere; and (iii) The ability to increase productivity and economic efficiency, thereby contributing to food security in the long run. An agricultural model that meets all three of these goals is ideal. Because of the complexity of the CSA concept, in practice it is very difficult to achieve the three goals at the same time. In different contexts, the order of priority goals is also different. CC reduction is an important goal, but not a mandatory criterion; just practice that CSA does not emit more

GHGs, does not cause negative effects on the climate and the living environment. Therefore, the establishment of a decision support framework is necessary to facilitate the selection of a list of CSA models that are suitable for practice.

In Vietnam, in a series of important decisions such as Action Plan to Response to CC in agriculture and rural development (Decision No. 819/QD-BNN-KHCN) (MARD, 2016); Plan for the implementation of the Paris Agreement on climate change (Decision No. 2053/QD-TTg) (Prime Minister, 2016); Implementation plan of the Paris Agreement on CC of the Ministry of Agriculture and Rural Development (Decision No. 891/QD-BNN-KHCN) (MARD, 2020); The national plan to adapt to climate change for the period 2021 - 2030, with a vision to 2050 (Decision No. 1055/QD-TTg) (Prime Minister, 2020), all emphasize the importance of climate change adaptation. develop and replicate agricultural production models that are intelligently adaptable to CC.

In fact, there is a need of a common and most appropriate method to guide stakeholders to review and evaluate CSA models or potential CSAs;moreover, it is necessary to indicate the basis for selecting suitable potential CSA models in each specific production condition. This study aims to review all the different assessment methods which are available; thereby, consider the similarities and differences to propose a framework or a common review and evaluation process. This process will be applied to review the list of existing CSA models in the South-Central Coast.

2. Method

The methods used in this study include:

Data collection and synthesis method: This method is used to review and analyze different evaluation processes and methods of domestic and foreign agencies and organizations. This method is also applied to review all agricultural production models with CSA potential in Vietnam in general and the South-Central Coast in particular.

Field survey: This method is used to determine the presence or absence of CSA models in actual agricultural production in the study area, preliminary determination of the effectiveness and relevance of CSA models - the model that adapts to recent and future climate changes. Ninh Thuan and Binh Thuan are the two provinces selected for the field survey.

The method of consulting experts: This method is applied to select typical agricultural adaptation models according to 3 pillars (ensure food security, adaptability, and reduce climate change) and the feasibility of agricultural models that are highly adaptable to increasing drought conditions in the South-Central Coast.

Community consultation method: Community engagement for consultants is used to collect information from farmers who directly practice local production activities. The information is qualitative and may indicate the potential suitability of the solution for specific local conditions.

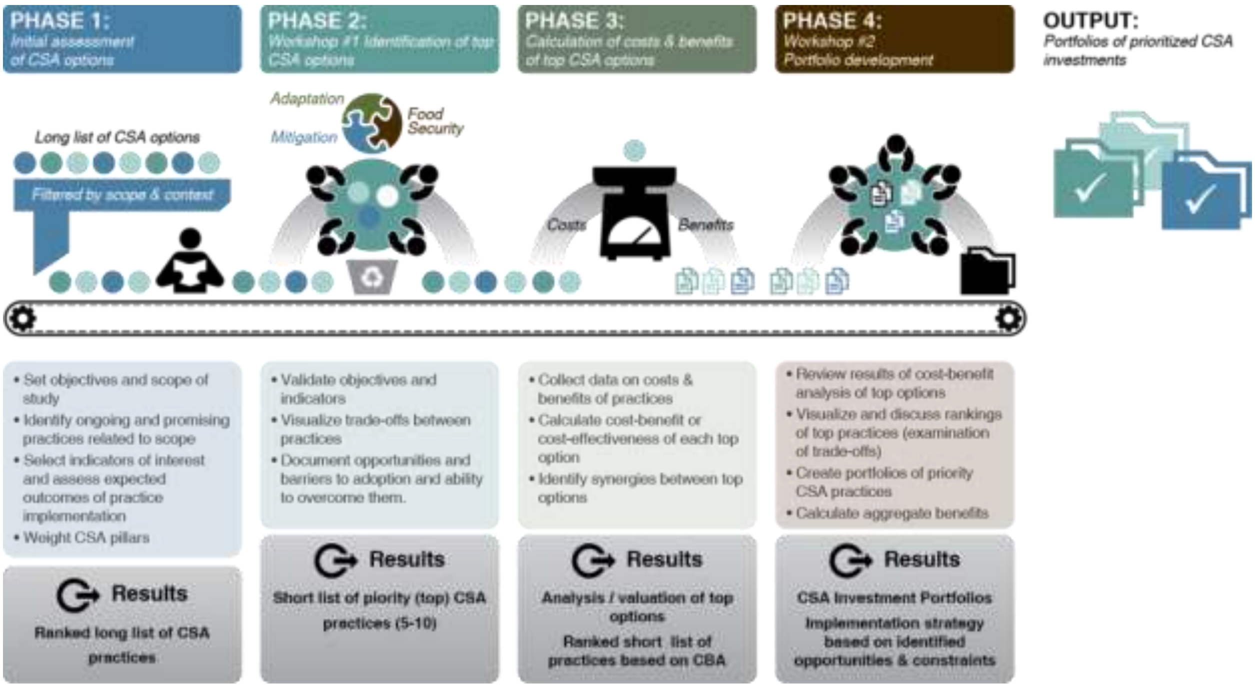
3. Results

3.1. Overview of processes for reviewing and evaluating potential CSA models

The inspection processes of different CSA models is mentioned below. Each given process represents different spatial levels from national, regional to local; for different audiences from policymakers, financial institutions to local managers.

In 2014, CIAT-CCAFS published the document "Climate-smart agriculture investment priority framework". The CSA prioritization framework is designed to meet the needs of managers at different levels (farm to policy, private and nonprofit organizations), and aims to identify determine the best cost to respond to climate change risks in the short and long term. In this document, the prioritization framework uses a four-phase approach to guide stakeholders through the process of filtering a long list of applicable CSA practices into portfolios of priority practices.

Figure 1. Description of the CSA Investment Prioritization Framework process



Source: CIAT, 2014

It can be seen that this process is more suitable for agencies, international organizations, national and regional policy makers, and financial institutions to consider and make decisions. Applying the above process, in 2015, the Institute for Agricultural Environment (IAE) in collaboration with CIAT conducted a review of CSA models in Vietnam (CIAT & IAE, 2015).

In order to have a more specific basis for selecting appropriate CSA models for each context as well as for replication, a study by MARD (2015) proposed a process (steps) for rapid review of The CSA model is as follows:

Step 1: Establish a list of models that are likely to be CSA models, or temporarily called CSA-oriented models based on analysis of secondary information including project reports, related programs related to CC mitigation/adaptive agricultural development, reports from DARDs, scientific reports, research results (both published and unpublished).

Step 2: Based on the CSA Basic Criteria to determine which models are CSA models, exclude non-CSA models. The result of this step is to make a list of CSA models that are being implemented in practice *(Table 1).*

Table 1: List of CSA models in practice

No.	Model name and main features	Project/ Program	Location, scale of application (starting year, area, number of households …)	The main benefits and impacts of the model				Advantages and disadvantages in model implementation	Policies related to model development and replication
				Increase productivity and ensure food security	Climate change adaptation	GHG reduction	impacts of the model		
	…	…	…	…	…	…	…	…	…

Source: MARD, 2015

Step 3: Make a list of CSA models suitable to the local practical needs for food security, CC adaptation, and CC mitigation. To compile this list, additional information should be collected through expert consultation and consultation with the local community. The purpose is to build the bases for the suitability and non-conformity of the model with local practical needs.

Step 4: Identify suitable potential CSA models for replication based on the characteristics of natural conditions; infrastructure conditions; household characteristics; policy mechanisms related to the CSA model.

On a smaller scale, in the study of Duong MT et al (2016), the research team conducted a quick inventory and assessment of the "climate-smart" of the existing farming systems in practice at (Climate-Smart Village - CSV), My Loi village, Ky Son commune, Ky Anh district, Ha Tinh province). The process includes the following steps: (1) Inventory of CSA models that consider CSA performance indicators that have been adapted to the context; (2) Evaluate the effectiveness of CSA indicators based on high or low-performance indicators for each indicator; while considering the potential to improve and further extend the model.

Thus, through the above overview, it can be concluded that the process of reviewing CSA models is very diverse. The common point in these processes is that the inventory implementation, aggregation of all potential CSA models is based on the synthesis of primary and secondary documents. The next step is to use the preliminary evaluation criteria to establish a list of CSA models. Based on specific local conditions, a further set of criteria is used to assess the relevance and replicability of these models. The difference between the processes depends on: what is the purpose of the review; who is the subject of the review; the national, regional, or local level. Accordingly, for each process, the number of criteria and the level of detail used to evaluate each process is also different.

3.2. Overview of criteria for reviewing and evaluating potential CSA models

3.2.1. Criteria for review and evaluation from international organizations

In 2013, FAO published the document "Climate-Smart Agriculture - Sourcebook", which includes Module 18 - Impact Assessment, Monitoring, and Evaluation. This module lays out the CSA assessment criteria, but mainly at the national, regional, and project levels; Evaluation criteria at the model level are few and non-specific. At the model level, FAO (2013) provides 7 general criteria for evaluation as follows: (i) Reduce soil erosion and improve nitrogen fertilizer use efficiency from the application of tillage, cover crop and crop rotation techniques; (ii) Improve the availability of irrigation water from soil and water conservation activities; (iii) Improve crop productivity by using new varieties, changing care regimes (fertilizer, irrigation), or by providing and using early weather and climate forecasting information; (iv) Improved livestock productivity from the use of new breeds and improved breeding techniques; (v) Balancing output, market price, and household income through fertilizer support programs; (vi) Improved economic resilience from diversification of income sources; and (vii) Reduce greenhouse gas emissions (GHGs) or increase the carbon accumulation capacity of the soil by applying better crop management and care techniques..

In 2014, CIAT-CCAFS published the document "Climate-Smart Agriculture Investment Priority Framework". This document does not provide a specific set of criteria to evaluate CSA models/practices.

In 2015, a group of experts from the World Bank (WB) in association with the International Food Policy Research Institute (IFPRI) developed a draft of the CSA evaluation criteria and indicators. The draft results were presented at the 2015 Global Scientific Conference on CSA in Montpellier, France. In 2016, WB officially published the document "Climate-Smart Agriculture Indicators". Accordingly, the World Bank divides CSA evaluation criteria into 3 main groups:

(i) Criteria on policy and institutions - CSA-Pol Index (assessment of the policy environment in facilitating and supporting CSA promotion), including policies to support CSA; improve infrastructure to support CSA; how to coordinate and implement CSA.

(ii) Group of criteria on technology/engineering - CSA-Tech Index (used to measure changes in productivity, adaptation, and mitigation to CC when applying technology); Evaluation is based on a baseline, that is, when no technique is applied.

(iii) Criteria for successful outcomes - CSA-Results Index (to measure application or non-applicability), including curricula indicators of direct results of CSA intervention implementation; CSA-allowed environmental metrics; indicators measuring the medium and long-term consequences of implementing a CSA intervention)

CCAFS has created a database of more than 378 CSA-related indicators collected from several international development agencies (FAO, DFID, GIZ, IFAD-ASAP, World Bank, USAID) to develop the CCAFS. CSA counter-programming and indicator tool (Quinney et al., 2016) for the purpose of monitoring outcomes and impacts. The tool proposes a shared framework/framework for agricultural programs to i) review current or planned levels of intervention for each CSA pillar, ii) compare the scope and intentions of the CSA between different project designs to program a climate-smarter future, and iii) assist in the identification and selection of an appropriate set of indicators to measure and track outcomes related to CSA..

3.2.2. Criteria for review and evaluation from organizations in Vietnam

a. Criteria for reviewing, evaluating, and ranking agricultural models adapting to climate change in general

In Vietnam, a number of research projects and projects have developed sets of criteria for evaluating and reviewing CC adaptation models such as CCWG, VNGO&CC, and SRD (2011); CARE (2013); Le Van Thang (2015), Truong Quang Hoc, et al (2018).

According to research by CCWG, VNGO&CC and SRD (2011) released in the report "Models to respond to climate change: experience of NGOs in Vietnam", there are 5 criteria for selection. climate change adaptation models, including (1) The effectiveness of the practice/model's response (adaptation and mitigation) to CC; (2) Involvement of the local community; (3) Sustainability (Economic, social and environmental performance); (4) Originality/creativity; and (5) Scalability.

Research by CARE (2013) proposed a set of criteria to identify and select livelihoods that can adapt to climate changes, including 5 groups of criteria (i) Economic compatibility, (ii) Institutional compatibility, (iii) Socio-cultural compatibility; (iV) Climate compatibility and (v) Environmental compatibility with a total of 18 criteria. As a result, there are 11 potential livelihood models to adapt to climate change. These models are classified according to the livelihood quadrilateral framework, then scored and ranked according to CC adaptation criteria.

In order to provide a scientific basis for the selection of climate change adaptation models in the central provinces, Le Van Thang (2015) proposed a set of criteria for assessing the adaptability to CC. including 4 criteria with 14 indicators. On the basis of survey results in 14 provinces (Thanh Hoa to Binh Thuan) on models with potential to adapt to CC, 16 models have been selected, evaluated, scored and classified the level of adaptation by each factor. In which, 03 models have high adaptability to CC, 08 models are quite adaptive and 05 models are moderately adaptive, none of which is low or less adaptive.

In a recent study, Truong Quang Hoc et al (2018) proposed a set of criteria for assessing climate change adaptation models (including 7 criteria with 29 criteria). These criteria are then scored and ranked for adaptability according to 5 levels: very low adaptability, low adaptability, medium adaptation, high adaptability and very high adaptability. Seven evaluation criteria include: (1) Adaptation to CC (5 indicators/40 points); (2) Reducing greenhouse gas emissions (4 indicators/10 points); (3) Economic efficiency and sustainability (4 indicators/10 points); (4) Social efficiency and sustainability (4 indicators/10 points); (5) Environmental efficiency and sustainability (4 indicators/10 points); (6) Conformity with local institutions and policies on CC and natural disasters (4 indicators/10 points); and (7) Scalability (4 indicators/10 points). The adaptability of the models is divided according to the score levels: less than 50 points - very low adaptability; 50 - 70 points - low adaptation; 71 - 80 points - highly adaptive; 81 - 90 points - highly adaptive; 91 - 100 points - very adaptive. After reviewing and evaluating, this study has shown a list of 33 climate change adaptation models.

b. Criteria for reviewing, evaluating and ranking climate-smart agriculture (CSA) models

In the report "*National prioritization of climate-smart agriculture practices in Viet Nam*", CIAT & IAE (2015) used the CSA Index to score according to the 3 CSA pillars below to screen out 19 representative CSA models for 3 agro-ecological regions (Red River Delta, South Central Coast, and Mekong River Delta).

Pillar 1 emphasizes productivity (including the ability to increase productivity, improve food security; ability to improve economic efficiency; suitability with farmers' ability to invest in CSA and with existing infrastructure) to help local managers and farmers understand the benefits of CSA. Considered the importance of this production pillar with other pillars in Vietnam, the expert's committee agreed to allocate 40 points shared in 100 points in the total for this pillar.

Pillar 2 focuses on adaptation capacity (including the adopted capacity to climate and weather, ecological conditions, natural resources exploitation and use; environmental protection. The expert's committee agreed to allocate 30 points.

Pillar 3 focuses on mitigation potential (including saving input in use, potential mitigation from a technical aspect, potential GHG emission reduction). GHG emission could not be quantified hence, experts based on the knowledge and potential footprint of carbon to give the points at a maximum of 30 points in remaining.

To rank the priority order of 19 models, the study uses the method of scoring by experts. The scoring criteria are as shown in Table 2.

Table 2. Set up the criteria for ranking comprehensive list of ongoing CSA practices

No	Selected criteria	Maximum points
1.	**Production pillar**	**25**
	Adopted capacity of relevant ecology	5
	Saving input in use	10
	Marketable output	10
2.	**Climate change adaptation pillar**	**30**
	Adaptation capacity to climate change	10
	Impact of gender balance	10
	Environmental effectiveness	5
	Social effectiveness	5
	Food security ensure	5
3.	**Climate change mitigation pillar**	**30**
	Mitigation potential	15
	Mitigation economic effectiveness (cost efficiency)	15
4.	**In line with local and sectoral plans/strategies**	**15**
	TOTAL	**100**

Source: CIAT & IAE (2015)

For the project of MARD (2015), in step 2, to determine which model is the CSA model, the project used the following basic set of criteria (Table 3):

Table 3: Basic set of criteria to evaluate the CSA model

Objectives of the CSA	Evaluation criteria
1. Increasing productivity, contribute to ensuring food security	1.1. Increased income per unit area compared to the control model (*) 1.2. Increased economic efficiency compared to the control model (*)
2. Adaptation to Climate Change	2.1. Increased stability (in terms of income) across seasons and years compared to the control model (*) 2.2. Increased resilience of crops/animals after being impacted by extreme weather events compared to control model (*) 2.3. Increased diversity of revenue sources compared to the control model (*) 2.4. Increased biodiversity compared to the control model (*) 2.5. Positive impact on restoring natural resources (soil fertility, reducing soil erosion, restoring biodiversity, etc.)
3. GHG emission reduction	3.1. Reduces GHG emissions compared to the control model (*) 3.2. Increased carbon capture/accumulation compared to the control model (*)
(*): The control model is a model where no new techniques are applied	

Source: MARD, 2015

In step 4, to identify CSA models with potential for replication, the study used a 1 to 5 scoring method by experts, local managers, and farmer communities. Evaluation criteria to consider the fit of the model with the characteristics of natural conditions; infrastructure conditions; household characteristics; policy mechanisms related to the CSA model (Table 4).

Table 4: Evaluation of the suitability of CSA models for manufacturers to apply in local conditions

No.	CSA model	In line with infrastructure	In line with soil conditions, irrigation water	In line with farmer's condition	In line with local policies to promote the model	Total
	(1)	(2)	(3)	(4)	(5)	(6)
	…	…	…	…	…	…

Source: MARD, 2015

Columns 2, 3, 4: Score on a scale of 1 to 5

Column 5: Score with 3 points as follows: Point 1: if there is a policy that hinders the application of the model; Point 2: if no policy hinders; no policy promotes the model; Point 3: if there is no policy to hinder; there is a policy to promote the model.

Research by Duong MT et al (2016) has established high or low-high indicators for each indicator. Specific criteria and indicators include (1) Economic criteria (Total output; Income; Labor input; Food security); (2) Adaptability (sensitivity to the effects of weather); (3) Mitigation potential (carbon accumulation; GHG emissions; Fertilizers; Energy); (4) Environmental impacts (Application of farming techniques on sloping land; Soil erosion; Ecosystem functions).

3.3. Review and evaluation

3.3.1. In term of the process of reviewing CSA models

Although there are differences in the subject and scope of implementation, in general, the process of reviewing CSA models for a particular region includes a number of general steps. Based on the synthesis of review procedures and other evaluation criteria for each step, the process of reviewing CSA models in the South-Central Coast region applies the following steps and evaluation criteria:

Step 1: Inventorying and listing all models with potential CSA (Desk research)

Step 2: Using the CSA model evaluation criteria to identify the model as a CSA model and re-establish the list of CSA models (desk research). The study used the set of criteria in Table 3 of MARD (2015).

Step 3: Conducting field survey to identify existing CSA models in production and collect information on models and local production conditions.

Step 4: Evaluating the effectiveness of the models according to the 3 CSA pillars, and at the same time assess the suitability to local production conditions. In this step, the study proposes to use a combination of methods to quickly evaluate the effectiveness of the models in Table 2 (CIAT & IAE, 2015) and the criteria for assessing the suitability of CSA models in the context of conditions. localities in Table 4 (MARD, 2015)

Step 5: Ranking the order of priority CSA models to propose development and replication.

3.3.2. In term of evaluation criteria of CSA models

There are two groups of criteria used for the review process, including:

(1) use preliminary evaluation criteria to determine which model is a CSA model (Table 3);

(2) using CSA's three-pillar performance evaluation criteria (Table 2); criteria to evaluate the ability to replicate and be suitable for specific local conditions (Table 4).

3.4. Results of reviewing CSA models in the South-Central Coast region

3.4.1. South Central Coast in the context of climate change

The South-Central Coast region includes the provinces located along the South-Central Coast extending from Da Nang to Binh Thuan. According to Pham Quang Ha et al. (2013), the South-Central Coast has a vulnerability index (0.536) is the third-highest in the country after the Mekong Delta (0.679) and the Southeast (0.602). This is an important indicator for identifying agricultural areas vulnerable to climate change. In fact, every year, the South-Central Coast is affected by many natural disasters and unfavorable weather conditions. Besides natural disasters such as storms and floods, the risk of drought is also assessed at a serious level (SRVN, 2004). Although it is a coastal area, in fact, the situation of prolonged drought and water shortage for agricultural production is happening in many provinces due to the characteristics of topography and other climatic factors. Research by Nguyen Lap Dan (2010) and Truong Duc Tri (2015) have shown the drought situation as well as predicted the trend of drought change in the South-Central Coast in the coming years. Under the impact of climate change, drought is likely to occur with more frequency and severity. Therefore, the implementation and application of CSA models have a very important role and significance in responding to increasingly adverse weather conditions and future climate change in South Central Coast.

3.4.2. Results of reviewing CSA models in the South-Central Coast region

Within the framework of this paper, the research has only focused and stopped at steps 1 to3 for the purpose of reviewing and defining a list of existing CSA models in the South-Central Coast.

Through reviewing and synthesizing from different data sources, a long list of potential CSA models is listed in the South Central Coast. Based on the set of evaluation criteria in Table 3 for preliminary assessment and selection of CSA models. The results of the review determined that the whole region has 18 models/technologies with 68 places being implemented in actual production. (Table 5)

Table 5. List of 18 CSA models/technologies in the South Central Coast region

No.	Code	Names of CSA	No.	Code	Names of CSA
1	TTK	Saving water irrigation	10	LC	Rotating green beans/corn on rice land
2	CDC	Shifting rice to upland crop	11	QLBV	Community-based sustainable forest management model
3	CTDC	Cultivation on sandy soil	12	SRI	System of rice intensification
4	1P5G	Applying “One must and Five reductions”	13	TC	Sugarcane Intensification
5	3G3T	Applying “3 reductions and 3gains”	14	DL	Biomat in animal husbandry
6	CS	Using LED light to off season dragon tree	15	BIO	Biogas

7	XC	Intercropping	16	XD	Growing and processing coconut fiber
8	VG	Vietgap	17	CPSH	Using Bioproducts
9	GTN	Drought tolerant rice varieties	18	TH	Mixed models

Source: Authors' synthesized, 2018

The above review results are just the first steps; therefore, in order to evaluate and prioritize CSA models, further studies need to clearly show the effectiveness of the models; co-benefits; scalability; technically feasible; inline with local and sectoral plans and strategies, in line with available local resources (financial, human, farming qualifications, institutional arrangements, and infrastructure); even further can meet the implementation of MRV and monitoring and evaluation (M&E).

4. Discussion and Conclusion

In the context of increasingly erratic weather events, the impact of CC is becoming more and more obvious. It is important to identify suitable livelihood models that are able to adapt to adverse weather conditions. However, to do this, it is necessary to have a suitable process, the criteria for evaluation and screening must be consistent and clear not only on the national level but also in accordance with local production conditions.

This study has contributed to an overview of the review processes, evaluation criteria, and classification of CSA models that have been implemented in Vietnam. Thereby, inherit and apply to the review of existing CSA models in the South Central Coast. This result is the basis for the author to continue to carry out further studies to evaluate the effectiveness of the models according to the CSA's pillars while ensuring the suitability and availability of resources. and natural, socio-economic and policy characteristics at the local level. With a no-regret approach, the application of climate-smart agriculture (CSA) models will contribute to minimizing risks if it occurs in the future.

SUSTAINABLE AGRICULTURAL DEVELOPMENT IN AN GIANG PROVINCE: SITUATION AND SOLUTIONS

MA. Nguyen Thi Xuan Loc
xuanlocntt2016@gmail.com
Department of Tourism and Vietnam Studies, Nguyen Tat Thanh University

Abstract

An Giang province identifies agriculture as a key economic sector and aims to become an agricultural center of the Mekong Delta. In order to promote the economic strengths, An Giang has been implementing the development of the agricultural economy in the direction of a sustainable growth. In this article, the author mentioned about the Sustainable Agricultural Development in An Giang province the situation and the solution to indicate the remaining situation and difficulties in agricultural development, at the same time, bringing devise practical solutions to develop the province's agriculture sector increasingly.

Keywords: *agriculture, An Giang, development, sustainability, sustainable agriculture*

1. Introduction

Taking advantage of the strengths of agriculture, An Giang province has focused on improving agricultural development towards sustainability. An Giang agriculture plays a key role in the process of its economic development. Therefore, the province focused on manufacturing and restructuring agriculture towards modernization and high-tech and identified that this is an important task. At the same time, An Giang agriculture improves the value of cultivation, growths agricultural products associated with the innovation of growth model in depth. Since then, it improves the value of agricultural goods production, increasing the competitiveness of agricultural products, contributing to poverty reduction, increasing farmers' income, ensuring social security by creating jobs and stable incomes for people, promoting socio-economic development. It is the orientations of An Giang province to develop a sustainable agricultural economy that has brought to greater achievements in recent years. However, there are still backlogs that need to be overcome. Therefore, in this article, the author focuses on researching situation of sustainable agricultural development in An Giang province, and clearly states the achievements and backlogs of the agricultural economy in An Giang province, thereby to specify appropriate recommendations to promote the agricultural economy of An Giang province towards sustainability.

2. Methods

A number of research methods have been applied in this study to clarify the issues of sustainable agricultural development in An Giang province.

Firstly, the methods of analysis and synthesis are applied to analyze documents related to research issues.

Secondly, the historical method is applied to describe the research problem according to the process, namely over the years to clearly see the agricultural economic development of An Giang province.

Finally, the logical methods helps to identify appropriate research issues.

3. Results

3.1. Theoretical basis

3.1.1. Sustainable Development

Sustainable development is an important goal in many areas, countries and regions. To achieve sustainable development, each country will rely on specific political, economic, cultural, social, geographic, ... characteristics to plan the most appropriate strategy for that country.

The term “sustainable development” was first used in the "World Conservation Strategy" proposed by IUCN (International Union for Conservation of Nature and Natural Resources - IUCN) in 1980. The overall objective of the Strategy is "achieving sustainable development by protecting biological resources" and emphasizing the effective use of natural resources, ensuring the living environment for human beings during the development process.

In 1987, the World Commission on Environment and Development (WCED) in the Our Common Future report introduced the concept of sustainable development as "Development that meets the needs of the present day without compromising the ability to meet the needs of future generations" (WCED, 1987, 43).

By 1992, the concept of sustainable development was reaffirmed at the Earth Summit Conference on Environment and Development taking place in Rio de Janeiro (Brazil), which confirmed: "sustainable development" in three important areas of the economy, society, environment, with practices and guidelines to achieve sustainable development goals in agenda 21 (UNCED, 1992).

In 2002, at the World Summit Conference on Sustainable Development taken place in Johannesburg (Republic of South Africa), the concept of sustainable development was further improved: "Sustainable development" is a process of development with close, reasonable and harmonious combination between three aspects of development, including economic development, social development, and environmental protection. Attention is paid to issues of economic growth, progress, and social justice; poverty reduction and job creation; handling, remedying pollution, restoring and improving environmental quality;

forest fire prevention and deforestation; rational exploitation and economical use of natural resources.

Thus, sustainable development in the most general sense is the combination of economic, social, and ecological fields into a unified whole. Economic efficiency must go hand in hand with social justice and environmental protection. To achieve sustainable development, first of all, the economic development issues must be addressed in a harmonious manner in three aspects: economic, social, and environmental. Economic sustainability means fast and safe economic development. Therefore, the healthy growth and development of the economy must meet the requirements of life and improve people's lives.

3.1.2. Sustainable agricultural development

Sustainable agriculture is a subject of great interest and lively debate in many segments of the world. Sustainable agriculture is defined as a system that, "over the long term, enhances environmentalquality and the resource base on which agriculture depends; provides for basic human food and fibreneeds; is economically viable; and enhances the quality of life for farmers and society as a whole"[T. Crews, 1991].

Sustainable agricultural development is an issue needed to be concerned, this is an objective requirement and needs to be well addressed such as the relationship between the natural environment system, social environment and human environment.

Sustainable agriculture firstly is crop and livestock on the same land that must be stable and tend to be increasingly improved, economic efficiency must be strengthened, nurture more people and the income level is also increasingly improved without destroying the environment of nature and the community.

Sustainable agricultural development is development that ensures the nature of the eco-agricultural economy with its own goals, structure and functions. Sustainable agriculture development is a development model that has a link between agricultural growth and general economic growth, with the natural environment, the poverty and the people in rural areas. Sustainable agricultural development is the development that meets the general growth needs of the economy but does not degrade the natural environment - people and ensure sustainable livelihoods above the poverty line for the people.

Thus, sustainable agricultural development is also based on three aspects: economic, social and environmental. Economic development must focus on environment and social security. Based on mentioned, we recognize that the sustainable development of agricultural economy in An Giang province also needs to pay attention to the following aspects: economy, society, environment in locality, region, nation and internation. The three factors: economy, society and environment always interact and complement each other in the process of sustainable agricultural development.

3.2. Policies on sustainable agricultural development of An Giang province

In order to develop sustainabl agriculture, the role of policy makers and development orientations of the agricultural sector is extremely important. Whether An Giang's agriculture really develops sustainably and effectively depends on the orientations and policies suitable to the actual situation of the province. In recent years, An Giang agriculture has achieved high results and developed in a sustainable manner. From 2012, the An Giang Provincial Party Committee issued Resolution No. 09-NQ / TU dated June 27, 2012 on agricultural development with high- tech application, stage 2012 – 2020 and vision to 2030. On that basis, An Giang Provincial Party Committee focused on leading to mobilize many resources for agricultural development in depth, constantly increasing productivity, quality, efficiency, competitiveness of agricultural products, improving material and spiritual life of farmers ... Next, the Provincial People's Committee issued policies to actively support the development of high-tech agriculture in An Giang province in the period of 2012-2020 and a vision to 2030 (Nguyen Hanh, 2019).

In 2016, under new pressures in the context of climate change, food security and international integration, the goal was to develop agriculture and rural areas comprehensively and sustainably. Recognizing this, the Resolution of the 12th National Congress of the Communist Party of Vietnam from January 20, 2016 to January 28, 2016, in Hanoi Capital, stated: " Accelerate restructuring of agriculture, build comprehensive ecological agriculture including agriculture, forestry and fishery towards modernization and sustainability, on the basis of promoting comparative advantages and reorganizing agricultural production, to promote and widely apply science - technology, especially biotechnology, information technology to agricultural production and management, and accelerate agricultural and rural industrialization and modernization to increase productivity, quality, efficiency and competitiveness, firmly ensuring national food security both in the short and long term; improve farmers' income and life” (Hoang Anh Tuan, 2019).

Implementing the Resolution of the Party and the Resolution of An Giang Provincial Party Congress for the term 2015-2020 also identified: "Agriculture is a key economic sector, making An Giang become an agricultural center of the Cuu Long Delta; strive to increase the average value of agricultural production to 192 million VND / ha by 2020, effectively using capital, resources, labor, technology... "(Nguyen Hanh, 2019). In 2016, An Giang province implemented the Sustainable Agriculture Transformation Project (VnSAT) with many positive activities, contributing to promoting agricultural restructuring.

An Giang Provincial People's Committee has just issued Decision No. 44/2018 / QD-UBND, providing for the management, exploitation and protection of irrigation works in the province.

Accordingly, the Department of Natural Resources and Environment shall assume the prime responsibility and coordinate with the Department of Agriculture and Rural Development in advising the provincial People's Committee in guiding the formulation of exploitation plans; licensing exploitation and use of water resources and discharging sewage into water sources as prescribed; carry out evaluation and submit to the provincial People's Committee for approval the plan of calculating charge for granting water right for exploitation and use of water to the concerned individuals and organizations.

The remarkable point in Decision 44 is that An Giang strictly prohibits acts such as drilling, digging soil, illegal construction within the protection area of irrigation works; Illegally occupying and using land within the area of protection of irrigation works; activities that hinder the management and repair of works.

Particularly strictly prohibited acts of causing pollution of water sources of irrigation works, such as discharging toxic substances, garbage, dead animals, bottles and pesticides; waste water from industrial production establishments or industrial parks, wastewater from production and aquaculture zones, daily-life waste water from residential and business areas (the above-said types of wastewater have not yet been treated or treated but not up to the permissible standards) into irrigation works. Acts of encroaching on the river surface, obstructing flood drainage, changing the flow, leading to local erosion phenomena in front of and after the project (Nguyen Hanh, 2018).

3.3. Situation of sustainable agricultural economic development in An Giang province

3.3.1. Achievements in sustainable agricultural economic development in An Giang province

Agriculture in An Giang province has achieved important results in the past years, paving the way for the process of agricultural development towards sustainability in the subsequent years.

An Giang province is aiming at the goal of developing a sustainable agricultural economy, strictly implementing the planning of rice and crop production areas, etc. In rice production, the trend of forming a production link between businesses and farmers, from the supply of high quality rice seeds to the stage of harvesting, product consumption, milling processing and export ... are implemented and most people choose. In the processing stage, the factory focuses on handling all waste products during the operation of the factory such as taking advantage of rice husks to milling rice husk firewood to serve as fuel, creating electrical energy to serve the re-operating the factory. The production process from rice to grain for export is practiced synchronously, safely, and this trend is developing.

The province has also focused on safe rice production, improving the quality and efficiency of rice cultivation. The An Giang agriculture sector promotes crop restructuring such as reducing rice acreage to shifting to fruit and other aquaculture, bringing higher economic benefits to farmers. Form cooperatives to grow fruit trees, combine with the construction of planting areas meeting VietGap standards, strongly apply technical advances to production; including drip irrigation to save water.

Implementing Resolution No. 09-NQ / TU of the Provincial Party Committee, the science and technology sector coordinates with departments, branches and local authorities to develop and plan high-tech agricultural production, specialized production areas comes into practice. Many models and scientific and technological projects are aimed at applying mechanization in agricultural cultivation, such as laser leveling machines, straw rollers; mechanization of agricultural harvest,...

The implementation of the National Target Program on building a new countryside in the period of 2016-2020 has contributed significantly to the development of the province's agricultural economy. To focus on building An Giang agriculture in association with building a new countryside towards modernization, sustainable development and proactively coping with climate change. Focus on developing smart agriculture, organic agriculture, clean agriculture and high value-added, branded and competitive agricultural products (Huu Huynh, 2020). At the same time, the province has applied the model of linking four houses (the State, farmers, scientists, entrepreneurs), developing agricultural cooperatives and implementing projects on reorganizing production and linking associated with processing and consumption markets.

The province has implemented the Restructuring project of agriculture sector; to prioritize the development of key products to recognize four new hi-tech agricultural regions: Phu Tan sticky rice area, Loc Troi rice-growing region, Kien An vegetable-growing area, Cho Moi fruit tree area. In order to improve productivity and profitability for people, An Giang province expanded to apply Global GAP, Viet GAP; focus on changing the structure of cultivated rice varieties in the direction of increasing the branded high-quality rice varieties which are bought by businesses with pre-set purchase prices. Instructing enterprises of Vietnam-Australia Group and some other typical enterprises in the province to apply for recognition of high-tech agricultural enterprises. Cooperating with businesses such as Angimex-Kitoku, Trung Thanh, Vuong Dinh, Tan Vuong, Tan Long, Loc Troi, Sunrice... on developing linkages of production and consumption of agricultural products. The companies engage with farmers through cooperatives, new type cooperatives associated with the company's material areas in the districts of Tri Ton, Thoai Son, Tinh Bien and Chau Phu. These companies will contribute capital and send personnel to participate in executive management. The province has provided farmers with good rice varieties, applying safe and high-quality production processes to meet the requirements of exporting rice products to foreign markets.

Enhancing the deployment and expansion of the Large Field to build the value chain of the rice industry, prioritizing reducing losses during and after harvest, while promoting mechanization investment in the field. Deploying financial, technical and market support package for rice products to develop the province's hulled rice-rice products. Increasing support for businesses in accordance with policies to encourage businesses to invest in agriculture.

Rice production

In 2017, the total area of rice cultivation in An Giang province reached nearly 649,200 ha. The total rice output of the whole year was approximately 4 million tons, the value of production increased, the estimated value of agricultural production reached 160 million VND / ha. (Vuong Thoai Trung, 2017).

In 2018, the cultivated area was 677.8 thousand hectares, accounting for 97.6%. In particular, 624,000 hectares of rice, crops reached nearly 54,000 hectares, 450.95 hectares of newly planted forestry trees. (Nguyen Hanh, 2018). In 2018, the association of large field production was maintained and improved, currently 31 food enterprises and 10 seed enterprises have signed contracts to link rice production and consumption.

In 2019, the rice production area of An Giang province will be about 639,000 hectares, the annual rice output will reach 3.92 million tons. Agriculture in An Giang province spends over 70% of the area using high-quality rice seeds for export, reducing the use of excess nitrogen fertilizer, reducing the use of pesticides, aiming to expand the production of rice varieties, clean rice and organic rice, developing a brand of safe rice, focusing on investment in soil and irrigation improvement.

Fisheries

In 2018, the province's fishery industry has many advantages, and the seafood export market is also expanded. Ensuring the area for raising and harvesting aquatic products according to the scheduled time, taking advantage of rising flood water to exploit natural aquatic resources.

In 2018, the harvested aquatic products will be about 1,726 hectares, the whole year harvested aquaculture output will be around 444,000 tons, with the total tra fish farming area being 900 hectares. An Giang is the leading province in implementing the Project of linking 3-pangasius seed production to facilitate the production of about 2.7 billion fish to the market (Nguyen Hanh, 2018).

Breeding industry

The province's animal husbandry has made a positive move, many businesses have been investing heavily in animal husbandry in An Giang province, with breeding techniques to ensure sustainable development, protect the breeding environment well, safe livestock products, and traceability, reducing small scale animal husbandry.

The agriculture and rural development sector of An Giang province is also implementing a plan to improve the quality of live cows to meet market requirements and increase profits for farmers, the province has supported the development of beef cattle and breeding cows high quality reproduction for farmers.

Paying attention to developing high-tech cow raising model will have a 3-fold profit increase compared to traditional cow raising, changing cow raising practices under small grazing to farms, ensuring the environment for grazing farming and living environment of farmers.

Cultivation

In 2017, the province's agricultural sector continued to shift its tree structure towards quality and high economic value. The total area of crops is over 60,000 hectares. The total area of fruit trees in An Giang province is over 15,800 hectares, up 19.2% (equivalent to an increase of 2,552 hectares over the same period). Promote production linkages under the model of large fields, the chain of production and consumption of vegetables, banana transplanted tissues, abalone mushrooms,... focusing on items of production organization, training, model building, developing consumer markets (Vu Dam, 2017).

Focusing on infrastructure construction and building links for raw material production areas such as Cat Chu mango, tricolor mango, green grapefruit production areas ... Agricultural construction work New villages have been implemented regularly and continuously, speeding up the recognition of pilot communes to complete the plan of 43 communes in 2018.

In 2019, the province's output of fruit trees reached 241,000 tons equal to 113.87%, Tra products exceeded 400,000 tons for the first time. (Le Hoang Vu, 2019). In 2020, An Giang develops agriculture towards a modern sustainable and rational growth, products associated with innovation of the growth model in depth. Besides improving the competitiveness of agricultural products, raising farming values and farmers' income.

Environment

Focusing on environmental protection in agricultural production towards sustainable development, An Giang aims at the GAP model with three increases and three reductions (increasing rice productivity, increasing rice quality, increasing efficiency economic, reducing the number of seed sowing, reducing the amount of pesticides, reducing the amount of nitrogen fertilizer) and saving water, using agricultural wastes as microbiological fertilizer have brought high efficiency. Combine flower planting on the banks of the fields to balance the ecosystem and protect the environment. Closely combining economic development, environment, social security, towards sustainable agricultural economic development.

Aiming at clean agriculture to protect the living environment and create products that are safe for public health, this is a production model in line with the current national and international development trends.

3.3.2. The backlogs in sustainable agricultural development in An Giang province

Besides the above advantages, there are still some difficulties and disadvantages. In terms of provincial management of agriculture and rural areas, there are still some shortcomings: issuing provincial policies on sustainable agricultural development, but most people have not grasped the mainstream of the issue, they do not fully understand their roles and responsibilities in the province's sustainable agricultural development. Besides, the basic solutions to effectively prevent and respond to climate change such as drought, salinity ... with the environment are not really thorough. This is a core issue for all levels of government to focus on and deploy to the people better to bring the Party's policy of the local government to each people to implement.

The land policy is also unstable, in which the regulations on the duration of land use rights is not for long term, making investment in agriculture limited, especially investment in sustainable development for the future. Many areas of agricultural production have developed well, but the short time of land use rights has prevented farmers and businesses from making long-term investment, leading to the problem that agricultural production will be less sustainable.

The competitiveness of agricultural products is still weak, mainly developing in width, increasing the area and output, but the product quality is low, production costs are high. This leads to farmers not being active in agricultural production, because of the high costs that will lead to farmers' losses, so they will not be associated with fields but can do non-agricultural jobs or leaving homeland.

Output of products and prices are always a concern and make farmers lack of salinity for agricultural production. Some agricultural cooperatives have not accessed loans, lack of human resources, lack of consumption links with businesses to ensure the output of products. The capacity of many businesses is limited when participating in production links under the model of large fields, production, modern agricultural development ... (Le Hoang Vu, 2019).

The level of social investment in agriculture is low, although a number of large enterprises have begun to invest in agriculture but in general there is still very few. The construction of high-tech agriculture is slow to change and has not created a breakthrough to increase added value.

Agricultural growth is mainly based on natural resource use. Intensive agriculture follows productivity and quantity, using a lot of inorganic fertilizers and agrochemicals (pesticides, herbicides, stimulants, and waste). This has an adverse impact on the environment, increasing pollution levels and weakening natural resources. Environment, water sources are polluted with industrial wastewater, emissions in industrial parks and trade villages are directly degrading the environment from crops to shrimps, fish, air,... causing danger to people.

The training of human resources for science and technology to serve agriculture is not yet high, and there is a shortage of experts and researchers in agricultural development. Agricultural production is still in a small state of production, the land is fragmented and not thorough in the implementation of large fields. As a result, it is difficult to apply science and technology to agriculture, once the field is too small, and it is not possible to change crops towards modern development.

The causes of these shortcomings and limitations for sustainable agricultural development include many factors, but the key issue is that people are not fully aware of their special position and role in the province's sustainable agricultural economic development Because of their unclear role and responsibility in sustainable development, the people involved have not been active, have a dependency, rely on the government's investment. At the same time, not fully grasping and implementing the motto that farmers are the subjects in agricultural economic development. There are still many limitations in propaganda and mobilizing people to participate in sustainable agricultural economic development in the province.

4. Discussion and Conclusion

Solutions for sustainable agricultural economic development in An Giang province

In order for An Giang province's agriculture to develop sustainably, it is necessary to have synchronous solutions and mechanisms from all levels of leadership, in which some following objectives should be attached:

Firstly, the province needs to make policies, timely and consistent with sustainable agricultural development. Implement synchronously regulations on agriculture, environment, social issues; attaching importance to agricultural extension, promoting investment attraction of enterprises into agriculture.

Secondly, further promote the implementation of agricultural restructuring towards sustainable development associated with building new cooperatives and new rural areas. Strengthening associates, developing cooperative groups and cooperatives, with the participation of businesses, providing input and consuming output products in production. This will be a driving force for An Giang province to increase added value and develop sustainable agriculture in the future. At the same time, renovating production organization in the direction of close association from production to product consumption between farmers and businesses. Guide and support farmers in implementing agricultural development and create an enabling environment to encourage businesses to invest in agriculture and rural areas, and join in cooperation for development.

Thirdly, in agricultural economy, it is necessary to create conditions for land users to decide the appropriate mode of land use. Continue to restructure crops, switch from rice land to grow crops of high economic value. Proactively in directing production in order to have timely plans and solutions with developments affecting agricultural production.

Fourthly, strengthening the mobilization of farmers to apply scientific and technological advances to production in order to save costs and improve economic efficiency. It is necessary to focus on scientific and technological research and application in agricultural production and processing, focusing on developing products with competitive advantages and consumption markets; diversify markets, invest in developing human resources in agriculture. Science and technology are considered as solutions that directly affect the productivity and quality of agricultural products; ensuring the improvement of productivity, quality and competitiveness of agricultural products and goods, and services on the market.

Fifthly, apply science and technology in agricultural development, in order to bring about efficiency, productivity, and quality of agricultural products, to compete with domestic and foreign markets.

Sixthly, promoting activities to raise awareness about environmental protection; apply measures to reduce environmental pollution in production; implement green, clean and energy-saving production programs. Encourage people to plant flowers on the banks of the fields in order to build large, sustainable commodity-producing areas, replicate models of vegetable growing in net houses, grow organic vegetables... Waste treatment from agricultural production and waste toxic (pesticide packaging) and domestic waste of people. (Le Hoang Vu, 2019).

It is necessary to focus on managing and coping with risks related to the environment; mitigating the impact of climate change on agricultural economy; implementing cultivation methods and selecting varieties suitable to the soil conditions to be able to solve the emerging environmental challenges; the province should have a timely response plan and appropriate agricultural production. Paying attention to the prevention of natural disasters, reducing adverse environmental impacts, strengthening the management of agricultural wastewater,... for the province's agricultural economy to develop sustainably (Ta Dinh Doan, 2017).

Seventhly, sustainable agricultural development requires solving social issues and farmers' lives, so sustainable agricultural development needs to pay attention to rural development. Building a contingent of professional, organized and qualified farmers will determine the formation and development of sustainable agriculture, since farmers and businesses are the subjects of this economy.

Concentrate on investing in developing agricultural economy, building rural areas, solving problems so that farmers become necessary and urgent with the goal of bringing rural agriculture modernization. Promote the role of farmers, protect the rights of farmers. Create favorable conditions for farmers to flexibly use agricultural land, create jobs and income for rural people, while increasing revenues for the provincial budget. Improving the position, role and life of the people, in association with building a modern agriculture, need to create conditions for farmers to change their jobs through programs and forms of vocational training for farmers in countryside.

5. Conclusion

Up to this time, An Giang has been developing a relatively complete agriculture, focusing on developing agricultural economy towards sustainability. Agriculture is considered as one of the key economic sectors and plays an important role in the economic development of the province.

In order for An Giang province's agriculture to develop in a sustainable manner, it is indispensable to strengthen the leadership of the Party and the Party committees at all levels in order to make timely and suitable policies to the provincial situation so that people can feel secure in production, businesses are assured of investment and cooperation in the field of agriculture. Therefore, the role of policies and orientations for agricultural development of leaders is very important and urgent. Agriculture sustainable development is really effective through the right orientation, consistent with the reality of the province.

In recent years, the agricultural sector of An Giang province has achieved important achievements, but some problems still need to be overcome. In particular, it is necessary to pay more attention to the orientation of developing a modern, sustainable agriculture and building a new countryside and new cooperatives with the common goal of developing a smart agriculture. Restructuring the agricultural sector in association with renewing the growth model, in order to create a breakthrough in agricultural development, agricultural products must be associated with renewing the growth model in depth, improve gray matter content and high competitiveness in domestic and foreign markets. Pay attention to the income of the people, in order to improve the quality, improve the life of farmers, contribute to poverty reduction and social stability.

Promote the application of science and technology in agricultural economics for sustainable and modern development. On the basis of concentrated production areas for key crops, to gradually shift to a model of safe agriculture and organic agriculture to create high-quality agricultural products. Replace the use of chemicals with biological and natural products. Since then, the requirements for good resolution have been raised: rational exploitation and use of resources, the application of sustainable ecological farming methods, prevention of environmental pollution and conservation of natural resources. It is necessary to have a close link between economic, social and environmental development towards sustainable agricultural development in An Giang province.

DEVELOPING CIRCULAR ECONOMY: THEORETICAL PERCEPTION AND CURRENT STATUS IN VIETNAM

Dr. To Hien Tha

tohientha@gmail.com

Le Quy Don Technical University, Vietnam

Abstract

The circular economy has been is a concept of interest to many scientists and governments. Circular economy development is gradually becoming a trend of countries, especially developed countries with few resources, especially when the world's resources are increasingly depleted. Vietnam is also facing an increasing amount of waste generated while raw materials and fossil fuels are increasingly depleted. Besides, most Vietnamese enterprises have outdated and outdated technology, small production scale and lack of investment resources for recycling technology. Faced with that fact, choosing a circular economy for Vietnam is an indispensable requirement in order to overcome the limitations of the traditional growth model, to help Vietnam avoid dependence on the external economy, to develope in a sustainable way economy. To promote the development of the circular economy in Vietnam, it is necessary to synchronously implement solutions from raising awareness to perfecting institutions and implementing organizations. This paper focus on clarifying the concept and content of the circular economy; clarify the role of circular economy for the national economy; analyze the current situation of circular economy development of Vietnam in recent years, thereby proposing some solutions to promote the development of circular economy in the coming time.

Keywords: *circular economy; sustainable development; linear economy*.

1. Introduction

Experiencing a process of development of the world economy from backward agricultural production to modern industry and industry and towards the digital economy, global economic growth has achieved great achievements.

However, along with that is the shortage of natural resources, increasing environmental pollution, changing ecosystems and climate change. To overcome these problems to ensure stable economic development, there is no shortage of input sources for the economic system, and to minimize waste released into the environment, towards an economy that is not waste, converted from a linear economy, based on the principle of exploiting natural resources from the natural environment as an input to the economic system, through the process of production and consumption and finally discharged into the environment into a circular economy, based on the principle that the output waste of economic activities will be recovered as input materials for the economic system and not generated. discharged into the environment.

In Vietnam, economic activity has so far been mainly based on the traditional approach that is linear economy, which is also the basic cause of the shortage of natural resources and especially the lack of natural resources. especially causing serious environmental pollution, in order to realize rapid and sustainable development, solve the relationship between economy and environment "without trade-off" between economic growth and environmental pollution and degradation, The transition to a circular economy is an appropriate direction. However, this transformation requires seizing the opportunities and accepting the challenges that need to be overcome.

2. Methods

The article is based on the general methods of the social sciences and published scientific works related to the research topic being sources of reference for the author to complete this article. In the research process, the author uses a combination of different methods such as analysis, synthesis, generalization, abstraction, statistics, comparison...

The data in the article are collected through official reports of the General Statistics Office; reports of the Ministry of Natural Resources and Environment, Reports of the Ministry of Industry and Trade and other scientists.

3. Results

3.1. Concept and role of circular economy

** Concepts and classifications*

The circular economy is fully understood as an economic model in which the design of operations, production and services aims to prolong the life of materials and eliminate negative activity on the environment. This is an economic model in which special attention is paid to the management and regeneration of resources in a closed loop, in order to avoid creating waste and polluting the environment.

According to Ellen MacArthur Foundation (2012), the circular economy is a system that restore and regenerate through devices proactive design. It replaces the concept of "end" end-of-life” of materials with the concept of concept of restoration, shifting towards use renewable energy, do not use harmful chemicals that damage the reuse and aim to reduce substances waste through the design of materials, products, products, technical systems and even models business model within the system that system. If the "linear economy" is only concerned with resource exploitation, production, consumption and discharge into the environment, it leads to the creation of a large amount of waste, as well as the maximum exploitation of natural resources. However, for socio-economic development, the concept economy focuses on the management and regeneration of resources in a closed loop to avoid creating waste. The transition to a private economy is also a great opportunity for rapid and sustainable development, not only achieving socio-economic and environmental goals but also effectively responding to climate change; raise people's awareness about reuse, waste recycling, and limit unnecessary consumption of single-use items. At the same time, extending manufacturer responsibilities to support 100% waste-to-material recycling is the shortest path to a low-carbon economy, especially in heavy industries...

This is a model of economic development in the world aimed at sustainable development, towards achieves 3 goals: (i) Responding to exhaustion of natural resources; (ii) Fix state cell environment in development in output; (iii) Harmoniously combine economic growth with a protective environment. In addition, the circular economy also brings many benefits to countries, helping to save costs, reduce price fluctuations and risks from suppliers, increase new calculations created by the technology eplacement of products.

The circular economy has many different approaches, divided into three levels by level:

At a low level, the circular economy focuses on the production process of businesses and the production of agricultural products, producers are encouraged and required to adopt cleaner production methods and equipment, ecological design.

At the medium level, the circular economy includes the development of eco-industrial parks and other agro-ecological systems; Designing to give your business the best chance of implementing a circular economy.

At a high level, all stages of the production process are designed, with no waste released into the environment. Waste is reduced to a minimum and reused.

Also a type of economy based on creative intelligence, the circular economy is the connection between economic activities in a reasonable and scientific manner, in which each of these economic activities forms a premise for other economic activities. another economic activity and into an economic cycle. Circular economy should be understood not as a closed, rigid, and at the same time circular economy has broad and narrow meanings. Broad meaning is in the whole country or a large area. With creativity, scientific calculation and the special support of technological achievements, several large manufacturing industries are logically arranged as a cycle, supporting each other to develop and create new products. quality products. In a narrow sense, it is a circular economy, where one product is an input for the production of another, including the reuse of waste as raw materials for further production activities.

* The role of the circular economy

The circular economy has a huge role to play in resource utilization taking on many forms, from redesign, reduce, repair, reuse, recycle, and geared towards sharing or leasing.

The circular economy describes an economic system based on business models that replace the concept of "end of life" with the reduction, reuse, recycling and recovery of materials in processes. production/distribution and consumption at the micro level (manufacturers, businesses, consumers), the intermediate level (eco-industrial parks), the macro level (cities, regions, countries and beyond), with the objective of achieving sustainable development, ensuring good environmental quality, economic prosperity and social justice, meeting present and future interests. While Linear Economy is only interested in the exploitation of resources, production, consumption and does not care much about discharging into the environment, it has maximized the exploitation of natural resources leading to the creation of natural resources. a huge amount of waste, while the circular economy focuses on the management and regeneration of resources in a closed loop, avoiding waste.

The transition to a circular economy is a great opportunity for rapid and sustainable development, not only achieving economic, social and environmental goals but also helping to respond to climate change. The transition to a circular economy helps meet the goals of the 2030 Agenda for Sustainable Development. Approaching the transition from a linear economy to a circular economy brings benefits in the context of resource scarcity and climate change. Besides, this approach is not only adjustments to mitigate the negative effects of the traditional economy - linear economy, but also a systemic change that creates long-term resilience. , business opportunities as well as environmental and social benefits.

At the same time, this is also a premise to realize the Sustainable Development Goals (SDGs 2030) through ensuring sustainable production and consumption, such as reducing the rate of "declining" resources, preserving meet the needs of future generations; raising people's awareness about reuse and recycling of waste, limiting unnecessary consumption of single-use items; extend manufacturer's responsibility to support 100% waste-to-material recycling. This is the path towards a low carbon economy, especially in heavy industries. Calculations of the European Union (EU) show that the circular economy through measuring and controlling activities from the demand side can help reduce emissions from industries by more than half. The circular economy is the best way to break the link between economic growth and negative environmental impacts.

Vietnam is a small country ranked 68th in the world in terms of area, 15th in the world in terms of population, but we are currently ranked 4th in the world in terms of plastic waste, with 1.83 million tons/year. Resource depletion, rapidly increasing energy consumption, pollution and land degradation, especially climate change are seriously affecting economic development.

According to the World Bank, air pollution alone cost Vietnam 5.18% of GDP in 2013. Water pollution can also cost Vietnam up to 3.5% of GDP. Along with that, resource depletion, rapidly increasing energy consumption, pollution and land degradation, especially climate change are seriously affecting Vietnam's economic development.

To address the risk of resource depletion, pollution and environmental degradation, we need to change our approach to transition from “traditional economic" models to “circular economy” This should be seen as a priority in the next stage of the country's development”

3.2. Current status of circular economy in Vietnam

According to the Ministry of Natural Resources and Environment, Environment, Vietnam's environment is under great pressure from domestic socio-economic development activities, international trade flows and cross-border impacts. The introduction of a large amount of waste (solid waste, wastewater, exhaust gas) into the environment, but the problem of waste control and management is still limited, leading to environmental pollution that continues to occur in many areas. where, many areas have been polluted quite seriously. The volume of solid waste generated has increased rapidly in quantity with increasingly complex composition. In addition, the import of scrap for use as raw materials for production or the import of used machinery, equipment, and vehicles also poses many risks to the environment. The management and treatment of solid waste in our country in the past time has not been applied according to the method of general management, solutions to reduce, reuse, recycle and recover energy from waste have not been applied yet. really focused. This leads to a high volume of solid waste that has to be buried. In some areas, waste buried in temporary and open-pit landfills has been a source of environmental pollution, affecting human health and human production. Linear economy causes resource depletion and waste increase. In Vietnam: solid waste increases by 10%/year, urban solid waste increases by 10-16%/year (the growth rate ranks 4th in Southeast Asia) (MONRE, 2017: 16); 11.6 million tons in 2016; 15.9 million tons in 2030 and 21.96 million tons in 2050, according to the World Bank.

Vietnam has sufficient conditions and has many favorable factors to apply circular economy. The socialist-oriented market economy institution is gradually being perfected towards modernity, synchronization and integration. The scale of human resources increased in all industries and fields, especially high-quality human resources in breakthrough industries and fields. Modern scientific and technological achievements are being rapidly and widely applied in many fields. Digital transformation of the economy is being strongly promoted. The national startup and innovation ecosystem is being formed. In particular, some models in the form of circular economy have worked remarkably effectively. All of the above expressions are a solid basis and an ideal environment for the application of the circular economy.

In Vietnam, although there are no official circular economic models, in fact there are some models close to circular economy in terms of industries, occupations and services. Typically in the field of industry, handicrafts in traditional craft villages have used scraps, by-products and wastes from industrial production processes to produce recycled steel, produce recycled paper, and produce recycled products. furniture export. plastic, nylon, recycled glass… However, these activities mainly bring financial benefits to producers and consumers without taking into account the overall economic benefits. This is also one of the main causes leading to environmental pollution and degradation in many localities today.

Although there are no official circular economic models, in fact there are some models close to circular economy in terms of industries, occupations and services. Typically in the field of industry, handicrafts in traditional craft villages have used scraps, by-products and wastes from industrial production processes to produce recycled steel, produce recycled paper, and produce recycled products. furniture export. plastic, nylon, recycled glass… However, these activities mainly bring financial benefits to producers and consumers without taking into account the overall economic benefits. This is also one of the main causes leading to environmental pollution and degradation in many localities today.

Recently, in Vietnam, there have appeared a number of new models moving closer to the circular economy such as the ecological industrial park model; model of processing aquatic by-products; Vietnam Packaging Recycling Alliance… However, businesses in Vietnam still have many limitations in terms of technological capacity and reuse. People and businesses still have an inherent habit in production and consumption of plastic bags and disposable plastic products. Meanwhile, Vietnam does not have a legal framework for circular economy development, this challenge needs to be overcome, otherwise the implementation of circular economy development will only be spontaneous and subject to regulation. market adjustment…

In Ben Tre, a province in the western part of Vietnam, models of reuse, recycling, and waste recovery have been established to bring financial benefits to production facilities and benefits to consumers and to the public. community. The most obvious in industrial and handicraft activities is the coconut flower cake made from copra ingredients with a mix of available ingredients into natural flavors unique to Ben Tre; After separating and removing all the coconut oil in the silk shell, the coconut residue will be discarded and become the input materials of animal feed processing facilities... Currently, Ben Tre has successfully researched and applied it. There are many models of organic waste treatment in agricultural production such as thanks to the application of tannin separation technology, which has turned coco peat waste into clean soil, applying biotechnology to turn coco peat into fertilizer. organic for clean and organic farming; turn cocoa pods into nutritious feed for livestock... In Can Tho city, there is an insect farm of Kim's Garden Can Tho Ecological Garden Co., Ltd. has successfully implemented insect solutions and probiotics into closed-loop agriculture, reducing 80% of feed costs. industrial food, especially minimizing waste from livestock to the environment. In Binh Duong province, since 2018, Binh Duong waste treatment complex has been put into operation, in addition to collecting and treating waste, the province's waste treatment complex is also invested with many new technologies. to turn waste into raw materials to create valuable products. In Tien Giang province, there are currently 26 establishments applying high technology in animal husbandry, which apply a closed cage breeding system, which can manage temperature, humidity and wind power in the barn. have a waste treatment system (biogas cellar, HDPE, biological buffer ...), limit odors, do not pollute the environment. Model of eco-industrial park in Ninh Binh and Da Nang saving 6.5 million USD/year.

According to the Ministry of Industry and Trade, Over the years, the cleaner production (CP) model has been promoted to widespread adoption. Up to now, nearly 350 enterprises and production facilities have been supported for rapid assessment, and 90 enterprises supported for CP application have become model points for CP application. After 10 years of implementing the CP Strategy in industry, by 2020, 68.5% of enterprises are aware of the benefits of CP application, an increase of 20.5% compared to 2010. 46.9% of production facilities production applied cleaner production, an increase of 35.9% compared to 2010, 12% of which achieved savings of 8% or more in reducing energy, raw materials per unit of product. In addition, 21% of medium and large enterprises have a department dedicated to cleaner production. In addition, the Strategy's activities in this period also have many advantages when integrated with other programs such as the National Industrial Promotion Program, the Sustainable Production and Consumption Program, the Savings Program, and the National Industrial Promotion Program. save energy and use energy efficiently... A number of typical models in the direction of circular economy in the field of economical and efficient use of energy have been actively deployed in recent times, typically: Building and implementing a model of using energy pilot use of alternative forms of energy and energy-saving household models; Applying the energy management model in industrial facilities; Building, disseminating and replicating successful demonstration models of alternative energy use in production and business establishments in many provinces and cities across the country; Develop, deploy and replicate demonstration models of households using renewable energy forms (such as solar, biogas, etc.) on an industrial scale.

Besides, the movement of Households to use energy economically and efficiently has been deployed on a large scale in the provinces, cities of Hanoi, Ho Chi Minh, Can Tho, Ba Ria - Vung Tau, Dong Thap, Binh Thuan, Can Tho, Tien Giang, Bac Ninh etc. The Ministry of Industry and Trade also organizes campaigns and competitions for energy-saving families with the goal of creating a popular movement and implementing solutions and using high-efficiency household appliances in each household. Currently, the National Program on economical and efficient use of energy for the period 2019-2030 has been promulgated by the Prime Minister with the aim of mobilizing all social resources to implement all solutions on energy use. effective savings to achieve the target by 2025. Specifically:

achieving energy savings of 5.0 to 7.0% of the total national energy consumption in the period from 2019 to 2025; reduce power loss to less than 6.5%; reduce the average energy consumption for industries/sub-industries compared to the period 2015 - 2018. The program also sets the goal of building 1 energy data center in Vietnam and at least 2 training centers. National Committee on economical and efficient use of energy together with the establishment of a fund to promote economical and efficient use of energy through socialization, sponsorship and cooperation of individuals and organizations at home and abroad.

Through these activities, businesses and production units are better defined and actively apply cleaner production solutions to reduce waste emissions, consume raw materials, energy and water, save money. production costs for the business. Thereby, enterprises and production units gradually actively implement fully the provisions of the law on environmental protection.

Overall though, Vietnam has just stopped at reuse and recycling of waste, bringing financial benefits to production and consumption establishments, but not bringing economic benefits, so the operation of those models has caused pollution. pollution and environmental degradation. Vietnam does not yet have a legal corridor to develop a circular economy, although there have been many initial transitions towards rapid and sustainable development, response to climate change and building a circular economy. Vietnam does not have a set of criteria to identify, evaluate, summarize and provide an accurate classification of the development level of the circular economy, which is a big challenge to know how the current economic development has continued. approach to circular economy development in sectors, fields and localities. Along with that is the decline in resources, energy, soil pollution and land degradation, especially climate change, which is seriously affecting the socio-economic development of Vietnam in recent years. Meanwhile, economic activities in Vietnam have so far been mainly based on the traditional approach, which is a linear economy, which is also the basic cause of the shortage of natural resources. nature, especially causing serious environmental pollution.

The development of the circular economy in Vietnam in general and the provinces and cities in particular is still mainly spontaneous, while the awareness of the circular economy and the need to switch to the development of an economic model circulation is limited. The circular economy requires new technological advances, but our country is a developing country, most of the technology is outdated, the production scale is small, this is a big challenge to overcome. Another important issue is the lack of good experts to solve well from the design stage to the final stage of reuse and recycling of waste.

3.3. Solutions to develop circular economy in Vietnam

In Vietnam, sustainable economic development is a matter of special concern to the

State with its determination to renew the growth model from width to depth associated with labor productivity, science and technology, and innovation, create. Circular economy is becoming an inevitable trend to meet the requirements of sustainable development in the context of increasingly degraded and depleted resources, polluted environment, and fierce climate change. Building a circular economy has been identified as one of the country's development orientations for the 2021-2030 period in the documents submitted to the 13th National Congress of the Communist Party of Vietnam. In particular, the Covid-19 pandemic has been affecting all aspects of global socio-economic life, deepening the demand for changing growth models towards sustainable development.

In the period of 2021 - 2030, it is necessary to focus on implementing many solutions to promote the circular economy in Vietnam in order to take advantage of cooperation opportunities in accessing and receiving technology transfer and digital transformation for development. sustainable development of the country. In particular, the State plays a leading and constructive role, businesses establish a management system, implement and comply with legal regulations, people must raise awareness, sense of responsibility, carry out supervision. community, promoting the role of mastery in building and developing circular economy in Vietnam. Specifically, it is necessary to implement a number of solutions to promote the development of the circular economy as follows:

First, strengthen communication work to raise awareness of the responsibility of the business community and people about the circular economy; on the responsibility of sorting waste at source for recycling and reuse; change consumer behavior towards environmentally friendly products.

Secondly, it is necessary to consider the development of the circular economy as an inevitable solution to renew the growth model, improve the quality of growth, improve the national competitiveness, ensure sustainable production and consumption, contribute to solving social problems, creating jobs, eradicating hunger and reducing poverty; allocate, manage and effectively use resources, protect the environment and respond to climate change.

Third, lead and direct the review, amendment, supplement and promulgation of new mechanisms, strategies, policies and laws to promote circular economy development, in line with the Party's guidelines and trends. In the new world, regulations and standards have been formed in the region and on a global scale.

Fourth, ministries, ministerial-level agencies, and provincial-level People's Committees shall integrate circular economy right from the stage of developing development strategies, master plans, plans, programs and projects; waste management, reuse and recycling. Considering natural resources as a source of natural capital that needs to be accounted for, monitored, evaluated and proportionately balanced with other capital sources in the process of policy making and administration at all levels, sectors and fields. Treat waste as a valuable resource that can be recycled, reused, created jobs and added value to the economy.

Fifth, bring into play the strength of the entire political system, thoroughly grasp the Party committees and authorities at all levels; strengthen propaganda widely throughout the society about the role, meaning, benefits and importance of circular economy development; integrate the requirements of circular economy development into the lives and practices of people, communities and the whole society.

Sixth, implement solutions to transform the economic model such as adjusting energy planning, gradually reducing dependence on forms of energy from fossil fuels, hydroelectricity; building a roadmap for technology and digital transformation based on energy efficiency and saving criteria, minimizing waste.

Seventh, specify the manufacturer's specific responsibilities for the recovery, recycling or disposal of discarded products based on the number of products sold in the market; develop environmental industry, market for environmental goods and services, environmentally friendly products...; project management according to the life cycle, establishing a roadmap for the development and application of environmental regulations and standards (emissions and technology) equivalent to the group of advanced countries in the region.

Eighth, focus right from the planning, planning, production design, product design to strengthen the connection of the circular production chain. Select a number of industries, fields of industry, agriculture and services to follow the circular economy model such as: paper industry, iron and steel production, thermal power, cycle water management. To develop urban centers, industrial parks, export processing zones and thermal power centers according to the circular model. Develop a set of indicators and criteria to monitor, evaluate and apply policies to encourage the transition to a circular economy at the national, regional and local levels, including contents on effective use of resources , resource consumption, waste utilization and emissions.

Ninth, building a market institution, promoting the application of market-based tools in the fields of resource management and environmental protection to encourage technological innovation, management methods, and consumer behavior. use of society in the direction of exploitation, rational and more efficient use of natural capital that nature bestows on the economy, avoiding the trap of resource curse; encourage better utilization of the economy's waste, preserve and protect the ecological environment, improve the resilience of natural systems and the resilience of the economy to natural shocks diseases, and climate change.

Tenth, promoting research and application of science and technology, taking digital transformation and applying achievements of the industrial revolution 4.0 as a driving force in circular economy development.

Effective management, allocation and use of natural resources, environmental protection, proactive response to climate change, and natural disaster prevention and control are urgent requirements to promote sustainable development of the country. The Party cares about leading and directing with many guidelines, strategies and policies of the era. The circular economy is identified by the world as a total solution towards sustainable development. The Resolution of the 13th National Congress of the Party has identified building a circular economy as one of the country's development orientations for the period of 2021-2030, a solid basis for us to believe in the development of the circular economy. successfully take advantage of opportunities and transform challenges to develop a circular economy, contributing to the management, allocation, exploitation and efficient use of natural resources, environmental protection and response effective with climate change, sustainable socio-economic development of the country until 2030, with a vision to 2045.

4. Discussion and Conclusion

The circular economy is a concept that has evolved over the decades to become a viable alternative to the current system of wasteful consumption. It is slowly taking shape and being adopted, requiring little sacrifice by the consumer or the industry. This system will pioneer long-term design, maintenance, repair, reuse, remanufacturing, refurbishment and recycling. As the world becomes more and more aware of the impact of humanity on the existence and development of our planet, the new economic system must not only address the finite nature of non-renewable resources, but also handle the large amount of waste generated… In the objective law of nature, there is no waste, because, everything is transformed, acting as raw material for new cycles.

Countries around the world as well as Vietnam are aiming to develop a circular economy to solve the challenge between economic growth and environmental protection, the shortage of natural resources. It is required to minimize exploitation and efficient use of raw resources, minimize waste as well as reuse and recycle waste as much as possible by industrial symbiosis. In order to develop a circular economy in Vietnam, it is necessary to understand the nature and rationale of this development in association with public-private cooperation and the support of the consumer community. Recognizing the challenges and key technologies of the Fourth Industrial Revolution to approach and apply for circular economy development.

Developing a circular economy in Vietnam requires a clear understanding of the nature and rationale of this development. To develop a circular economy, it is necessary to summarize and evaluate existing development models for agriculture, industry, service and tourism sectors, thereby identifying development methods close to approaching the circular economy as the basis for upgrading to development according to the criteria of the circular economy. Developing a circular economy, it is necessary to be aware of the opportunities to take advantage of these opportunities, on the other hand, must also see the challenges for the development of the circular economy that will be encountered in order to take measures to overcome. Developing a circular economy requires appropriate solutions based on Vietnam's practice and lessons learned from the world.

REALITY AND FACTORS AFFECTING THE HIGH-TECH APPLICATION BEHAVIOR OF HOUSEHOLDS IN SHUTCHI CATFISH FARMING IN CAN THO CITY

MA. Nguyen Thi Nghia
nghiahcma4@gmail.com
Academy Of Politics Region IV, Can Tho, Vietnam

AbstractL

The study aims to analyze the reality and factors impacting the high-tech application behaviors of households in shutchi catfish farming in Can Tho city. This is basis for proposals and recommendations to local authorities in order to enhance the effectiveness of promoting factors of high-tech application in the city's shutchi catfish farming.

Keywords: *Application, High technology, impacting factors, Can Tho city.*

1. Introduction

Can Tho city is one of the top provinces with largest farming area of shutchi catfish in the Mekong Delta. The areas with large farming scale of shutchi catfish of the City include Thot Not district; Co Do district; Vinh Thanh district; in which Thot Not district specially has 360 ha. By 2020, Can Tho city has applied new science and technology in the field of shutchi catfish farming; particularly in building a concentrated area of shutchi catfish rearing and farming in accordance with the farming planning; in processing stage; has continued to promote the development of shutchi catfish farming for export. This, thereby, contributes to rational and effective use of natural resources, increases the proportion of the fishery industry, and at the same time improves incomes of people involved in the industry.

However, in general, the application of high technology in shutchi catfish farming of households in Can Tho city has not been well implemented, still use manual labor in some stages while that can be replaced by mechanization to increase productivity. The question is, how to promote the application of high technology in shutchi catfish farming? This study aims to analyze and clarify the reality and elements affecting the application behavior of shutchi catfish farming households in Can Tho city.

2. Method

2.1. Data collection method

The study conducted a survey of 120 shutchi catfish farming households in some districts of the city, including Thot Not, Co Do, Vinh Thanh, in order to collect qualitative and quantitative information on the behavior of high technology application in shutchi catfish farming as well as effectiveness of the application (the survey took place from 15th

to 25th October, 2020). The farming households were randomly selected according to the list provided to the research team by the local government of the districts.

2.2. Analytical method

The study collected information from shutchi catfish farming households and analyzed, processed the survey results. The study applied the Independent-sample T-Test model to analyze the relationship between high-tech application behavior (dependant variable, with nominal scale) with independent variables such as number of years of experience, area, age, educational background (with proportion scale). On the basis of analyzing this relationship, the study established a logistic regression model to test the factors impacting high-tech application behavior in shutchi catfish farming of households in Can Tho city. Based on the analysis of qualitative data from in-depth interviews, the study determined a logistic regression model with the following independent variables:

Table 1. Logistic regression model with independent variables

Variables	Explanation	Sources
Age	Measured by age	Syntherized from qualitative research
Experience	Measured by number of farming years	
Area	Measured by farming area (m2)	
Social capital: + Local government support + Government training + Business training	+ Measured by local support (yes/no) + Measured by number of training sessions per year + Measured by number of training sessions per year	
Educational background	Measured by number of schooling years	

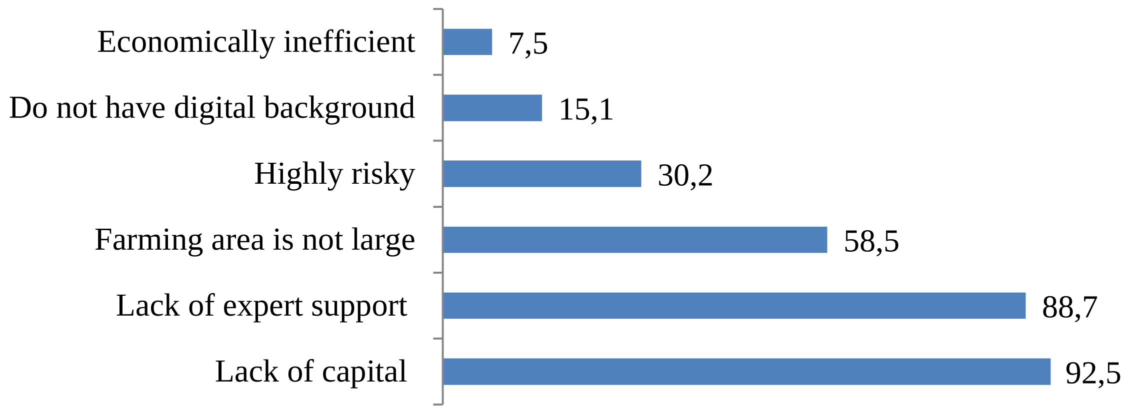
(Source: Author syntherized from in-depth interviews)

3. Result

3.1. Reality of farming households' high-tech application in shutchi catfish farming

The survey results of 120 shutchi catfish farming households in Can Tho city showed that 71 households, accounting for 59.2% of the total surveyed subjects, said that they have applied high technology in shutchi catfish farming while the 40,8% remaining said the opposite (the reason of not application is shown in Table 1; in which, the lack of capital and the support of experts accounts for the highest proportion and economically inefficient accounts for the lowest one).

Figure 1. Reason of not applying high technology in shutchi catfish farming (%)



(Source: Results of author's survey, 2020)

For households those apply high technology to the process of raising catfish, the survey result shows that the application of high technology to water treatment accounts for the highest proportion, followed by raising/caring techniques and the lowest is to stage of food processing. This proves that water plays an important role in shutchi catfish farming. Also, previous studies show that water management techniques for shutchi catfish farming have not been advanced while water demand changes with each period of farming.[106]

Table 2. Farming households apply high technology to stages of shutchi catfish farming

Stage	Number (out of 71)	Proportion (%)
Water treatment	69	97.2
Fish caring/raising	50	70.4
Preventice/cure diseases	46	64.8
Food processing	43	60.6
Harvest and storage	41	57.8

(Source: Results of author's survey, 2020)

[106] Nguyen Thanh Phuong and Nguyen Anh Tuan (2016), Shutchi catfish farming in the Mekong Delta: success and challenges for sustainable development, Agriculture Publishing House, Hanoi, p.78.

Previously, farmers took care of, processed food and prevented diseases for shutchi catfish mainly by traditional methods or through accumulated experience, but now, some farming households have applied high technology. This does not only help fish grow quickly but also reduce costs, increase productivity and ensure quality. The survey results show that the average productivity of shutchi catfish farming before applying high technology is 306.3 tons/ha/year and increase 50.87 tons/ha/year after applying high technology, making average productivity to 357tons/ha/year. Also, the cost of investments also decreased from 2.4 million VND/kg/crop of fish farming to 2 million VND/kg/crop.

Income is one of the criteria to evaluate the effectiveness of high-tech application in shutchi catfish farming. The average income of shutchi catfish farming households is about 34.4 million VND/ha/crop. In which, the households those apply high technology have an average income of about 45.9 million VND/crop/ha, much higher than those do not (17.6 million VND/crop/ha). In addition, the study also shows that the income gap is very clear between the 20% of the top income group and the 20% of the bottom income group, about 4.5 times. In which, 92% the lowest income group do not apply high technology in shutchi catfish farming and 8.0% of those do; meanwhile, 100% of households applying high technology belong to the highest income group (see table 3).

Table 3. Income distribution of households applying high technology in shutchi catfish farming (%)

	Apply	Not apply	Total
Group 1 (lowest)	92.0	8.0	100.0
Group 2	90.9	9.1	100.0
Group 3	27.3	72.7	100.0
Group 4	0.0	100.0	100.0
Group 5 (highest)	0,0	100	100.0
Total	40.8	59.2	100.0

(Source: Results of author's survey, 2020)

Thus, the application of high technology in shutchi catfish farming has brought many benefits to farmers in Can Tho city. However, the number of households that do not apply high technology in shutchi catfish farming is still quite high.

3.2. Factors impacting households' behaviors of high-tech application in shutchi catfish farming

The reality from the survey results shows that there is still a fairly high percentage of households in Can Tho city that have not yet applied high technology in shutchi catfish farming. In order to have practical solutions to promote the application of high technology in shutchi catfish farming, the study analyzes the factors impacting the behavior of high-tech application of households in shutchi catfish farming in the city.

To evaluate the factors, the study analyzed logistic regression model with 7 independent variables. As shown in data table 4. The model with a value of -2 Log likelihood = 27,336 shows that this model is suitable, allowing the analysis to clarify the relationship between independent variables and high-tech application behaviors of households in shutchi catfish farming in Can Tho city.

Table 4. Model of factors affecting the high-tech application behavior of households in shutchi catfish farming in Can Tho city

Variables	Coefficient B	Exp (B)	Statistical significance	Confidence interval 95%	
				Lower	Upper
Constant	-2.656	0.070	0.001		
1.Area	1.357$^{(***)}$	3.884	0.001	1.270	2.680
2.Number of farming years	-0.477$^{(**)}$	0.621	0.015	0.904	1.926
3.Educational background	0.847(**)	2.333	0.041	1.018	2.372

-2 Log likelihood = 27.336; N=120					
(***), (**): Statistical significance *1%, 5%*					

(Source: Results of author's survey, 2020)

As for the variable on area, the survey results show that the average area of shutchi catfish farming households is about 46,865m2; of which, households with high technology application in shutchi catfish farming have the average area is about 60,735 m2, 3 times higher than that of households without high-tech application. To illustrate this difference, the data in Table 6 show that, if the pond area is increased to 1000m2, the ability of households to apply high technology is also 3.9 times higher. Obviously, farming area is one of the factors affecting the decision of households to implement high-tech application behavior in shutchi catfish farming. This is explained that, if the pond area is expanded while fish is still raised by traditional methods, the households cannot guarantee the handling of problems such as water treatment, care, harvesting and preservation. . Furthermore, traditional farming leads to high investment costs.

As for the variable on farming years (experience), the survey results show that households applying high technology in pangasius farming have an average of 6.28 years of farming, 1.84 years lower than households without application. The question is, how does the number of farming years affect the households' decision to apply high technology in shutchi catfish farming? And the results in Table 6 show that the number of farming years has a negative relationship with the decision to apply high technology. It means fewer years of fish farming the household have, the higher possibility they apply high technology in fish farming. The reason is, households with many years of shutchi catfish farming often use and believe in their experience in handling problems that occur during fish farming. Indeed, it is good to use experience in shutchi catfish farming, but in the current situation, the competitiveness in terms of quality, price as well as the harshness of the environment (water source, climate) make empirical fish farming no longer suitale, difficult to compete as well as create an increased risk of disease.

As for the variable on local government support, this is the variable that represents the relationship between local government and farmers. The results in Table 4 show that, if households receive support from local government, the ability to apply high technology in fish farming is 1.6 times. This finding further strengthens the relationship between local support and farmer behavior in performing livelihood activities. In fact, local authorities have supported many activities such as connecting farmers with banks and credit funds for capital access; with scientists and technicians for activities of training fish farming techniques, supporting disease treatment, and controlling water sources.

As for the variable on local authority's training, in recent years, local authorities have regularly trained farmers on techniques of shutchi catfish farming. As a result, households have advantages in applying high technology to shutchi catfish farming. The regression model in Table 6 shows that, if the session number of local training in shutchi catfish farming techniques is increased by one time, the ability to apply high technology in shutchi catfish farming will double.

As for the variable on business and expert support, although the results in Table 6 show that the support of enterprises and experts increases the ability to apply high technology in shutchi catfish farming; however, the level of statistical significance shows the value of $p>0.05$; therefore the study cannot conclude the influence of these two variables.

4. Conclusion and recommendations

4.1. Conclusion

In recent years, farmers of the surveyed localities in Can Tho city have applied high technology in shutchi catfish farming. Farmers often apply high technology in stages such as fish care/raising, water treatment, harvesting and preservation. High technology application in shutchi catfish farming has brought many benefits to farmers in the surveyed localities in Can Tho city. High technology application helps to reduce costs, increase productivity and farmers' income. However, there is still a high percentage of households participating in the survey that have not yet applied high technology in shutchi catfish farming due to lack of capital, limited educational background and they have not known the benefits of high technology application in shutchi catfish farming.

Regarding the factors impacting the behavior of applying high technology in shutchi catfish farming, the study has shown that the behavior of applying high technology in shutchi catfish farming is influenced by many factors. These are pond area, number of farming years (experience), educational background, local authority support, participation in training sessions organized by local authorities. The factors have a positive relationship with the behavior of applying high technology in shutchi catfish farming, only the variable on shutchi catfish farming experience has a negative relationship. This is one of the important bases for researching a number of recommendations which encourage farmers to apply high technology in shutchi catfish farming in Can Tho city in the coming time.

4.2. Recommendations

On the basis of analyzing the factors affecting the behavior of high-tech application in shutchi catfish farming, the study suggests some recommendations as below:

Firstly, plan the appropriate pond area. To do this, local authorities need to develop plan for every single stage of shutchi catfish farming and provide information about this plan fully and publicly; encourage farming households to participate in cooperation to expand the area of farming ponds under the direction of local authorities; guide shutchi catfish farming households to expand their farming pond area based on specific local conditions.

Secondly, improve human capital. It is necessary to improve farmers' educational background in order to access information and easily absorb shutchi catfish farming techniques; strengthen training in fish farming techniques according to modern methods so that farmers can effectively apply them to the farming process; encourage farmers to change traditional and manual farming methods into modern ones with high technology application in order to contribute to improving the value chain of the local shutchi catfish industry.

Thirdly, improve social capital. The government needs to timely support people when they face difficulties in accessing capital and technical resources; strengthen and overcome limitations in cooperation, develop production models in groups, and replicate the effectively cooperative model of shutchi catfish farming in the community of farming household.

SESSION 9:

DEVELOPMENT ISSUES IN THE CONTEXT OF COVID-19

THE IMPACTS OF COVID-19 ON THE DEVELOPMENT OF NINH BINH PROVINCIAL TOURISM

MA. Trinh Ngoc Dung
trinhdungvpub@gmail.com
MA. Bui Xuan Tung
xuantungvp7@gmail.com
Ninh Binh Provincial People Committee Office, Ninh Binh, Vietnam

Abstract

Since 2019, the world has been facing one of the greatest threats - COVID-19 epidemic causing serious damages not only human health but also the global economy. As an important part of the economy, the tourism industry was not an exception to COVID-19. In fact, COVID-19 has brought impacts reversing decades on progress of tourism development. According to scholars, although tourism is vulnerable, it could adapt quickly and bounce back to the new normal situation if there is a proper strategy to recover. Using secondary data with desk research method, this paper investigate how COVID-19 impacts on the wellbeing of tourism industry by taking an example from Ninh Binh - a growing and attractive destination in Vietnam. After comparing the performance of Ninh Binh tourism before and during COVID-19, this paper illustrates the impacts of the pandemic to the development of tourism and demonstrates difficulties that destination has suffered. Also, it pointed out strategies for 03 key stakeholders of Ninh Binh provincial tourism including local government, tourism business (both direct and indirect business) and local community. At last, there 06 main suggestions are synthesized from these strategies to assist destination recover soon from COVID-19, namely, (1) preventing COVID-19 from spreading it out into the community; (2) issuing and implementing effectively policies to support businesses and locals; (3) Improving regional linkages, collaborations inside and outside destination; (4) Applying digital transformation on tourism operation and development (5) Encouraging hotels to transform into high quality quarantine places during COVID-19 period; (6) Improving people trust on local government and encouraging for the development of social cohesion among government, businesses and locals.

Keywords: *COVID-19, impacts of pandemic, Ninh Binh tourism, Strategies for recovering*

1. Introduction

Tourism is one of the most important global economic sectors, being the world's third-largest exporter (after fuels and chemicals), contributed 7% of global trade in 2020 (UNWTO 2021). Acknowledging the role of tourism in socio-economic development, promoting Vietnamese nature, culture as well as the country’s image, Vietnamese government has issued policies that encourages and supports the national tourism industry. According to VNAT (2020), in 2019 the country welcomed 18 million visitors with revenue of about VND 755 trillion, accounting for 9.2% of the national GDP, with stable and sustainable growth indicators in the last 10 years and tourism has become an economic key of Vietnam nowadays.

Understanding that tourism will be an economic development trend soon and taking advantage of the provincial natural and cultural resources, Ninh Binh provincial economy has been shifted from heavy manufacturing industries to the tourism economy in recent times. Nowadays, Ninh Binh has become one of the most attractive places in Vietnam and played a significant role in the National Tourism Development Plan of Vietnam. However, the occurrence of COVID-19 pandemic has caused great disruptions throughout the provincial economy and its tourism industry was not an exception. Therefore, it is necessary to research what the impacts COVID-19 has on destinations are and how destination can overcome the pandemic.

The purpose of this research is to investigate the impacts of COVID-19 has on tourism industry and suggest strategies that destination could implement to recover and adapt to the pandemic. Using desk research method using secondary data, this article will compare the situation before and after the pandemic to identify the difficulties, challenges and opportunities that COVID-19 brings to Ninh Binh tourism; at the same time, proposing solutions and strategies to overcome difficulties, contribute to the recovery process Ninh Binh provincial tourism during and after the pandemic.

2. Literature Review

2.1. The COVID-19 pandemic and Global tourism

a. The outbreak of COVID-19

Coronavirus disease 2019 (COVID-19) is an infectious disease caused by Severe Acute Respiratory Syndrome Coronavirus 2 (SARS-CoV-2). COVID-19 has been traced back on November 2019 by the first case detect in Wuhan City, Hubei province, China. COVID-19 defined as an infectious disease caused by a new virus which was spread very fast and until May 2020, the total confirmed cases of COVID-19 worldwide are more than 158 million cases with nearly 3.3 million of deaths (World Health Organization, 2021). COVID-19 spreads primarily through contact with an infected person when they cough or sneeze. According to Bakar and Rosbi (2020), the pandemics spreads when a person touches a surface or object that has the virus on it, then touches their eyes, nose, or mouth. COVID-19 virus can live up to 72 hours. COVID-19 has given significant impact on the economic development worldwide. With the large-scale quarantines (about 14 and some countries require more than 14 days), travel restrictions, and social-distancing measures drive a sharp fall in consumers, business expenditure, and tourism demand. This situation was created economic recession globally. However, many efforts have been done by governments to reduce the spread of COVID-19 virus. For example, a few countries were performing a lockdown approach for movement control order (MCO). Although it might stop spreading out the virus, the impacts of this approach are consumers stay at home, businesses lose revenue and lay off workers and unemployment levels rise sharply.

b. Covid-19 and its impacts on global tourism

Tourism is one of the world's major economic sectors. In 2019 it received 1.5 billion visitors, an increase of 3.8% compared to 2018, contributed impressive $8.9 trillion to the world's GDP accounted for 7% of global trade and it was the 10th consecutive year, the number of visitors has increased positively (UNWTO, 2020). According to the International Labor Organization (2020), tourism created about 330 million direct and indirect careers worldwide, equivalent to 10.3% of total global employment and 1 in 10 jobs globally. However, with the outbreak of the COVID-19 pandemic, the world economy and the global tourism industry have faced one of the greatest threats. Countries such as the U.S., Europeans, South American countries have millions of cases with thousands of deaths; many countries and cities must impose lockdowns, the traveling is restricted, and people are required to stay home. As a result, tourism industry is freeze, destinations are blocked and locked down, international flights are canceled, tourism laborers lose jobs, and visitors' traveling is limited, and all parts of tourism vast value-chain have been affected and delayed. According to UNWTO, export revenues from tourism could fall by $910 billion to $1.2 trillion in 2020. This will have a wider impact and could reduce global GDP by 1.5% to 2.8%. As many as 100 million direct tourism jobs are at risk, in addition to sectors associated with tourism such as labor in accommodation, food services and transportation industries that employ 144 million workers worldwide. Small businesses (which shoulder 80% of global tourism) and countries where tourism is the key economic factors are the ones receiving the most negative impacts from COVID-19.

To limit and prevent the negative influences of COVID-19 to global tourism, OECD (2020) suggested policies to governments, including: restoring travelers confidence; supporting tourism businesses to adapt and survive; promoting domestic tourism and supporting safe return of international tourism; providing clear information to travelers and businesses; and limiting uncertainty (to the extent possible); evolving response measures to maintain capacity in the sector and address gaps in supports; strengthening co-operation within and between countries; building more resilient, sustainable tourism. Due to international travelling restriction, many countries encourage domestic travel (Sigala, 2020) to help destination survive through COVID-19 period. Besides that, to incentive international travel, especially between countries which have stable COVID-19 situation, the term “Travel bubble” is established. According to Lou and Lam (2020), “travel bubble” is a program that allows tourists to travel to countries nearby without quarantine requirement.

Since the beginning of 2021, many travel bubble relationships are implemented such as Austria – Germany, Denmark – Norway, Australia – New Zealand, China – South Korea, Singapore – China, Indonesia – China, South Korea, Japan, Australia. However, these travel bubbles are mostly for either diplomatic or business purposes, not leisure and the bubbles could be burster anytime, depending on the pandemic situation.

2.2. COVID-19 and its impacts on Vietnam tourism

As soon as the occurrence of the epidemic, Vietnam's tourism industry has suffered heavy losses including domestic tourism and international tourism. The travel restriction has been imposed on all tourist attractions and Vietnam restricted the entry of overseas tourists since April 2020. Industry such as, hospitality, hotel, restaurant, and transportation sectors were mostly postponed, and tourists' attractions were closed due to nationwide social distancing. The number of international visitors is only available in January and February, from March 2019 there are almost no visitors. Domestic tourists also feel sharply due to the complicated developments of the epidemic and Vietnam's social distancing. Tourism businesses faced with difficulties, causing many tourism industry employees to lose their jobs, even without income ... According to VNAT (2021), international visitors to Vietnam in November 2020 were estimated at 17.7 thousand people, up 19.6% over the previous month but down 99% over the same period last year; however, these are international workers or experts who works in Vietnam. In the first 11 months of 2020, international visitors to our country were estimated at 3.8 million, down 76.6% over the same period last year. Total visitors in the first quarter of 2020 reached 3.7 million visitors, down more than 18% over the same period; revenue from accommodation and dining services in the period was estimated at VND 126,200 billion, equivalent to 10% of the total revenue of commercial and service activities of the country, down 9.6% compared to the first quarter of 2019; Tourism revenue in the first quarter of 2020 was estimated at VND 7,800 billion, accounting for 0.6% of the total and down 27.8%. About 80-90% of small and medium-sized travel enterprises suspend their operations or activities.

Some important economic sectors related to tourism such as transportation are also seriously affected, in which, air transport is greatly affected by international passengers using Vietnam's aviation accounting for nearly 80%. Road and rail transport services also suffered negatively when trade and tourism activities declined, festivals and events are canceled. Transportation support services also decreased such as flight management services, airport services were all affected. Some other industries such as agriculture (agricultural production to serve visitors); banking and finance (restaurants, hotels without guests resulting in inability to pay bank debt); small craft industry (producing souvenir items for visitors) are seriously affected.

For recovering soon from the second COVID-19 epidemic, the tourism industry continues to launch the domestic tourism stimulus program towards improving safety and attractive factors. The Vietnam National Administration of Tourism has issued a set of criteria for tourism safety and launched the application “Safe Vietnam Tourism”, “Vietnamese travel in Vietnam”. Traveling businesses also generated collaborations to make affordable deals and enhance service quality. Although there are certain achievements on domestic tourism, Vietnam’s tourism industry is still facing many difficulties due to the potential risk of epidemics, vaccines have not been produced and globally have not achieved community immunity, so the response and adaptation to COVID-19 of the tourism industry will continue in the near future.

2.3. Overview of the Ninh Binh tourism (before COVID-19)

According to the Ninh Binh Department of Tourism (2019), Ninh Binh has an area of 1,390 square kilometers and a population of nearly 1 million, currently possesses 01 World Heritage Site, 1.499 cultural and historical relics, of which 79 were classified at the national level and 235 were classified at provincial level. Especially, the Trang An Scenic Landscape Complex was recognized as world natural and cultural heritage by UNESCO in 2014. Favorable nature along with the rich history has created many scenic places and historical and cultural relics in Ninh Binh. Most of Ninh Binh's tourists attractions have a combination of natural resources and humanities resources.

In terms of natural resources, Ninh Binh’s topography is divided into three distinct areas, the hills in the west and northwest, the plain in the east and the coastal area in the south. Three-fourths of the area is hilly and mountainous, diverse karst topography is a base for the development of flora and fauna, forming many tourist destinations with beautiful natural scenery that attracts to tourists, especially the cave complex such as Trang An, Tam Coc - Bich Dong, Van Long Wetland Nature Reserve, Van Trinh Cave, Dich Long Cave, Thien Ha Cave.. . The forest ecosystem in Ninh Binh is very distinctive, with Cuc Phuong National Park, a typical tropical forest with an area of over 22,000 ha, home to nearly 2,000 species of higher plants and about 2,600 species of animal; The Van Long nature reserve, which is featured fourth largest wetland ecosystems in the Red River Delta (about 2,643 ha). In addition, Hoa Lu Special-use Forest and Kim Son coastal mangrove forest have a rich ecological system and landscape with many rare and precious plant and animal species listed in the Red Book of Vietnam and the World. Ninh Binh has about 18km of coastline in the new land Kim Son.

Besides scenic places, cultural and spiritual tourism is also a strength of Ninh Binh, promoting the advantage of a sacred land which was the capital of three dynasties: Dinh, Early Le, Ly, associated with the great changes of the national history. It is also a place of convergence and development of many religions, especially Buddhism and Christian. Ninh Binh has a large number of religious and cultural architectural works that have historical value, such as, Phat Diem Stone Church, Hoa Lu Ancient Capital, Bich Dong Pagoda, Bai Dinh Pagoda, etc. The historical and cultural relics in Ninh Binh mainly associated with the

Dinh, Early Le and Ly Dynasty. In addition, Ninh Binh is one of the locals who still preserve many folk festivals. At present, the province has 74 festivals, some festivals have become the tradition not only of local people but also of the whole province and attract the attention of domestic and international visitors such as, Hoa Lu Festival, Thai Vi Temple Festival, Duc Thanh Nguyen Temple Festival, Trang An Festival, etc. Moreover, regarding gastronomy culture, Ninh Binh cuisine has many famous dishes such as goat meat (Thit De), burned rice (Com Chay). The beautiful nature, historical-cultural relics and delicious dishes of this land known as "Miniature Vietnam" will certainly leave many unforgettable impressions in the heart of visitors.

Taking advantage of the diverse tourism resources as well as the supporting and leading from the Central Committee Party and Government, the visitors to Ninh Binh has been increasing in the period of 2010-2019 (Table 1). In 2019, the province welcomed 7.65 million visitors, of which: domestic visitors: 6.68 million visitors, international visitors: 970 thousand visitors (with the average growth in number of visitors is 12%, annually), tourism revenue reached VND 3,600 billion, the service industry accounted for 46.2% of the GRDP structure of the province (Ninh Binh Provincial People Committee, 2020). Many investors in the field of tourism services inside and outside the province have come and invested in Ninh Binh. Up to now, the province has issued investment certificates for 36 investment projects on tourism, with a total investment of VND 16,212 billion. Along with the rapidly increasing number of tourists coming to Ninh Binh, the development of tourism has created many jobs for local people. If in 2010 Ninh Binh had 8,550 workers both directly and indirectly in this field, by 2019 this number increased to 21,500 people, the average labor growth rate in the last 9 years is 25.9% per year. In addition, traffic infrastructure such as national highways, health system, Internet facility and accommodation infrastructure such as restaurants, hotels, homestays, entertainment areas, walking streets, supermarkets, shopping centers are being invested which contributes to promoting the tourism and service sector of the province, creating jobs for locals; therefore, poverty is alleviate and socio-economic is able to develop effectively and efficiently.

Table 1: Overview of Ninh Binh tourists 2010 – 2019

	Year	**2010**	**2015**	**2019**	**2020**
International tourists	**Total number of international tourists**	663,3	600,6	915,0	196,0
	Percentage compared to the total number of guests	21,4	10,0	11,96	7,47
	Average length of stay (by day)	1,99	1,52	1,8	1,0
Domestic tourists	**Total number of domestic tourists**	2.433,3	5.392,6	6.735	2.429

	Year	2010	2015	2019	2020
	Percentage compared to the total number of guests	78,58	89,98	88,04	92,53
	Average length of stay (by day)	1,55	1,28	1,85	1,0
Total number of visitors		3.096,6	5.993,2	7.650	2.625,3

2. Method

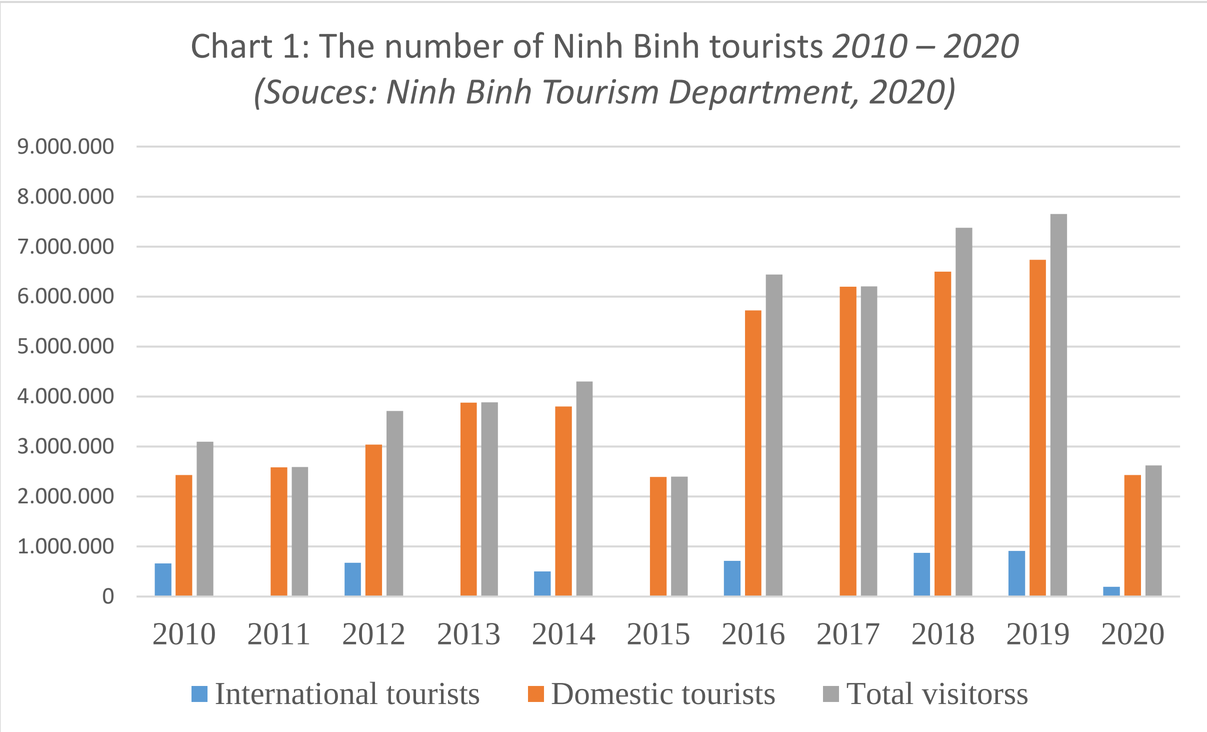
2.1. Research method

To investigate what the impacts of COVID-19 and figure out the strategies and solutions for overcoming the COVID-19, this research uses secondary research which is also known as desk research. According to Smith and Smith (2008), secondary research is a common approach to a systematic investigation in which the researcher depends on existing data or secondary data on research process. This research design involves organizing, collating, and analyzing these data samples for valid research conclusions. Secondary research is also known as desk research since it involves synthesizing existing data that can be sourced from the internet, peer-reviewed journals, textbooks, government archives, and libraries. What the secondary researcher does is to study already established patterns in previous researches and apply this information to the specific research context.

2.2. Data collection and analyze

In this research, the data is collected from sources such as journal article, report from international organizations, non-government organization, Vietnamese government and Ninh Binh local government achieves. To find out the impacts of COVID-19 on tourism, this research takes the example of Ninh Binh provincial tourism and compares the tourism performance before and after the outbreak of COVID-19 pandemic. Furthermore, based on the current situation of Ninh Binh destination and its strengths as well as weaknesses, this research will suggest strategies that can assist the destination to survive and adapt to COVID-19.

As an attractive destination of Vietnam, Ninh Binh was not an exception to COVID-19. International tourists couldn't arrive, the number of domestic tourists went down, traveling is restrictions directly damaged seriously provincial tourism. As a result, many hotels, restaurants, areas, and tourist attractions must remain closed, and tourism revenue has plummeted. In 2020, Ninh Binh tourism not only failed the target of 7.0 million visitors, but also, 2020 has been the worst year in terms of development since 2010. The recovery of



Ninh Binh tourism must depend about COVID-19 of Vietnam and the effectiveness of future COVID-19 vaccines. All the data about tourism performance was collected in government public data and will be analyzed in the next paragraph.

In terms of economic impacts of the pandemic, according to the Ninh Binh Tourism Department (2020), the total number of tourists coming to Ninh Binh in 2020 reached 2.8 million, only 37% compared to 2019, of which domestic visitors 2.6 million were only 39% compared to 2019, international visitors only reached 200,000, only 21.4% compared to

	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020
Series1	551.427	654.148	778.957	897.445	942.779	1.420.9	1.764.9	2.528.2	3.200.0	3.600.0	1.600.0

2019. Tourism workers in 2020 decreased from 21,500 to 14,000 workers, which means 7.500 careers were lost. As it shown on the Chart 1, comparing before and after the launch of COVID-19, the performance of Ninh Binh tourism in 2020 seems to be taken back into 2010. With the downward number of tourists, as it is indicated in Chart 2, the total tourism receipt also is negatively impacted. In 2020, total tourism revenue is 1.600 billion VND, equal to 44% comparing to 2019 and less than the total tourism revenue in 2016. International tourists are restricted to entry Vietnam, domestic tourists fear the spreading of pandemic; as a result, many hotels, restaurants, tourists' attractions must remain closed causing loses on the tourism revenues. Furthermore, many tourism businesses went bankrupt because they cannot pay for bank interests leading tourism workers lost jobs. Also, not only tourism businesses have suffered, tourism supplying business are negatively impacted by COVID-19. In terms of social impacts, although the negative impacts of COVID-19 to the economy and tourism of Ninh Binh is obvious with strong evidences from statistics, the social risks are also very high. For instances, Ninh Binh tourism workers are mostly from low-income households and they are vulnerable with the damages of COVID-19. Losing jobs can change their livelihoods, loss income and make their lives harder. Moreover, loss tourism revenue can cut the budget to conserve the environment and historical relics heritage causing negative impacts on the environmental and cultural heritages.

3. Results

As it is discussed above, there are disadvantages that COVID-19 brings to economic and social well-beings of Ninh Binh province. To prevent the spreading of COVID-19, people are encouraged to stay home and keep distances between each other; therefore, people could not go anywhere and tourism services must be closed. Damages are obvious and significant; however, it still has chances for Ninh Binh to overcome. First of all, on the Chart 1, domestic tourists are the main tourists in Ninh Binh and international tourists only takes a small number on the total tourists in the period 2010-2020, therefore, if Ninh Binh target the domestic tourists effectively during the pandemic, tourism businesses and workers would have opportunities to recover the pandemic. Secondly, due to the downward on tourists, the environment receives less impacts from tourism activities, the air will be clean as people do not travel. According to Rosbi and Bakar (2020), since people cannot travel for a long time because of the pandemic, once the COVID-19 is controlled worldwide, the tourism demand will raise remarkably and destinations like Ninh Binh province would prepare to be ahead for the future trend. In the next section, based on the results of this research, there are strategies suggested for Ninh Binh tourism to overcome the pandemic and adapt to the new normal situation.

The strategies to recover from covid-19 for ninh binh province

According to Sigala (2020), tourism is the industry most affected by the pandemic but also one of the most recoverable industries. Therefore, if the destination can catch on to the new tourism trend, Ninh Binh will have breakthrough opportunities, so the management, local government, businesses and locals need to be prepared so that as soon as the epidemic passes, the tourism market will flourish, there will be suitable products for tourists and be ready for the development in the “new normal situation”.

As stated above, compare the situation before and during COVID-19, evidences are showing that these impacts of COVID-19 bring to Ninh Binh social-economic development and its tourism industry disadvantages. To overcome the disaster, this article will point out strategies implemented by 03 groups of stakeholders, namely, the local government (Ninh Binh Provincial People Committee), the businesses and locals to overcome the pandemic. Dabphet (2012) stated that these 03 groups are the key stakeholders that determine the development and performance of a destination. Due to the social-political specifics of Vietnam, local government plays a significant role in the plan and issues strategies, yet it must be along with the assists and involvement of the business and local people to be effective.

Local government

During the COVID-19 epidemic, the priority concern of local government is to keep the situation stable without new infections and must acknowledge that “do not to trade health and community benefits to achieve economic benefits”.

Guiding businesses and people; strengthening inspection, supervision and propagating the observance of basic principles of epidemic prevention; transparency of information about the pandemic, prevention of fake news causing confusion for locals and visitors about the epidemic situation.

Based on the actual situation of the locality, imposes policies to support and promote the tourism industry, focusing on exploiting the domestic tourist market. For example: Promulgating policies to support bank loan interest rates for tourism enterprises and enterprises in tourism value chain, especially small and medium-sized enterprises (categorizing businesses by sector to have specific preferential rates); reducing land rents for tourism service projects; providing funding support for individuals and households unemployed due to epidemic. Discounted fares or free fares at government-managed tourist attractions.

Due to the epidemic situation, revenues from tourism activities to reinvest in the protection of ecosystems, preservation of cultural and historical relics are affected; therefore, local governments need to involve and spend money on activities of protecting ecosystems, preserving relics, cultural and historical heritages.

Re-planning tourism development policies, with an increased focus on improving the resilience of tourism destinations and community to overcome and adapt with pandemic; catching the trend of the domestic and international tourism industry, proposing to apply tourism industry solutions such as vaccination passports, travel bubble, and so on.

Inviting and facilitating for event companies or reporters, newspapers on reporting and filming about the natural and cultural attractions in Ninh Binh; enhancing the promotion of images, building promotional videos on websites, digital platforms with diverse content and forms, subtitled in many foreign languages.

Coordinating with other provinces and destination to develop regional links and collaboration, create conditions for businesses inside and outside the province to cooperate closely with each other, build multi-provincial tours to serve tourists.

Continuing to invest and improve facilities of relevant sectors such as health, education, telecommunications, transport infrastructure to serve tourism. Prioritizing the construction of telecommunications infrastructure to accelerate digital transformation because digital transformation is one of the effective tools to adapt and recover from the COVID-19 pandemic.

The businesses

Follow the guidance of the management agency (from the government) on COVID-19 prevention, especially accommodation service must not accept to accommodate in cases where foreigners enter illegally or do not present documents about equal and valid quarantine.

Priority on developing the brand and promotion strategy, ensuring service businesses can provide their services in a new development environment. Many companies and businesses mainly focus on attracting international customers need to change marketing methods, attract domestic visitors to suit the actual situation.

Strengthening the collaboration and cooperation with companies and businesses inside and outside the province to create regional links. Promoting cooperation and links to build new tours and tourism products, share peak season visitors or improve service quality is one of the methods for the tourism industry to adapt to COVID-19

Building tourism products that express local culture, in accordance with Vietnamese customs and provincial customs to attract domestic tourists; producing promotional videos with subtitles in many languages, using advertising tools on social networking to promote to domestic and foreign tourists.

Encouraging hotels to transform their accommodation business to a high-quality quarantine area to maximize profits and generate income during the COVID-19 pandemic.

The local people

Supporting for the governments and businesses, well-implemented the guide to prevent the COVID-19 pandemic from authority, and try not to let the epidemic spread within the community

Responding to the movement launched by the local government or the General

Department of Tourism: “Each citizen is a tourism ambassador”, promoting beautiful images of people, lifestyle, cultural traditions of Ninh Binh people

Raise awareness of protecting ecosystems and environment, preserving cultural and historical relics; diversify income, livelihoods and avoid over-dependence on the tourism industry

Expressing the rights, obligations, responsibilities and voices of the people through giving opinions on the planning development of the tourism industry of the province, in particular, the Tourism Plan is necessary to focus on sustainable development, exploiting economic benefits but must priorities with environmental protection, preserving indigenous cultures and traditions and ensuring the rights and interests of the community.

According to McGehee et al (2010), local people play an important role in tourism resilience. Many destinations and countries tend to reinvest in facilities (e.g., rebuild roads after a disaster) or focus on promoting tourism product to attract visitors back to their destinations after a disaster. However, social capital, community cohesion, or the solid relationship among communities, businesses and local government is one of the most significant factors for the adaptability of the destination (McGehee et al 2010). Therefore, people must unite to overcome these difficulties, trust in the leadership of the government to adapt to the “new normal situation” during COVID-19 period.

4. Discussion and Conclusion

COVID-19 epidemic not only causes harm to human health, moreover, the rapid spread of nCovi virus also causes the collapse of the health system and the collapse of the economy. To limit the spread of the COVID-19 epidemic, all economies were shut down, people restricted travel to avoid exposure to COVID-19. This is the premise that causes world tourism to suffer, many destinations fall into crisis. As commented above, COVID-19 brings challenges, difficulties and opportunities for growth and breakthrough. In Ninh Binh province, although the economy is also heavily influenced by the COVID-19 epidemic, with the determination and participation of the whole political system, the consensus of businesses and people, the economic sector in general and the tourism industry has made certain achievements. For the effective adaptation of the provincial tourism in the new normal situation, the article has shared several strategies for three main groups of stakeholders, including local government, the business and local community. In general, the strategy to be effective implemented, the tightening coordination of 03 stakeholders is a must; in which, attention should be paid to the following 06 focus points: (1) ensuring a good disease prevention, preventing epidemic diseases from spreading out into the community; (2) issuing and implementing effectively policies to support businesses and people to overcome the epidemic; (3) Improving regional linkages, linkages between companies, businesses and local authorities, promote promotion and cooperation activities for mutual development inside and outside destination; (4) Applying digital transformation, continuing to promote on social media with subtitle on many languages to attract international attentions (5) Encouraging hotels to transform into high-service quality quarantine zones to maximize profit during the hard time of COVID-19; (6) Improving people trust on local government, as well as enhancing social cohesion among the community. Besides that, although there are losses and damages caused by COVID-19, the tourism of Ninh Binh still have chances to breakthrough and recover fast because their main visitors are domestic visitors. Therefore, if the situation within Vietnam is stable, the tourism has opportunities to resist with COVID-19 and still be a key economic factor.

In the following years, the world could never be the same as before (Sigala, 2020). COVID-19 has caused significant disruptions and damages to the socioeconomics in general and tourism in particular. However, as it stated, tourism and the community in destinations have its own resilience and adaptive capacity. The government, businesses and people around the world will acknowledge and figure out strategies to survive and transform in order to adapt to the "new normal situation", yet the effectiveness of strategies will highly depend on the effectiveness of vaccines. Regarding Ninh Binh tourism, as domestic is the main source of tourists, it still has chances to take economic and social advantages from tourism activities by applying 06 suggestions listed above. However, the whole tourism industry needs to wait until COVID-19 pandemic is under control to be truly recovered from the disaster. Any solutions for developing tourism in COVID-19 period is temporary and the tourism activity could be shut down any time to prevent spreading the virus.

To sum up, as it is stated above, belongs with the negative impacts, there would be positive impacts and the target of destination to take the advantages, catch the new trend, transform, and adapt with the new situation. This report discusses the impacts COVID-19 has on the tourism industry with the focus on Ninh Binh province in Vietnam. To sum up, there are 07 main suggestions for local government, businesses, and the local community to follow and recover from the pandemic. In the future, for a research paper, it should figure out the factors that help destination over the pandemic or what are the factors that make tourism resilient with the COVID-19 to help destination could effectively survive through the pandemic.

IMPACT OF THE COVID-19 PANDEMIC ON TOURISM ACTIVITIES IN DA NANG CITY

Dr. Dinh Van Trong

trongdv@due.edu.vn

Faculty of Political Theory, Danang University of Economics, Da Nang, Vietnam

Abstract

With the goal of developing tourism to become a spearhead economic sector of the locality, over the years, the Party Committees and authorities of Da Nang city have paid much attention to investment and development and obtained many promising results. The number of tourists coming to Da Nang is increasing which leads to the tourism revenue is increasing as well, significantly contributing to increasing state budget revenue, creating jobs, and improving people's lives. In 2020, the outbreak of the Covid-19 pandemic halted tourism service activities in the locality, causing heavy losses and damage to the tourism industry. Within the framework of this article, the author focuses on clarifying: Potentials and advantages of tourism development in Da Nang city; Impact of the Covid-19 epidemic on tourism activities in Da Nang city. From there, propose some solutions to restore and develop tourism activities in Da Nang City in the coming time.

Keywords: *Tourism, Covid-19 pandemic, impact, Da Nang city.*

1. Introduction

The complicated developments of the Covid-19 pandemic in 2020 and early 2021 have strongly affected tourism activities in the world, Vietnam in general, and Da Nang city in particular. Flight bans, travel restrictions, and tourist apprehensions about the effects of the pandemic have left many hotels, restaurants and retail chains in tourist attractions in the city deserted. The whole Da Nang tourism industry was almost exhausted, tourists and tourism revenue dropped seriously. In this article, the author focuses on clarifying the impacts of the Covid-19 pandemic on tourism activities in Da Nang city.

2. Methods

To clarify the content: Impact of the Covid-19 pandemic on tourism activities in Da Nang city, in this article, the author collects many sources, such as Statistical Yearbook of 2017, 2019, Report of the General Statistics Office of Da Nang City on the socio-economic situation of the locality over the years from 2000 to 2020, reports on the situation of tourists as well as tourism revenue of the Department of Culture - Sports - Tourism, the Implementation plan of action program No. 28-Ctr/TU dated February 18, 2019, of the City Party Committee on sustainable development of marine economy in Da Nang city to 2030, vision to 2020. 2045 of the People's Committee of Da Nang City, History of the Party Committee of Da Nang City, ...

thereby using historical, statistical, analytical, and comparative methods to clarify the potentials and advantages of position. Geographic location, natural resources, and population characteristics affect tourism development in Da Nang city. Current status of tourists as well as tourism revenue in Da Nang from 2000 to 2020.

3. Results

3.1. Potential and advantages of tourism development in Da Nang city

Da Nang city has an area of 1,255.53 km² (of which the mainland is 950.53 km²; the Hoang Sa island district is 305 km²), including 06 districts (Lien Chieu, Thanh Khe, Hai Chau, Cam Le, Ngu). Hanh Son and Son Tra) and 02 districts (Hoa Vang and Hoang Sa island district) [6; p.29].

Da Nang is one of the great urban centers of the country, where it has converged with many potentials and advantages to become the economic, political, cultural and social center of both the Central region and the Central Highlands. The advantages of geographical location, natural resources, and people are essential factors to make Da Nang an attractive tourist destination for domestic and international tourists.

3.1.1. The geographical location

Da Nang is located at 15°55' to 16°14' North latitude, 107°18' to 108°20' East longitude, bordered by Thua Thien - Hue province to the north, Quang Nam province to the west and south, and bordered by Quang Nam province to the East Sea. Thanks to such a geographical position, Da Nang has a temperate climate, not too cold in winter, but not too hot in summer, so it is quite suitable for tourism and resort activities.

Due to the geographical characteristics of being in the middle of the country, on the North-South transport axis in terms of road, railway, sea, and air, it is 764km from Hanoi to the North, and far from Ho Chi Minh City about 964 km to the south. In addition, Da Nang is also the center of three famous world cultural heritages of Vietnam: Hue ancient capital, Hoi An ancient town, and My Son Sanctuary. With this location, Da Nang soon became the center of the country in transit, welcoming tourists of the country.

3.1.2. Natural resources

Da Nang city is one of the important gateways to the sea from the Central Highlands and Laos, Cambodia, Thailand, and Myanmar to the Northeast Asian countries through the East-West economic corridor, with the ending point being Tien Sa Seaport [6; p.23-24]. Da Nang city is endowed with rich, diverse, and abundant natural resources.

To the northeast of Da Nang city is Son Tra peninsula with an area of 400 hectares of primeval forest, diverse in flora and fauna. There are 12 impressive tourist destinations here such as Linh Ung pagoda, Ban Co peak, thousand-year-old banyan tree, radar station 29 (Indochina God’s eye), Tien Sa port, Tien Sa beach, Da Den beach, Nghe cape, Bai Nam beach, Bai But beach, Bai Bac Beach, InterContinental Danang Sun Peninsula Resort. The West is Ba Na Hills tourist area located at an altitude of over 1000m with a cable car system reaching 4 world disciplines: the largest disparity, the longest total length of the cable, and the heaviest cable combined with the area. Fantasy Park is the largest indoor amusement park in Southeast Asia. To the southeast of the city is the famous Marble Mountains with a system of communal houses, pagodas, and shrines in Asian architecture, a system of churches in Western architecture, museums, notably the sculpture art museum. Cham carving attracts a large number of tourists to visit. And the North is Hai Van Pass - where there are many ideal stops to see the dreamy Da Nang city.

Da Nang has a coastline of about 30 km, sloping, smooth sand with many beautiful beaches, such as:

**** Non Nuoc beach*** stretches 5km and is located about 10km from the city center to the Southeast, in Hoa Hai ward, Ngu Hanh Son district. Non Nuoc Beach stretches like an arc, fine white sand, gentle slope, clear blue water, sunny and windy. Fresh environment, ideal temperature, less affected by the northeast monsoon. This is a favorable condition for tourists to swim and relax all year round.

**** Bac My An beach*** is located in Bac My An ward, Ngu Hanh Son district, Da Nang city, about 7km southeast of the city center. Bac My An beach has 5 beautiful beaches, including T18 beach, My Da Dong 2, My Da Dong 3, Bac My An, and Furama hotel area.

Before 1975, this was just a natural beach, after Da Nang was liberated, the state built here a motel and a sanatorium to serve the convalescence needs of cadres, workers, and officals in Quang Nam - Da Nang province. Recently, with the appearance of resorts, Bac My An has become famous, known by domestic and foreign tourists as an international resort.

**** My Khe beach*** has a length of approximately 900m, belongs to the busiest type of beaches in Da Nang, is located 3km from the city center, so it is very familiar to residents. The American magazine Forbes voted My Khe beach as one of the six most attractive beaches on the planet. It can be said that My Khe beach has fully met the basic voting criteria of Forbes, such as My Khe beach is convenient in terms of traffic; the beach is open to all visitors free of charge; the beach has long and flat sand, sunshine and wave coverage suitable for playing sports; capable of ensuring the safety of visitors; There are luxury resorts, international standard villas...

* Nam O Beach is about 17 km northwest of Da Nang city center, Nam O dawn is said to be an ideal picnic place for people who like going “backpacking”. Starting from the city center, along Nguyen Luong Bang Street, passing Xuan Thieu beach at the entrance to the winding fishing village, people will see the white sand stretching along the coast appearing before your eyes. From the sand about a few hundred meters, we will encounter a fairly wide rock at the foot of the mountain with thousands of pebbles mixed with coral rocks.

**** Xuan Thieu Beach*** which is about 3 km south of Nam O Reef - a place associated with history. Before 1975, this beach was reserved only for American soldiers (U.S. soldiers called Xuan Thieu beach “Red Beach” (i.e. Red Sea)). Currently, Xuan Thieu beach is invested with many high-end beach resortes and a variety of sports and entertainment services at sea, such as: surfing, flying parachutes, jet skis.

Xuan Thieu Beach is steeper than other beaches, but the water here is more clean and quiet because there is partly water from the Han River pouring out, the water taste is not as salty as other places. Since 1992, Xuan Thieu tourist area has been established with a relatively continuous and complete service system such as hotels, restaurants, some entertainment services, beach services.

* The beaches of Son Tra Peninsula are a privilege that nature has generously bestowed on Da Nang city. In the figure reaching out to the sea, Son Tra is a giant screen shielding the city. Located about 10 km northeast of the city center, Son Tra Peninsula with an altitude of 693m above sea level. It is also a diverse and abundant nature reserve, protected under the national prohibition forest regime. Son Tra Peninsula is surrounded by a beautiful coastline arc with beaches, such as: Tien Sa Beach, Black Rock expanse, Rang Beach, But, Da, South, North, Con, Trem expanses. Son Tra Peninsula is a convergence of all elements for visitors to visit, resort, have fun and discover the adventure of unspoiled mountains and forests. With its own characteristics, Son Tra Peninsula has created interesting attractions and unique experiences that tourists coming to Da Nang can hardly forget.

In addition, Da Nang has Han River, which contains many potentials and advantages to exploit tourism development.

The Han River is made up of a tributary of the Thu Bon River that is integrated with the Cam Le River. Han River is 1,200m wide, water flow is about 3m/sec, with an average depth of 4 to 5m, the vessel can enter the river to dock easily. The last section of the river connects to Da Nang Bay. The bay has an average depth of 10 to 15m of water, the mouth of the bay is up to 20m of water.

Han River has long been the pride of the people of Da Nang. This river has poetic beauty, bringing many benefits, especially exploiting to develop night tourism. Starting at the pier, visitors will be able to visit the city center at night on the Han River, visitors can admire the unique bridges in Vietnam, such as the Han River (the only cable-stayed bridge in Vietnam, the symbol of the intensevitality of Da Nang city), Thuan Phuoc Bridge (the longest hammock bridge in Vietnam), dragon bridge (the largest steel dragon in the world) and the new tran Thi Ly bridge (the bridge with a tower tilted 117m high, the 3-side cable-stayed system radiating like a sail winding into the South China Sea).

3.1.3. Population characteristics

Da Nang city has a large population compared to the whole country. According to statistics, in 2019, the population here reached 1,134,310 people, ranking 39th in the country. The structure of labor working in the predominantly service sector, accounting for 68.20%; industry - construction accounted for 28.48% of the labor structure; the agriculture, forestry and fishery sector accounted for only 3.32%.

In the city, there are about 37 ethnic groups and foreigners living together. In particular, the most ethnic group is the Kinh with more than 1 million people, the second largest is Chinese with 2,974 people, the Cha Tu ethnic group has more than 1000 people, along with other ethnic minorities such as Tay, Ede, Muong, Gia Rai, etc. With a large population and diverse cultural identity as above, it has created a unique cultural identity for the people here. In the folk beliefs of the sea, the sea gods are worshipped very diverse and rich, reflecting the aspirations and dreams of fishermen who go to sea. Since then, it has created many customs and festivals that attract a large number of visitors near and far to visit and experience.

3.2. Impact of the Covid-19 pandemic on tourism activities in Da Nang city

3.2.1. Tourism activities in Da Nang city before the Covid-19 pandemic

In order to facilitate the socio-economic in general and tourism activities of Da Nang city in particular with conditions for development, on October 16 2003, the Ministry of The Political Ministry introduced Resolution 33-NQ/TW on the construction and development of Da Nang city in the period of industrialization, to modernize the country. On January 24, 2019, the Politburo continued to issue Resolution No. 43-NQ/TW on the construction and development of Da Nang city to 2030, with a vision to 2045.

Implementing the Resolution of the Politburo, over the years, the Party committees and the Government of Da Nang city have set out many guidelines and policies to concretize the Resolutions of the Politburo with the goal of "Developing tourism to become a key economic sector" in the local economic development. As a result, a number of major tourism projects of domestic and foreign strategic investors have been put into operation for tourism development such as Sun Group, DHC, BRG, AHT, Vin group, Along with that, many activities to promote and promote the image of tourism through festivals, cultural events, sports, tourism are also directed to organize, such as: International Marathon, IRONMAN 70.3, show "Charming Da Nang", Soul Viet ... and especially Danang International Fireworks Festival, Clipper Race 2016, ABG5-2016 Asian Beach Games, Danang International Tourism Fair 2016, Da Nang Paragliding Open "Flying over Tien Sa 2017", Asia Golf Tourism Festival 2017, APEC Premium Week 2017, Danang International Hot Air Balloon Festival was held from April 27th to May 1st 2019 at Hoa Trung High-Tech Park and Ho Chi Minh City, Hoa Vang district and support festivals in Bach Dang street area, so on. Through the above special festivals, it has attracted tens of thousands of domestic and foreign tourists to visit and travel, contributing to promoting and enhancing the local tourism image to domestic and international tourists.

Accommodation facilities serving tourists are interested in construction investment. On average, there are nearly 100 new accommodation facilities built each year in Da Nang with about 6,000 rooms. In particular, the number of hotels from 1 to 3 stars is more than that. According to statistics of the Danang Tourism Promotion Center, as of the beginning of June 2019, out of 800 accommodation establishments in Da Nang city, there are nearly 650 1-3-star hotels and equivalent. While the hotel is 4-5 stars and equivalent to just over 80 establishments, the rest are luxury resort villas, villas - standard apartments, campsites - motels with standard rooms for rent. Along with the increase in the number of hotels, high-quality hotels also increased, but this number is still quite modest in the total number of hotels throughout the city. The business activities of hotels keep a fairly stable growth rate with an average room use capacity of 75%, coastal hotels and 3-5-star hotels with room capacity in summer can be up to 90-100%.

With the efforts of party committees and local authorities, the past time tourism activities in Da Nang have achieved very remarkable results.. The number of tourists coming to Da Nang increases every year with a fairly high growth rate. The total number of visitors to Da Nang in 2000 was only 393 thousand, in 2007 it exceeded the threshold of 1 million visitors. In 2009, during the global financial crisis, tourists to the City still increased by nearly 15% compared to 2008, reaching more than 1.1 million visitors, the total revenue of the Tourism industry in 2009 reached more than VND 1 trillion, up 12.8% compared to 2008.

Inthe period of 2009 - 2013, along with the development of Vietnam's tourism industry, the number of tourists coming to Da Nang continued to increase, with an average annual growth rate of 26.9%, of which international visitors increased by 39.7% and domestic visitors by 24.5%.

***Table 1.* Tourist to Da Nang in the period of 2009-2013**

(Unit: tourists)

	2009	**2010**	**2011**	**2021**	**2013**
Total number of visitors	1.131.104	1.499.210	2.227.909	2.570.957	2.938.563
International visitors	155.912	290.933	402.752	409.551	595.095
Domestic visitors	975.192	1.208.277	1.825.157	2.161.406	2.343.468

(Source: Da Nang General Statistics Office in the period of 2009 – 2013)

Entering the period 2014 - 2019, the number of visitors to Da Nang increased rapidly and steadily, with an average growth rate of 17.9%, of which international visitors increased by 29.8% and domestic visitors by 13.0%.

***Table 2.* Tourist to Da Nang in the period of 2014-2019**

(Unit: tourists)

	2014	2015	2016	2017	2018	2019
Total number of visitors	3.800.000	4.600.000	5.510.000	6.600.000	7.600.000	8.692.421
International visitors	955.000	125.000	1.660.000	2.300.000	2.875.000	3.522.928
Domestic visitors	2.800.000	3.350.000	3.840.000	4.300.000	4.700.000	5.169.493

(Source: Summary of Report of the Department of Culture, Sports and Tourism of Da Nang City)

Along with that, total tourism revenue in the period 2014 - 2019 also increased rapidly with an average growth rate of 16.7% in wet year. Total tourism revenue over the years also increased sharply. In 2014, the total tourism revenue was estimated at 987.1 billion VND, by 2017 it was reached 1597.2 billion VND, an increase of 61.1% compared to 2014. By 2019, total tourism revenue reached 2138.0 billion VND, increasing 12.2% compared to 2018.

Table 3. **Tourist to Da Nang in the period of 2014-2019**

(Unit: Billion VND)

	2014	2015	2016	2017	2018	2019
Total number of visitors	987,1	1.166,4	1.461,6	1.597,2	1.905,6	2.138,0

(Source: Statistical Yearbook 2017 and 2019)

The continuous increase in total tourism revenue over the past years as above is a clear demonstration of the logic with the increase in the number of visitors to Da Nang city. This not only creates conditions for Da Nang to continue affirming its tourism brand with domestic and international tourists but also significantly contributes to the economic restructuring, creating more jobs and improve people's lives.

3.2.2. Impact of the Covid-19 pandemic on tourism activities in Da Nang city

In early 2020, after the outbreak of the Covid-19 epidemic, implementing the social distancing policy of the Prime Minister, in Da Nang city, all activities in the fields of hotels, motels, restaurants and transportation were suspended. Along with that, the aviation industry in Da Nang was also severely affected when a series of domestic and international flights to and from Da Nang were cancelled. This leads to a decrease in the number of international visitors to Da Nang. Domestic tourists also dropped sharply due to the complicated development of the epidemic and Vietnam implemented social distancing. Tourism businesses face difficulties, causing many employees of the tourism industry to lose their jobs, even without income, ...

After the Prime Minister began easing social distancing measures, allowing tourism services to resume operations, with the direction of Party Committees at all levels, the Department of Tourism promptly mobilized many resources. and actively coordinate with local departments, agencies and sectors to deploy many solutions to stimulate demand and restore tourism activities in the area such as: strongly implementing communication activities about safe - attractive Da Nang destinations. Guided through news articles, tourism images in the press, major domestic and international TV channels, the highlight is a video clip promoting Da Nang tourism on BBC World News; promoting the title of the top 10 destinations in 2020 voted by Google, introducing check-in points, other perspectives on Da Nang on the online channel with high traffic Youtube, Tiktok, Twitter, Instagram, page Fanpage and city tourism portal… Thanks to that, tourism activities in the city are gradually restored.

At the end of July 2020, the Covid-19 epidemic broke out again, following the social distancing policy of the 2nd Prime Minister, Da Nang city had to suspend activities such as festivals and religious ceremonies. , sports activities, events; operations of non-essential businesses and services; amusement parks, entertainment, beauty facilities, karaoke, massage, bars, discos, video games, theaters, cinemas, stadiums, training grounds,... So, the Da Nang's tourism businesses have not had time to recover from the 1st outbreak, but have to face and suffer the 2nd wave of Covid-19 epidemic, which makes many businesses located in the city already difficult. difficult even more difficult. The tourism stimulus packages were almost frozen due to the sudden increase in the number of tourists canceling the tour.

Entering 2021, the Da Nang city government has been making efforts to recover the tourism industry after the heavy losses caused by the Covid-19 epidemic in 2020 with many new experience tourism products, organizing many tourism events, and many more. exciting activities and events. Along with that, many large units and businesses in the area such as: Ba Na Hills tourist area also organize the program of the magical winter festival, the program to welcome the new year "New Year's Eve Party" with many activities. experience high-class, novel and attractive cuisine to serve tourists; Art performance program Co Tu Dance "Tung Tung Da Da" is free for visitors of Nui Than Tai Hot Springs Park Tourist Area. However, due to the general context of the whole country, the Covid-19 pandemic broke out again in many provinces and cities across the country, the number of tourists to Vietnam in general and Da Nang city in particular did not achieve the expected results.

According to the report of Da Nang city, in 2020, tourists to Da Nang decreased sharply, the total number of visitors served by accommodation establishments was estimated at 2.67 million, down more than 64% compared to 2019, of which tourists international arrivals is estimated at 703 thousand arrivals, equal to only 24.5% of 2019. Visitors served by travel agencies are also at a record low, especially foreign tours have decreased deeply, Da Nang tourists traveling abroad also For example, international visitors to Da Nang only focus on the first 3 months of the year. Due to travel restrictions, the average number of days of stay of tourists increased higher than in previous years, estimated at 2.47 days/time, of which international visitors are 2.33 days/time and domestic tourists are 2. ,54 days/time (In 2019, this indicator is 2.12, 2.13 and 2.10 days/time, respectively) [3, p. 6-7]. Notably, in the first 3 months of 2021, tourism activities continued to be affected by the COVID-19 epidemic. The number of visitors to accommodation establishments serving the first quarter was estimated at only 610.6 thousand arrivals, down 52.5% over the same period in 2020, of which international visitors were estimated at 48.6 thousand arrivals, down 91. 7% and domestic visitors estimated at 562 thousand arrivals, down 19.3% [4, p. 11].

4. Discussion and Conclusion

The Covid-19 pandemic has caused heavy damage to the tourism economy of the country in general and Da Nang city in particular. In 2020 and early 2021, the number of visitors to Da Nang decreased sharply compared to the same period last year. Along with that, revenue from accommodation, food and travel services also did not reach the plan. Units and businesses operating in the tourism sector were the hardest hit, leading to a halt in other fields.

However, Da Nang city is considered as a place with many potentials and advantages for tourism development. The strategic goal of Da Nang tourism development to 2030 with a vision to 2045 is to build and develop a world-class Da Nang tourism brand, connecting with tourist routes in the region and the region above. biodiversity conservation facilities, promoting the city's natural, cultural and historical heritage values. At the same time, promote the potential and advantages of the sea in tourism and service development; effectively exploiting the potential of sea tourism, creating unique and highly specific marine tourism products and building Da Nang tourism brand to reach the international level [5, p.5]. Therefore, in the near future for Da Nang tourism to recover and develop in the context of the complicated development of the Covid - 19 pandemic, in my opinion, it is necessary to focus on implementing some of the following solutions:

Firstly, in the face of the complicated situation of the Covid-19 pandemic, Da Nang city, on the one hand, need to update and promptly implement the Government's instructions on the prevention of COVID-19 epidemic. 19 to business tourism and people; strengthen the inspection and prevention of epidemics at enterprises and tourist establishments; promote epidemic prevention and control propaganda and well implement the 5K message of the Ministry of Health, on the other hand, must proactively come up with synchronous and powerful solutions to recover and develop post-Covid-19 tourism, such as: Tax exemption and reduction for businesses in the tourism industry or organizing many activities to stimulate demand, build new attractions to attract tourists or promote communication and promotion of Da Nang destinations. Along with that, Da Nang city needs to have a plan to improve the quality of tourism business activities, develop tourism human resources by continuously organizing training classes, fostering skills and professionalism.

Secondly, tourism businesses need to have a plan to adjust their operations, study market needs to have suitable quality tourism products; strengthen alignment to increase resistance and grow strong; linking with airlines, transportation, hotels, restaurants... to build tourism stimulus packages, helping tourism recover quickly after Covid - 19. Coordinate with functional units of Da Nang city step up promotion, publicity and development of new tourism products to attract international tourists, especially tourists from regions not affected by the Covid-19 pandemic.

Third, travel businesses, hotels, restaurants and Da Nang people when participating in tourism activities should pay attention to strengthening safety measures to prevent and control the Covid-19 epidemic according to regulations. government to both ensure the safety of passengers and at the same time protect their own safety.

CHALLENGES FOR THE CHINESE ECONOMY AFTER THE COVID-19 PANDEMIC

Dr. To Hien Tha
tohientha@gmail.com
Military Technical Academy, Hanoi, Vietnam

Abstract

The covid 19 pandemic has had a strong impact on the global economy, including China. The covid -19 pandemic has plunged the Chinese economy into negative growth after nearly 40 years of continuous growth. Although the Chinese government has adopted many economic policies, this country still faces many challenges. This article analyzes and outlines domestic and foreign challenges facing China after the pandemic: the workforce hasn't adequately recovered due to several factors; debt pressure; domestic demand decreased; the resurgence of the pandemic; the shortage of export orders.

Keyword: *Covid-19, China, challenge, economy.*

1. Introduction

January 20th 2020, Beijing confirmed to be dealing with a new strain of coronavirus, in 3 months, the sudden shock from the pandemic Covid-19 reduced 7 points % of the growth of China. The first quarter 2020's GDP reduced by 6.8% compared to the same period's figure of 2019[107] . China's economy has officially experienced negative growth since 1992. Due to the rapid spread of the disease, China has to enact massive lockdown and nation-wide quarantine. Factories in the world's largest manufacturer have continuously been shut down. All economic activities ceased.

Only after announcing the lockdown lift of Wuhan, where the first case of Covid-19 was reported, at the start of April 2020, has China started to revive its economy. However, China's economy still has to face numerous challenges aside from the risk of a second outbreak.

2. Methods

This paper uses an overall and comprehensive approach to collect and summarize the recent studies and reports which are related to this topic. All the data and figures are obtained based on the secondary data provided by some public organizations like Vietnam News Agency; General Statistics Office of Vietnam; The Ministry of Labour - Invalids and Social Affairs, etc.

[107] http://thoibaotaichinhvietnam.vn/pages/quoc-te/2020-04-17/trung-quoc-gdp-giam-68--lan-dau-tang-truong-am-tu-khi-thong- ke-85524.aspx

3. Results

Internal challenge

Although China announced, as of mid-March 2020, more than 90% of businesses with annual revenue larger than 20 million CNY have reopened, except for the province of Hubei (province of China) – the center of the Covid-19 pandemic in China. Meanwhile, the central and local governments in this second-largest economy have announced multiple credit incentives to support businesses restart production. At the same time, China's economy still faces these challenges:

First, the workforce hasn't adequately recovered due to several factors.

According to official data, more than 50 million migrant workers haven't been able to work. Some are still in quarantine. Others are unable to travel from rural areas – where transport services have ceased, or be deemed redundant by the original employers due to the lack of demand from customers and partners alike. Local governments are also under pressure from the effort to contain the spread of the pandemic, which makes them ever so nervous and cautious in allowing people to go back to work. Gaode, a traffic surveillance and online mapping service, estimated on Wednesday 11 of March, only about half the working population in coastal cities went back to work. Office workers are still working from home[108].

Alongside that, owners of big businesses, especially factories which export goods with low-profit margin also fear that if one worker is reported with the disease, the local government will force them to pay for 2 weeks of quarantine expenses for dozens or hundreds of workers. Therefore, requiring workers back to work is still limited.

Second, debt pressure.

China's banking system will face immense pressure from the Covid-19 pandemic. Bad debt will spike if banks are to lend out massive amounts of money to rescue the economy. Household and corporate debt of China has inflated after a decade of growth, mainly the result of financial leverage.

According to the South China Morning Post, analysts warned if the government requested banks to lend out money to industries devastated by coronavirus, bad debt will skyrocket, threatening both the banking system and the economy.

Before the outbreak of coronavirus, China's financial system was already in shambles. According to the Institute of International Finance (IIF), until the The first quarter 2019, gross debt of businesses, households, and government soared to over 303% of GDP figure, equivalent to 40,000 billion USD[109].

---

108 https://zingnews.vn/trung-quoc-noi-lai-san-xuat-doanh-nghiep-gian-lan-de-nhan-tro-cap-post1059213.html

109 https://bizlive.vn/kinh-doanh-quoc-te/bom-no-trung-quoc-40000-ty-usd-va-cac-bong-ma-de-doa-kinh-te-the-gioi-3523166.html

The disease will probably negatively affect businesses and local governments more than it would households. Therefore, Chinese government will be more lenient concerning the debts of local governments. The government will allow localities to borrow more at lower interest rates. As a result, the debt volume will increase in the coming years.

By the end of the Q4/2019, the bad debt balance at commercial banks increased to 2,410 billion yuan (344.2 billion USD), 46.3 billion yuan (6.6 billion USD) higher than the previous quarter, according to the statistics of the China Insurance and Banking Administration. The bad debt ratio at commercial banks is 1.86%, equivalent to the third quarter of 2019[110].

The People's Bank of China has said it will "back up” bad debts affected by the coronavirus. However, coronavirus remains to be a difficult test for the Chinese banking system. In 2019, the Chinese government had to intervene in the operations of three local banks, raising questions about the stability of the banking system in the country of 1.4 billion people. Baoshan Bank was subsequently acquired by the central government, while Jinzhou and Hengfeng Bank are, until now, partly guaranteed by the state and private investors.

Credit rating firm Standard & Poor (S&P) estimates that the NPL ratio in Chinese banks could rise to 6% if the COVID-19 pandemic continues[111]. Up to now, the People's Bank of China has pumped billions of dollars into the financial system to promote lending and reduce the cost of loans. The impact of the Covid -19, will put Chinese companies at risk of default in 2020.

Third, domestic demand decreased.

The increase of domestic demand is expected for Chinese businesses to be able to overcome the pandemic. However, the risk is, many businesses went bankrupt after two months of paralysis, causing the unemployment rate to increase from 5.2 to 6.2%, equivalent to 5 million people losing their jobs[112], not to mention migrant workers who have not returned yet and workers who do not have formal contracts. This has made the domestic demand less bright.

Gavekal Dragonomics consultancy organization, based in Beijing estimates, Covid - 19 will cause losses of about 115 billion cubic wages for migrant workers and the damage is permanent, because workers can not get back the 3 months they lost even if they work harder . This situation caused domestic demand to continue to decline, in the context of the retail industry's revenue decline of 20.5% in the first 2 months of 2020[113].

Although the supply problem can be solved relatively quickly, the recovery of demand is the problem. Even people with no income loss tend to respond by limiting

113 https://tintucnhanhvn.com/trung-quoc-doi-mat-cu-soc-kinh-te-thu-hai-vi-ncov/

spending and increasing savings amid the current pandemic.

According to a survey conduct by *Rong360.com, a* financial *firm,* 64.4% of participants will cut back spending after the pandemic ends and 31.4% of whom confirm that they have no plan to increase spending when the situation is better[114].

Fourth, the resurgence of the pandemic

The reopening of the economy could put China facing the risk of a second outbreak. There are 2 main reasons that lead to this situation, one is China "imports" viruses from abroad; second is the possibility that pathogens have not yet been completely suppressed in communities. Chinese experts warn that the pressure of an economic recovery in fear of a pandemic outbreak will create a distorted economic picture in China.

The fact is that resuming factories in China is not easy. The Covid -19 pandemic is still spreading all over the world, so China could face the risk of a "second wave of infection" when many Chinese return home from abroad.

Besides, China has yet to completely quell the pandemic. Therefore, the risk of a second outbreak of disease is still lurking in China. The Chinese government recognizes that the continuation of economic activities has many risks. Covid-19 is still spreading around the globe, every day, China has dozens of new "imported" cases (Chinese people who get sick from abroad return home). Hong Kong also saw a surge in new "imported" infections. The fact that some businesses open their doors to workers too early makes it difficult for the anti-pandemic campaign. A large titanium factory opened in February and was immediately closed because many workers were infected with the virus.

The Chinese economy rescue plan is based on a series of policies and campaigns to encourage workers to return to work, improve domestic and foreign business confidence and save companies that are slipping to the brink of bankruptcy. However, some local governments and businesses worry that they will be severely punished by the government if the disease spreads. They, therefore, have chosen to delay the continuation of production.

External challenges

First, the shortage of export orders:

After more than 2 months, all economic activities, production has mostly stalled, many Chinese businesses are preparing to face the second economic shock of the Covid - 19 pandemic, which originated from outside the country. This time it was not due to the lack of raw materials for production, but the sharp decline in demand for goods from international buyers. In the context of several countries with rapid outbreaks, global financial markets plummeting, consumers and businesses since the uncertainty the future holds, leading to a halt of global demand for Chinese goods.

[114] https://kinhdoanhvaphattrien.vn/hau-dich-covid-19-cu-soc-kinh-te-thu-hai-doi-voi-bac-kinh-co-hinh-thu-the-nao.html

So far, China has partially recovered its supply chain after more than 2 months of lockdown, but now the Covid -19 pandemic has exploded globally, Europe, America, and Africa, all experienced a medical crisis. The impact of the Covid -19 pandemic on the global economy has caused the world demand to drop significantly. This has a direct impact on the export of China.

The state of the shutdown to prevent the spread of the pandemic of many countries in the world has made it difficult for the export segment, which accounts for 20% of China's GDP. China Customs data has just released show that exports of this country decreased by 17.2% in January and February 2020, compared to the same period last year[115]. This is the strongest decline since February 2019. Many Chinese factories are running at nearly full capacity for foreign demand, but goods remain to be undesirable.

Currently, all of China's top four markets, the European Union (EU), the US, Southeast Asia and Japan are facing difficulties due to the COVID-19 pandemic, which limits orders from China. National. Therefore, the government cutting taxes, or subsidies, will not help if companies do not receive orders. The situation will only really improve once the pandemic is under control around the world.

Second, the risk of threatening China's global economic position

To date, the pandemic has infected more than 3 million people and more than 200,000 deaths globally. The world's wave of anger over the Chinese government's treatment of the pandemic is putting pressure on and threatening China's global economic position.

US President Donald Trump on April 27 said he could ask China to pay damages because of Covid -19. Meanwhile, British and German officials also want China to clarify information about COVID-19.

Whether or not China can maintain its position in the global economy or be isolated, will be one of the most important questions for China, after the pandemic is under control. There are many indications that Covid -19 has led the world to be less friendly with China. This affects the international environment that has helped China grow at an impressive rate in recent years.

One of the biggest pressures the Chinese government faces is that the global value chain is rapidly changing, which could affect the job market in China in the short term and undermine its long-term role. The country's term in the global economy.

Covid -19 is an opportunity for the West to reconsider its supply chain and global production chains, restructuring the world trade order, in which China is no longer the *center* of the world trade network.

Three leading economies in the world, the US, Japan and the European Union (EU) recently planned to encourage companies to relocate production out of China. Companies have been changing their supply chains before, due to rising costs and the impact of the US-

[115] http://tapchitaichinh.vn/tai-chinh-quoc-te/kinh-te-trung-quoc-kho-co-kha-nang-phuc-hoi-hinh-chu-v-321632.html

China trade war. However, Covid -19 is causing countries to accelerate the process. Although this is not an immediate threat to China, the pandemic itself can cause serious challenges in the long term.

Besides, Covid-19 also exposes the world's dependence on Chinese goods, especially on necessary medical equipment. The lack of personal protective equipment (PPE) also makes many people regret the lack of production in developed countries.

Three years ago, when the newly elected president of the United States, Mr. Donald Trump had a definitive view of reducing the level of economic dependence on China.

Continental Europe has demanded Beijing to rebalance bilateral economic relations. The Covid -19 pandemic further strengthened that stance. The most recent is Japan: not as brash as US President Donald Trump, but since March 2020, Prime Minister Shinzo Abe has continuously "*encouraged Japanese business people to think about restructuring their investments in foreign countries, the destination could be countries in Southeast Asia ".* South Korean car group Hyundai has a plan to divert investment from China to India[116].

President of China Xi Jinping announced that maintaining a stable supply chain and value chain is one of the six priorities throughout the pandemic, and China should be prepared to deal with external changes. This announcement shows the determination of China in maintaining its position in the global economy.

Efforts to revive the economy

After loosening restrictions across the country, China entered a period of economic recovery facing both domestic and foreign challenges. The Chinese government has made efforts to restart the economy through macroeconomic policies, especially fiscal and monetary policy.

Regarding fiscal policy: The Chinese Government has implemented the following solutions:

First, reduce taxes and lower taxes and fees for businesses. China has launched a series of bailout packages such as tax reduction and the exemption for businesses. In 2019, China reduced taxes and fees by more than 2,300 billion yuan and by 2020, China will continue to reduce its large scale by over 1,000 billion yuan[117]. The reduction is mainly aimed at local businesses.

Second, to expand the budget and increase government spending. The Chinese government continues to promote the role of fiscal policy, by expanding capital investment through the issuance of special bonds of local authorities for large infrastructure projects.

The People's Bank of China (PBOC) has released data showing that the total value of bonds issued in China reached 5,300 billion yuan (about 748.6 billion USD) in

[116] https://bnews.vn/trung-quoc-kho-khan-phuc-hoi-kinh-te-giai-doan-hau-covid-19/155138.html
[117] Vietnam News Agency: "China Economic Prospects", Special Reference, February 24, 2020

March 2020. The value of government bonds reached 370 billion yuan, while the value of bonds issued by local governments was 387.5 billion yuan. By the end of March 2020, the size of China's bond market was 103 trillion yuan. China has stepped up the issuance of municipal bonds this year to support projects aimed to minimize the impact of the Covid - 19 pandemic. As of the end of March 2020, the debit balance of local governments stood at 22,500 billion yuan[118] .

Alongside the increase in the effectiveness of government investments, promoting the activeness of private investment, accelerating the construction of important projects. Concentrate funding on vulnerable businesses, however selectively rather than in discriminatorily.

Third, financial support to rescue the aviation industry. The Chinese government injected billions of dollars into the aviation industry, allowing some state-owned airlines to acquire smaller airlines that have suffered heavy losses as a result of the plunges in the need for transportation services, consider debt waivers and offer more favorable aircraft rental terms. The government provides financial subsidies to airlines, along with assistance packages for international services, waives the responsibility to pay aviation development funds, airport and air traffic control fees for airlines[119].

For monetary policy:

Over the past four months, the People's Bank of China has made efforts to implement a series of stimulus measures to "prop up" the economy, increasing support for businesses and individuals affected by the pandemic. Such measures include:

First, cut interest rates on MLF and LPR loans

The first cuts were made when China was at the focal point of the Covid - 19 pandemic. On February 17, PBOC announced to lower the interest rate by 10 basis points on about 200 billion yuan (28.65 billion USD) worth of 1-year medium-term loans (MLF), or from 3.25. % previously down to 3.15%. Following that, the 1-year basic lending rate (LPR) was lowered from 4.15% to 4.05% / year, the 5-year term rate was set at 4.75%, down from 4.8% / year.

On April 15, PBOC continued to cut the 1-year MLF rate, from 3.15% to 2.95% - the lowest level since this liquidity tool was introduced in September 2014. The PBOC's lowering of the interest rates helped push 100 billion yuan ($ 14.19 billion) into the financial market. As of April 20, PBOC continued to cut 20 basis points of 1-year LPR interest rate to 3.85% / year from 4.05% / year earlier, while LPR for 5-year term has cutting more modestly with 10 basis points from 4.75% / year to 4.65% / year[120] .

[120] https://ndh.vn/quoc-te/trung-quoc-tiep-tuc-giam-lai-suat-cho-vay-trung-han-xuong-thap-ky-luc-1266855.html

Second, the injection of over 300 billion yuan through repurchase agreement (Repo)

Monday 17/2, the PBOC also injected 100 billion N pleased yuan (about 14.33 billion US dollars) into the financial system through the agreement to sell and buy back shares (repo) due in 7 days with an interest rate 2,4%. Two weeks earlier, on February 3, PBOC reduced the interest rate by 0.1% on the 7-day and 14-day repurchase contracts, thereby pumping about 170 billion USD into the financial system.

As of March 30, PBOC continued to lower the 7-day reverse repo rate again, from 2.4% to 2.2%, to ease the pressure on the already damaged economy. heavily caused by the Covid-19 pandemic. This is the third time reverse repo interest rate has been cut since November 2019 and the strongest drop in nearly 5 years. Through this tool, PBOC has injected 50 billion yuan (7 billion USD) into the banking system[121].

Third, reduce the required reserve ratio

Since the beginning of 2020, PBOC has cut the required reserve ratio (RRR) 3 times to intervene in the economy. First, on January 6, PBOC lowered the RRR rate for commercial banks by 50 basis points (from 13% for large banks and 11% for smaller lenders applied previously) to reduce lending rates for businesses. This action by PBOC also means pumping into the financial system about 800 billion yuan (115 billion USD).

On March 16, the PBOC proceeded to reduce the RRR rate for eligible banks for the second time. The action will liquidate 550 billion yuan ($ 78.57 billion) from long-term reserves. This cut is aimed at comprehensive financial solutions, and banks that meet certain standards can get a discount of 50-100 bps.

By April 3, PBOC once again reduced the RRR rate for small and medium banks, thereby continuing to clear about 400 billion yuan ($ 56.38 billion) to help support the economy. domestic. Specifically, the PBOC will reduce the RRR rate by 100 basis points in two stages. Accordingly, the first reduction of 50 bps will take effect from April 15 and the next reduction of 50 bps will be effective from May 15. Also, according to the PBOC, interest rates on excess reserves of Chinese banks will decrease from 0.72% to 0.35% and take effect from April 7[122].

Fourth, extending debts: The Chinese banking system has also extended debts worth nearly 3.34 trillion yuan ($ 477 billion) in January 2020, equivalent to total outstanding loans. Chinese bank credit in 2007. Money supply increased by 8.4%, exceeding 202 trillion Yuan, about 28.9 trillion USD (January 2020) - the highest level in history, nearly twice the size of the Chinese economy[123].

Finally, loosen some regulations on bad debt rating standards: China is also taking

[122] https://cafef.vn/nhtw-trung-quoc-da-lam-nhung-gi-de-cuu-nen-kinh-te-khoi-bong-den-covid-19-20200421142938487.chn

[123] http://www.vnba.org.vn/index.php?option=com_k2&view=item&id=13543:ngan-hang-trung-quoc-manh-tay-bom-tien-cuu-kinh-te-trong-dai-dich&Itemid=253&lang=vi

unprecedented measures to avoid bad debts such as extending the due date of loans to companies at risk of late payments and loosening regulations on delinquent debt classification. This measure is expected to help both banks and borrowers “breathing room”. However, it is likely to increase the level of risk for banks in the long term.

The latest S&P Global report estimated that the current pandemic could cause the bad debt ratio of the Chinese banking system to triple to about 6.3%, equivalent to an increase of about 5,600 billion people. bad. S&P Global also said that "suspicious" debts in this country could peak at 11.5% of the total debt after the pandemic ends[124].

All the actions shown above indicate that the Chinese Government is making great efforts to restart the economy. However, analysts said that it may take several months for the economy to be able to return to pre-crisis levels, particularly economic recession worldwide will increasingly put pressure on efforts to revive the economy of China. As conditions for reemployment remain weak and commodity exports are constrained, it is predicted that the PBOC will continue to take more measures to boost the economy.

4. Discussion and Conclusion

Thus, it can be said that the measures taken from the beginning of February have helped to stabilize the Chinese economy. Despite disappointing The first quarter 2020’s GDP statistics, China's economic activity showed signs of recovery in March 2020. For example, growth in industrial production, fixed-asset investment and retail sales has increased and currently at -1.1%, -9.4% and -15.8%, respectively, from -13.5%, -24.5%, and -20.5% low between January and February 2020[125]. In addition, 99% of businesses have resumed work, while 84% of small and midsize businesses have reopened[126].

The continuation of businesses and the return of workers to work in March 2020 has helped to partially reverse the decline in manufacturing activities, investment and consumption spending in the first two months of 2020. Even so, it is still too early to see the March growth data as evidence for China's economic recovery, because a series of uncertainties are still waiting ahead. Meanwhile, fears of a Covid -19 outbreak in China have prompted many economists to predict that China will experience a period of difficult and slow recovery, before the economy is in full swing. can grow strongly again.

According to the International Monetary Fund (IMF), China will maintain its growth rate of 1.2% in 2020[127], while the world will experience a worse recession than the Great Recession of 2008. With this pessimistic outlook, China is unlikely to achieve the ambitious goal that the Chinese regime set out this year, which is double the figure compared to 2010.

In the following period, challenges for the world's second largest economy are yet to

be over. The Covid -19 pandemic is accumulating many risks and disadvantages from China's geopolitical environment. A pandemic crisis is unlikely to end in a year or two. The impact of the pandemic will last much longer than the impact of the global financial crisis in 2008. The world trade picture and the global value chain will be impacted hard for many years to come. The geopolitical environment of China will increasingly deteriorate, and would be a great political challenge for China.

IMPACT OF COVID-19 ON CHILDLABOUR: INTERNATIONAL CONTEXT AND ISSUES FOR VIET NAM

Truong Thi Tam

truongtam1202@gmail.com

Social Work Faculty, Vietnam Trade Union University, Vietnam

Abstract

Child labour is a global issue, taking place mainly in poor and developing countries when socio-economic conditions are limited. There are various causes of this situation and one of them is the consequences of poverty, the level of access and quality of education, the lack of parental care, public awareness and the support efficiency of the social security system ... This situation not only affects the quality of labor resources, hinders the development of many aspects of society, but also a strategic issue, requiring countries to commit to solving when participating in world economic integration. In recent years, countries have shown great efforts to improve the situation, estimating that the number of child labour globally has decreased from 246 million children to 152 million in the 2000s. However, in the current context, with the existing impact from the Covid-19 pandemic, the above achievements are shaken. Covid-19 has devastated the global economy, affecting the livelihoods of many households, especially poor families in least developed countries, and increasing the risk of children becoming child labour. This article explores the impact of Covid-19 on child labour and the challenges of this problem in some countries around the world. From there, this article will discuss and point out strategic issues in the prevention and settlement of child labour from the approach of social policy and social work in Vietnam.

Keywords: *Child labour, Covid-19, Social Policy, Social Work*

1. Introduction

The concept of "child labour" means children participating in labor in accordance with the law and labor activities that hinder or negatively affect the development of their physical, intellectual, personality and comprehensive development. Is a case of child labour considered based on three factors: (1) Does the nature of the work the child participate in have a negative effect on the physical, mental and moral development of the child? (2) Are working conditions heavy, toxic and dangerous? (3) Is the working time suitable for the age prescribed by law?

Between 2008 and 2012, globally, the recruitment of child labour among the ages of 5 to 14 decreased by 2.7% (about 32 million); and the 15-17 year old group decreased by 2% (9 million). This reduction is available in both sexes, but the declining rate for boys is faster than for girls [6]. According to the International Labour Organization (ILO)'s "World

Report on Child Labour (2015)" report, there are 168 million child laborers in the world [9], in which the Sub-Saharan Africa has the highest rate of child labour (with 28% of children aged 5-14), then to the Middle East and North Africa; East Asia and the Pacific (each with a rate of 10%), Latin America and the Caribbean (9%) [28]. Nearly half of all disadvantaged child labour (about 73 million children) are doing jobs that directly endanger their health, safety and mental development. The main areas focusing on child labour were agriculture (70.9%), services (17.1%) and worked in the industry (11.9%) [10]. In some countries such as India, Nepal, China, Philippines, Pakistan etc., the situation of child labour is still quite complicated. In particular, with the strong impact from the Covid-19 pandemic to the world currently, the disadvantaged groups in society including child labour will be directly affected and face many risks. This creates many new challenges for countries and regions in developing and implementing intervention strategies and programs to address child labour in the new context.

Vietnam is one of the countries that still has child labour. With the efforts of the government and the support of international organizations such as the ILO, UNICEF etc. the number of child labour has decreased from 1.75 million (in 2012) accounting for 9.6% of the population of children aged 5-17 to 1.03 million (in 2018) accounting for 5.4% of the population of children aged 5-17 [12,13]. However, in many countries, the impact of covid-19 is placing new difficulties and challenges with the increased risk of child labour in Vietnam's non-official economic sectors, especially among poor families who have lost their livelihoods due to the epidemic. By overview approach to understanding the effects of Covid-19 with the child labour situation in some countries, the article proposes recommendations for developing and implementing solutions in prevention and intervention to address this issue in the new context from the approach to policy and social work activities.

2. Method

Find out how changes in the socio-economic context under the impact of Covid-19 are affecting the lives of young workers to recommend solutions that are appropriate to the new context to intervene to address this issue is the purpose throughout the documents mentioned. There are many different approaches to achieve that goal. As the Covid-19 epidemic spreads, children are vulnerable to neglect due to lower mortality rates, one study has reported a mortality rate of 0.03 per 100000 deaths among children aged 0–9 years [3]. Some child welfare organisations have warned that the various lockdown measures will lead to more cases of child sexual, physical and emotional abuse and neglect [4]. Ugandan Health Ministry figures show that there has been a significant increase in child abuse rates in various forms across Uganda during the blockade due to Covid-19 [23]. The number of calls to the Uganda Children's Help Hotline (UCHL) to ask for help has increased 13-fold since before the Outbreak of Covid-19 [14]. On the other hand, considering the impact of Covid-19 on child labor is placed in the context of the seasonal migration of their parents. The closure of workplaces and the risk of Covid-19 have directly affected the livelihoods of seasonal migrant working families in Nepal. Coupled with the disruption in access to education has increased the risk of children participating in child labour in both groups: children emigrating with their families or children left behind for care relatives in their home country [1]. In addition, considering the impact of previous crises on child labour such as the Ebola epidemic in Africa and the global HIV/AIDS epidemic and the August 2007 global financial crisis also provides corroborating evidence for understanding the assumptions about the possible effects of Covid-19 on child labour in the current context [23]. The increased risk of child labour was also found when considering the impact of Covid-19 on the lives of poor families, the effects that children in poor families face such as nutritional needs are reduced, inability to respond to changes in learning methods when schools are closed, access to social security systems is interrupted etc. found to be one of the main effects of many children being over-engaged [11].

By overview and analysis of the sub-document including academic articles in specialized journals synthesized by the search engine on the website: https://scholar.google.com, https://www.sciencedirect.com with the search keywords "*impact of covid-19, child labour, social work*"; academic articles at the international scientific conferenceon Social Work with Child Labour (ISBN: 978-604-65-3274-3, 2018); press release, project documents etc. posted on the ILO website in the "*Child labour"* directory; ILO, UNICEF, survey and research reports... and relevant agencies and organizations about child labour, this article aims to contribute to highlighting the impacts of the Covid-19 pandemic on the situation of child labor in the world. From there, it raises policy issues and social work activities in preventing and solving this problem in Vietnam.

3. Results

3.1. Covid-19 increases the risk of child labour

Human Rights Watch (HRW, 2020) warns that the global economic downturn caused by the COVID-19 crisis will likely increase child labour and child marriage rates. "Research has found that child labour has a lot to do with the financial shocks that families experience, such as illness, disability or loss of parental employment. Many families don't have the credit or savings to withstand financial failures, including loss of income and without adequate government support, their children may be at higher risk of joining the workforce to help their families survive". De Hoop and Edmonds (2020) emphasizes that: "child labour will be an important coping mechanism for poor households experiencing COVID-related shocks" [5]. According to the International Labour Organization (ILO), global child labour has steadily declined over the past two decades, but the COVID-19 pandemic threatens to reverse this trend. There are up to 60 million people are expected to fall into poverty this year, and that certainly motivates families to send children to work. A joint report by the ILO and the United Nations Children's Fund estimated that as the poverty rate rises by 1%, child labour will increase by at least 0.7% [15,25].

- *The number of child labourers* at increased risk due to parental death or treatment, the reason for COVID-19 can force children to become main workforce that generates income for families, especially in poor families [8].

- *Child labour is at greater risk of abuse and exploitation*: in the effect of the Covid-

19 pandemic, the demand for personal protective equipment (PPE) increases, medical equipment manufacturers put pressure on progress for their factories located in countries such as China, India, Malaysia etc. increases the risk of using child labour in countries considered to be the world's factories because the labor costs of child labour are always much lower than that of adult workers. Meanwhile, regulations on the sale and purchase of these products from suppliers suspected of forced labor were also relaxed due to urgent demands from the market. The situation is similar in agriculture, the agricultural processing industry and the garment industry. An apparel exporter in India explained the pressures on the industry that could lead to an increase in the use of child labor as follows: when work has fallen, contractors can accept orders at a lower cost, and this will require them to use cheaper labor, especially child labour [8]. For agriculture, social distancing causes households to fall into temporary agricultural labor shortages, so they can use their own children as alternative workers. In fact, children in rural areas will have to work more time in fields, plantations ... with the nature of work is also harder, more toxic than usual.

- *The closure of schools increases the risk of child labour and marriage among girls*: It is clear that in addition to the functions of cultural education for children, it also plays a very important role when keeping children at school and reducing the risks of labor and early marriage in children. However, when going to school was disrupted due to Covid-19 along with reducing families' incomes pushing poor families to look for ways to survive, they were forced to let children become low-cost workers or for girls to marry early [8,23]. In India, while the Covid-19 pandemic forced children out of school, many children secretly moved to farms and factories to work, exacerbating the problem of child labour in the country [15,24,27]. The situation is similar in Uganda, with many parents losing their incomes, unable to feed their families and being pushed into extreme poverty, leaving children in these families engaged in dangerous work to support their families. According to the Save the Children survey: 56% of respondents thought there had been an increase in child labour since the start of the lockdown [26]. In many parts of Uganda, children have been seen selling food items, alcohol, firewood on the streets or working in gold mines andgrazing livestock... since the blockade began [14,26]. On the other hand, due to the impact of the epidemic, schools turn to online learning, but not all families are equipped with modern equipment suitable for children's distance learning, this leads to disruptions in access to education or affects the quality of learning and learning. This situation is common in many countries such as India, Nepal, Ghana, Bangladesh etc. [1,8,11].

- *Child labour faces a high risk of infection:* For various reasons such as un-protective working environment, lack of protective equipment or disease prevention etc. make child labour work in service areas, small manufacturing households, especially street child labour at increased risk for Covid-19 infection. In Ghana, many children from low-income families have to make a living raising themselves and even raising their whole family, by working on the streets. More than 90,000 children are reported to be working on Ghana streets and are involved in various jobs such as cleaning glasses, begging or porters [11]. With the harsh economic reality caused by the COVID-19 pandemic, many children have been forced to take to the streets to work, despite the risks of infection from the epidemic. In India, when the epidemic spread quickly and a blockade was issued, while people were asked to go home, around tens of thousands of street child workers had nowhere to go. This puts them at risk of arrest, fines or even imprisonment for violating social control orders [8].

- *Programs and activities to prevent and intervene with child labor are interrupted*: with the requirements set out from the blockade and social distancing to control the spread of the epidemic, the intervention activities to solve this problem of agencies and social organizations are suspended, especially with activities organized based on the community or direct mass media activities [8,11,15,23]. In addition, the impact of Covid-19 has a significant impact on the economic development of countries, putting more pressure on the state budget on social security. In the new context, many countries must rebalance the priority of disbursement for urgent programs in disease prevention such as vaccine purchasing, expense for the health system etc. also significantly affects the allocation of budgets for action programs to address child labour. In Uganda, during the blockade because of the pandemic of social workers on the front lines of the government - those worked with monitoring cases of abuse, violence, and exploitation of children were classified as non-essential workers. On the other hand, when schools are closed, social workers in schools also have their support and supervision work interrupted with children who are at risk of becoming child labour. This fact makes it even more difficult to check, early detection of acts of abuse and exploitation of child labour [23].

3.2. Recommendations for the prevention and settlement of child labour in the context of Covid-19

- Strengthen case management at the facility in monitoring and early detection of cases of child labor through reports of violations from people in the community through support hotlines. Develop a social security information management system to capture information on child protection and the implementation of social security systems for subjects, strengthening the provision of inter-linked social services in different fields (e.g., social protection, child protection, education, health etc.) through a software system managed by the Ministry of Labor, Invalids and Social Affairs.

- Enhance indirect forms of communication through social platforms such as Fanpage, voice message, website, youtube etc. At the same time, to ensure the effective use of social media platforms, the government needs to stop taxes or reduce taxes on telecommunications companies, social media platforms with effective content.

- It is necessary to properly recognize the position, role and importance of social workers in the early supervision, detection and management of cases for child labor at the establishment.

- Focusing on the coordination of stakeholders in the prevention and solving of child labor issues such as: social invalids, police, health, schools, child care protection officers, social workers...

- Develop child-friendly health services by strengthening equipment, improving professional capacity for junior health centers.

- Improve access to water, sanitation and housing services for children, especially girls.

- Provide financial and social support to disadvantaged families with activities such as loans, technical assistance, tax exemption, strengthening support packages for unemployed workers, extending bank loans, encouraging young parents to join peer support groups...

4. Discussions and Conclusions

The impact of Covid-19 has placed many new challenges in terms of the risk of increasing the number and complex and dangerous developments of child labour, which has become the effectiveness of activities and programs to prevent and tackle child labour in many countries around the world. This fact requires governments to take immediate action, further expressing their efforts in the prevention and repelling of the Covid-19 pandemic. At the same time, it is also necessary to continue to effectively implement strategies on the eradicating of child labour in the global supply chain. In order to do so, it is necessary to build, design and implement intervention solutions on child labour in the coming time, requiring flexible integration, in line with new requirements from practice.

In Vietnam, the situation of child labour in the 1980s has improved significantly. With the remaining **1.03** million child labour numbers (2018), which **519,805** have been identified as being in hard work, toxic, dangerous (accounting for 2.7% of the total number of children aged 5-17, accounting for nearly 50.4%of the total child labour) and the common challenges that are pose in the context of the Covid-19 epidemic are creating many difficulties for the government and stakeholders is solving this problem [13]. From the recommendations drawn in addressing child labour in some countries in the context of the Covid-19 epidemic, in near future, the prevention and reduction of child labour in Vietmam should pay attention to some of the following contents:

- *From a policy and legal perspective:* It is necessary to continue researching, formulating, amending and finalizing the relevant legal framework on child labour; to define and give a unified concept of child labor in legal documents, to finalize process, procedures and guidance in the Inspection Law on the organization of child labour inspection and supervision in non-official economic areas; to change and raise the punishment level for cases of violations of child labour; To research and put solutions in to practice for control and trace ability of exported products to avoid the use of child labor in the supply chain; Formulating, finalizing and proceeding to seek opinions to promulgate the Law on Social Work Practice as a legal basis for the professional activities of social workers *in Vietnam.*

- *From the social work activities perspective*: Child protection is one of the top priority areas and tasks of Social Work, especially for disadvantaged children such as child labour. With four basic functions: prevention, therapy, recovery and development, Social Work focuses on two main groups of activities including: (1) Activities of prevention of child labour and (2) Activities of intervention and support for child labour. In the new context, social work activities should also focus on adjustments to the COVID-19 epidemic situation.

+ With activities to prevent child labour: Social work should continue to focus on activities such as communication to raise awareness for children, especially the group of children participating in economic activities - high-risk subjects become child labor with knowledge about children's rights, the provisions of the law on child labour, the consequences of child labour ...; Raise awareness of the families of children and communities about the provisions of law and the responsibilities of families and communities in preventing and abolishing child labor; Inform enterprises and employers about regulations prohibiting the use of child labor in the production supply chain, regulations on child labor in the commitments of free trade agreements (CPTPP, EVFTA). It is necessary to help employers recognize the responsibility of the business in this regard, because no one can replace the business in overseeing the entire production process, subcontractors and its entire supply chain. Estimating the requirements set out from social distancing to control the epidemic, media and forms of communication also need to add and choose new forms based on social platforms such as fanpage, voice messages, website, youtube etc. Combining the broad spectrum goal by mass media with in-depth communication according to the group model, the club with the choice of media content suitable for each group of audiences. Continue to maintain support activities of social work in schools on education and development of life skills for disadvantaged children and children participating in economic activities; Motivate resources to provide, equip minimal techniques, or promote online education through television, radio... to maintain distance learning for children who do not qualify in the event of school closures. Promoting networking activities, supporting the improvement of livelihood conditions for poor families and disadvantaged families with loan support, production technical assistance, tax exemption, strengthening of support packages for unemployed workers, extension of bank loans, emergency subsidies in cash or in-use.

+ With the activities of intervention and support for child labor: Implementing the expansion of statistics, listing and importing data into the child management system at risk of becoming child and child labor who have been child labor in the areas in order to serve the case management; Develop, complete and train leading social workers on emergency intervention procedures for child labour in need; Building monitoring system, providing information, shelter addresses etc. in the community in supporting early detection and intervention with child labour; Promoting the provision of intensive social work services with child labour (medical care; counseling/psychological counseling, alternative care for cases where it is necessary to ensure safety, temporary isolation from risk factors for injury to children; protection, legal assistance to protect the legitimate rights of children before related parties; to provide repatriated support in case of wandering child labor for a living, being herded or trafficked; support community integration for child labour after intervention etc.) in the direction of bringing these services closer to the community, not merely those provided framed at social work centers and social protection centers. In the context of the epidemic, it is necessary to promote the strengths of indirect interventions such as the operation of the child protection hotline (111), providing counseling services, psychological counseling over the phone, carrying out monitoring and case management through capturing information from online platforms etc. In addition, itis necessary to strengthen the development of the social work network in the hospital and focus on coordinating with stakeholders in the process of operation. At the same time, it is necessary to strengthen the activities of training and developing human resources in social work, regularly training and improving professional capacity for social workers at the base of in-depth knowledge and topics on skills and working processes with child labour.

Preventing and addressing child labour in the context of covid-19 is solving many new challenges for governments in many countries including Vietnam. Maintaining and adjusting interventions in accordance with new conditions is a task set for state management agencies to achieve dual objectives while ensuring epidemic prevention and control, socio-economic development and significant control of risks and consequences from the epidemic. In the current context, it should be recognized that: preventing and reducing child labour no longer stops at the issue of child protection, it is also a strategic issue of national economic development in the context of integration, increasing pressure on the health system in the context of the epidemic when the risk of covid-19 infection of child labour increases and is a global social problem that hinders the implementation of progress, fairness and social development. The synchronized and sustainable solutions with the cooperation of many relevant departments, branches and social organizations are considered the most effective strategies to solve this problem in the current context.
