EFFECTS OF TREND INFLATION ON MONETARY POLICY AND FISCAL POLICY SHOCKS IN VIETNAM

Dr. Le Thanh Ha

Email: lethanha@neu.edu.vn[1]

Faculty of Economics, National Economics University, Hanoi, Vietnam

Abstract

This paper analyzes variations in effects of monetary and fiscal shocks on responses of macroeconomic variables, determinacy region, and welfare costs due to changes in trend inflation by expanding the New-Keynesian model of Ha et al. (2020). We consider that while the central banks can employ either nominal interest rate (IR rule) or money supply (MS rule) to conduct monetary policies, they also use their budgets for capital and recurrent spending to conduct fiscal policies. By using Simulated Method of Moment for parameter estimation, we characterize Vietnam's economy during 1996Q1-2015Q1. The results report that consequences of monetary policy and fiscal policy shocks become more serious if there is a rise in trend inflation. Furthermore, the money supply might not be an effective instrument and using the government budget for recurrent spending produces severe consequences in the high-trend-inflation economy.

Keywords: *Trend inflation, determinacy region, capital and recurrent spending, Vietnam.*

1. Introduction

Lessons from previous crises have shown three weaknesses in policy implementations of the State Bank of Vietnam (SBV). First, SBV has always pursued the objective of stabilizing currency value, curbing inflation, and contributing to the economic development, which was too widely-targeted and lack of specification. Second, the policy implementation in Vietnam, which was a combination of the monetary and fiscal policies has still been inappropriate in the sense that it was used excessively, thus it reacted and became policy shocks. Third, the SBV lacked a commitment to consistently pursue a fixed inflation target. Table 1 reports these facts. Following Ha et al. (2020a), we also document the evidence of time-varying trend inflation in Vietnam during 1996-2015 period as in Figure 1. Therefore, the Vietnamese economy was simultaneously buffeted by inefficient implementations of monetary and fiscal policies as well as time-varying trend inflation.

Previous papers have exploited various aspects of trend inflation. For example, changes in transmission mechanism of monetary policy and the dynamics of the economy in response to the shocks due to trend inflation are examined by Ascari and Sbordone (2014).

Moreover, Kiley (2007), Ascari and Ropele (2009) and Coibion and Gorodnichenko (2011) have examined the relationship between trend inflation and the model's determinacy. Welfare analysis of trend inflation has also attracted attentions of many scholars such as Nakata (2014), Ascari et al. (2018) and Ha et al. (2019, 2020a, 2020b). These studies have emphasized the importance and necessity of research pertaining trend inflation.

Although previous works have investigated various aspects of trend inflation, there still exist gaps in the literature. First, the papers examining effects of trend inflation on the dynamics of the economy to the policy shocks, especially fiscal policies are very scarce. Regarding monetary policy shocks, the prior scholars mostly concentrate on the case that the central banks employ the nominal interest rate as an important instrument, while they have abstracted a comparison the efficiency in using the different tools in the economy with time-varying trend inflation. This analysis can provide the central bank with a guideline to improve the efficiency if there is a rise in trend inflation. Second, the impacts of trend inflation on consequences of ineffectively using the national budget for different purposes such as capital investment or recurrent spending have not been exploited. Furthermore, there has been a paucity of evidence about an association between trend inflation and policy shocks in developing countries.

In this paper, we expect that trend inflation causes consequences of monetary and fiscal policy shocks to be more severe. The reasons are as follows. First, the relationship between trend inflation and structural shocks has been investigated thus far. For example, the transmission mechanism of monetary policy and the dynamics of the economy in response to the monetary shocks are altered by trend inflation (Ascari and Sbordone, 2014). Variations in the parameters of the log-linearized model explain for these alternations. Ascari and Sbordone (2014) demonstrate that responses of macroeconomy to monetary policy shocks are affected by trend inflation since it reduces the slope of New Keynesian Phillip curve. The similar evidence on effects of trend inflation on marginal efficiency of investment (MEI) shocks or monetary policy uncertainty shocks are also provided by Ascari et al. (2018) and Ha et al. (2020b), respectively. Second, Ascari and Sbordone (2014) and Ha et al. (2020a) provide empirical evidence that changes in trend inflation are associated with the ability of the monetary authority to guarantee a determinacy region and macroeconomic stability. However, this paper only concentrates on the interest rate rule while the change in determinacy regions when the monetary authority uses the money supply instrument have not been argued so far. In this paper, we follow Woodford (2003) to prove that the determinacy region that is derived from the Taylor principle when the central banks adopt the money supply rule narrow when trend inflation is higher[2]. Third, the literature has also provided empirical evidence that trend inflation influences welfare costs of shocks (Nakata,

[2] Let see the details in Section 5.2.

2014; Ha et al., 2019, 2020a) and volatility shocks (Ha et al., 2020b). However, the previous scholars have not paid enough attention to the effects of trend inflation on welfare costs of policy shocks.

We, therefore, attempt to fill these gaps in the literature by expanding the model of Ha et al. (2020a) in two dimensions. First, we consider that monetary authorities conduct the monetary policies by using two instruments: the nominal interest rate (IR rule, henceforth) and money supply (MS rule, henceforth). Second, we assume that the SBV uses its budget for capital and recurrent spending. This study employs Simulated Method of Moment (SMM) for the quarterly data in Vietnam during the 1996Q1-2015Q4 period to characterizes Vietnamese economy. This paper aims at investigating influences of trend inflation on policy implementations in Vietnam. To obtain this goal, we concentrate on analysing how trend inflation causes variations in impacts of monetary and fiscal shocks in term of responses of macroeconomic variables, determinacy region, and welfare costs. This study, therefore, provide a multi-dimension analysis on this issue.

With these expansions, we provide empirical evidence to support the view that trend inflation is associated with consequences of policy shocks in Vietnam. In particular, impacts of monetary and fiscal shocks on responses of macroeconomic variables, determinacy region, and welfare costs are signified if there is a proposal to raise trend inflation. In other words, consequences of ineffectively implementing policies are more serious if there is a rise in trend inflation. We also document the fact that the money supply might not be an effective instrument and using government budget for recurrent spending produces severe consequences if trend inflation is higher.

The rest of this paper is organized as follows. The discussion over related papers is presented in Section 2. The extended model will be discussed in Section 3 while Section 4 explains how to measure welfare costs. Section 5 shows the estimated parameters and main results and some conclusions are provided in Section 6.

2. Method

We develop the model that consists of four classes of agents: the household indexed by $j \in [0,1]$, the final-goods producing firms, a continuum of intermediate-goods producing firms indexed by $i \in [0,1]$, and the authority.

2.1. The Household

In the model, we assume that given a budget constraint, households determine the level of consumption (C_t) and working hours (H_t) to maximize their expected discounted present value of future period utility. Their period utility function can be expressed as follows:

$$\sum_{t=0}^{\infty} \beta^t (\ln(C_t - \gamma C_{t-1}) - \frac{\omega}{1+\upsilon} H_t^{1+\upsilon}), \tag{1}$$

where β and γ denotes the discount factor and the habit formation parameter, which are restricted as $0 < \beta < 1, 0 \leq \gamma < 1$. υ is the inverse Frisch elasticity of labor supply. The flow budget constraint is given as:

$$P_t C_t + \frac{B_t}{R_t} + \mathrm{M}_t = B_{t-1} + M_{t-1} - P_t T_t + W_t H_t + D_t. \tag{2}$$

Equation (2) illustrate distinct sources of income of households. Households can supply $h_t(i)$ units of labor to each intermediate-goods producing firm $i \in [0,1]$ to earn $W_t h_t(i)$ at the beginning of each period. By owning the intermediate goods, they also receive a nominal profit, D_t, and receive lump-sum government transfer, T_t. And then they decide to distribute their income in diverse ways. During each period t, households purchase consumption goods, C_t, from the final-goods producing firms at the nominal price, P_t. They also purchase the one-period bond, B_t, from the intermediate-goods producers at the price $1/R_t$ as saving. Suppose that the households carry M_{t-1} units of money. Therefore, households choose labor supply, h_t, bond holding, B_t, money holding M_t, and consumption, C_t, to maximize the lifetime utility subject to the budget constraint.

2.2. The Final-Goods Producing Firm

Final-goods producing firms employ the constant-return-to-scale technology to maximize profits. They use $Y_t(i)$ units of intermediate goods sold at a nominal price $P_t(i)$ in order to manufacture Y_t units of final products, as follows:

$$[\int_0^1 Y_t(i)^{\frac{\theta_p - 1}{\theta_p}} di]^{\frac{\theta_p}{\theta_p - 1}} = Y_t, \tag{3}$$

where θ_p denotes the price elasticity of demand for intermediate goods. The profit maximization problem of the final goods-producing firms is demonstrated as follows:

$$P_t[\int_0^1 Y_t(i)^{\frac{\theta_p - 1}{\theta_p}} di]^{\frac{\theta_p}{\theta_p - 1}} - \int_0^1 P_t(i) Y_t(i) di. \tag{4}$$

We derive the first order condition for the problem of final-goods producing firms that is represented as:

$$Y_t(i) = [\frac{P_t(i)}{P_t}]^{-\theta_p} Y_t. \tag{5}$$

Due to the zero profit in the equilibrium of the competitive final-goods firms, we can represent the final good price as follows:

$$P_t = [\int_0^1 P_t(i)^{1-\theta_p} di]^{\frac{1}{1-\theta_p}}. \tag{6}$$

2.3. The Intermediate-Goods Producing Firm

During the period t, a continuum of intermediate-goods producing firms indexed by i ∈ [0 1] hire $h_t(i)$ units of labor supplied by households to produce Y_t units of intermediate goods (i). Their constant-returns-to-scale technology is expressed as follows:

$$Z_t h_t(i) = Y_t(i). \tag{7}$$

The logarithm of aggregate technology shock, Z_t, follows a stationary stochastic process

$$\ln(Z_t) = \rho_Z \ln(Z_{t-1}) + \epsilon_{Z_t}, \tag{8}$$

where ϵ_{Z_t} denotes the serially uncorrelated innovation, which is characterized by a normal distribution with mean zero and standard deviation σ_Z. The intermediate-goods producers are presumed to follow staggered Calvo price fashion to set nominal. Specifically, a fixed fraction, η_p, of firms, which cannot re-optimize its nominal prices, still set their prices according to the indexation rule (Calvo, 1983). We can represent the way that those firms reset their prices as follows:

$$P_t(i) = (\pi_{t-1}^{\mu_p} \overline{\pi}_t^{1-\mu_p})^{\chi_p} P_{t-1}(i), \tag{9}$$

where χ_p and μ_p expressess a degree of price indexation and the relative weight on lagged inflation, respectively. The inflation, π_t, is computed as $\frac{P_t}{P_{t-1}}$ and we interprete $\overline{\pi}_t$ as the central bank's inflation target. By contrast, there is a fraction $(1 - \eta_p)$ of firms, which have ability to set their price. They select the price P_t^* to maximize the present value of future profits:

$$E_t \sum_{t=0}^{\infty} \beta^s \frac{\lambda_{t+s}}{\lambda_t} \eta_p^s [P_t^*(i)(\overline{\pi}_t^{\chi_p s})^{(1-\mu_p)} (\pi_{t-1,t+s-1}^{\chi_p})^{\mu_p} - \frac{W_{t+s}}{Z_{t+s}}] Y_{t+s}(i), \tag{10}$$

such that

$$Y_{t+s}(i) = [\frac{P_t^*(i)(\overline{\pi}_t^{\chi_p s})^{(1-\mu_p)} (\pi_{t-1,t+s-1}^{\chi_p})^{\mu_p}}{P_{t+s}}]^{-\theta_p} Y_{t+s}, \tag{11}$$

where $\pi_{t+s-1} = (\frac{P_{t+2}}{P_{t+1}}) \ldots (\frac{P_{t+s}}{P_{t+s-1}})$ if s = 1,2,3,..., λ_t is the same as the Lagrangian multiplier on the household's budget constraints, and W_t denotes the nominal wage.

2.4. Authority's policy

2.4.1. Monetary Policy

Regarding IR rule, the authority sets the short-term nominal interest rates (R_t) to deviations of inflation (π_t) from the central bank's inflation target $(\overline{\pi})$ and deviations of output (y_t) from the steady state $(\overline{y})$ as follows:

$$\frac{R_t}{\overline{R}} = (\frac{R_{t-1}}{\overline{R}})^{\rho_R} [(\frac{\pi_t}{\overline{\pi}})^{\phi_\pi} (\frac{y_t}{\overline{y}})^{\phi_y}]^{1-\rho_R} exp(\epsilon_{R_t}). \tag{12}$$

The parameter ρ_R illustrates the degree of interest rate smoothing. ϵ_{R_t} is an i.i.d monetary policy shock.

Regarding MS rule, we follow Zhang (2009) to represent the central bank's money supply (M_t^s) mechanism as follow:

$$M_t^s = (g_{m,t})M_{t-1}^s, \quad (13)$$

$$\frac{M_t^s}{P_t} = \left(g_{m,t}\right)\frac{M_{t-1}^s P_{t-1}}{P_t P_{t-1}}. \quad (14)$$

Money growth rule can be expressed as

$$\frac{gm_t}{gm} = \left(\frac{gm_{t-1}}{gm}\right)^{p_{gm}} \left(\frac{\pi_{t+1}}{\overline{\pi}_t}\right)^{-s1} \left(\frac{y_t}{y}\right)^{-s2} \delta_r e^{mt}, \quad (15)$$

$$e_{mt} = p_{em}e_{mt-1} + \epsilon_{mt}. \quad (16)$$

This rule bases on the idea that the central bank implements monetary policies by using the money supply. In the equation (4), gm_t is the growth rate of money, p_{gm} illustrates the persistence of the money growth, and s_1, s_2 are responses of money growth to deviation of inflation from the target and output from the steady state, respectively.

The evolution of trend inflation is described as a persistent AR(1) process as

$$\ln(\overline{\pi_t}) = (1-\rho_{\overline{\pi}})\ln(\overline{\pi}^*) + \rho_{\overline{\pi}}\ln(\overline{\pi}_{t-1}) + \epsilon_{\overline{\pi}_t}, \quad (17)$$

where $\rho_{\overline{\pi}}$ denotes the degree of shock persistence and $\epsilon_{\overline{\pi}_t}$ is a standard normally distributed shock which is independent of time.

2.4.2 Fiscal Policy

The public spending is written as

$$G_t = (1-\frac{1}{g_t})Y_t, \quad (18)$$

where g_t is an exogenous disturbance following the stochastic process

$$\ln(g_{t+1}) = (1-\rho_g)\ln(\overline{g}) + \rho_g\ln(g_t) + \epsilon_{g_t}, \quad (19)$$

where $(1-\frac{1}{\overline{g}})$ represents the steady-state value of government spending relative to output. In this paper, we consider that the government uses the budget for different pusposes: capital and recurrent spending, and then measure their impacts.

2.5. Market Clearing Condition

The market clearing condition in the labor market, the goods market and the bond can be expressed in turn as

$$H_t = \int H_t(i)di, \quad (20)$$

$$Y_t = C_t + G_t, \quad (21)$$

$$B_t = 0. \quad (22)$$

2.6. Method for Quantifying Welfare Costs

The present article follows Ha et al. (2019, 2020a, 2020b) to use the perturbation method to compute the approximation to the policy functions around the deterministic steady-state. We then use those to quantify the welfare. The welfare can be decomposed into three diverse component as follows:

$$E[\sum_{t=0}^{\infty} \beta^t u(x_t)] \approx \sum_{t=0}^{\infty} \beta^t u(\overline{x}) + \sum_{t=0}^{\infty} \beta^t Mu(\overline{x}) E[x_t - \overline{x}] + \sum_{t=0}^{\infty} \beta^t Nu(\overline{x}) E[(x_t - \overline{x}) \otimes (x_t - \overline{x})] = U_d + U_l + U_v,$$

where $x_t = [C_t, C_{t-1}, H_t]$; and $Mu(\overline{x})$ and $Nu(\overline{x})$ denote vectors which expressess the first and second derivative of u(.) evaluated at the deterministic steady state of x_t $(\overline{x})$. Three components are respectively the deterministic component, $U_d = \sum_{t=0}^{\infty} \beta^t u(\overline{x})$, the level component, $U_l = \sum_{t=0}^{\infty} \beta^t Mu(\overline{x}) E[x_t - \overline{x}]$, and the volatility component , $U_v = \sum_{t=0}^{\infty} \beta^t Nu(\overline{x}) E[(x_t - \overline{x}) \otimes (x_t - \overline{x})]$.

Then we can quantify the welfare cost as follows

$$E[\sum_{t=0}^{\infty} \beta^t u((1 + \tfrac{wc}{100}) C_{A,t}, (1 + \tfrac{wc}{100}) C_{A,t-1}, H_{A,t})] = E[\sum_{t=0}^{\infty} \beta^t u(C_{B,t}, C_{B,t-1}, H_{B,t})],$$

where $C_{A,t}, H_{A,t}$ are consumption and labor supply in the economy with $\sigma_{\overline{\pi}} > 0$ and $C_{B,t}, H_{B,t}$, are in economy with $\sigma_{\overline{\pi}} = 0$.

2.7. Data

The system consists of five observable variables, including output growth (g_t^y), inflation (π_t), short-term nominal interest rate (r_t), money supply growth (g_t^M), and government spending growth (g_t) that is either capital or recurrent spending. This study uses quarterly Vietnam data collected from 1996Q1 to 2015Q4. We collect the raw data from the database available at General Statistics Office of Vietnam (GSO) and International

Financial Statistics (IFS). The data for government spending growth are available at the website of State Bank of Vietnam. We also divide seasonally-adjusted figures for real GDP by the total population, which is to GDP per capital. This indicator then serves as a measure of output growth. We also obtaint measures of inflation and nominal interest rate, respectively by making quarterly changes in seasonally-adjusted figures for Consumer Price Index and quarterly lending rate. All data are de-trended prior to the estimation of the model.

3. Results

In this analysis, we examine the effects of trend inflation on welfare costs of policy shocks. These policy shocks include monetary and fiscal policy that may distort the economic welfare to produce welfare costs. A high level of trend inflation then magnifies these costs and lead to more severe consequences. Previous scholars such as Nakata (2014), Ha et al. (2019, 2020a) concentrate on measuring welfare costs of trend inflation. Ascari et al. (2014) and Ascari et al. (2018) pay attention to cyclical effects of trend inflation. Ha et al. (2020) investigate interactions between trend inflation and policy risk shocks in term of welfare costs and dynamic responses of variables to policy risk shocks. To our best knowledge, however, there is no paper that studies effects of trend inflation on welfare costs of policy shocks. Therefore, this article serves to fill this gap in the literature.

We firstly quantify welfare costs of monetary shocks in Vietnam and report the results in Table 4. With an assumption that the central bank sets inflation target at 2%, welfare costs of monetary shocks is modest (0.015%). An increase in trend inflation level produces higher welfare costs. Furthermore, we compare welfare changes due to trend inflation when the central bank uses distinct instruments. Figure 4 indicates trends of output and welfare when using the IR (Figure 4a) and MS (Figure 4b) rule. Both rules show that welfare decline nonlinearly. However, adopting MS rule causes welfare to decline more considerably but this negative effect seems to diminish when trend inflation is higher, as indicated on the convex downward curve. On the other hand, the welfare follows the concave downward curve under IR rule implying that welfare fall more substantially when trend inflation rises.

Table 4: Welfare Costs of Monetary Shocks

Welfare Costs of Fiscal Shocks

This section concentrates of welfare costs of fiscal shocks. We consider that the government uses the budget for various purposes: capital and recurrent spending. By using the actual data in Vietnam taken from SBV, we estimate respective values of fiscal shocks, including $\bar{g};\ \rho_g;\ and\ \sigma_g$. We report the results in Table 5 and 6.

Regarding capital spending, we obtain the estimated parameters: $\bar{g} = 1.07;\ \rho_g = 0.85;\ \sigma_g = 0.007$. Table 5 reports welfare costs of government capital spending shocks on the economy. We show that welfare costs of government's capital spending is very small

(0.08%). The variation in inflation target levels does not cause any change in these costs. Table 5 reports no significant change in the business cycle properties. Thus, the increase in capital spending does not cause severe issues to the economy and the signifying effects of trend inflation are also not recognized.

Table 5: Welfare Costs of Fiscal Shocks (Capital Spending)

		$\bar{\pi}^* = 1.02^{0.25}$		$\bar{\pi}^* = 1.06^{0.25}$

E(C)*		-0.40	-0.41	-0.394	-0.397
E(H)*		0.01	0.01	0.14	0.14
$100\sigma_C$		0.68	0.93	1.97	2.04
$100\sigma_H$		1.28	1.54	1.66	1.90

Note: (*) expressed as percentage deviation from the deterministic steady-state. U_d, U_l and U_v are the deterministic steady-state, level and volatility component, respectively. $\bar{g} = 1.07;\ \rho_g = 0.85;\ \sigma_g = 0.007$.

Source: Author's calculation.

By using the data for recurrent spending, we achieve estimated values for fiscal shocks given as: $\bar{g} = 1.23;\ \rho_g = 0.46;\ \sigma_g = 0.034$. Table 6 reports welfare costs of recurrent spending shocks, which is significantly higher than capital spending shocks. More importantly, a higher trend inflation level signifies these costs. The results suggest that recurrent spending might produce more severe consequence as compared to capital spending, especially there is a rise in trend inflation.

4. Discussion and Conclusion

This paper extended the New-Keynesian model in Ha et al. (2020a) by two dimensions. We assumed that the monetary authorities employ two instruments: nominal interest rate and money supply to conduct the policies. In the specific analysis regarding fiscal policy, we decomposed the government spending into capital and recurrent spending. The main purpose of this article is to investigate impacts of trend inflation on consequences of policy shocks in Vietnam. While prior scholars focused on the cyclical effects of trend inflation, our attention is paid to changes in welfare costs of policy shocks due to trend inflation. Although a few papers investigated changes in welfare costs of policy risk caused by trend inflation, there is no paper to study interaction between trend inflation and policy shocks. A change in determinacy region when the central banks use the nominal interest rate and money supply was another interest. Our paper also made the further contribution by distinguish the effects of shocks to capital and recurrent spending on the economy and examining effects of trend inflation on these effects.

Our result illustrated that trend inflation leads to changes in effects of monetary and fiscal shocks on the economy. In particular, trend inflation signifies impacts of monetary and fiscal shocks on responses of macroeconomic variables, determinacy region, and welfare costs. In other words, trend inflation causes consequences of policy shocks to be more severe. The empirical results also suggested that with a rise in trend inflation, the money supply might not be an effective tool and using government budget for recurrent spending produces severe consequences.

THE RELATIONSHIP BETWEEN LOGISTICS SERVICE OUTSOURCING AND PERFORMANCE OF IMPORT-EXPORT COMPANIES IN HO CHI MINH CITY

Dr. Nguyen Thanh Hung

nguyenhung@ufm.edu.vn

Faculty of Commerce, University of Finance – Marketing, Ho Chi Minh City, Vietnam

Abstract

The emergence of globalization has made outsourcing become one of the business strategies widely applied to provide the best services for businesses in the private and public sectors. While some researchers have analyzed the concept of outsourcing and its effect on the performance of the organization, very little research has been done on this issue in the context of import-export firms. Therefore, the absence of this research raises the question: "What is the impact of logistics outsourcing operations on the performance of import-export companies?" This quantitative study was conducted in one of the key economic centers - Ho Chi Minh City - to answer the above question. Respondents for this study included import-export and logistics staff (including managers and supervisors) at import-export enterprises. The results show the positive effects of outsourcing logistics services to the organization's performance and at the same time identify outsourcing activities that positively affect the performance of import-export businesses.

Keywords: *Import-export company, Logistics, Outsourcing, Organizational performance,.*

1. Introduction

Outsourcing, which is the strategic use of external resources to carry out activities handled by employees and internal resources, has received increasing interest in management practices around the world in recent decades (Bhattacharya, Singh and Bhakoo, 2013). The reasons companies decide to outsource are so different, the motivations most often mentioned are to achieve cost benefits or focus on core competencies. These two drivers are often linked together as an argument while managers use outsourcing to improve the use of capital investments by concentrating company human and capital resources on corporate operations activities (Quélin & Duhamel, 2003). In addition to these main motivations, other reasons for outsourcing mentioned in studies include achieving best practice by approaching external capabilities (Kakabadse, 2002); converting fixed costs into variable costs (Alexander and Young, 1996); and act as a tool to adapt to rapidly changing environments (Leavy, 2004). Increasing a company's internal focus on core business is often thought to improve performance and, as a result, increased market value.

Outsourcing is a management strategy through which a company assigns some non-core functions to more efficient, specialized service providers so that the organization can execute and focus on core business activities. The trend of globalization has driven many companies to outsource services from specialized firms to focus on their competitive advantage. Companies are sometimes forced to seek outsourced services due to a lack of human resources because they face challenges of acquiring the right skills and knowledge to enable them to gain world class competencies similar to what is expected of the service providers (Kremic, Tukel & Rom, 2006).

Outsourcing decisions are influenced by an organization's ability to invest in capacity development and maintain a position of competency superior to that of its competitors. Processes in which the organization lacks the necessary internal resources or competencies can be outsourced. Organizations can access additional capabilities from external providers that cannot benefit from implementing those processes internally (Irina, Liviu and Ioana, 2012).

The outsourcing concept has not received considerable attention and support, which can be considered as a favorable condition for improving the development and performance of an organization in Vietnam. The import and export sector needs enormous logistic mechanisms and requires careful management of this in order to achieve the organization's operational effectiveness. The core business of an import-export company is to do international business even though they still need to purchase goods, manage inventory, clear customs and transport goods. All of these other activities are not core and can be outsourced so that import and export companies can focus on their core function of doing international business.

Although some scholars (Bhattacharya et al., 2013; Njuguna, 2010; Kroes & Ghosh, 2010; Bustinza, Arias-Aranda and Gutierrez-Gutierrez, 2010) have demonstrated the positive effect of logistics outsourcing on activities of the organization, but there is a lack of research on this issue in the context of import-export companies. Therefore, further experimental studies are needed to shorten this research gap.

Scholars have defined outsourcing in many different ways. Previously, Lonsdale and Cox (2000) defined outsourcing as "the process of transferring an existing business, including related assets, to a third party". For their part, Bustinza et al. (2010) defines outsourcing as an organization retaining responsibility for providing services but assigning the day-to-day performance of those services to an external organization, according to contracts with agreed standards, costs, and conditions. In this study, outsourcing is defined as “the strategic use of external resources to carry out activities handled by employees and internal resources” (Bhattacharya et al., 2013).

Outsourcing is based on many theories, but this research applies the following theories: Resource-Based Perspectives, Transaction Cost Economics, Core Competencies and Contract Theory.

1.1. The structure of outsourcing

From the studies reviewed, four main structures of outsourcing are identified: cost reduction, quality improvement, technology adaptation and risk management.

a. Cut the cost

Outsourcing frees up capital, thus allowing investment in core operations, improving the organization's focus, freeing up management time and reducing staff costs and giving the organization flexibility (Lysons & Farrington, 2006). Reducing costs and improving efficiency are frequently cited as the main drivers of outsourcing. Smith & McKeen (2004) call them “outsourcing performance” is done with the clear goal of saving money through staff cuts and other resources.

b. Improve the quality

Quality is the ability of a product or service to consistently meet a customer's needs and expectations by delivering value for money. Growth in outsourcing is attributable to firms that need diverse and high quality services to survive and excel in rapidly changing external environments (Kok & Richardson, 2003). However, building strong outsourcing partnerships faces challenges given that companies don't know how to choose their outsourcing provider and poorly manage outsourcing relationships (Kok & Richardson, 2003). Quality can be described as being suitable for use. Quality in outsourcing contracts exists when the contract serves its function and meets the goals of both parties.

Outsourcing contracts can be affected by human and environmental factors in the organization. To build a satisfying relationship with service providers, businesses need to equip themselves with the knowledge and ability to appropriately manage relationships (Ren, Ngai, & Cho, 2010). In their research, Lee & Kim (1999) found that outsourcing success is influenced by 5 factors: trust, business understanding, benefit and risk sharing, conflict and commitment, while Anderson & Narus (1990) found other factors such as top manager's support, communication, and seniority of relationships. Successful outsourcing allows companies to achieve their organizational goals and build a competitive advantage (Han, Lee, & Seo, 2008).

c. Technology adaptation

Organizations are choosing to outsource non-core service activities such as HR services, Finance, Transport, IT and Engineering to both local and global service providers who have experience and better technical know-how in those fields. In any case, outsourcing such functions is a challenging process. The process is driven by factors that are not merely cost reduction (Moeen, Somaya, & Mahoney, 2013). Other factors such as service design, job management in different cultures and business process redesign are important factors that must be considered in outsourcing management. The service provider is also responsible for making changes in the service industry as needed due to changes in technology (Holcomb & Hitt, 2007). Similarly, when a company does not have the necessary qualifications to perform non-core activities, outsourcing may be an option.

Increasing inflation rates keep product prices rising, calling for more capital, and pressuring companies to reduce costs further in order to maintain their short- and long-term survival (Moeen, Somaya, & Mahoney, 2013). Manufacturing is expensive and requires high operating costs, thus becoming the main reason for outsourcing.

Device failure leads to delays in the delivery of products and services, which in turn results in poor organizational performance resulting in customer dissatisfaction and loss of goodwill. For specialized (and individually built) equipment, knowledge and skills to perform maintenance and spare parts required for replacement are required from original equipment manufacturers (OEMs) (Holcomb & Hitt), 2007). Therefore, the customer must have a maintenance service contract with the OEM which results in a non-competitive market. If the resellers provide maintenance service instead of OEM, the switching cost will prevent the customer from changing their service agent, so the customer is tied up and can't do anything without major financial harm (Moeen et al., 2013).

d. Risk management

The goal of outsourcing should be to unleash management and create trust so that companies take more risks in more value-added core businesses. However, outsourcing business activities leads to serious risk issues related to operational changes related to human resources, physical assets, technology and business processes, leading to to operational risk (Irina et al., 2012). Furthermore, outsourcing brings uncertainty as the new relationship between service provider and company represents an unproven agreement. In addition, it is difficult to justify whether the carrier performs the task better than the one internally performed (Lungescu, Pampa & Salanta, 2011). While outsourcing can come with different types of risks, they are all related to performance. This requires a risk assessment before entering into the outsourcing agreement for any business function (Irina et al., 2012).

Outsourcing results in loss of control, loss of critical skills and knowledge, loss of intellectual property, insecurity, quality of service can be reduced, and costs can increase and lose the ability to innovate (Wayman , two thousand and thirteen). There is also a need for continuous monitoring and monitoring of the service provider relationship as well as for dispute resolution. The most important challenge is how to deal with the change in the balance of power in favor of the service provider (Weele, 2010).

Due to the fact that the parties to the outsourcing contract have a long-term relationship, many issues need to be considered. Several aspects are of interest in contracting. According to Weele (2010), risks related to outsourcing contracts can be aggregated as technical risks, commercial risks, contractual risks or performance risks.

Several scholars (Bhattacharya et al, 2013; Njuguna, 2010; Kroes & Ghosh, 2010; Bustinza, Arias-Aranda, and Gutierrez-Gutierrez, 2010) have demonstrated that outsourcing positively affects team performance. This will be discussed in the next section.

1.2. Organizational performance

According to Jenatabadi (2015), organizational performance can be broadly defined as "a set of financial and non-financial indicators that provide information on the extent to which objectives and outcomes are achieved". Cocca and Alberti (2010) argue that organizational performance can be represented by the following aspects: effectiveness, efficiency, quality, productivity, quality of work, profitability, innovation and learning.

Efficiency refers to an organization's ability to fulfill its goals in the right way while efficiency refers to the full use of resources to accomplish its identified goals. Quality refers to the ability to effectively meet or exceed customer expectations (Jiménez-Jiménez & Cegarra-Navarro, 2007); productivity is related to the ratio of output to input; quality of work life that indicates an employee's emotional response to their work and organization (Pavlov & Bournce, 2011); profitability refers to revenue that exceeds cost while innovation refers to the continual improvement of a product / service or process (Rhee, Park & Lee, 2010); and according to Argote (2011), learning is defined as the ability of an organization to continuously create, store and transfer knowledge within the organization. Key aspects of organizational activity identified by other scholars include the ability to innovate (Liao & Wu, 2010; Rhee et al., 2010); productivity (Field, 2011); employee satisfaction and the ability to amplify to acquire, transfer and utilize new knowledge (García-Morales, Lloréns-Montes, & Verdú-Jover, 2008); competitive advantage (Hsu & Pereira, 2008), and improving the organization's reputation (Calantone, Cavusgil and Zhao, 2002).

2. Method

This study seeks to expand the knowledge in the field of logistics management by improving and testing a model that assumes logistics outsourcing activities are the determinant of the organization's performance.

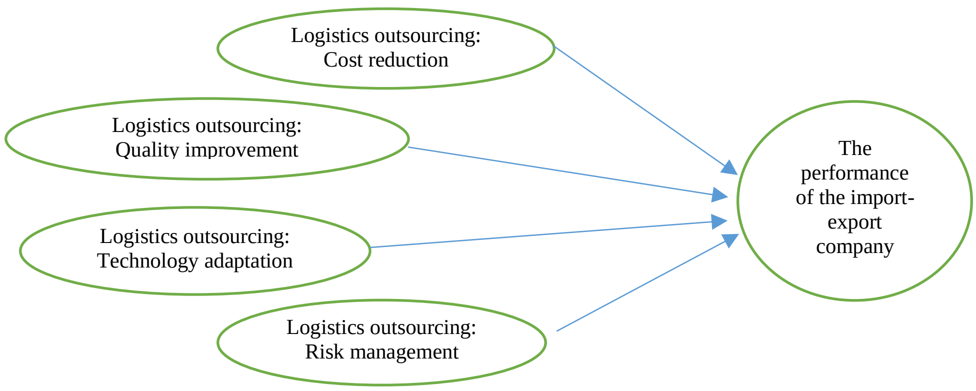

Figure 3.1. Research model (Source: Nzitunga, 2019; Joyclare, 2020 and author)

Because outsourcing frees up capital, thus allowing investment in core activities, improving the organization's core competencies, freeing up management time and reducing staff costs as well as bringing in the organization more flexibility (Kenneth & Lysons, 2006), the first hypothesis is thus derived:

H1: Cost reduction through logistics outsourcing positively affects the performance of import-export companies.

Scholars (Ren, Ngai, & Cho, 2010; Han, Lee, & Seo, 2008) have found that outsourcing provides improved quality by using a knowledgeable service provider, experience and expertise in providing a particular service, improving the organization's operational efficiency. Therefore, the second hypothesis is developed:

H2: Quality improvement due to logistics outsourcing positively affects the performance of import-export companies.

In Moeen, Somaya and Mahoney (2013) found a positive effect of technology adoption from outsourcing on organizational performance. From there, there is a reason to believe that this is also the case for the import and export sector. Therefore, a third hypothesis was formed:

H3: There is a positive relationship between technology adaptation achieved from logistics outsourcing and organizational performance in the import-export industry.

Several researchers have provided evidence of a positive association between risk management and organizational performance (Nair, Purohit, Choudhary, 2014; Saleem & Abideen, 2011). Therefore, the fourth hypothesis is deduced:

H4: Effectively manage risks due to logistics outsourcing that can positively affect the organization's performance in the import-export industry.

3. Results

For this study, a quantitative approach was used. Measurement data are used to form facts and explore patterns in research. This approach was chosen because the study seeks to test a set of hypotheses and it is an appropriate approach for a study designed to analyze theory through proposed hypotheses and collect data to support or refute these hypotheses (Leedy and Omrod, 2010). The sample subjects for this study included import-export and logistics staff (including managers and supervisors) at import-export companies in Ho Chi Minh City.

3.1. Sample

Due to the application of the EFA analysis method, the sample size is based on two factors: the minimum size and the number of measurement variables. According to Hair et al. (2010), the minimum sample size is 50, preferably 100, and the ratio of observations /

measurement variable is 5/1, meaning that each measurement variable needs a minimum of 5 observations. The study has 32 measurement variables, so the minimum sample size is 5 x 32 = 160. Research crowd is import-export enterprises in Ho Chi Minh City. The study used a simple random sampling method. Questionnaires were sent to import and export businesses by email, fax and directly. The total number of questionnaires distributed was 350, returned 270 with valid samples of 253 corresponding to 93.7% rate used as research data. Out of 253 observations, the distribution followed (table 3.1).

Characteristics of the research sample showing gender, age, academic level, position in the enterprise, the results are shown in Table 3.1.

Table 3.1. Sample characteristics

3.1.1 Gender

Gender	**Quantum**	**Ratio**
Male	160	63.2
Female	93	36.8
Total	253	100

3.1.2 Age

Age	**Quantum**	**Ratio**
19 - 29	73	29
30 - 39	142	56
40 - 49	28	11
Over 50	10	4
Total	253	100

3.1.3 Academic level

Level	**Quantum**	**Ratio**
Post graduate	32	12.7
Bachelor	165	65
Baccalaureate	48	18.9
Import-export certificate	8	3.4
Total	253	100

3.1.4 Position

Position	Quantum	Ratio
Governor	10	4
Manager	30	12
Staff	157	62
Others	56	22
Total	253	100

3.1.5 Outsourcing field

Outsourcing activities	Quantum	Ratio
Warehousing	35	14
Inland transport	23	9
Package	10	4
Consolidation & Deconsolidation	15	6
Chartering	43	17
Documentary	127	50
Total	253	100

(Source: author's data)

According to the analysis, there are 160 men and 93 female respondents, which shows that the number of male workers in import-export companies accounts for nearly twice the number of female workers at the rate of 63.2 and 36.8%, respectively. The results also showed that the majority of respondents (56%) were between the ages of 30 and 39. Only 4% of the respondents were 50 years of age or older. The rest, at the age of 19 - 29, make up 29% while 11% of the respondents are in the age group 40 - 49. This shows that the import-export companies hire the workforce mainly in the age group 30-39 and very It is rare to hire workers aged 50 and over. The reason may be due to the many movements between customs departments, ports and ICDs, shipping agency agency offices, packing and withdrawing container goods with a variety of time, so import and export companies. giving priority to young and dynamic laborers. The proportion of 4% of respondents in the age group above 50 can also be attributed to the fact that the labor force in this age group has become a manager, making it more difficult to access the sample.

The results showed that the majority of respondents (65%) have a bachelor's degree, while a baccalaureate degree is only 18.9% and postgraduate is 12.7%. This result shows that import-export companies mainly hire workers with bachelor's degrees, very few hire workers with import-export certificates because the work involves a lot of specialized profession, needing judgment. , analyze and solve problems and situations. In terms of positions and positions in the organization, the results show that most of them are employees (62%), while a very small percentage is the director (4%). The rest of the respondents are managers (12%) and other positions (22%). Due to their busy work, senior managers and directors are difficult to access and if they can do so, these individuals often authorize subordinates to answer the survey. Regarding the outsourcing field of logistics services, the results showed that document operations accounted for the largest proportion (50%) compared to other service sectors that import-export companies performed. This proportion shows that the main outsourced logistics services of import-export companies are import and export customs clearance procedures, finalization of processed goods norms, import and export taxes, thereby showing for import and export enterprises, customs procedures are considered to be complicated and complicated operations and should be outsourced.

3.2. Inspection scales using Cronbach's coefficient alpha reliability

Analysis results of Cronbach's alpha (table 3.2) show that most scales have Cronbach's alpha coefficients greater than 0.6 and total variable correlation coefficients greater than 0.3 (Hair et al., 2010). So the standard, ensuring reliability scales will be included in the analysis of the discovery factor EFA.

Table 3.2. Results of analysis of confidence coefficients Cronbach's alpha

Concept	Number of variables	Cronbach's alpha	Corrected Item-Total Correlation	Conclusion
Cost reduction	6	0.947	0.661 – 0.909	Yes
Quality improvement	6	0.913	0.621 – 0.849	Yes
Technology adaptation	6	0.908	0.606 – 0.832	Yes
Risk management	6	0.925	0.657 – 0.873	Yes
The performance of the import-export company	8	0.841	0.416 – 0.751	Yes

(*Source: author's data*)

3.3. Explore factor analysis (EFA)

The results of the factor analysis method are evaluated through KMO coefficient, loading coefficient, the difference between two or more factors, eigenvalue and total variance explained.

After analyzing Cronbach Alpha, the observed variables of the model continue to be included in the analysis of the exploratory factors EFA according to the Eigenvalue standard greater than 1 and 05 factors are extracted. KMO coefficient = 0.843> 0.5, so all variables are satisfactory. The total variance extracted is 82.552, which means that these 5 extracted factors explain 82.552% of the variation of the data and are satisfactory. With Varimax rotation, the loading coefficients are all greater than 0.5 and meet the conditions of factor analysis. Therefore, these 5 observed variables are accepted and continue to be included in multiple regression analysis to consider the impact level of the independent variable on the dependent variable of the research model.

Name and explain the factor: The observed variables after being handled and removed appropriately, the variables with large loading coefficients in the same factor will be the explanatory variables for that factor and based on the nature of the specific variables that the factor includes will find a new name for the factor, this property is called the discovery property, which is a prominent feature of EFA.

From the KMO and Barlett's test results, we have KMO coefficients of 0.843, greater than 0.5 and sig of 0.000, less than 0.005. Total Variance Explained results show that the total variance extracted is 82.552%, greater than 50% and the Rotated Component Matrix results show that all factor loading factors Factor loading are greater than 0.5. At the same time discover a new factor. Specific results are in (table 3.4)

Table 3.4. Results of explore factor analysis EFA

Concept	KMO	Sig.	Cumulative of Variance	Loading factor
	0.843	0.000	82.552 %	
Cost reduction (CP)				0.705 – 0.947
Quality improvement (CL)				0.701 – 0.860
Technology adaption (CG)				0.655 – 0.879
Risk management (RR)				0.680 – 0.886
Market flexibility (LH)				0.637 – 0.851
Organizational performance (HS)	0.749	0.000	71.768%	0.534 – 0.861

(*Source: author's data*)

The following EFA adjusted research model is:

Organizational Performance = Function (Cost Reduction, Quality Improvement, Technology adaption, Risk Management, Market Flexibility).

Test assumptions of the linear regression model

In order for the results of the analysis to have broad implications from the sample to the whole, the study continues to perform the step of testing the assumptions of the regression model. To perform the linear regression analysis step, the model must ensure that there is no multicollinearity phenomenon, because "multicollinearity makes our assessment of the impact of each independent variable on the dependent variable into deviation"(Hoang & Chu, 2008).

Table 3.5. Multicollinearity test

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	3.116	.294		10.597	.000		
	CG	.093	.061	.131	1.530	.000	.482	1.075
	CP	.053	.541	.732	.988	.000	.635	1.574
	CL	.048	.682	.623	.705	.002	.452	1.214
	RR	.289	.054	.412	5.358	.000	.594	1.683
	LH	.003	.061	.104	.054	.003	.518	1.929

a. Dependent Variable: HS

(*Source: author's data*)

Verification of no multicollinearity phenomenon identified by VIF magnification of factors 1.929 (<2) meets the requirements. It can be concluded that no multicollinearity has occurred.

c. Multiple regression analysis

Regression analysis was performed with 05 independent variables, including the variables: Cost reduction, Quality improvement, Risk management, Technology adaption, Market flexibility and one dependent variable, Organization Performance. The Enter method is used to analyze this relationship. Variables with significance level <0.05 are selected.

Table 3.6. The summary model using the Enter method

Model Summary[b]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson

1	.764[a]	.733	.715	.67183	1.846

a. Predictors: (Constant), LH, RR, CP, CG, CL

b. Dependent Variable: HS

ANOVA[a]

Model		Sum of Squares	df	Mean Square	F	Sig.
	Regression	5.224	5	1.045	27.558	.000[b]
1	Residual	34.149	247	.138		
	Total	39.373	252			

a. Dependent Variable: HS

b. Predictors: (Constant), LH, RR, CP, CG, CL

(*Source: author's data*)

From the results we see that the Adjusted R Square = .715 means that about 71.5% of the organizational performance variance is explained by the independent variables, the rest is due to factors outside the model and random error. The Sig value of the F-test is 0.000 <0.05. Thus, the built-in linear regression model can be broadly extrapolated and applied to the whole.

So the standardized linear regression equation is as follows: Organization Performance from outsourcing logistics services = 0.732 (Cost reduction) + 0.623 (Quality improvement) + 0.131 (Technology adaption) + 0.412 (Risk management) + 0.104 (Market flexibility)

4. Discussion and Conclusions

4.1. Summarize and discuss key findings

4.1.1. The effect of cost reduction on the organization's performance

The first hypothesis - specifically that cost reduction through logistics outsourcing positively affects the organization's performance in the import and export industry - is confirmed by the coefficient of statistical significance (0.732). This finding is consistent with research by (Lysons and Farrington, 2006; Smith and McKeen, 2004). The management effects are logistics outsourcing that leads to cost reduction through the elimination of ineffective assets; reducing investment in assets and redirecting internal resources into company core operations; and the availability of more funds for other projects, thus leading to increased organizational performance.

4.1.2. The impact of quality improvement on the organization's performance

For the second hypothesis - the hypothesis that quality improvement due to logistics outsourcing positively affects the organization's performance in the import-export industry has been confirmed by the coefficient of statistical significance (0.623). This is consistent with research by (Ren et al., 2010; Han et al., 2008). This implies that for the import-export industry, the achieved organizational performance is proportional to the level of logistics quality.

4.1.3. Effect of technology adaption on an organization's performance

In addition, for the third hypothesis, namely, there is a positive relationship between the application of technology obtained from logistics outsourcing and the organization's performance in the import-export industry, small statistical significance (0.131) was found by regression analysis, consistent with the study of (Moeen et al., 2013; Holcomb & Hitt, 2007). This means that for the import-export industry, the organization's performance is proportional to the adaption of new technology by the organization, but the level of impact is limited.

4.1.4. The effects of risk management on the performance of the organization

Relating to the fourth hypothesis - effective management of logistics outsourcing risk is likely to positively affect the performance of an organization in the import and export industry - the statistical relationship is found by regression analysis (0.412). This is consistent with research by (Irina et al., 2012; Wayman, 2013). In addition, here, the regulatory implication is that for the import and export industry, the performance achieved by the organization depends on whether risk management practices are enhanced.

The study also discovered a new factor that is market flexibility, although the statistical significance is still modest (0.14).

This study has contributed to additional studies on logistics management. While the findings point to a positive statistical significance for logistics outsourcing operations, as well as for organizational performance, there is room for improvement. Adequate evidence from research suggests that import-export firms should implement appropriate logistics outsourcing to improve their organization's performance in the import-export sector in Ho Chi Minh City. These aspects are measurable and therefore manageable.

4.2. Conclusion

The import and export sector needs effective logistics mechanisms and requires careful management to achieve the organization's operational effectiveness. The core business of an import-export company is international business, although they still need to purchase raw materials, manage inventory, clear customs and transport goods. All of these activities are not core activities and should be outsourced so that import and export companies can focus on their core function of international business.

With the findings of the study showing the positive effect of outsourcing logistics on the organization's operations, steps that can be taken immediately to address the current situation may include but are not limited are: strategic planning of all stages and aspects of logistics management; ensuring that key personnel are trained in logistics management, in contemporary logistics management concepts and principles; objectively measuring logistics management performance and ensure that there is an appropriate outsourcing plan to effectively support the implementation of logistics management policy.

Abstract

This study applies ARIMA model in forecasting the number of containers through seaport cluster No. 5 according to Decision No. 1745 / QD-BGTVT dated August 3, 2011. Data were collected from the Vietnam Maritime Administration, the Vietnam Port Association (VPA) for the period 1995-2020 and processed using the software "R". The results show that ARIMA model (0.2.1) is suitable for forecasting container throughput of seaport cluster No. 5 in the period of 2021-2025 with an average forecast of 6.77% corresponding 946,716 TEUs. With this result, policymakers and businesses will help to formulate policies, plans as well as to plan properly and reasonably.

Keywords: *Forecast, TEU, ARIMA, Container, Throughput.*

1. Introduction

According to the planning of development of Vietnam's seaport system up to 2020, orientation to 2030 and the detailed plan approved in Decision No. 1745 / QD-BGTVT dated August 3, 2011, the seaport cluster number 5 is the inter-port system between Ho Chi Minh City (Ho Chi Minh City), Dong Nai and Ba Ria - Vung Tau, including the entire system of ports in Ho Chi Minh City on the Saigon River, Nha Be River. and the deep-water port Cai Mep - Thi Vai in Ba Ria - Vung Tau. This port cluster system plays an important role not only for transportation but also for the development of the southern key economic region, which contributes more than 40% of the country's GDP and attracts more than 50% FDI of Việt Nam[1]. Therefore, forecasting container throughput volumes seaport cluster No. 5 is a very important activity for the government, seaport operators, FDI investors, and import-export enterprises in the region in establishing planning, planning policy, operation management. The more accurate the forecast results, the more feasible the policy making as well as the plan are. The port container throughput projections are often used directly in container port operations and often use a TEU (Twenty Equipvalent Unit) of one TEU equivalent to one 20 feet container. This forecast also relates to the purchase of additional machinery, equipment, supplies, and worker placement and placement. Moreover, unlike

[1] http://www.baodongnai.com.vn/kinhte/201905/vung-kinh-te-trong-diem-phia-nam-vai-tro-dan-dat-trong-phat-trien-2944651/

other manufacturing industries, the container terminal industry cannot increase the capacity and size of the container terminal and yard to meet changing needs but must rely on strategies such as inventory management. warehouse, outsourcing, overtime. Therefore, forecasts are necessary for control and planning of the container port system as well as for the port operator in decision-making and planning. In this study, the authors use the univariate forecasting method, in which the future value time series is assumed based only on past values to predict the future container throughput of ports. hybrid. Historical data is analyzed to identify models and build future forecasting models. And ARIMA model is the model selected on the "R" treatment tool to forecast container throughput of port cluster No. 5 in the next 5 years. Research data were collected from the Vietnam Maritime Administration and the Vietnam Port Association (VPA) for the period 1995-2020.

2. Literature Review and Research Model

There are many models used to forecast container throughput of ports, the most common being a regression model to identify and measure causality of variables such as the research of T.C. Guo (1993) or H.D.Liu. et al. (1996). It is necessary to consider the estimated error caused by the factors of predictive uncertainty, so some studies find it is necessary to adjust the forecast using alternative techniques. As a study by J.G. Gooijer et al. (1989) used diverse time series models to define the navigational steel traffic flow at the port of Antwerp. Meanwhile W.H.K. Lam (2004) proposes a No-Ron (NN) network model to forecast cargo traffic through Hong Kong ports. And, C.C.Chou (2004) used classified integral representation method, a new method to calculate the opacity to predict the total volume of import and export containers for Taiwan ports and found that the forecast results. better than seasonal forecast (SARIMA). In addition to individual models, some authors have used combined models to predict container throughput through ports such as studies by Shih-Huang Chen et al. (2010) using genetic programming. (GP), analytical method (X-11) and moving average integrated with automatic seasonal regression (SARIMA) to forecast container throughput through major Taiwan ports or such as Gang Xie et al. (2012) used the least squares-based approaches to support vector regression (LS SVR) model to forecast the container throughput at the proposed ports and the results show the resulting. The proposed combination can achieve better predictive performance than the individual approaches. According to Mingfei Niu et al (2017), this group of authors built a synthetic model to combine many models such as VMD-ARIMA-HGWO-SVR for prediction for the purpose of improving stability and accuracy. of container throughput through Chinese ports. In summary, the above forecasting models have their own advantages and disadvantages and depend on statistical data. Meanwhile, according to Robert et al., (1979), the ARIMA model is very suitable for linear relationships between present data and past data. Moreover, Brockwell et al., (2001) also suggested that the ARIMA model will forecast more accurately when the data are detailed in the year.

3. Methods

Box & Jenkins (1970) first introduced the Autoregressive Integrated Moving Average (ARIMA) model in time series analysis, known as the Box-Jenkins method. The ARIMA model is combined by 3 main components: AR (Self-Regression Component), I (Stationary Calculation of Time Series) and MA (Moving Average Component). According to Gujarati (2006) as well as R. Carter Hill et al., (2011) to use the ARIMA model in time series prediction, it must go through 4 steps.

Step 1: Identify the model

To use ARIMA model (p, d, q) in prediction, it is necessary to identify three components p, d and q of the model. The component d of the model is identified through the time series stationary test. If the time series stops at order 0 we denote I (d = 0), if the first difference of the stop sequence we denote I (d = 1), if the second difference of the stop series we denote I (d = 2). To test chain stop using the modified Dickey – Fuller unit root test (ADF) and Phillips-Perron test (D. Dickey and W. Fuller, 1979): $\Delta Yt = \beta 0 + \beta 1t + \pi Yt-1 + \sum_{j=1}^{t} \Delta Yt - 1 + \varepsilon$. Test hypothesis H0 with $\pi = 0$, H1 with $\pi < 0$ and use student statistics (symbol t). After the stationary test, we will determine the order of the self-regression process (AR) and the moving average process (MA) through the autocorrelation chart (ACF) and partial correlation chart (PACF). According to G. Box and Jenkin (1970), the p-order regression procedure, symbol AR (p) is: $(Yt - \delta) = \alpha 1(Yt-1 - \delta) + \alpha 2(Yt-2 - \delta) + \cdots + \alpha p (Yt-p- \delta) + ut$.

Where: Yt is the time series, δ is the expectation of the series Yt, ut is the white noise. According to D. N. Gujarati and D. C. Porter (2009), the q-order moving average procedure, denoted MA (q) is: $Yt = \mu + \beta 0ut + \beta 1ut-1 + \beta 2ut-2 + \cdots + \beta qut-q$. Combining we have ARIMA model (p, q) as follows:

$$Yt = \Theta + \alpha 1Yt-1 + \alpha 2Yt-2 + \cdots + \alpha pYt-p + \beta 0ut + \beta 1ut-1 + \beta 2ut-2 + \cdots + \beta qut-q.$$

Identification of the ARIMA model (p, d, q) is to find suitable values of p, d, q, where d is the degree of difference of the time series to be investigated, p is the order of self-regression and q is the order moving average. Determining p and q will depend on the graphs PACF = f (t) and ACF = f (t).

Step 2: Estimating the parameters and selecting the model.

The model parameters will be estimated using the "R" tool. The process of model selection is the process of experimenting and comparing adjusted criteria R^2, AIC and Schwarz until we choose the best model for prediction.

Step 3: Test the model

To ensure the model is suitable, the error of the model must be white noise, you can use the ACF correlation chart or Breusch-Godfrey test to check the autocorrelation of the error. For variable variance, either the White or ARCH test can be used. Besides, to evaluate the reliability of the predictive model, the study uses MAPE index (Mean Absolute Percent Error). According to C. Lewis (1983), the MAPE greater than or equal to 50%, the forecast is incorrect, 20% - 50% is valid, 10% -20% is a good forecast, and less than 10% is a perfect forecast. The MAPE index is defined as follows:

$$\text{MAPE} = \frac{100}{n} x \sum_{i=2}^{n} \left|\frac{xt-\mu t}{xt}\right|$$

In which "xt" is the true value and "µt" is the forecast value at time t, n is the total number of predictions.

Step 4: Forecast

After testing the error of the forecasting models, if appropriate, it will be used in the forecasting.

4. Results

4.1. Building ARIMA model

To build the ARIMA model, we must first test the solitude of the chain of container throughput through the port. Dickey-Fuller (ADF) and Phillips-Perron (PP) test results show that / t-stat / are both less than the critical value. Therefore, it is concluded that the chain of container throughput through the port does not stop. Shown in figure 1

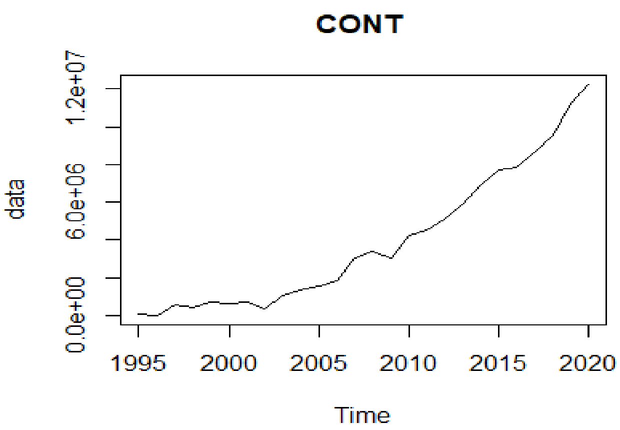

Figure 1: Zero difference graph

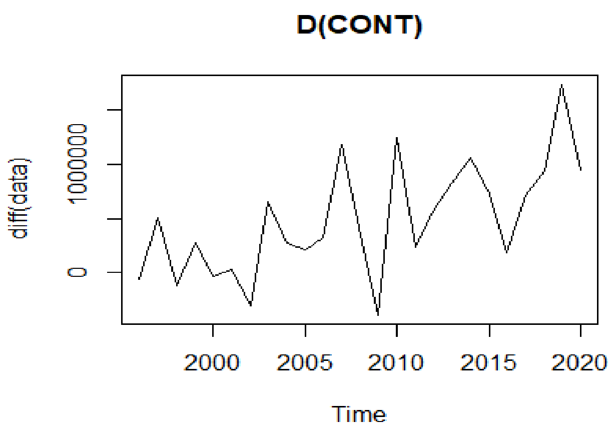

Figure 2: Graph of difference of order 1

…ain through the port does not stop at the zero difference, the first difference must be taken to test the stopping and the result of the chain still does not stop shown in Figure 2. Continuing to take the second difference, the production chain. The volume of containers through the stopped port is shown in Figure 3. Results of the ADF and PP tests are shown in Table 2 after the chain has stopped. And the stationary test results show Table 2 with graph ACF in figure 4 and PACF in figure 5, showing the chain stopped and significant P <0.05, which means that it is reliable to predict.

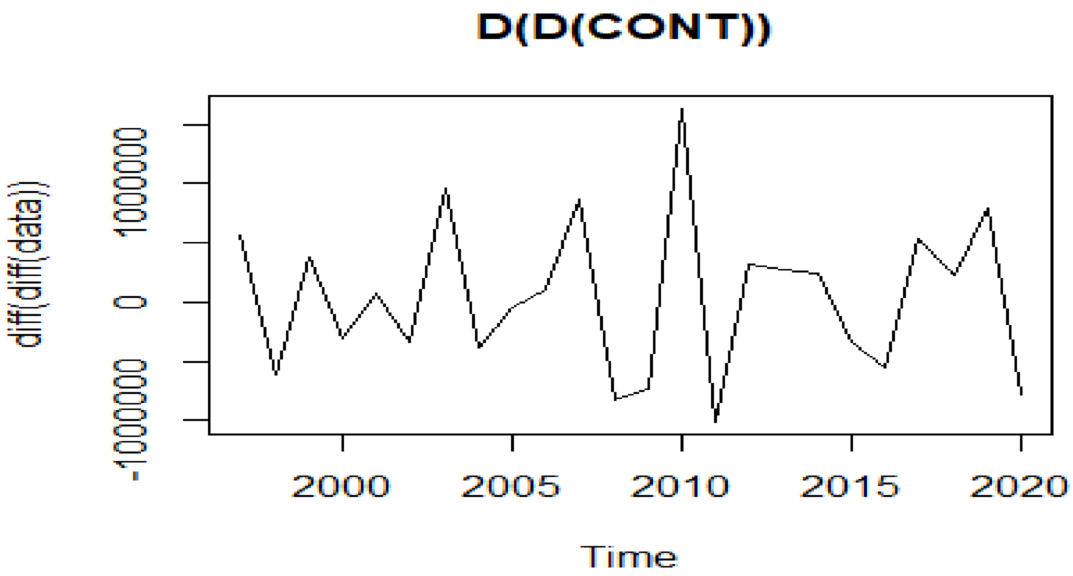

Figure 3: Graph of difference of order 2

Table 2: Stability TEST results

Variale	**Value ADF**	**P-value**
CONT	0.077666	>0.99
D(CONT)	-3.9485	0.02511
D(D(CONT))	-5.4249	<0.01

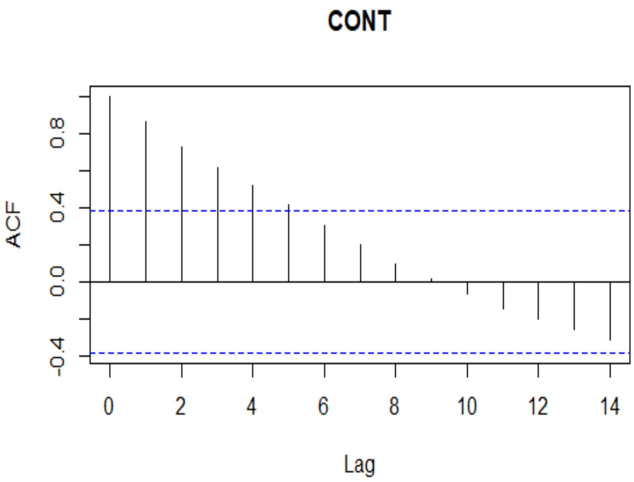

Figure 4: ACF chart

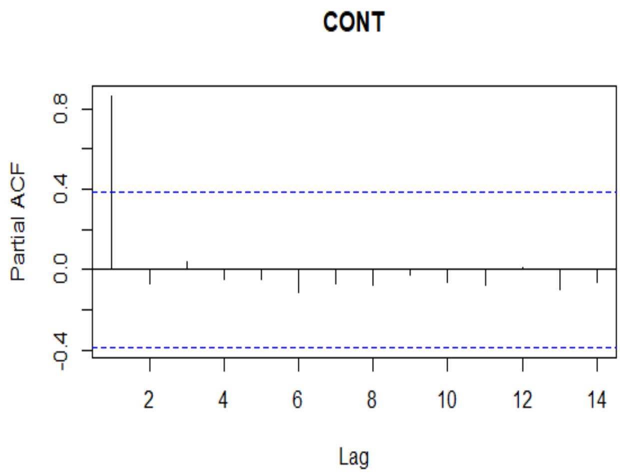

Figure 5: PACF chart

4.2. Estimation of model selection parameters

To find the most suitable prediction model, it is necessary to use empirical methods by comparing adjusted R2, AIC and Schwarz with the smallest AIC. The comparison results show that ARIMA model (0,2,1) is the most suitable model for statistical data set. The results of the models are shown in Table 3.

Table 3. AIC results of some models

Model	AIC
ARIMA (0,2,2)	702.2987
ARIMA (0,2,0)	712.3595
ARIMA (1,2,0)	707.0652
ARIMA (0,2,1)	701.254
ARIMA (1,2,1)	702.7549

4.3. Test the model

To know if the ARIMA model (0,2,1) violates the assumptions of the regression model, it is necessary to do some more tests. The White test shows that the model has no variance and variance. The Breusch-Godfrey test showed that the error had no similar correlation, the Jacque-Bera test showed that the random error had a normal distribution. Moreover, the calculation and comparison of the MAPE index of the models showed that ARIMA (0,2,1) had higher accuracy in terms of both reference data and test data shown in the table 4 and the model error are shown in Table 5

Table 4. Regression results of ARIMA model (0,2,1)

	Estimate	S. E	t.value	p.value	Lag
MA1	-0.754	0.111	-6.81	3.85e-07	1

n = 26; 'sigma' = 483936.9; AIC = 701.254; SBC = 702.5121

Table 5. Model error

ME	RMSE	MAE	MPE	MAPE	MASE	ACF1
136105.7	464951.5	338816.6	0.7716496	20.78972	0.6075287	-0.2493524

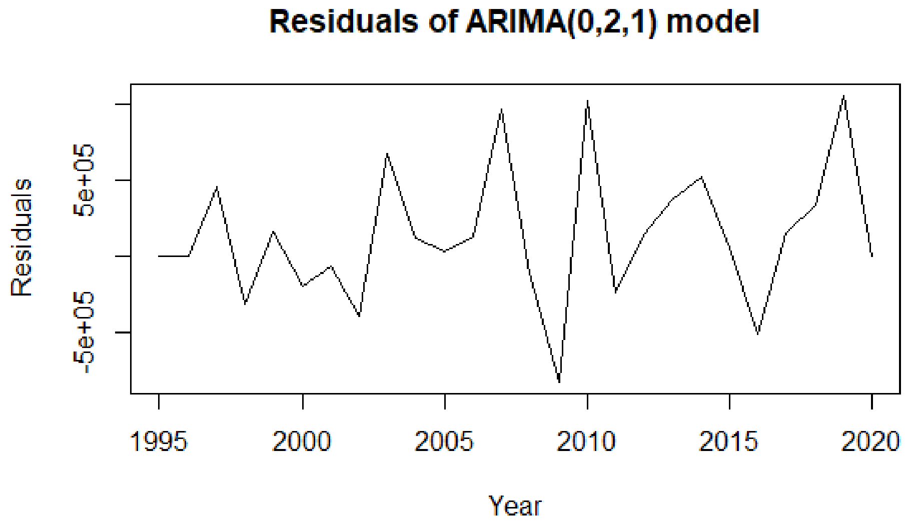

Figure 6: Steady test chart of residuals

Continuing to test the residue of the residue in the ARIMA model (0,2,1), we see that H0, the residual of the model is not stationary and the remainder of the model has no correlation phenomenon. It can be concluded that the statistics are sufficiently reliable for the forecast. Results are shown in figure 6; Table 6; figure 7 and table 7

Table 6. Results of the stationary residue test of the model

Type	Lag	ADF	P-value
no drift no trend	0	-5.63	<=0.01
	1	-3.93	<=0.01
	2	-2.62	0.0112
with drift no trend	0	-6.19	<=0.01
	1	-4.83	<=0.01
	2	-3.59	0.0158
with drift and trend	0	-6.36	<=0.01
	1	-5.13	<=0.01
	2	-4.20	0.0163

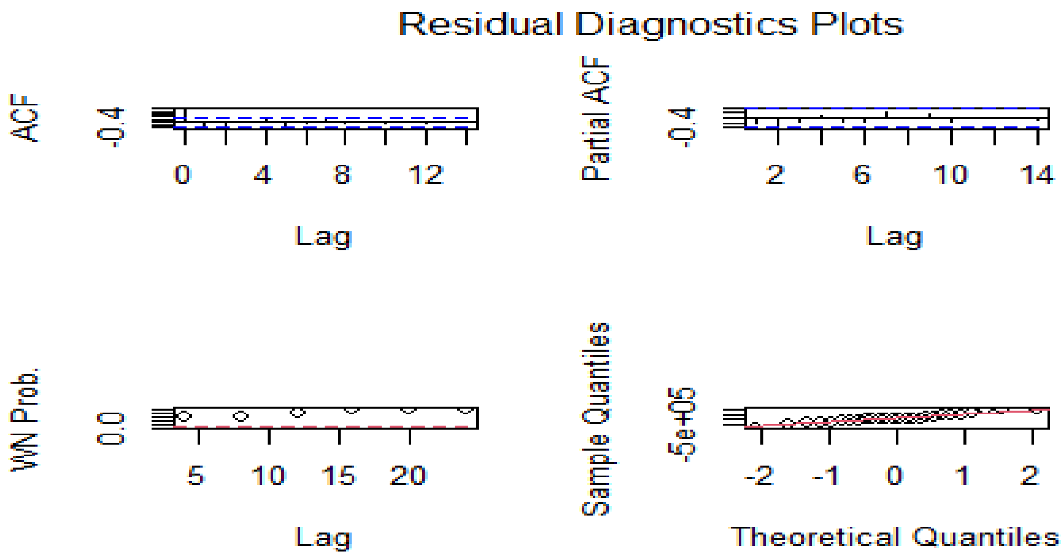

Figure 7: ACF and PACF diagram of remainder

Table 7. Test of similar correlation

Lag	LB	p.value
4	3.17	0.530
8	6.99	0.538
12	7.98	0.787
16	8.28	0.940
20	8.78	0.985
24	9.00	0.998

Continuing to test the ARCH effect to test the variance of variance, the test results show that H0: The variance of the model is unchanged, which means that the data is statistically significant. The ARCH effect test is shown in Figure 8 and Table 8 shows the results of testing the variance of error

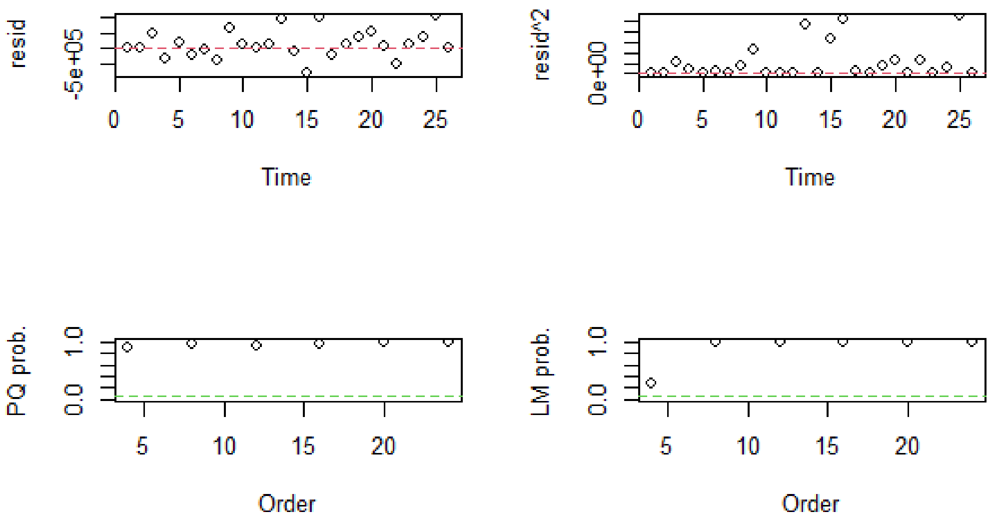

Figure 8. Testing the ARCH effect

Table 8. Results of testing variance of variation

order	PQ	p.value	LM	p.value
4	1.049	0.902	3.789	0.285
8	2.763	0.948	0.482	1.000
12	5.695	0.931	-0.001	1
16	7.098	0.971	0.148	1
20	7.167	0.996	0.245	1
24	7.352	1.000	0.385	1

4.4. Forecast

From the test results, we have the forecast results of the container throughput through the port cluster No. 5 to 2025 are shown in Table 9 and Figure 9.

Table 9. Forecast of container throughput through port cluster No. 5 from 2021-2025

Unit: TEU

	Point Forecast	Low 95%	High 95%
2021	13,168,441	12,199,542	14,137,340
2022	14,115,157	12,566,832	15,663,482
2023	15,061,873	12,942,984	17,180,762
2024	16,008,589	13,301,200	18,715,978
2025	16,955,305	13,633,835	20,276,775

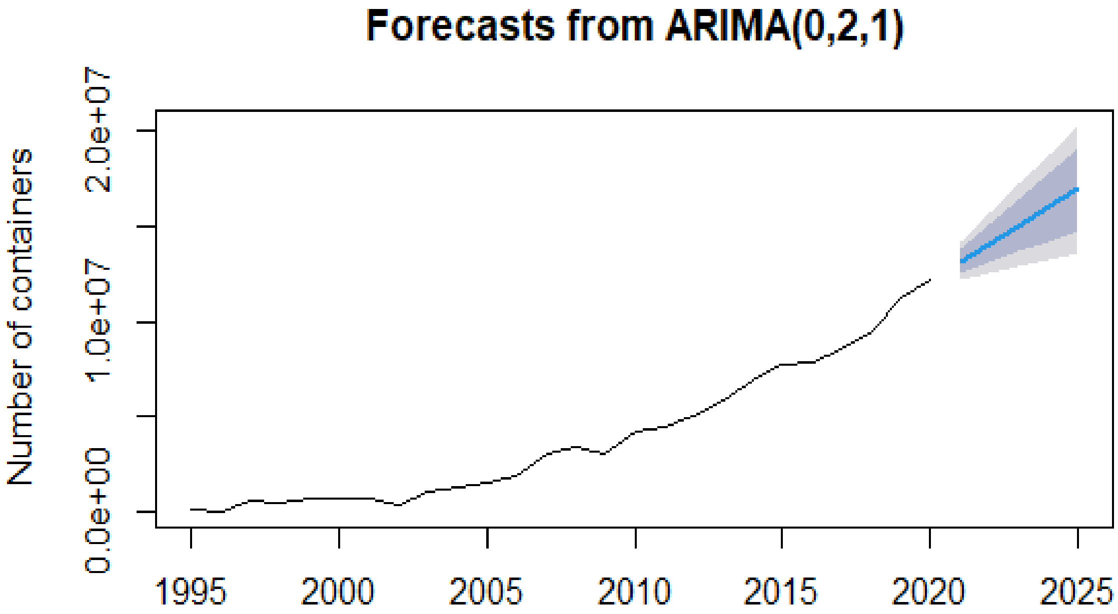

Figure 9: Forecast chart of container throughput through port cluster No. 5 in the period of 2021-2025

The forecast results in Table 9 show that the container throughput through the port cluster No. 5 is forecast to increase on average annually in the period 2021 - 2025 of 6.77% or 946,716 TEUs. In which, the lowest increase volume with reliability p> 0.05% is 2.22%, equivalent to 367,290 TEUs and the volume of containers through the port cluster No. 5 with reliability P <0.05% is 10.69%, corresponding to the level of output of 1,526,142 TEUs.

5. Discussion and Conclusion

Thus, the application of forecast results helps policy makers to deal with the increase in container throughput through the port cluster No. 5 in the future. The government should have solutions to develop infrastructure, connect logistics networks to avoid traffic congestion, which is inherently traffic and the gateway to ports located in this port cluster area 5 have been and are congested as well. serious degradation. For businesses doing business in port operations, they should have strategies to develop and expand ports as well as build and link more satellite systems or have plans to purchase handling equipment to improve their competitiveness. competition as well as efficient port operation. As for import-export production and business enterprises or FDI enterprises, there are plans to choose a cluster of import and export ports to avoid congestion, overload at this port cluster, which will incur a lot of logistics costs. business results.

Research and application of ARIMA model to forecast container throughput of port cluster No. 5 with the aim of finding the best forecasting model for forecasting container throughput of ports in Vietnam. Research results show that, ARIMA model (0,2,1) shows good forecast of container throughput through port and ARIMA model application has been done in a number of studies around the world. However, this study has not compared the forecast results with some other models, these limitations will be addressed in the next study.

POLICY INTEGRATION IN THE CONTEXT OF GLOBALIZATION: AN OVERVIEW APPROACH

Dr. Nguyen Duc Huu

huund@dhcd.edu.vn

University of Trade Union, Hanoi, Vietnam

Abstract

International integration is an inevitable process, due to the social nature of labor and the relationship between people. Individuals who want to survive and thrive must have relationships and links that form the community. Many communities are linked to each other to form society and national-ethnic groups. Countries are linked together to form larger international bodies and form the world system. The development of each country and ethnicity depends directly on the policies and strategies chosen by its leadership. Starting from the objective trend of globalization, policy integration is a relatively new concept, especially in the context of Vietnam's deeper integration into the world. This article introduces the conceptual approach to policy integration from a theoretical perspective. Hopefully this is an important data, helping policymakers identify solutions to participate and contribute to the country's international integration process.

Keywords: *Policy, policy integration, globalization*

1. Introduction

Since 1960s, "globalization" has become one of the concepts widely used in contemporary social sciences and at the same time one of the most controversial. Globalization is understood as a phenomenon associated with an increase in the number and intensity of mechanisms, processes and activities that promote increased mutual dependence among countries around the world as well as economic and political integration at the global level. Accordingly, globalization overshadows national borders, narrowing spaces across aspects of the world's economic, political, social and cultural life

There are many ways of analyzing policy in the context of globalization, in which policy association and integration are recognized as of top importance in the policy-making process of each country. The world today faces significant challenges, from persistent poverty and severe inequality along with climate change and environmental sustainability, conflict and inequality. It all hinders a joint effort for people to have the opportunity to develop comprehensively. In that context, policy integration is not indispensable without the element of globalization. Social issues seriously harm human development, such as violent labor, terrorism, migration, human trafficking, etc. are against the desire to make the world a better place

With the effect of promoting human development while eliminating the negative side effects, policy integration will expand the opportunities of the current generation but not reduce the opportunities of future generations. Policy integration requires that countries' strategies be agreed and planned in creating job opportunities, ensuring human welfare, and building action towards sustainable development. However, shortly after the G 20-2017 summit took place in Germany. The joint statement demonstrates the views of the group of 20 major economies on various world issues, including financial transparency, food security, cooperation in solving the migrant crisis and fighting terrorism... This reflects on the ongoing challenges facing the world brought about by globalization. In fact, it makes it even more difficult to integrate policy.

Many of today's most pressing societal challenges including terrorism, food security, climate change, involuntary migration, or underemployment (WEF 2015) are crosscutting the boundaries of established jurisdictions, governance levels, and policy domains. While it is recognized that these problems require some level of policy integration, severe integration challenges to policymakers and their institutional surroundings continue to exist (Briassoulis 2004; Geerlings and Stead 2003; Hovik and Hanssen 2015; Jochim and May 2010; Jordan and Schout 2006; Kettl 2006; Tosun and Lang 2013). Examples in the literature are abundant, including the problems of compartmentalization, fragmentation, competing and incoherent objectives, policy under- and overreaction, competing issue-attention, and inconsistent instrument mixes. These integration challenges emerge particularly when complex societal issues are confronted with traditional forms of subsystem policymaking within hierarchic governance systems (Jochim and May 2010; May et al. 2006). In these governance systems (sub-)sectoral policy is made by relatively stable actor configurations, each of which is characterized by specific sets of associated interests, belief systems, and problem perceptions (Baumgartner and Jones 2009; Sabatier and Jenkins-Smith 1993). Differences between subsystems generally do not allow for the coherent or holistic approaches that are needed to satisfactorily deal with problems of a cross-cutting nature (Jochim and May 2010). Rhodes (1991: 212) therefore aptly characterized the governance of these 'cross-cutting problems' through sectoral subsystems as resulting in 'policy messes.' What makes the governance of cross-cutting problems even more messy is that many are 'wicked'; in addition to cross-scale dynamics, these problems involve high degrees of ambiguity, controversy, uncertainty, and deadlocked interaction patterns (Rittel and Webber 1973; Termeer et al. 2015).

To overcome these integration challenges, governments and international organizations have introduced various initiatives to stimulate cross-sectoral policy integration between subsystems. Many of these initiatives, such as joined-up-government and whole-of-government, were developed as an answer to New Public Management (NPM) principles that had further worsened governance systems' abilities to deal holistically with cross-cutting policy problems (Christensen and Lægreid 2007; Halligan et al. 2011). Various scholars argue that it is somewhat surprising that this range of governance initiatives has not yet led to a general theory of policy integration in the political sciences (Geerlings and Stead 2003; Lafferty and Hovden 2003; Tosun and Lang 2013). Instead, the governance of cross-cutting policy problems has been studied through a plethora of approaches and schools of thought, all of which have distinct backgrounds and foci but also share considerable overlap (for overviews, see: Geerlings and Stead 2003; Tosun and Lang 2013).

This article tries to approach the concepts, theories and views of policy integration while reviewing and comparing the policy integration of scholars from an overview of foreign documents. With the aim of contributing to improving understanding of the term policy integration - an important tool for Governments to participate in the planning process and specially to coordinate policy in the face of the current trend of globalization

2. Method

Our aim in this paper is to theorize and bring some conceptual convergence in the debate on policy integration for the governance of cross-cutting policy problems. The concept of 'policy integration' was first used by Arild Underdal (1980) in the context of integrated marine policy. He argues that an 'integrated policy' is one in which the 'constituent elements are brought together and made subject to a single, unifying conception' (ibid.: 159). After his publication, the notion has primarily been used in the context of sustainable development, where it is referred to as Environmental Policy Integration (EPI) (e.g., Jordan and Lenschow 2010; Lafferty and Hovden 2003; Runhaar et al. 2014), and, more recently, as Climate Policy Integration (CPI) (e.g., Adelle and Russel 2013; Dupont and Oberthür 2012; Nilsson and Nilsson 2005). The principle of policy integration, however, remains the same: The objective of EPI is to incorporate, and, arguably, to prioritize, environmental concerns in non-environmental policy domains,Footnote1 with the purpose of enhancing environmental policy outcomes.

Whereas much of the early EPI literature understands the concept as a governing 'principle' or desired policy outcome, more recently scholars have directed their attention toward the ways in, and extents to which, EPI has become adopted within various political systems and policy processes, and the factors that facilitate or hinder this adoption (for an overview of this literature, see: Jordan and Lenschow 2010). These recent studies mark the shift toward a more processual approach to policy integration, i.e., one that proceeds beyond studying whether EPI has been implemented or not toward the dynamics and reasons behind (dis)integration. However, as Adelle and Russel (2013) put it, existing typologies have been mainly used to evaluate progress toward EPI (for example in: EEA 2005; Jordan and Schout 2006; Mickwitz et al. 2009), rather than approaching integration as an inherently dynamic concept in itself (i.e., as a derivative of the verb 'to integrate'). As a result, integration just comes in one flavor: It is a desired state that is reached, or else we do not speak of policy integration at all. In this paper, we aim to reconceptualize policy integration by adopting a processual understanding of integration. The shift from a relatively static (desired) outcome centered approach toward a differentiated processual understanding of integration raises interesting questions about when integration is fully realized, what elements constitute integration processes, and how these may develop over time, inter-alia. To address these questions coherently and to align integration studies with adjacent theories on policy dynamics, we propose a conceptual framework that unpacks the notion of policy integration (Hogan and Howlett 2015). We thereby view policy integration as a multi-dimensional and 'ongoing process' (EEA 2005; Jordan and Schout 2006; Keast et al. 2007). This differentiated view recognizes that policy integration '…potentially has many various aspects which may not always 'move' in parallel or at the same speed' (cf. Bauer and Knill 2012: 31). Through this pursuit, the framework aims to contribute to the advancement of the study of policy integration theory in the context of globalization.

3. Results

Having elaborated the four starting principles of our processual approach to policy integration, we can now define the concept. We define policy integration as an agency-driven process of asynchronous and multi-dimensional policy and institutional change within an existing or newly formed governance system that shapes the system's and its subsystems' ability to address a cross-cutting policy problem in a more or less holistic manner. Tracking such a process in a systematic manner requires a more concrete conceptualization of the various dimensions of integration. The goal of the remainder of the paper is to set out these dimensions.

3.1. Policy frame

The last remark is particularly relevant for the first dimension of policy frame, which has generally been used to refer to competing or dominant problem definitions of societal problems in public policy debates (Baumgartner and Jones 2009; Schön and Rein 1994). Policy frames have hereby been shown to have predictive value regarding public support for and decisions about policy alternatives (Lau and Schlesinger 2005; Roggeband and Verloo 2007). Here, we follow a narrower interpretation of policy frame and concentrate on how a particular problem is perceived within a given governance system. In particular, this dimension is about whether a cross-cutting problem is recognized as such and, if so, to what extent it is thought to be requiring a holistic governance approach (Peters 2005). Importantly, the policy frame here entails the problem definition and governance understanding that is dominant among the governance system's macropolitical venues and decision-makers. This dominant problem definition may deviate from whether and how the problem is perceived in individual policy subsystems ("Subsystem involvement" section). The absence of a policy frame that fosters a common governance approach can pose serious risks. Gieve and Provost (2012) for example show how the lack of awareness and promotion of the need to coordinate between monetary and regulatory policy subsystems resulted in the collapse of the U.S. subprime mortgage market and eventually in the 2007–2009 financial crises.

The more specific policy frame we discern, focusing on the elements of cross-cuttingness and holistic governance, is embedded within a broader frame. The sociopolitical mechanisms that influence the continuity and change of these broader policy frames have been studied extensively and include focusing events, policy entrepreneurship, and interest mobilizations (Baumgartner and Jones 2009; Zahariadis 2007). In addition, the policy frame is informed by the administrative culture of a governance system. Some administrative cultures have hereby been shown to be more open toward integration than others and this differs across countries and issues (Hoppe 2010). For example, Anglo-Saxon countries are more likely to adopt integrative approaches compared to Napoleonic countries (6 2004).

An important methodological side-note is that policy frames are generally not straightforward to observe. The cognitive and normative ideas that constitute frames are sometimes articulated in a foundational document or statement, but they eventually become taken-for-granted elements (Rayner and Howlett 2009) and, as a result, are not easily identifiable (for a discussion of methodologies, see: Verloo 2005).

We distinguish four manifestations of the policy frame in policy integration processes, which are presented in the following Table 1.

Table 1 Manifestations of policy frame

Low amounts of policy integration ⟷ High amounts of policy integration

Policy frame	The problem is defined in narrow terms within the governance system; the cross-cutting nature of the problem is not recognized and the problem is considered to fall within the boundaries of a specific subsystem. Efforts of other subsystems are not understood to be part of the governance of the problem. There is no push for integration	There is awareness that the policy outputs of different subsystems shape policy outcomes as well as an emerging notion of externalities and do-no-harm. The problem is still predominantly perceived of as falling within the boundaries of a particular subsystem. There is no strong push for integration	As a result of increasing awareness of the cross-cutting nature of the problem, an understanding that the governance of the problem should not be restricted to a single domain has emerged as well as associated notions of coordination and coherence	General recognition that the problem is and should not solely be governed by subsystems, but by the governance system as a whole. Subsystems are desired to work according to a shared, 'holistic' approach, which is particularly recognized within procedural instruments that span subsystems

Source: Toward a processual understanding of policy integration.Howlett, M. (2007)

3.2. Subsystem involvement

The second dimension of policy integration is subsystem involvement. This dimension captures the range of actors and institutions involved in the governance of a particular cross-cutting policy problem. The rise of a cross-cutting problem on the political agenda is often followed by an increase in the number of subsystems that are formally or informally involved (cf. Peters and Hogwood 1985). This has been shown to be particularly the case when two or more subsystems share beliefs and functional overlap (Zafonte and Sabatier 1998). Actors within subsystems often play an active entrepreneurial role in involvement by trying to expand their subsystem's jurisdiction over such broad issues (Jones and Strahan 1985). These expansions of jurisdictions are not only relevant from the perspective of who decides what, they also affect the overarching policy frame that was discussed in "Policy frame" section (Baumgartner and Jones 2009).

It is hereby important to note that the exact boundaries of subsystems may be difficult to determine, because they are analytical constructs rather than firm demarcations (Nohrstedt and Weible 2010). However, it is generally possible to identify relatively stable groups of actors and institutions involved in making a specific policy (Koppenjan and Klijn 2004; Sabatier 1988). In addition, it is not necessarily entire subsystems that are raising or addressing an issue. Sometimes, individuals, or groups of actors within a subsystem may draw attention to a particular concern and as such come to function as policy entrepreneurs (Jochim and May 2010). By redefining a problem as a cross-cutting policy problem, these actors may realize the incorporation of the problem within a subsystem, resulting in a broadening of the subsystems involved in the governance of the problem.

The first indicator consists of which subsystems are involved in the governance of the cross-cutting issue. Subsystems are considered to be involved when they explicitly address a particular problem within their policy process—thus when they label policy efforts, i.e., activities involving agenda-setting, preparatory debates, policy design, or internal and external communication, inter-alia, in terms of the problem—regardless from whether these efforts substantially contribute to addressing the problem or not (Dupuis and Biesbroek 2013). The engagement of subsystems is thus determined by the extent to which subsystems consider a particular issue to be of their concern as well as the recognition of the issue's cross-cutting nature and governance implications thereof. A good illustration of how such beliefs within subsystems can change over time is the adoption of fisheries concerns within EU development cooperation policies. For a long time, the potential role of fisheries for improving livelihoods and food security had been overlooked, until some policy entrepreneurs within the development cooperation and fisheries subsystems realized that mutual synergies could be realized (Candel et al. 2015).

Apart from those subsystems that are involved, it is important to account for those that are not yet but could be (Dupuis and Biesbroek 2013; Sabatier 1988). Drimie and Ruysenaar (2010) for example show how the impact of South Africa's Integrated Food Security Strategy remained limited due to the failure to include subsystems other than the agricultural subsystem. As a result, the implementation of the strategy was dominated by agricultural policy efforts, while matters of health, nutrition, access, and social inequality remained largely unaddressed. Involvement of other subsystems could have led to new information, perspectives, and resources (cf. Jack 2005). The indicator can therefore best be assessed through a proximity-to-target measurement, determining how many of the potentially involved subsystems are involved.

The second indicator involves the density of interactions between subsystems in a network configuration. As not all subsystems are involved to the same extent, a distinction can be made between subsystems in which a problem is primarily embedded, and subsystems that are only indirectly involved in a problem's governance (cf. Orton and Weick 1990). For relatively higher amounts of policy integration we would, apart from a larger number of subsystems involved, expect a set of dominant subsystems, i.e., subsystems characterized by high intentionality, that engage in frequent interactions with each other, while maintaining less frequent interactions with a set of less engaged subsystems. A possible manner of measuring these interactions lies in determining how often subsystems, e.g., departments, have the lead in developing policy proposals regarding a particular problem and how often other subsystems have an input through procedural instruments such as impact assessments and inter-departmental taskforces and consultations (for example as in: Hartlapp et al. 2012). Using these two indicators, we distinguish four possible manifestations of subsystem involvement within a policy integration process, ranging from low to high integration, see Table 2.

Table 2 Manifestations of subsystem involvement

	Low amounts of policy integration ⟷			High amounts of policy integration
Subsystems involved	One dominant subsystem, which governs the issue independently Formally, no other subsystems are involved, although they may be in terms of substantial, non-	Subsystems recognize the failure of the dominant subsystem to manage the problem and externalities which results in the emergence of	Awareness of the problem's cross-cutting nature spreads across subsystems, as a result of which two or more subsystems have formal responsibility for	All possibly relevant subsystems have developed ideas about their role in the governance of the problem. The number of subsystems that are formally

	intentional policymaking	concerns about the problem in one or more additional subsystems	dealing with the problem	involved is equal to or higher than at previous manifestations, but complemented with a less engaged set of alternative subsystems
Density of interactions	No interactions	Infrequent information exchange with dominant subsystem	More regular and formal exchange of information and coordination, possibly through coordinative instruments at system-level	High level of interaction between formally involved subsystems, that maintain infrequent interactions with a less engaged set of subsystems

Source: Toward a processual understanding of policy integration. Howlett, M. (2007).

3.3. Policy goals

Each governance system and associated subsystems have several short-, medium-, and long-term policy goals to pursue, some of which are directly impacting, or are impacted by, the cross-cutting problem. A policy goal here refers to the explicit adoption of a specific concern within the policies and strategies of a governance system, including its subsystems, with the aim of addressing the concern. We recognize that policies can be rather abstract and set out strategic lines, or take the shape of concrete programs entailing specific interventions (Howlett and Ramesh 2003). The dimension of policy goals, here, focuses on two aspects: (1) the range of policies, both at system-level and within subsystems, in which (concerns about) a cross-cutting problem is adopted as a goal, and (2) the coherence between the consequential diversity of policy goals.

First, as higher degrees of integration involve a relatively high density of subsystems, they also encompass a broader range of policies. Ideally, concerns about a cross-cutting problem would be adopted as a goal in all these policies. However, our starting principle of asynchronous integration implies that this does not always happen in practice. Here too, a proximity-to-target measure could be used, assessing the number of potentially relevant policies in which these concerns are adopted. Whereas at low degrees of integration we would expect policy goals regarding a cross-cutting problem to be restricted to one or a few domains and associated policies, shifts toward enhanced policy integration are accompanied by a diversification of policy goals across domains (cf. Peters and Hogwood 1985). Stead (2008) provides an example of low integration in terms of policy goals by arguing that the integration of transport policy is hindered by the autonomous and sectoral goal-setting by other subsystems. An example of enhanced integration of policy goals is given by Hustedt and Seyfried (2015), who show how enhanced internal coordination of climate change policies within the European Commission resulted in the adoption of climate change mitigation and adaptation goals in the policies of a number of non-traditional domains, such as energy and maritime affairs.

One of the main integration challenges found in the literature is that there are often fundamental differences in the way in which various policy goals get framed and perceived, also in terms of temporality or geographical scale (Adelle et al. 2009). A second indicator therefore involves the degree of coherence within a governance system vis-à-vis a cross-cutting policy problem (Rayner and Howlett 2009). Coherence can be achieved and measured within a policy domain (May et al. 2006), but for cross-cutting policy problems it is particularly relevant how the goals of various domains and associated subsystems relate to each other. In other words, coherence relates to whether a governance system's policies contribute jointly to—or at least do not undermine—specific objectives (e.g., food security, employment or sustainable development) (OECD 2013: 7). However, the operationalization and measurement of horizontal coherence within a governance system vis-à-vis cross-cutting issues is understudied at best and highly controversial at worst (Nilsson et al. 2012). The progress of policy integration studies will largely depend on whether conceptual and methodological agreements for studying policy coherence can be found. Here, we confine ourselves to a simple binary distinction between strong and weak coherence. Weak coherence exists when attuning of policy goals between subsystems does not or hardly take place. Strong coherence exists when subsystems attune their policy goals to jointly address a cross-cutting problem, which they can do by mitigating externalities, searching for synergies, or even working toward a system-wide 'integrated policy strategy' (Rayner and Howlett 2009). Whereas the first is achieved by 'negative coordination,' i.e., one subsystem formally has the lead in drafting policy proposals and monitors other subsystems for possible negative effects by applying the 'do-no-harm' principle (OECD 2014), the latter two take the shape of 'positive coordination,' i.e., subsystems jointly work together toward a comprehensive approach (Scharpf 1994). A good example of an integrated policy strategy is the sustainable development strategies that many governments have adopted to integrate economic, social, and environmental development objectives (Meadowcroft 2007). Table 3 presents the four manifestations of policy goals associated with relatively stronger or weaker degrees of policy integration.

Table 3 Manifestations of policy goals

	Low amounts of policy integration	⟵	⟶	High amounts of policy integration
Range of policies in which problem is embedded	Concerns only embedded within the goals of a dominant subsystem	Concerns adopted in policy goals of one or more additional subsystems)	Possible further diversification across policy goals of additional subsystems	Concerns embedded within all potentially relevant policy goals
Policy coherence	Very low or no coherence. Occurs when cross-cutting nature is not recognized, or when subsystems are highly autonomous in setting (sectoral) goals	Because of rising awareness of externalities and mutual concerns subsystems may address these to some extent in their goals	Coordinated sectoral goals, which are judged in the light of coherence	Shared policy goals embedded within an overarching strategy

Source: Toward a processual understanding of policy integration. Howlett, M. (2007).

3.4. Policy instruments

The fourth dimension of policy integration consists of the substantive and/or procedural policy instruments within a governance system and associated subsystems. Substantive instruments allocate governing resources of nodality, authority, treasure and organization (Hood 1983) to directly affect the 'nature, types, quantities and distribution of the goods and services provided in society.' Procedural instruments are designed to 'indirectly affect outcomes through the manipulation of policy processes' (Howlett 2000: 413–415). Procedural instruments can also be deployed at a governance system-level, for example to facilitate the coordination between subsystems (Jordan and Schout 2006). Within a policy integration process, we distinguish three types of indicators related to policy instruments for policy integration: (1) subsystems' deployment of instruments, (2) procedural instruments at system-level, and (3) the consistency of substantive and procedural instruments.

First, as higher amounts of policy integration are characterized by a wider range of subsystems involved and of associated policies in which the problem is adopted as a goal, they ideally also include supportive instruments within subsystems' policies to pursue the more or less coherent sets of goals. In other words, we would expect a diversification of instruments addressing the problem across subsystems' policies. These instruments can be both substantive or procedural, depending on the nature of the problem and the governance philosophies within a subsystem (Howlett 2009).

Second, enhanced amounts of policy integration are characterized by the deployment of procedural instruments at governance system-level to coordinate subsystems' policy efforts and to enforce and safeguard the consistency of the instrument mix as a whole (Jordan and Lenschow 2010). Examples of such instruments include overarching plans and strategies, constitutional provisions, legislative standards setting, overarching funding programs and financial incentives, consultation mechanisms, impact assessments, interdepartmental working groups, and (green) cabinets, inter-alia (e.g., Adelle et al. 2009; EEA 2005; Feiock 2013; Jacob and Volkery 2004; Jacob et al. 2008; Karré et al. 2013; Ross and Dovers 2008). At the highest degree of integration, organizational procedural instruments will take the shape of a boundary-spanning structure or overarching authority that oversees, steers and coordinates the problem as a whole (Jochim and May 2010; Lafferty and Hovden 2003). Jochim and May (2010) provide the example of U.S. Community Empowerment regime in the 1960s and 1970s, in which subsystems of economic development, housing, education, employment, social welfare, and transportation worked together to realize urban renewal. This mutual effort was facilitated by the creation of overarching inter-agency review teams. Pelkonen et al. (2008) give another example of a boundary-spanning structure by showing how the Finnish Science and Technology Policy Council, a governmental advisory body, fosters the integration of science and technology policies between domains.

Third, higher amounts of integration are characterized by a stronger consistency of policy instrument mixes, i.e., the sets of instruments that subsystems have developed incrementally in an ad hoc fashion over a longer course of time (Gunningham and Sinclair 1999; Howlett and Rayner 2007). This consistency is relative to the (more or less) coherent goals that a set of instruments is meant to help procure (Howlett 2009; Howlett and Rayner 2007; Rayner and Howlett 2009). Thus, an appropriate instrument mix effectively realizes certain integration objectives (Adelle and Russel 2013). As with policy goals, the consistency of instrument mixes should, in case of a cross-cutting policy problem, be assessed for the governance system as a whole, thus between subsystems. It is hereby not only the types of instruments that matter, but also their magnitude and whether they are targeted to the appropriate audiences (EEA 2005). Although the public policy literature has provided various arguments for why inconsistencies may arise and how they could be overcome (on paper) (e.g., Gunningham et al. 1998; Rayner and Howlett 2009), as with coherence an univocal and agreed-on operationalization of the consistency of instrument mixes is lacking. For the sake of our theoretical argument, it suffices to distinguish between weak and strong consistency. Within strong consistency, a further distinction can be made between negative coordination of instruments, i.e., mitigating the externalities of subsystems' instruments, and positive coordination, i.e., seeking synergies between instruments or even developing a unified instrument mix at system level (cf. Scharpf 1994). The latter has also been referred to as a ‘new governance arrangement’ and involves the replacement of subsystems’ existing instrument mixes that resulted from an incremental process of policy layering with an entirely new and consistent instrument mix (Howlett and Rayner 2006, 2007).

Table 4. Manifestations of policy instruments

Low amounts of policy integration ⟷ High amounts of policy integration

Range of subsystems’ policies that contain policy instruments	Problem only addressed by the substantive and/or procedural instruments of a dominant subsystem	As a result of increased awareness of externalities one or more additional subsystems (partially) adapt their instruments to mitigate negative effects	Possible further diversification of instruments addressing the problem across subsystems	Instruments embedded within all potentially relevant subsystems and associated policies
Procedural instruments at system-level	No relevant procedural instruments at system-level	Some procedural information sharing instruments at system-level)	Increasing number of system-level procedural instruments that facilitate subsystems to jointly address the problem	Broad range of procedural instruments at system-level, including boundary-spanning structures that coordinate, steer and monitor subsystems’ efforts
Consistency	No consistency. Sets of instruments are purely sectoral and result from processes of policy layering	Subsystems consider externalities of sectoral instrument mixes in light of internal and inter-sectoral consistency	Subsystems seek to jointly address the problem by adjusting and attuning their instruments. Consistency becomes an explicit aim	Full reconsideration of subsystem instrument mixes, resulting in a comprehensive, cross-subsystem instrument mix that is designed to meet a set of coherent goals

4. Discussion and Conclusion

In the previous sections we have presented a new conceptual lens to study policy integration processes. It is important to note that our framework should first and foremost be seen as a heuristic that may serve as a starting point for more refined policy integration studies. We acknowledge that we have touched upon a broad range of concepts and scholarly debates within the public policy literature; all of which deserve, and fortunately receive, more lengthy elaborations in themselves. The primary goal of this paper has been to synthesize fragmented accounts of policy integration into a single, more refined framework. This inevitably has left open important questions about individual concepts and ontologies, for example about how to study policy coherence ("Policy goals" section) and consistency ("Policy instruments"). We hope this paper will be an impetus to addressing such loose ends within the policy integration literature. In addition, the ambition of this paper has been to draw policy integration out of the domain of environment and to make it a subject of general theorizing in the political sciences as more and more problems are perceived as "wicked" and cross-cutting. Although debates on EPI in the early 2000s have certainly set the agenda and have provided a firm foundation for thinking about integration, expanding the integration debate and agenda to other domains and (associated) scholarly communities could provide new perspectives on mechanisms of stability and change, interactions and possible trade-offs between parallel integration processes, and normative implications of (the absence of) policy integration.

The relevance of the framework to policymakers and political leaders lies in three contributions. First, the framework offers an assessment tool to evaluate current degrees of policy integration in the governance of a particular cross-cutting problem. In addition, it can be used for comparing these degrees over time, between issues, or between governance systems to address the normative question whether integrative progress is enough. A second contribution is the above argument that these actors should not oversee the merits of lesser degrees of policy integration. Thirdly, the framework shows that actors should think about the four dimensions as conditions that they need to invest in simultaneously, if they want to realize a mutually supportive interplay across the four dimensions that enable full policy integration. The challenge then is to overcome the asynchronous nature of most integration processes by investing sufficient capacity and resources, including will, into synchronization efforts. For those out of government office, the framework may be a helpful tool to monitor whether political promises to invest in more integrative approaches are kept and, consequentially, to hold decision-makers accountable to the commitments they make. Such accountability measures may be the first step toward integration beyond mere discursive levels for a range of issues that lie waiting to be addressed.

OPERATING CASH FLOW AND CORPORATE FINANCIAL PERFORMANCE OF LISTED COMPANIES IN VIETNAM

Dr. Truong Thi Thu Huong

truongthuhuong@tlu.edu.vn

Faculty of Economics and Management, Thuy Loi University, Hanoi, Vietnam

Abstract

The paper investigates the effect of operating cash flow on the corporate financial performance of non-financial companies listed on the stock market in Vietnam, spanning the period from 2009 to 2018. The stuty use the fixed effects model, with panel data. The results show that operating cash flow has a positive effect on operational efficiency which is measured through ROA and ROE. In addition, the results also indicate that asset growth and investment opportunities have a positive effect on business performance. In contrast, the debt ratio has a negative impact on the performance of the business. From which, the paper highlights the importance of cash flow management and provides recommendations for regulators and managers to improve firms' operational efficiency.

Keywords: *Cash flow; Financial performance; Stock market; Investment opportunities.*

1. Introduction

The operational efficiency of the business is an essential financial factor that attracts investors and managers' attention [18]. Induced organizational effectiveness plays a significant role in the company's safety and growth, supporting the company to succeed in the market. Therefore, operational efficiency remains a vital factor that investors consider in making a decision to purchase or sell stocks. Managers, hence, always attempt to detect manners to improve the firm's operational efficiency. From these two perspectives, this research evaluates the factors that influence a firm's operational efficiency - one of the most salient topics in corporate finance.

Cash flow is defined as an "in and out" movement of money in a company or an entity given a certain time [11]. Indeed, cash flow management is a prominent part of the company and will determine the survival of a business. On the one hand, cash flow plays a substantial role in influencing the decision-making process of a company since the company's purpose is to generate positive net cash flow. Besides, enterprises need to manage their cash flow properly to achieve their financial needs while reducing costs and increasing firm performance.

Several researchers have studied the relationship between cash flow and operational efficiency. The test findings are, however, contradictory. A positive connection between cash and performance has been found in particular authors. Adelegan [1] has experimentally analyzed the relationship between cash flow and dividends on the Nigerian stock market. The author uses the ordinary least squares regression method, with 63 companies from 1984 to 1997. The research results show that cash flow affects the change of dividend in the firm. The author also finds a positive and meaningful relationship between the company's cash flow and efficiency. Tsuji [21] studies the revenue and operational efficiency of the electrical equipment sector in the Tokyo stock exchange, applying ordinary least square with annual data from 2009-2011. The findings demonstrate the different relationships between the cash flow and efficiency of the business. Cash flow factors help companies to forecast future stock profits.

The link between cash flow and productivity in hospitals and the media industry in Nigeria was investigated by Frank and James [6]. Pearson's descriptive statistical analyzes and analysis have shown that the link between cash flow and net income is positive and statistically meaningful. The author has since affirmed that the cash flow has an impact on the business output of the company. In the Nigerian stock market, another study was carried out. The research evaluates the cash flow-to-financial output of listed banks in the emerging economies from Ogbonnaya, et al. [16]. The findings show that cash flow in operations has a positive effect on banks ' financial performance. Cash flow from investment and financial activities, by contrast, has a negative but weak effect on the bank's financial performance.

On the other hand, cash flow could have a negative influence on operational efficiency. Hong, et al. [10] examined Chinese listed immobilier companies' relation between free cash flow and financial results from 2006 to 2011. Free cash flow is negatively related to a company's financial performance. However, surplus free cash flow can affect the company's financial results. Ashtiani [3] shows a negative but not significant link between the cash flows, investment efficiency, and financial results of listed companies on the Tehran Börse. Significance of statistics. Whereas, Watson and Wells [23] find the relationship between the cash flow and operating performance was negative and statistically significant. The relationships between profit and cash flow variables in the Iran stock market have been analyzed by Mazloom, et al. [15]. Multi-variable method for analyzing regression using data from 2003 to 2011. The results of the regression indicate a significant negative correlation between firm performance and cash flow.

In Vietnam, Thanh and Ha [22] explore the effect on market performance in Vietnam from banking relations. The author uses a multiple regression analysis based on data from 465 Vietnamese companies from 2007 to 2010. Research shows that the efficiency of business decreases with increased banking ties. Moreover, the study shows that cash flow is inversely linked to the company's revenue-to-equity ratio. Cash flow, therefore, has an adverse impact on the efficiency of Vietnamese-listed companies.

From the above reviews, a variety of empirical studies have been conducted worldwide and in Vietnam to determine the effect of cash flow on firm operational efficiency. However, their research results are contradictory and distinct. The results of empirical studies are different between countries and industries. The purpose of this article, hence, to investigate the effect of cash flow on firm operational efficiency in Vietnam.

The study based on agent theory and free cash flow theoryAgency theory focuses on the conflict between managers and shareholders [9]. Practically, Chief executive officers are not always the same as the chairman, and managers are not members of the board. Therefore, managers do not adhere to shareholders' interests and thus take steps to the detriment of shareholders or devalue the enterprises [20]. Shareholders pay the costs of the agency in conjunction with supervising managers, and these costs of the agency represent a possible expense because of a conflict of interests between the shareholders and public managers

Consistent with agency theory, the free cash flow hypothesis implies that managers tend to pursue their personal goals and ignore shareholder value when firms have excessive free cash flow [12, 13]. Due to the conflict between managers and shareholders, the chief executive of the firm tends to invest extra cash in new projects despite the low net present value, leading to a deterioration in firm value. Jensen and Meckling [13] followed this hypothesis and then replicated it in Jensen [12]. Following Jensen [12] suggestions, managers are expected to expand resources beyond the optimum scale. The shortage of money would prevent the firm expenditure on inefficient projects [14]. Coincidentally, managers are enforced to participate in foreign markets to increase their resources. Therefore, a company's cash flow can affect the company's operational efficiency. One way to alleviate the effect of free cash flow is by employing debt financing that restrains overinvestment behaviors, implying that this issue might be mitigated through a higher level of debt in the capital structure.

2. Method

2.1. Sample

To examine the effect of cash flow on firm operational efficiency, we collect financial information of 502 listed companies listed in the Ho Chi Minh stock exchange from 2009 to 2018. The sample is restricted by excluding insurance, real estate, securities, and banks because of their different financial reporting systems and a higher leverage level than other sectors [5]. We acquire financial data from the StoxPlus database.

2.2 Models and Variable Construction

In order to analyze the impact of cash flow on the efficiency of Vietnamese stock-market firms, we propose the following models:

$$ROA_{it} = \delta_0 + \delta_1 * Cashflow_{it} + \delta_2 * Firm\ size_{it} + \delta_3 Firm\ growth_{it} + \delta_4 * Market - to - book_{it} + \delta_5 * Firm\ leverage_{it} + \gamma_i + \lambda_t + \epsilon_{it} \quad (1)$$

$$ROE_{it} = \delta_0 + \delta_1 * Cashflow_{it} + \delta_2 * Firm\ size_{it} + \delta_3 Firm\ growth_{it} + \delta_4 * Market - to - book_{it} + \delta_5 * Firm\ leverage_{it} + \gamma_i + \lambda_t + \epsilon_{it} \quad (2)$$

The dependent variable is Firm performance measured by two indicators: returns on assets (*ROA*) and returns on equity (*ROE*), and the main independent variable is the *Firm cash flow* measured by the cash flow from the market divided by the total assets of the company. The control variable in the model includes *Firm size, Market-to-Book, Firm growth*, and *Firm leverage*.

Table 1: Variable construction

ID	Variable name	Abbreviation	Definitions
1	Return on asset	*ROA*	Net income divided by total asset
2	Return on equity	*ROE*	Net income divided by total equity
3	Firm cash flow	*Firm cash flow*	Annual cash flow divided by total assets
4	Firm size	*Firm size*	Ln(total assets)
5	Asset growth	*Firm growth*	Annual changing ratio: Firm growth =$(TA_t-TA_{t-1})/TA_{t-1}$
6	Market to book ratio	*Market-to-Book*	Market value divided by book value
7	Firm leverage	*Firm leverage*	Total leverage divided by total assets

The fixed effects model (FEM) and random effects model (REM) were used to perform regression analysis. First, the author estimates the above two models with the FEM and REM. Then, the author uses Hausman test to compare between FEM or REM model. Hausman test results show that the fixed effects model (FEM) is more suitable than the random effects model (REM). Therefore, the study uses the FEM with the STATA to test the models.

Next, We investigate the autocorrelation phenomenon, heteroskedasticity, and multicollinearity in the models. The Wooldridge test (with the xtserial command) is used to test for autocorrelation. The analysis of variance change in the FEM model is done with xttest3 command. To check the phenomenon of multicollinearity, the author used the vif command in STATA.

Table 2: Validity test

Panel A: Autocorrelation test

Wooldridge test for autocorrelation in panel data H_0: no first-order autocorrelation	
Model 1	**Model 2**
F(1, 542) = 140.465 Prob > F = 0.0000	F(1, 542) = 99.369 Prob > F = 0.0000

Panel B: Heteroskedasticity test

Modified Wald test for groupwise heteroskedasticity in the fixed effect regression model H_0: sigma(i)^2 = sigma^2 for all i	
Model 1	**Model 2**
chi2 (601) = 5.9e+35 Prob>chi2 = 0,0000	chi2 (502) = 2.4e+33 Prob>chi2 = 0,0000

Panel C: Multicollinearity test

	VIF	**1/VIF**
Firm cash flow	1.34	0.74
Firm size	8.29	0.14
Firm Market-to-book	1.40	0.71
Firm growth	1.46	0.68
Firm leverage	7.38	0.13
Mean VIF	4.27	

Source: Author's calculations

The results of the Wooldridge test (Panel A) and the Modified Wald test (Panel B) show that the two models have the phenomenon of autocorrelation and heteroskedasticity. The results of the VIF magnification coefficients of the independent variables are less than 10, so there is no multicollinearity phenomenon in the model. Therefore, the cluster and robust command in STATA is used to correct the autocorrelation and heteroskedasticity in the FEM model.

3. Results

3.1. Descriptive statistics and correlation analysis

The mean, standard deviation, minimum value, and maximum value of the variables in the research model are described in Table 3.

Table 3: Summary statistics

	Obs.	Std. Dev.	Mean	Minimum	First quartile	Median	Third quartile	Maximum
ROA	5584	0.07	0.07	-0.07	0.02	0.05	0.10	0.30
ROE	5584	0.13	0.14	-0.17	0.05	0.13	0.21	0.53
Firm cash flow	5531	0.14	0.06	-0.27	-0.03	0.05	0.13	0.42
Firm size	5606	1.43	12.98	10.01	12.04	12.89	13.91	16.49
Firm growth	5003	0.32	0.16	-0.26	-0.02	0.09	0.24	1.55
Market-to-Book	4555	0.58	0.73	0.13	0.34	0.55	0.91	2.82
Firm leverage	5606	0.23	0.50	0.06	0.32	0.52	0.68	0.89

Source: Author's calculations

The mean, standard deviation, minimum value, and maximum value of the variables in the research model are described in Table 3. The table shows that the average *ROA* value for the Vietnam stock market of non-financial firms is 7.00 percent for the period 2009 to 2018, while the mean *ROE* value is 14 percent. That means that the average profit after tax is 7 dongs when the company spends 100 dongs of assets, and the most considerable gain is 30. Additionally, the total net profit of 100 VND invested in the company would be VND 14 on average and record 53. The average value of the *Firm cash flow* statistics is 0.06, which means the average operating cash flow for non-financial companies listed on the stock exchange of Vietnam in the 2009-2018 period is 6% of their total company assets. The mean value of the variable *Firm leverage* is 0.50, meaning that on average, firms use about 50% of borrowed capital to build the company's assets.

Table 4 represents the correlation between variables in the model (1) and (2) as follows:

Table 4: Pairwise correlations

Panel A: Correlation matrix for the first model

Variables	*(1)*	*(2)*	*(3)*	*(4)*	*(5)*	*(6)*
(1) ROA	1.000					
(2) Cash flow	0.373***	1.000				
(3) Firm size	-0.071***	-0.014	1.000			
(4) Firm growth	0.186***	-0.194***	0.084***	1.000		
(5) Market-to-book	0.329***	0.149***	0.164***	0.109***	1.000	
(6) Firm leverage	-0.436***	-0.193***	0.330***	0.064***	-0.140***	1.000

Panel B: Correlation matrix for the second model

Variables	*(1)*	*(2)*	*(3)*	*(4)*	*(5)*	*(6)*
(1) ROE	1.000					
(2) Cash flow	0.286***	1.000				
(3) Firm size	0.060***	-0.014	1.000			
(4) Firm growth	0.249***	-0.194***	0.084***	1.000		
(5) Market-to-book	0.266***	0.149***	0.164***	0.109***	1.000	
(6) Firm leverage	-0.037***	-0.193***	0.330***	0.064***	-0.140***	1.000

Note: This table reports the correlation matrix between variables. The main dependent variables are *ROA* and *ROE* measured by net income divided by total assets and total equity, respectively. Control variables are *Firm size, Firm growth, Market-to-book,* and *Firm leverage*. Significance at the 10%, 5%, and 1% level is indicated by *, **, *** respectively.

As can be illustrated from Panel A and Panel B, the results of the correlation coefficient matrix between pairs of variables have absolute values less than 0.8, so there is no multicollinearity issue between the variables in the model. Therefore, eliminating research variables is not necessary, and the model is rational.

3.2. The impact of cash flow on firm operational efficiency

In this section, we investigate the effect of cash flow on firm operational efficiency. The primary dependent variables are the Return on assets and the Return on equity. The results are illustrated in table 5 below:

Table 5: The effect of cash flow on firm operational efficiency

Dependent variable	ROA	ROE
Cash flow	0.058***	0.105***
	(0.008)	(0.016)
Firm size	-0.006	-0.002
	(0.004)	(0.008)
Firm growth	0.055***	0.104***
	(0.004)	(0.009)
Market-to-book	0.02***	0.04***
	(0.003)	(0.005)
Firm leverage	-0.152***	-0.146***
	(0.013)	(0.025)
Constant	0.212***	0.233**
	(0.043)	(0.092)
Observations	4325	4325
R-squared	0.305	0.248

Note: Significance at the 10%, 5%, and 1% level is indicated by *, **, *** respectively.

Source: Author's calculations

- ***Firm cash flow***

The *Firm cash flow* variable coefficient (δ_1) in model 1 is 0.058, at a significant level of 1%. The coefficient of the cash flow variable in model 2 is 0.105 at 1% of significance. Therefore, operating cash flow has a positive and statistically significant impact on two indicators that measure the company's performance, namely return on asset and return on equity of non-financial companies listed on the stock market in Vietnam. It means that, as the company's operational cash flow ratio rises, operational efficiency always improves. Adelegan [1], Frank and James [6], and Ogbonnaya, Ekwe and Uzoma [16] have considered this analysis. The above relationship, however, contrasts with the results found in the Iran stock market of Ashtiani [3] on the Tehran Stock Exchange, Watson and Wells [23], Mazloom, Azarberahman and Azarberahman [15] with the dependent equity income variable, Hong, Shuting and Meng [10] on the Chinese listed real estate companies, Tsuji [21], the Tokyo Stock Exchange (2013).

➢ ***Firm size***

Coefficients of the *Firm size* variable in model 1 and model 2 have negative values of 0.006 and 0.002, respectively. Nevertheless, firm size has no impact on the business performance of non-financial companies listed on Vietnam's stock market. Some author found no correlation between firm size and operational efficiency, such as Ha-Brookshire [8] found no evidence of the impact of firm size variable. Thus, it can be seen that the results on the effect of scale on operational efficiency are not consistent among studies, depending on the characteristics of each different industry.

➢ ***Market-to-Book***

The coefficient of the market-to-book variable in model 1 and model 2 are both positive values: 0.02 and 0.04 at 1% of significance correspondingly. That means investment opportunities have a strong statistical positive effect on income on both assets and equity of non-financial companies listed on Vietnam's stock market.

➢ ***Firm growth***

The growth rate variable - *Firm growth* has positive Beta coefficients (0.055 and 0.104) and has a very high statistical significance of 1% in the two above models. Therefore, if the company has a high growth rate, its operational efficiency will also increase. Thus, investment opportunities and growth rates have a positive impact on the operational efficiency of non-financial companies listed on Vietnam's stock market. This result shows that companies with more investment opportunities and are in a period of high growth are also more efficient than firms with fewer investment opportunities and low growth. This result is similar to many studies in the world, such as Amidu [2], Onanjiri and Korankye [17], and Gill, et al. [7].

➢ ***Firm leverage***

The coefficient of the debt ratio variable (*Firm leverage)* in model 1 and model 2 are both negative (-0.152 and -0.146), with high statistical significance at 1%. Therefore, the debt ratio has a negative impact on the operational efficiency of the firm. Thus, with the non-financial companies listed on Vietnam's stock market using more debt, their operational efficiency decreases. The same result is also found in the study of Amidu Amidu [2], Dogan and Topal [4] with the dependent variable of ROA. However, some studies have found a positive effect of debt use on operational efficiencies such as Sunday & Partners (2015) with the dependent variable ROA, Priya and Nimalathasan [19], and Dogan and Topal [4] with the dependent variable ROE.

4. Discussion and Conclusion

The article examined the influence of operating cash flow on the performance of non-financial companies listed on the Vietnam stock market in the period 2009-2018. The results have shown that operating cash flow has a positive effect on operating performance, measured through two indicators of return on assets (ROA) and return on equity (ROE). Besides, investment opportunities and growth rate of total assets also have a positive effect on the performance of the company. In contrast, debt ratio have a negative effect on performance.

The company's operational efficiency is positively correlated with the ratio of operating cash flow to total assets. So if the company wants to increase its operational efficiency, it is necessary to control the proportion of cash flow operating in the company. Companies should consider increasing operating cash flows as their total assets increase. Besides, investment opportunities and growth of the company are also important indicators that have a significantly positive impact on operational efficiency. However, according to the life cycle theory, these two indicators will change according to different development cycles of the company. In the early stages and growth phases, a company often has various excellent investment opportunities to expand its customer base and reach potential markets. Therefore, the company should maintain higher amount of cash to carry out investment and development activities, increase assets, thereby helping to improve operational efficiency. When the stage is ripe, investment opportunities decrease, and competition in the market increases, leading to a decrease in efficiency in using assets and equity of enterprises. In that case, the company should reduce the amount of cash by distributing it to its shareholders, like paying a cash dividend. The above move can help stabilize investor sentiment when receiving dividends from businesses. Finally, to improve operational efficiency, companies need to limit the use of debt. Using too much debt will have a negative effect on operational efficiency. Therefore, managers need to calculate to determine the optimal debt structure for each enterprise to improve operational efficiency.

Abstract

The authors carried out a research project on the impact of acquisitions on the financial performance of Vietnamese listed companies. The sample includes 20 non-financial companies listed on the Hanoi Stock Exchange (HNX) and Ho Chi Minh City Stock Exchange (HSX) from 2010 to 2019. Firstly, the results have shown that acquisitions have a negative effect on profitability, particularly ROA and PM of Vietnamese non-financial companies and at the same time, raise pessimistic views to the debt-to-equity ratio. However, the age of the acquisitions show little to none effects on the aforementioned. Finally, acquisitions' impacts on the liquidity of Vietnamese non-financial firms are negligible, despite margins, leverage, and firm size all positively affect the company liquidity. Thereby suggesting that by commencing acquisitions, Vietnamese companies can afford to save cost of debt and expenses.

Keywords: *Acquisitions, financial efficiency, profitability, liquidity, leverage, Vietnam.*

1. Introduction

The world has a tendency to move towards economic globalization as a result of the impact of trade in general and particularly, free trade. Mergers and acquisitions (M&A) are one of the outstanding activities that catch up with this globalization trend, which have had high growth prospects around the world in recent years. Large and well-known deals have taken place in the banking sector (ABN Amro & Barclays PLC, 2007), the technology sector (Antel, TPG Capital & Goldman Sachs), and the marketing sector of technology companies (Salesforce & Alibaba, 2018). There have been many studies around the world regarding the topic of M&A, notable mentions are (Singh & Mogla, 2010) comparing the performance of the company before and after the merger of the target companies in India, (Chang & Tsai, 2012) studying on the long-term performance of consolidated companies over the period of 1990 to 2007 or (Gugler, Mueller, Yurtoglu & Zulehner, 2003) contributing a large international assessment of the impact of mergers on profits from 1981 to 1998. In Vietnam, M&A activities and their impacts have also been studied by a few authors, one of the highlights is "Analysis of the impact of mergers and acquisitions activities on the performance of listed companies." by Nguyen Thanh Nhan (2019).

During the current economic crisis related to the issue of maintaining business operations, especially concerning the survival of businesses when the COVID-19 pandemic occurred and has had a great impact on the world economy. The emerging economy of Vietnam in particular, which comprises mostly small and medium-sized enterprises, will be more susceptible to the negative impacts of this threat. Therefore, M&A are considered to be able to create waves of corporate restructuring, which will contribute to the improvement of structure, openness, connection, and the ability to participate in the global supply chain individually of each company in particular and the economy in general. Especially, in the context that Vietnam is a country with developing economy aiming to join the world globalization trend. According to Quartz, the globalization situation in Vietnam is quite good, as evidenced by the fact that in 2017, Vietnam's trade-to-GDP ratio reached more than 200%. Mergers and acquisitions activities have attracted more attention since the inception of the Enterprise Law in 1999 and have become more active in recent years with a rapid growth in both quantity and scale. According to the Vietnam M&A Market Overview report in 2018, in the past 10 years, specifically from 2009 to 2018, the country had 4,353 M&A deals with a total value of 48.8 billion USD. In 2019, there were 10 outstanding M&A deals, focusing on consumer goods, retail, finance, banking, and real estate.

Inheriting the research of Abdul Rashid and Nazia Naeem (2016), we carry out the study to analyze the impact of acquisition activities on the financial performance of non-financial enterprises, an ongoing activity with more popularity than mergers in Vietnam. Specifically, throught the assessment of the impact of acquisitions on important financial ratios indicating the financial performance of the companies such as *Profitability Ratios* (Return on Assets and Profit Margin), *Leverage Ratios* (Debt-to-Equity Ratio and Interest Coverage Ratio) and *Liquidity Ratios* (Current Ratio and Quick Ratio). Some related research results are worth mentioning, such as the study of Chatfield, Dalbor, Ramdeen and Harrah (2011) on the financial situation in the form of abnormal profits, from which results showed that the target audience in the restaurant has received considerably positive returns from the aggregate benefits of the acquisition; in addition, Leepsa and Mishra (2012) examined the effects on post-acquisition financial performance in manufacturing firms in India. Their results showed that the financial performance of the company after the acquisition has improved in terms of liquidity, which is the current ratio, quick ratio and return on assets, but most of the results are not statistically significant. .

We conduct the research with the desire to give managers a clearer and more objective view of the impact of acquisitions in order to propose better business and restructuring methods and policies timely and precisely for the state of the business in the current epidemic context. At the same time, the research results can contribute to the those research documents regarding the impact of M&A on the Vietnamese market to help investors identify the market and make effective investment decisions, which is beneficial for individual investors in particular and corporate strategy managers in general.

2. Methodology

2.1. Data

The study uses data of 20 non-financial companies listed on Hanoi Stock Exchange (HNX) and Ho Chi Minh City Stock Exchange (HSX) during the period from 2010 to 2019. The data extracted from the financial statements of these companies is collected on web portals such as: https://vietstock.vn/, https://cafef.vn/, https://www.stockbiz.vn/, https://www.cophieu68.vn/. Also, we remove the companies which lack of information during the research period and financial companies from our sample since the specific characteristics of these types of companies may falsify the research results, in other words, we select non-financial listed companies for our research sample. Besides, we use 2-year pre and post-acquisition average of financial ratios in our empirical analysis so that our priorities are the companies which made the acquisitions in the period from 2012 to 2017.

2.2. Research models

The study examines the change of the following ratios capable of assessing the financial performance of the companies:

i. The Profitability Ratios include Return on Asset (ROA) and Profit Margin (PM);

ii. The Leverage Ratios include Debt-to-Equity Ratio (DE) and Interest Coverage Ratio (COV);

iii. The Liquidity Ratios include Current Ratio (CR) and Quick Ratio (QR).

In addition to the above financial ratios, we include different control variables in the models which are the firm age (Age), the firm size (Size) and dummy variable in order to ensure the robustness of the results and reduce the possibility of multicollitnearity in the same way of Abdul Rashid and Nazia Naeem (2016). The specific calculations of the variables are represented in Table 1.

Table 1. Formula for calculating variables in the research model

VARIABLE	VARIABLE'S NAME	MEASURE
ROA	Return on Assets	$ROA = \frac{Net\ profit}{Total\ assets}$
PM	Profit Margin	$PM = \frac{Rate\ of\ return}{Revenue}$
DE	Debt-to-Equity Ratio	$DE = \frac{Liabilities}{Equity}$
COV	Interest Coverage Ratio	$COV = \frac{EBIT}{Interest\ expense}$
CR	Current Ratio	$CR = \frac{Current\ assets}{Current\ liabilities}$
QR	Quick Ratio	$QR = \frac{Current\ assets\ - Inventory}{Current\ liabilities}$
Age	The age of the company	Age is calculated from the date that the company was listed on the HSX or HNX until it made the acquisition
Size	The size of the company	$Size = \ln(Total\ assets)$
D	Dummy variable	Dummy variable has the value 0 in the pre-acquisition period and 1 the post-acquisition period

Inheriting the research of Abdul Rashid and Nazia Naeem (2016), we use different regression models by considering profitability, leverage and liquidity ratios respectively as the dependent variables respectively and altering the independent variables (or called control variables) which are the other ratios different from the dependent variable. Also, the other control variables included in the models such as the firm age, firm size and dummy variable.

The study uses Ordinary Least Squares Method (OLS) and empirical Bayesian estimation to enrich our research. Bayesian estimation provides precise results as compared to the traditional OLS technique because it used priors (average of data) that made the results had been more reliable as the standard deviations tend decrease due to priors.

Model of the impact of acquisitions on profitability

To examine the impact of acquisition deals on profitability in terms of return on assets (ROA) and profit margin (PM), we estimate the following equations:

$$Y_{it}(ROA) = \beta_1 + \beta_2 D_{it} + \beta_3 CR_{it} + \beta_4 DE_{it} + \beta_5 Size_{it} + \beta_6 Age_{it} + u_{it} \quad (1)$$

$$Y_{it}(ROA) = \beta_1 + \beta_2 D_{it} + \beta_3 QR_{it} + \beta_4 COV_{it} + \beta_5 Size_{it} + \beta_6 Age_{it} + u_{it} \quad (2)$$

$$Y_{it}(PM) = \beta_1 + \beta_2 D_{it} + \beta_3 CR_{it} + \beta_4 DE_{it} + \beta_5 Size_{it} + \beta_6 Age_{it} + u_{it} \quad (3)$$

$$Y_{it}(PM) = \beta_1 + \beta_2 D_{it} + \beta_3 QR_{it} + \beta_4 COV_{it} + \beta_5 Size_{it} + \beta_6 Age_{it} + u_{it} \quad (4)$$

Inside:

Subscripts i and t represent the i-th company and the t-order time respectively.

u_{it}: Error without mean and constant variance.

Modeling the impact of acquisitions on leverage

To examine the impact of acquisition deals on leverage through debt-to-equity ratio (DE) and interest coverage ratio (COV), we estimate the following equations:

$$Y_{it}(DE) = \beta_1 + \beta_2 D_{it} + \beta_3 CR_{it} + \beta_4 ROA_{it} + \beta_5 Size_{it} + \beta_6 Age_{it} + u_{it} \quad (5)$$

$$Y_{it}(DE) = \beta_1 + \beta_2 D_{it} + \beta_3 QR_{it} + \beta_4 PM_{it} + \beta_5 Size_{it} + \beta_6 Age_{it} + u_{it} \quad (6)$$

$$Y_{it}(COV) = \beta_1 + \beta_2 D_{it} + \beta_3 CR_{it} + \beta_4 ROA_{it} + \beta_5 Size_{it} + \beta_6 Age_{it} + u_{it} \quad (7)$$

$$Y_{it}(COV) = \beta_1 + \beta_2 D_{it} + \beta_3 QR_{it} + \beta_4 PM_{it} + \beta_5 Size_{it} + \beta_6 Age_{it} + u_{it} \quad (8)$$

Model of the impact of acquisitions on liquidity

To examine the impact of acquisition deals on liquidity through the current ratio (CR) and quick ratio (QR), we estimate the following equations:

$$Y_{it}(CR) = \beta_1 + \beta_2 D_{it} + \beta_3 COV_{it} + \beta_4 ROA_{it} + \beta_5 Size_{it} + \beta_6 Age_{it} + u_{it} \quad (9)$$

$$Y_{it}(CR) = \beta_1 + \beta_2 D_{it} + \beta_3 DE_{it} + \beta_4 PM_{it} + \beta_5 Size_{it} + \beta_6 Age_{it} + u_{it} \quad (10)$$

$$Y_{it}(QR) = \beta_1 + \beta_2 D_{it} + \beta_3 COV_{it} + \beta_4 ROA_{it} + \beta_5 Size_{it} + \beta_6 Age_{it} + u_{it} \quad (11)$$

$$Y_{it}(QR) = \beta_1 + \beta_2 D_{it} + \beta_3 DE_{it} + \beta_4 PM_{it} + \beta_5 Size_{it} + \beta_6 Age_{it} + u_{it} \quad (12)$$

Modeling for empirical Bayesian

In order to apply the empirical Bayesian estimation, from equations (1) to (12), we take the dependent variable Y_{it} in the form of a matrix and all of the control variables in their respective equations are considered X_{it} matrix. Priors are estimated by taking the average values of the financial ratios, age and size of the firms in our sample. These average values are considered as $\overline{Y}$ and $\overline{X}$ matrices to apply the empirical Bayesian estimation.

3. Results

3.1. Descriptive statistics

The result of the descriptive statistics shows that the return on asset (ROA) of these companies makes up an average of 6.87%. The DE ratio has the mean value (1.1949) very close to the minimum value (0.0626), which shows that most of the Vietnamese listed non-financial companies are financing their main business with shareholders' equity. In general, companies have less solvency because the mean value of CR variable (2.3260) is close to the minimum value (0.3986). The firm age (Age) has a huge disparity among the companies in the sample. Firm sizes are quite similar when the mean size (28) is moderately different from the maximum and the minimum value of variable.

Table 2. Descriptive statistics

Variable	n	Mean	S.D.	Min	0.25	Mdn	0.75	Max

3.2. Regression results according to Ordinary Least Squares Method (OLS)

Impact of acquisitions on profitability (ROA and PM)

Table 3 shows that acquisitions are at 1% statistically significant and have a negative impact on ROA. The acquisitions have a negative impact on the profit margin (PM) of the acquired companies, which is represented by a coefficient value of negative 0.0406015. Also, financial leverage as debt-to-equity ratio (DE) has a negative effect on PM. As we can see that, after the acquisitions, the profitability has been decreased due to the coefficient value of the dummy variable is negative. Quick ratio (QR) and size of the company have a significant positive effect on profit margin with coefficient values of 0.0225229 and 0.0100218 respectively.

Table 3. Impact of acquisitions on profitability (ROA, PM) represented in equations (1), (2), (3), (4) according to OLS Method

Impact of acquisitions on leverage (DE and COV)

Table 4 provides evidence that acquisitions have a significant negative impact on debt-to-equity ratio (DE) because the coefficient of the dummy variable is negative 0.377453 with p-value of 0.016. The PM and the firm age have a significant negative relationship with the debt-to-equity ratio. The relationship between the firm age as well as the firm size with interest coverage ratio (COV) is negative.

Table 4. Impact of acquisitions on leverage (DE, COV) represented in equations (5), (6), (7), (8) according to OLS Method

Impact of acquisitions on liquidity (CR and QR)

The result presented in Table 5 shows that all the independent variables, ROA, COV and Age have a significant positive impact on the current ratio (CR) of the acquiring firms but the firm size. The results of the control variables show that COV is positive related to QR, which is not significant while the return on asset and age of the firm have a positive and statistically significant impact on liquidity position (QR) of the acquired companies.

3.3. Regression results according to Empirical Bayesian Estimation (EM)

In Bayesian statistics, drawing conclusions does not depend on the size of the data (Baldwin & Fellingham, 2013; Depaoli & van de Schoot, 2016; Doron & Gaudreau, 2014) and solutions for drawbacks of frequency statistics when population parameters are assumed to be constant but unknown. Therefore, the authors use Bayesian estimation method and Gibbs sampling algorithm to understand the impact of acquisitions on firm performance.

Impact of acquisitions on profitability (ROA and PM)

Table 6 illustrates that acquisitions reduce the profitability of the acquiring company based on the negative coefficient of the dummy variable. The current ratio has a positive effect on the return on assets ratio (ROA). On the other hand, the debt to equity ratio (DE) has a statistically significant and negative impact on ROA. In addition, firm size and age do not have a significant impact on profitability. The findings confirm the results of the OLS estimation and these results are in agreement with Loderer & Waelchli (2010).

Table 6. Impact of acquisitions on profitability (ROA, PM) according to Empirical Bayesian method

Impact of acquisitions on leverage (DE and COV)

In Table 7, the results related to control variables such as ROA, CR are similar to the results of OLS. The acquisition reduces the leverage of the debt to equity (DE) ratio. Firm age and profit margin have a negative but almost insignificant effect on the debt to equity ratio of the acquiring company. Firm size has almost no effect on leverage, however, we surprisingly find the impact of quick ratio on debt to equity ratio to be negligible.

Impact of acquisitions on liquidity (CR and QR)

Ultimately, the results from Table 8 provide evidences that the impact of acquisitions is positive but not considerable, a finding which is consistent with the OLS estimation results that the authors presented earlier. In particular, it can be observed that the coefficient of the dummy variable is negative, however, it is not statistically significant.

1.363246	0.003158	0.139507	1.369757	Sigma2	1.698946	0.175554	0.004222	1.684869

4. Discussion and Conclusion

The results of the study on the impact of acquisitions on the profitability of companies are consistent with the study (Pawaskar, 2001), showing that acquisitions do not lead to profit growth. Although the acquisition of a less-growing company helps to increase market share, it also increases costs in the early stages, especially agency costs in the acquired company due to changes in the company's organizational structure... However, quick ratio (QR) and firm size have a statistically significant and positive effect on ROA. At the same time, similar to Loderer & Waelchli (2010) and Singh & Mogla (2008, 2010) studies, the results of traditional OLS methods and Bayesian empirical estimation both prove that acquisitions reduce profit. The study's findings suggest that firms with more liquidity are likely to have higher profit margin, while firms with high debt to equity ratios are likely to have lower profit margin.

From the results of studying the impact of acquisitions on leverage, we conclude that acquisitions have no statistically significant effect on leveraged positions, as measured by COV of acquired companies in Vietnam. But the evidences obtained from the two methods also show that acquisitions have a considerably negative impact on debt to equity (DE) ratio.

Finally, for the liquidity ratio of the sample firms, the acquisitions, although have a positive impact, do not affect substantially to the current ratio and do not have any statistical significance to the quick ratio of the acquired company.

AGRICULTURAL EXPORT: WHICH SPECIALIZED SKILLS THAT VIETNAMESE SME MANAGERS NEED TO OVERCOME TECHNICAL TRADE BARRIERS

Dr. Le Tien Dat

datlt@tmu.edu.vn

Thuongmai University, Hanoi, Vietnam

Abstract

In recent years, Vietnamese agricultural export has increased significantly due to the growth in the market demand, the improvement in product structure, the intensive application of high technology, as well as the incentives of the government. Nonetheless, the capabilities of Vietnamese small and medium-sized enterprises' (SMEs') agricultural products to meet the technical requirements of the international market is still limited. In this situation, the support related to human resource management in order to enhance abilities for SME managers is extremely necessary. By adopting qualitative approach, this paper investigates the perceptions of Vietnamese agricultural exporters with regard to specialized skills they need in export. Data is collected through in-depth interviews with 124 Vietnamese SMEs doing business in various fields, exporting various agricultural products and coming from various provinces/cities in Vietnam. The participants shared a range of training need with regard to knowledge to help them overcome technical barriers, which was then used to develop appropriate training courses. SME managers and training institutions may use the outcomes of this study do develop effective training programs for SME managers.

Keyword: *specialized skills, technical barriers, Vietnam, SMEs*

1. Introduction

A great number of Vietnamese agriculture product types, especially Vietnamese fruits, are increasingly penetrated fastidious markets, which also sets the higher requirements for quality improvement for Vietnamese producers. However, in export, SMEs are often required to adjust their products to meet the requirements of markets, especially of fastidious markets. A number of product adjustments need to follow the regulations of the governments of the importing countries, especially those regarding the protection of the health and safety for their citizens (Leonidou 2004).

This paper, to begin with, explores the perceptions of Vietnamese agricultural SME managers with regard to specialized skills needed to help them overcome technical barriers in export. Subsequently, implications related to relevant training programs on technical skills are provided. Research outcomes are expected to be beneficial to SME managers and training/consulting institutions in assisting Vietnamese SMEs to overcome technical barriers in exporting agricultural products to overseas markets.

2. Literature Review

Agricultural export

Enterprises tend to export goods and services for many reasons. Particularly, export may help firms increase their revenue and profit when accessing new markets as well as reduce business risks by diversifying export markets (Troy, 2019). For SMEs, they tend to penetrate into international markets when they realize that the domestic market for their goods and services is saturated or is on the downward trend (Daniels *et al.*, 2013). The decision to expand the market is also made when SMEs want to maintain the development pace, gain numerous benefits such as accumulating international business experiences, accessing modern technology and financial sources, as well as joining the supply chain (Edinburgh Group, 2014; European Commission, 2003).

Agricultural product export activities has witnessed the more involvement of SMEs. When developing countries increasingly participate in the global supply chain of agricultural products, the role of SMEs is increasingly important. Global Trade Report 2016 (WTO, 2016) pointed out some characteristics of the agricultural export activities of SMEs. Firstly, the share of SMEs participating in the agricultural export is still low compared to large enterprises. Secondly, almost all SMEs are indirectly involved in the export of agricultural products. Thirdly, thanks to the revolutionary advances in information technology and e-commerce, the potential of SMEs to participate in export is growing. Fourthly, governments are likely to pay more attention to promoting the participation of this sector in agricultural exports.

Technical trade barriers to SMEs in agricultural export

The impacts "Technical Barriers to Trade" (TBT) on different countries, with different economic growth are not the same. Bao and Qiu (2012) described that measures related to TBT imposed by a developing country have greater impact on export of other developing countries rather than on that of developed countries. However, TBT introduced by a developed country can affect equally export of both developed and developing countries. The export activities of developed countries affected by TBT of developed countries are normally greater than that of developing countries.

Research of Decreux *et al*. (2010) on the impact of NTBs in the EU-Korea free trade area also emphasized that different industries are generally affected differently. Bao and Qiu (2010) supported this view by noting that the impacts of TBT on agriculture and other commodities are different. Accordingly, TBT is considered as a factor limiting commercial transactions of agricultural products, but promoting commercial transactions of manufactured products. The results of this study is quite similar to studies of other authors such as Fontagne *et al.* (2005), Disdier *et al.* (2008) and Moenius (2004). Fontagne *et al.* (2005) generalized the findings of the Moenius (2004) by indicating that trade barriers, including TBT, have a negative impact on trade in agricultural products, but have little or even positive impact on trade in the majority of other commodity production. Choi *et al.* (2015) reflected that the "Sanitary and Phytosanitary Measures" (SPS) affecting the trade of the agricultural and food sectors is greater than that of other industries, when considering the international business among China, Japan and Korea.

As can be seen from above studies, TBT have a quite negative impact on the export of agricultural products, especially for developing countries. Therefore, a study with the aim of supporting enterprises in developing countries such as Vietnam in order to overcome the challenges from technical barriers becomes more crucial.

3. Method

3.1. Data Collection

According to Saunders *et al.* (2012), in the studies where the perceptions of participants are investigated the qualitative method should be used. The qualitative method often enables researchers to obtain rich and detailed responses to their investigation (Bryman & Bell, 2011). The primary data in this research were collected in the form of semi-structured interviews. This type of interview provides the researcher with the opportunity to probe answers provided by the interviewees, as they are asked to explain or build on their responses (Bryman & Bell, 2011; Saunders *et al.*, 2012). During the interviews, particular responses may provide interesting and useful ideas for the interviewer to develop the study further.

This research was conducted with 124 agricultural export SMEs. Based on the list of agricultural SMEs in selected provinces, the researcher approached SME managers. Thanks to the introduction of state officials in these provinces, the researcher found it more convenient to connect SME managers. Besides, many of participants were referred by previous interviewees, by using the “snow-ball” technique. The interview protocol was used to assist the interviewer during interview.

3.2. Data Analysis

According to Creswell (2014), qualitative researchers use a step-by-step procedure to systemize the data analysis process. In such a process, researchers organized the data, conducted a preliminary read-through of the database, coded and organized themes, and organized the data in a format for interpretation. The qualitative QSR support software Nvivo supported the data analysis process.

4. Results

4.1. Understanding of technical requirements

General understanding of technical requirements

To begin with, SME managers in this study expressed their need to gain a general understanding of technical standards, as"*knowledge of technical barriers has a huge impact on agricultural export*" (M_82). Besides, the SME manager wanted to acquire "*in-depth knowledge of technical barriers because it directly affects the production process to create commodities to meet the requirements"* (M_30). From their view, only when they master regulations related to technical standards, they may "*avoid violating international regulations*" (M_78), as well as "*minimize the risks in export* " (M_80). This becomes more essential when the understanding of Vietnamese SMEs in this issue is still limited, whereas the requirements from foreign markets are becoming stricter and more complicated. One SME manager emphasized:

"I expect to be equipped with specialized skills related to technical barriers. Currently, technical barrier is still a big challenge for Vietnamese agricultural exporters. An agricultural firm that wants to survive and develop needs to have a deep understanding of all technical requirements to manufacture satisfactory products" (M_29)

In addition, SME managers also wanted to be aware of "*the impact of technical barriers on factors such as price determination and selection of export products*" (M_115). In certain cases, to meet the standards, SMEs have to make great investment in technology, which pushes production costs higher and leads to a disadvantage in price competition.

Proficient use of methods to meet technical requirements

Along with understanding of technical barriers and "*skills to assess and analyze technical requirements*" (M_113), SME managers also wanted to acquire skills to apply and implement activities to meet these technical requirements. Based on the widely and consistently trained and shared knowledge, the manufacturers, exporters, farming households and trading firms would be unified in accordance to the requirements, creating standard export products. One SME manager said: *"We must learn specialized knowledge of technical standards because mastering this knowledge may help us set specific criteria to meet the agricultural export requirements"* (M_72).

Mastering techniques and methods of production and business to meet technical standards becomes much more difficult for SMEs which are new to agricultural export business. Therefore, with these young firms, the skills assisting them to use techniques in manufacturing and exporting to meet technical requirements become more important, as shared by one SME manager:

"I expected to have the ability to use proficiently techniques to meet technical standards in agricultural export, as my company has just established, the standardization in manufacturing and operation has not completed" (M_100)

SME managers also wished to acquire techniques and methods to handle disputes related to technical barriers. One SME manager expressed: *"I need to be proficient in technical methods to meet technical standards, both in production for export, and in dealing with legal matters"* (M_84)

Update and forecast changes related to technical requirements

SME managers shared the need to be updated on information related to technical standards in order to "*meet the requirements of new partners, new markets*". (M_47) and to "*make appropriate adjustment*". (M_94).

Recognizing that the technical standards are becoming stricter, which is due to serves trade barriers and the more demanding requirements of consumers, especially those on food safety, SME managers showed the importance of proactive adaption to changes related to technical standards in agricultural export. In this case, the learning skills of SME managers is strongly crucial.

Agricultural export SME managers also expected to acquire "*skills to predict technical barriers*" (M_76). Capturing "*changes and trends in the application of technical barriers by countries*" (M_115) may help SMEs to be more proactive in production and export, as well as in business strategies adjustment.

4.2. Specific understanding of technical regulations

Understanding of packaging and labeling regulations

Knowledge of standards related to packaging and labeling was believed to help SME managers to provide correct information on product packaging that satisfies labeling requirements, especially those of some difficult export markets. The information provided on the packaging, especially on agricultural products labelling, was believed to be "*directly related to consumer health and the environment*" (M_33), therefore, it is often strictly regulated.

Understanding of food safety regulations

Among technical requirements, food safety standards were emphasized by SME managers as the most important condition, as shared by one SME manager: *"It is necessary to master food safety requirements in export because a very small deviation may make agricultural products to be rejected"* (M_50).

Furthermore, "*a small trouble related to food safety may greatly affect the reputation of the company*" (M_19). Therefore, SME managers extremely stressed that this understanding must be in-depth, comprehensive and updated. One SME manager emphasized: "*The agricultural export SMEs need to have thorough and comprehensive* *understanding of regulations on quality and food safety standards, otherwise it may lead to great loss"* (M_55).

Meanwhile, the capabilities to meet food hygiene and safety standards is still a huge limitation of Vietnamese export SMEs, as shared by a manager: *"Among challenges from export markets, strict regulations on phytosanitary and food safety are major problems of many Vietnamese agricultural SMEs in export"* (M_123).

SME managers particularly showed the need for "*in-depth knowledge of food safety and hygiene standards in both traditional and potential markets*" (M_88). They wanted to master food safety standards in some key markets that they are approaching, especially in difficult ones such as Japan and Korea. One SME manager said: *"I need understand technical standards of food hygiene and safety because they are the most important regulation in exporting to Japan, Korea. However, many Vietnamese agricultural exporters have not meet these requirements "* (M_77).

Understanding of the maximum residue levels of Pesticides

Vietnamese SME managers wished to earn more specific understanding of regulations related to maximum levels of pesticide residues. These regulations have been commonly used by countries to protect domestic production, as shared by a manager *"Some countries set very low residue levels and they are extremely difficult to satisfy"* (M_40). In fact, these standards are often considered as "*the biggest concern of Vietnamese exporters*" (M_81).

In addition, regulations related to *"maximum residue levels of other chemicals that affect product quality*" (M_95) were also requirements that SME managers need to satisfy.

Understanding of product traceability

How to gain certifications of origin of agricultural products was a content that SME managers wanted to master. Among these certificates, Hazard Analysis and Critical Control Points (HACCP) was particularly emphasized by Vietnamese SME managers.

Understanding of phytosanitary regulations

Regulations related to phytosanitary such as irradiation requirements were standards that Vietnamese agricultural export suggested to be considered when exporting. These regulations have been seen as a great challenge of Vietnamese agricultural exporters and require the investment of SMEs in all stages of production and export. One SME manager said:

"The most difficult technical barriers for my company are phytosanitary and food safety which are usually set at a high level by foreign markets and require great effort to satisfy" (M_121).

4.3. Understanding of voluntary certifications

The understanding of voluntary certifications related to food hygiene and safety, working safety, environmental issues...was also the content that SME managers in this study expected to master.

Understanding of ISO 14001

According to the SME managers, environmental protection is a responsibility not only of individual enterprise, but also of the whole community. In particular, ISO 14001 related standards such as the Environmental management system (EMS) were particularly noted by participants.

Understanding of SA 8000

From the view of Vietnamese SME managers, ensuring corporate social responsibility (CSR) and management system certification (SA 8000) are related to increasing export competitiveness as well as maintaining sustainable development and corporate reputation for SMEs. One SME manager said: *"I need knowledge and skills to apply SA8000 because it is the inevitable requirement for enterprises to integrate into international markets"* (M_20).

Furthermore, understanding of food safety management system certification (ISO 22000), Hazard Analysis and Critical Control Point (HACCP), Certificate of Good Agricultural Practice (Euro Gap/Global Gap), Good Manufacturing Practices (GMP), or Food Quality Certifications such as Geographical Indications (GI), were also contents related to voluntary certifications that SME managers in this study wished to capture.

4.4. Understanding of product quality requirements

From the viewpoints of SME managers in this study, overcoming technical barriers requires them to gain an in-depth understanding of product quality. In particular, satisfying product quality standards and testing requirements is a prerequisite for penetrating any foreign market. One SME manager shared: *"it is necessary to understand quality standards and requirements related to inspection to avoid losing export opportunities and exporting banned commodities"* (M_55).

Product quality was perceived to be directly related to the export capacity of agricultural SMEs, and requires the efforts of many stakeholders. One SME manager said: *"Improving product quality requires the efforts of many relevant parties such as farmers, manufacturers, exporters, researchers and state agencies"* (M_123).

In particular, SME managers emphasized the importance of "*understanding export product quality requirements of the target markets*" (M_15). One SME manager stressed:

“Only when the enterprises’ product meets the quality requirements of the target markets, the export objectives may be reached and the unnecessary risks may be avoided” (M_44).

To satisfy product quality standards, the SME managers shared the wish to understand "*procedures to assess quality standards to meet technical standards*" (M_23). Based on the understanding of product quality procedures and assessment processes, the agricultural export SMEs may "*produce and export the most appropriate products”* (M_39).

4.5. Understanding of product quality regulations of specific export markets

In order to export to a certain market, SME managers needed to master "*export regulations and technical standards of particular export countries*" (M_32) as "*each market has its own particular requirements for different products*" (M_44). One SME manager said: *“Each country has a different system of standards for product quality, especially for food safety. A single fault related to product quality may cause huge losses, including a loss of enterprises’ reputation. Therefore, it is necessary to understand quality standards of each export country”* (M_19).

SME managers also expressed the need for group of technical standards required by both traditional and potential markets, as well as those from certain regions such as the EU and the US. The requirements of difficult markets such as Korea, Japan are specific contents that SME managers would like to understand. One SME manager said: *“I need knowledge about technical standards currently applied in the most demanding markets in order to manufacture and supply products to meet specific standards in those demanding markets”* (M_89).

In particular, SME managers needed skills to examine the suitability between the quality requirements of each market and their production and export capacity in order to develop strategies to select the right product-market pair and minimize possible risks. One SME manager said:

“I need in-depth knowledge of quality standards and skills of standard analysis of potential export markets. I also want to understand the process of assessing and verifying the product quality on these markets, thereby ensuring the quality of exported goods, limiting risks in export” (M_05).

Due to “*difficulties in satisfying technical requirements set by export markets*” (M_33), as well as the potential loss of violating regulations of export markets, SME managers expected the government should develop programs to help them acquire fully understanding of policies and regulations related to the standards of key exporting countries. Based on that, "*SMEs will be more proactive in preparing conditions to overcome barriers*" (M_20).

4.6. Understanding of agricultural product regulations

SME managers in this study paid particular attention on regulations in agricultural export. From their view, technical standards in agricultural export is strongly difficult to overcome, compared to other industries. Besides, due to the limited export value of Vietnamese agricultural products, they expected to gain knowledge of technical standards to increase export value. One SME manager said: *"I need knowledge of agricultural production, especially technical standards to improve export value, ensuring the quality of agricultural products"* (M_01).

SME managers also emphasized the need for understanding technical standards of agricultural products in specific markets in order to produce, cultivate and trade agricultural products in appropriate to the requirements of export markets. SME managers believed that as agricultural standards are usually related to human health, countries often set strict barriers to these products. They expected to participate training activities to improve understanding of agricultural technical standards of key export countries.

Almost all SME managers interviewed acknowledged that technical standards are normally used as non-tariff barriers and protection tools for agricultural production in export countries. Therefore, it requires SMEs to proactively satisfy these standards to seize export opportunities.

In particular, SME managers in the study wanted to have an in-depth understanding of the standards set for organic agricultural products regulated in particular export markets. One SME managers said: *"I need to know about standards set for organic products in the US, EU, Japan, Australia markets to which my company tends to export agricultural products"* (M_107).

4.7. Understanding technical standards for specific agricultural products

Besides the difference among markets, the differences in technical standards set for various export products were emphasized by SME managers as the knowledge they wanted to master, as shared by one SME manager: *"In fact, each type of agricultural product has its own characteristics and the requirements of each export market for these products are also different. Therefore, SMEs need to fully understand these requirements to reduce the risks"* (M_99).

SME managers wished to master technical standards applied for specific agricultural products to better prepare suitable products for export. One SME manager took an example

"I need to understand the regulations set for lychee products when exporting to certain markets. Normally, there are requirements for traceability, pesticide residues and irradiation prior to export" (M_107).

Because of these differences, SME managers expected to join in-depth training courses on particular agricultural export products, such as "*training on standards in fruit export, particularly on lychee export*" (M_110) with the aim of developing and adjusting business strategies, in accordance with the requirements of target markets. However, it is difficult for one course to cover all the barriers in all markets, thus "*introduction to technical barriers of some popular target markets of Vietnamese agricultural SMEs*" (M_119) was the content that participants wanted.

5. Discussion and Conclusion

5.1. Implications

Based on qualitative findings, some training programs to improve knowledge of SME managers with regard to technical barriers in trade are provided. Accordingly, training courses on TBT should support SME managers improve their capabilities to be able to: Know how to identify and distinguish technical barriers; Know how to assess the possible impact of technical barriers on import-export activities; Know how to meet technical barriers set by specific markets.

Specific courses focusing on enhancing in-depth knowledge related to technical standards should include following contents: Introduction on general TBT; Technical requirements (labeling, terms used); Inspection procedures (accreditation, sampling, testing, registration, approval); Analysis of agreements on TBT

Some specific contents related to TBT that need to be clarified to participants are:

- *Introduce regulations prohibiting or restricting import of products shown in the Technical Barriers to Trade (TBT) regulations:* Prohibitions regulated in TBT; Authorization requirements for reasons related to TBT; Registration requirements for importers in accordance to TBT regulations; Other requirements or prohibitions

- *Introduce regulations on maximum levels of pesticides chemicals in products:* General introduction about maximum levels of pesticides and chemicals in products; Regulations on restricting the use of certain substances

- *Introduce regulations on labeling:* General regulations on labeling; Regulations on labels for shipping procedures; Product packaging specifications

- *Introduce regulations on production and post-production regulations:* TBT on the manufacturing process; TBT regulations on transport and storage; Other requirements

- *Introduce requirements on product identification and quality assessment (such as organic and ecological labels)*

- *Introduce product quality regulations:* Assessment on quality conformity related to TBT; Requirements on product registration; Requirement on testing (Conformity);

Certification requirements (according to a certain standard); Inspection requirements (in the importing country); Requirements on traceability information (in production, processing and distribution).

- *Introduce regulations on pre-shipment inspection:* Regulations and procedures for inspection before checking; Requirement on direct deposit; Requirements for permission to pass through customs ports; Requirements for import monitoring (automatic licensing process); Other procedures

Training courses on voluntary sustainable certification should also be provided to Vietnamese SME exporters, such as those related to Environmental certification includes certification for Organic Agriculture, Other regulations such as ISO 14001 and ISO 22000; Social certification such as SA 8000; Certificate of food safety and good practice including: GAP, GMP, GI.

In addition to the general introduction, training courses for Vietnamese agricultural export SMEs should specify the contents associated with the export of agricultural products and appropriate to the limited capacities of Vietnamese SMEs. Apart from training courses, seminars and workshops to help SMEs update the changes related to technical standards are also essential.

Furthermore, the courses should include in-depth contents related to technical standards for agricultural products exported to specific markets, as well as technical standards for some specific agricultural products. Therefore, the grouping of exporters with similar products, exporting to similar markets in training courses or seminars may increase training efficiency.

5.2. Conclusion

The paper has provided the perceptions of Vietnamese SME managers with regard to skills and understanding needed to overcome technical barriers in agricultural export. SME managers shared a range of knowledge, from general understanding of technical standards to specific regulations related to labeling, food safety, maximum residue levels of pesticides, product traceability, and phytosanitary, etc. The understanding of product quality regulations applied in specific markets and for particular products were also reflected by SME managers. Based on the training need investigated, some implications related to training courses were provided.

Abstract

In the context of integration, in addition to increasing foreign capital inflows, Vietnamese enterprises are becoming more and more interested in outward foreign direct investment activities. This research expands the Investment Development Path model to assess the influence of some macroeconomic factors (GNI per capita, the proportion of expenditure on science and technology, FDI flows, USD to VND exchange rate, total import-export turnover) on Vietnamese enterprises' outward foreign direct investment (OFDI) flows. Using the 32-year dataset (1989-2020), the regression results depict that the proportion of expenditure on science and technology, the amount of FDI, GNI per capita had a positive impact on the capital OFDI of Vietnam. However, the growth rate of total import-export turnover harmed OFDI flows in the same period. Meanwhile, the difference variable of exchange rate USD to VND in the multiple regression model didn't have statistical significance. Based on regression model results combined with qualitative studies, the authors propose some policy implications to promote OFDI flows of Vietnam in the near future.

Keywords: *Investment Development Path, OFDI.*

1. Introduction

Vietnamese enterprises have started carrying out OFDI projects since the late 1980s. However, Vietnam's OFDI flows over the past 30 years have experienced many fluctuations in both registered capital and number of projects. Accumulated to the end of 2020, Vietnamese enterprises have invested abroad 1401 projects with registered capital was 21.46 billion USD. However, from 2015 to present, the OFDI capital flows of Vietnamese enterprises slowed down notably. In 2020, the registered capital was almost 819.7 million USD, which was 55% more than that of 2019 but still nearly equal to 24.3% compared to 2010. This is a new phenomenon that requires updated studies on determinants affecting

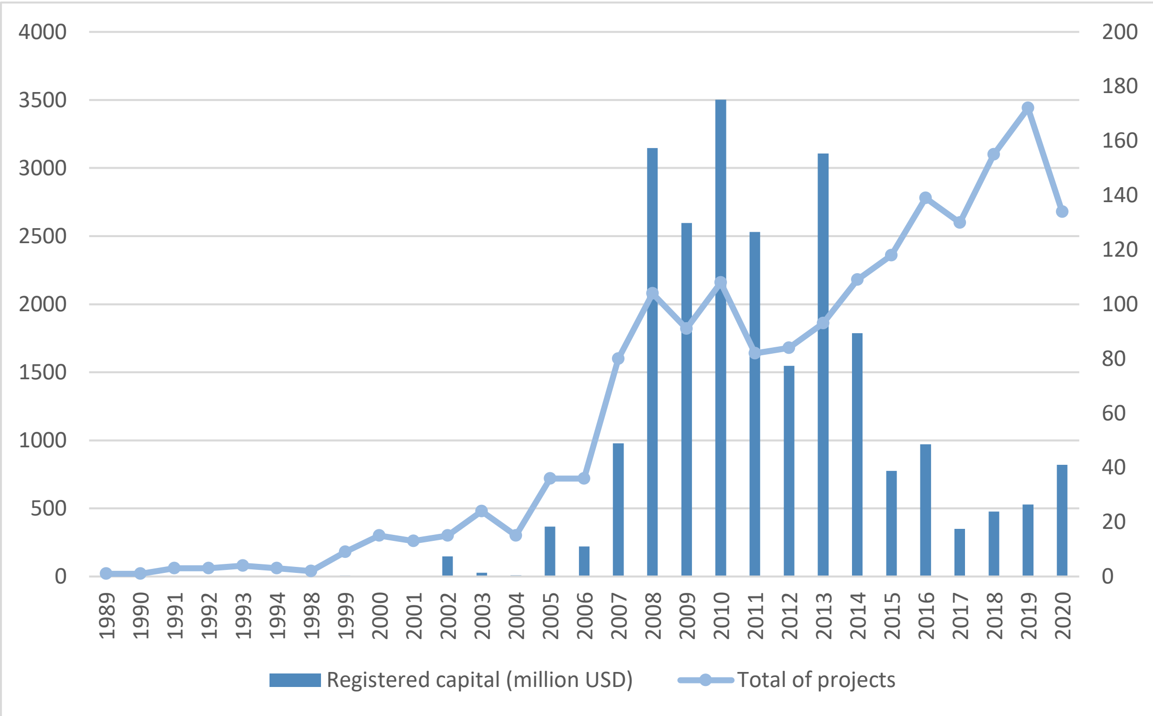
OFDI flows of Vietnamese enterprises. This research combines qualitative studies and the Investment Development Path model (IDP) to assess the influence of some macroeconomic factors on the OFDI of Vietnamese enterprises and propose policy implications.

Overview of Vietnam's outward direct investment

Accumulated to the end of 2020, Vietnamese enterprises have invested abroad in 1401 projects with the total investment of 21.46 billion USD, the average capital per project was 15.32 million USD.Outward foreign direct investment activities of Vietnamese enterprises can be divided into four stages:

Figure 1: Vietnam's outward direct investment in the period 1989 - 2020

(Accumulation of projects having effect as of 31.12.2020)



Source: Foreign Investment Agency, Ministry of Planning and Investment

Vietnamese enterprises have started carrying out OFDI projects since the late 1980s. However, in the period 1989-1998, the projects were spontaneous and experimental with a small scale of investment capital. There were only 17 registered projects with a registered capital of 13.6 million USD, the average capital per project was only 0.8 million USD. In this period, most of these projects were conducted by SoEs, focus on Laos and Cambodia in building health and educational infrastructure under agreements between the governments.

In the period 1999-2005, OFDI flows of Vietnamese enterprises experienced a significant growth not only in the number of projects but also in the scale of capital. Specifically, in this period, there were 127 new registered projects with the registered capital of 567.7 million USD, which were more than 7.47 times in total projects and 41.74 times in total investment capital in the previous period; the average capital was 4.47 million USD/project. This achievement was based on the Government's promulgation of Decree No.22/1999/ND-CP and other related legal documents, laying the "foundation" of the legal basis for outward investment activities. The large projects were mainly focused on processing and manufacturing; mining; agriculture, forestry and aquaculture.

The period 2006–2010 could be considered as the "booming" period of Vietnam's OFDI flows. Specifically, in only five years, Vietnamese enterprises have registered to invest in 419 projects, the registered capital was 10.477 billion USD, the average capital per project was 24.93 million USD. It was a remarkable growth in both scale and the number of projects. In which, there were 11 projects with the registered capital of over 100 million USD, such as a telecommunications network cooperation investment project in the Republic of Mozambique the registered capital of 493.79 million USD; Sekaman 1 with the registered capital of 441.6 million USD, the hydroelectric project Sekaman 3 with the registered capital of 273.1 million USD. Especially, the Long Thanh-Vientiane economic zone project with the registered capital up to 1 billion USD, was the largest OFDI project of Vietnam in this period. To have that outstanding development, it is necessary to mention the role of the project "Promoting Vietnam's investment abroad" approved by the Prime Minister in February 2009. In particular, Decree 78/2006/ND-CP guiding the implementation of the 2005 Investment Law brought new thinking: Investors and enterprises of all economic sectors have the right to invest abroad, have the right to autonomy, self-responsibility in business activities, minimizing unreasonable, unnecessary "approval" regulations that are contrary to the principle of freedom of business... This thinking has created favorable conditions for Vietnamese enterprises to invest abroad, enhancing international integration.

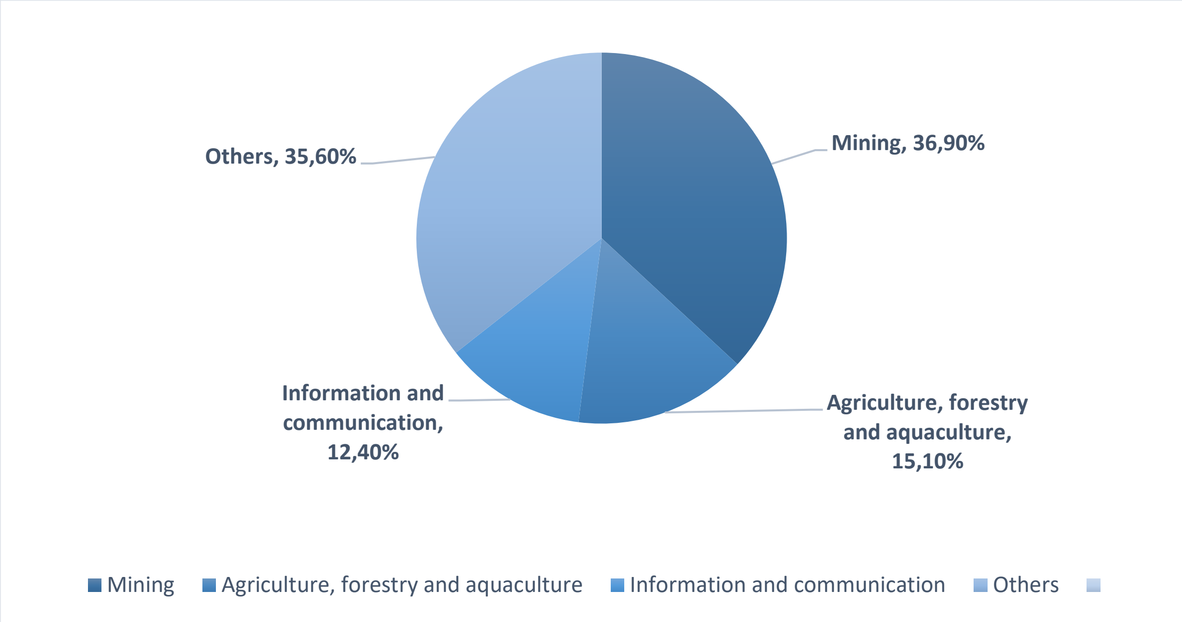
In the period 2011-2020, OFDI of Vietnamese enterprises fluctuated dramatically and tended to decline. The investment capital reached the peak of 3.1 billion USD in 2013, then dropped sharply to 350.1 million USD in 2017, equal to 11.3% that of 2013 before a slight recovery from 2018 to 2020. Since 2018, Circular 03/2018/TT-BKHDT guiding and promulgating a sample document for implementing outward investment procedures of the Ministry of Planning and Investment has had a positive impact on OFDI activities, the registered capital tend to increase but still slow. Notably, in this period, 241 projects had to stop operating before the deadlines with the capital of 2.42 billion USD(accumulated from 2011 to 2020). Thus, after the period 2006 - 2010 witnessed the "boom" of OFDI activities with the feature of "placeholder investment", the period 2011-2020 can be considered as a "restructuring" period, slowly but surely.

Regarding to OFDI by fields, the industry is the key sector which accounted for the highest proportion of investment from Vietnam to other countries with the investment capital of 10.94 billion USD, comprised up to 51% of the investment capital of Vietnamese enterprises. In which, mining accounted for 7.9 billion USD registered with 58 projects, represented 72.2% of the total OFDI capital in the industrial field and 36.9% of the total OFDI capital of Vietnam. Some notable large projects: PVEP's Bir Seba - Algeria mine project joint venture; PVEP's joint venture investment project to develop and exploit block Junin 2 in Venezuela; with the registered capital of 12.4 billion USD and capital contribution of 1.8 billion USD from the Vietnamese side. Hydroelectric projects also attracted investment capital of up to 1.5 billion USD, which was recorded as 6.98% of the total registered capital of all fields. By the end of 2020, there were nine investment projects in this field, mainly in the two markets of Laos and Cambodia. Lower Sesan 2 Hydropower (Cambodia) by EVN International Joint Stock Company was the most prominent, with the registered capital of 806.4 million USD, accounting for 50.6% of the total OFDI capital of the electric field. Notably, despite accounting for the largest proportion of accumulated investment capital, OFDI flows into the industrial sector are experiencing a sharp decline in recent years, when capital flows have shifted to the service and agricultural sectors. In 2020, Vietnam only had 27 new registered projects in the industrial sector, of which there was only one project in the mining field of Long Thanh Golf Business and Investment Joint Stock Company, deployed in Laos with the total investment capital of 6 million USD.

Regarding the agricultural sector, accumulated by the end of 2020, the registered capital reached 3.25 billion USD, accounted for 15.1% of the total registered OFDI capital. Investment projects in the agricultural sector were mainly in the two traditional markets of Laos and Cambodia with projects on planting and processing rubber, coffee, sugarcane, corn, etc. Notably, in recent years, OFDI flows in the agricultural sector are gradually shifting to large-scale projects, applying high-tech agriculture. Large corporations such as Vinamilk, Hoa Phat, or TH are investing to develop high-tech agriculture abroad. In 2018, TH Group inaugurated the first high-yield dairy farm within the framework of the complex project of dairy farming, high-tech milk processing , and some food projects with the total investment of 2.7 billion USD. In 2020, Vinamilk also increased capital for a high-tech cow farm investment project in Laos. Specifically, in August 2020, Vinamilk poured an additional 41 million USD into Lao-Jagro Development Xiengkhouang Co., Ltd, increased Vinamilk’s investment capital at Lao-Jagro from 25.4 million USD to 66.4 million USD. This combination is also known as the “resort” of organic dairy cows in Laos, which is part of Vinamilk’s long-term strategy to develop fresh milk material areas at home and abroad with a total expected investment is 500 million USD.

Figure 2: OFDI of Vietnamese enterprises by field

(Accumulation of projects having effect as of 31.12.2014)



Source: Foreign Investment Agency, Ministry of Planning and Investment

Service was the field that represented the highest percentage of projects, with 978 projects, accounting for 69.8% of the total number of OFDI projects (accumulated to the end of 2020). In particular, the information and communication segment was a bright spot in the general picture of OFDI in Vietnam. The most prominent is the success in the international market of Viettel Military Telecommunications Group - Top 15 largest telecommunications enterprises in the world in terms of users, Top 30 largest telecommunications enterprises in the world in terms of infrastructure. Currently, Viettel has invested in 10 countries(3 continents), focusing on mobile telecommunications services, especially several new services such as 4G, 5G, e-wallets, large information technology projects to serve corporate and government customers. Viettel's strategy is transforming from providing telecommunications infrastructure and services to provide digital infrastructure and services. In 2020, 10 overseas markets of Viettel grown significantly in both revenue and profit, sending home nearly 333 million USD.

2. Expanding the Investment Development Path model to assess macroeconomic factors affecting OFDI flows of Vietnam

Vietnam's foreign direct investment has had many fluctuations, developing rapidly in the stage 2006-2010 but quiet in the last six years. To analysis how Vietnam's macroeconomic factors affect OFDI of Vietnamese enterprises, this article uses the IDP (Investment Development Path) model, which was fomulated by Dunning (Dunning, 1988). The IDP model is widely used in research, assessing the impact of the development level in a capital-exporting country on its OFDI. According to the IDP model, OFDI and FDI of a country both positively depend on the level of development of that country (usually calculated as GNI per capita); based on that basis, the governments will choose their own Investment Development Path. Since each country's development path is unique (Bellak, 2001), GNI per capita is not a perfect measure of economic development. Therefore, some other variables are used, such as volume of FDI flows (Chen Jen Eem, 2019 and Bellak, 2001), trade volume (Sheng Ma, 2020 and Dunning, 2001), national institutions (Jiyong Chen, 2020 and Bevan, 2004), the level of science and technology (Saleh Shahriar, 2019 and Stoian, 2013)… In this study, macroeconomic variables are used to evaluate the factors affecting the OFDI flows of Vietnam (OFDI) are: GNICAP (gross national income per capita), RDSB (the state budget expenditure on science and technology), IFDI (FDI inflow into Vietnam), ER (exchange rate) and IE (import-export turnover/GDP). Some hypothesises are made as follow:

Hypothesis H1: OFDI has a positive relationship with the development of the economy, being measured by the growth rate of nominal GDP per capita.

The IDP model also indicates the positive relationship between the development of science, technology and OFDI. Science and technology will help private companies as well as state owned companies increase labor productivity, creating a competitive advantage and scale; thereby, which leads to the increase in the amount of OFDI. Therefore, a further hypothesis is given:

Hypothesis H2: OFDI has a positive relationship with the development of science and technology, being measured by the proportion of the state budget investing in science and technology (RDSB) (%)

The IDP model also concludes that the amount of inflow capital (IFDI) will enhance OFDI. This can be explained by the spillover effect of FDI, when FDI flows into one country, the domestic companies will have to raise the level of management and operational efficiency, which leads to relative advantages with other countries. Hence, this promotes OFDI activities, exploits new markets to increase profit. Therefore, author propose the third hypothesis:

Hypothesis H3: OFDI has a positive relationship with the IFDI capital.

Besides the basic IDP model with the above three factors, many scholars also propose to research the influence of some other macro factors such as the exchange rate, the openness of the economy on OFDI. Countries with stronger currencies often have more financial advantages than countries with weak currencies (Paulo ReisMourao, 2018). Therefore, Kyrkillis and Pantelidis (2003) argued that the revaluation of the domestic currency will increase the desire to invest abroad of domestic companies. Thus, the authors propose the hypothesis:

Hypothesis H4: OFDI has a positive relationship with the revaluation of the domestic currency (measured by exchange rate USD/VND)

Besides the exchange rate, the high openness of the economy will also contribute to the promotion of OFDI activities. The high openness of the economy will facilitate import and export companies to expose to and learn more from foreign markets as well as to know the relevant regulations and standards, to overcome the differences in language, culture and law, organizing overseas activities and marketing products in the international markets (Paulo ReisMourao, 2018). All of which play an important role in encouraging OFDI, especially it can become a more feasible strategy than export. Therefore, the authors propose the hypothesis:

Hypothesis H5: The openness of the economy has a positive effect on OFDI. capital flows

Table 1: Description of variables in the model

Variables		**Description**	**Data sources**	**Citation sources**
Dependent variable: OFDI (USD)		Annual registered OFDI	Ministry of Planning and Development	
Independent variables:				
Variables according to IDP basic model	The development of economy (GNICAP) (USD per capita)	GNI per capita	General Statistics Office	Saleh Shahriar et al (2019),
	The proportion of expenditure on science and technology over state expenditure (RDSB) (%)	% expenditure on science and technology	General Statistics Office, Annual figures of the Ministry of Finance	Saleh Shahriar et al (2019), Stoain (2013) Jiyong Chen, (2020)
	FDI flows into Vietnam (IFDI) (mln USD)	Annual registered FDI	Ministry of Planning and Development	Paulo ReisMourao (2018),
Extended variables	Economic openness	import-export turnover/GDP (IE (%))	World Bank	Sheng Ma (2020) Rosfadzimi (2013)

	Exchange rate (ER) (USD/VND)	World Bank	Chen Jen Eem (2019) Andreff et al (2014)

Source: collected by authors

3. Result

The data of the variables in the model is taken annually from 1989 to 2020. The data is in the form of time series so that it must be tested to determine the stationarity for the variables, then use the univariate regression to find the variables that affect OFDI. Then, put the statistically significant variables in the univariate regression model into the multiple regression model. The selected variables included in the multiple regression model are RDSBt-2, IFDIt, GNICAPt, D(ER)t, and D(IE)t.

Table 2: Correlation coefficients between independent variables

	RDSB	IFDI	GNICAP	D(IE)	D(ER)
RDSB	1,0000	-	-	-	-
IFDI	0,3362	1,0000	-	-	-
GNICAP	-0,3448	0,4855	1,0000	-	-
D(IE)	-0,1657	0,0335	0,0687	1,0000	-
D(ER)	-0,0396	-0,1849	-0,1685	0,0024	1,0000

Source: calculated in Eviews by the authors

Refer to Table 2, the correlation coefficients between the independent variables are all less than 0.7. This illustrates that the variables in the model do not have multicollinearity.

Table 3: Testing of model defects

	WHITE	BG	RAMSEY
F-statistic	4,212983	1,498556	0,035541
Prob	0,189594	0,198365	0,896582

Source: calculated in Eviews by the authors

According to Table 3, the White, BG, and Ramsey test show that the model is suitable, without defects such as variable variance, autocorrelation, or lack of variables; the functional form of the model is also appropriate.

Table 4: Result of regression model

Variable	Coefficient	Prob
C	-3528,1943	0,0008
$RDSB_{t-2}$	2120,1820	0,0015
$GNICAP_t$	0,6285	0,0122
$IFDI_t$	0,0384	0,0010
$D(IE)_t$	-8,3748	0,0785
$D(ER)_t$	0,1289	0,3119
Obs	30	
R^2	0,5352	
F-statistic	12,8849	
Prob(F-statistic)	0,000018	

Source: calculated in Eviews by the authors

The regression result in Table 4 shows that the ratio of state budget spending on science and technology with a 2-year lag, FDI inflows into Vietnam and gross national income per capita have a positive impact on OFDI; in contrast, the change in total import-export turnover/GDP hurts OFDI capital flows. The difference variables of the exchange rate in the multiple regression model is not statistically significant. With the regression model, it is easy to see the influence of investment in science and technology on the growth of OFDI. With a two-year lag, a 1% increase in budget spending on science and technology will increase the amount of OFDI capital by 2120.18 million USD. In fact, the leading enterprises in OFDI activities are also the leading enterprises in investment in modern science and technology such as Viettel, FPT, Hoang Anh Gia Lai, Vinamilk. In the meantime, the spillover effects of IFDI are still limited. With the increase of 1 million USD registered FDI into Vietnam, there was only 0.0384 million USD increase in OFDI respectively. It can be explained the technology spillover and the participation of Vietnamese enterprises in the value chain of FDI enterprises are still low. In fact, during the period 1989-2020, the amount of FDI into Vietnam mainly focused on manufacturing and processing, real estate. Meanwhile, OFDI capital is mainly invested in mining, hydropower, and agriculture. The difference in investment structure also limits the spillover effect of FDI on OFDI capital flows. About the economic growth factor, the GNICAP variable in the multiple regression model has a positive impact on OFDI capital. This indicates that the domestic economic growth, especially in the non-state sector in recent years has contributed to the promotion of OFDI capital flows. However, the result of the regression figure out a negative impact of the growth rate of total import and export turnover on OFDI capital flows. The reason is that, in the research period (1989-2020), Vietnam was still basically a trade deficit country. Hence, a large amount of foreign currency flowed abroad to serve the import of goods. Because the demand for foreign currency for imports is often high, the supply of foreign currency for OFDI activities is limited, which led to a negative effect on OFDI activities. Besides, the results in Table 4 show that the difference variable of the exchange rate in the multiple regression model is not statistically significant. This result shows that OFDI activities of Vietnamese enterprises are not directly affected by the fluctuation of the USD/VND exchange rate. This can be explained by the fact that Vietnam's USD/VND exchange rate from 1989 to 2020 was still strictly regulated by the government in the direction of "stable" and allowed fluctuations within a narrow range. The government's control of the exchange rate has led to relative independence between the exchange rate and the growth of Vietnam's OFDI capital inflows.

4. Conclusions

Despite a wide range of fluctuations,Vietnam's OFDI had a significant growth since the Decree 78 of the Government in 2006 regulating OFDI. In addition, Vietnam's economic development has also had a positive impact on Vietnam's OFDI. The increase in the government expenditure on science and technology and the IFDI of Vietnam, creating a technology spillover effect had a direct impact, promoting OFDI capital flows in Vietnam; meanwhile, the growth rate of total import-export turnover had a negative impact on OFDI capital flows. This leads to investment policies to promote science and technology in Vietnam, especially in key industries investing in other countries. . Promoting scientific research and the transfer of science and technology in key sectors such as information technology, telecommunications and high-tech agriculture,etc. will create competitiveness to help Vietnamese enterprises have enough scientific factors, management qualifications to carry out OFDI activities. The State needs to create more favorable conditions to help the enterprises in these fields have good competitiveness, and dominate target markets. Other recommendations for the Government of Vietnam are having more policies to promote FDI inflows into Vietnam, especially in manufacturing and processing industries; opening more international relationships; boosting the technical transfer of FDI enterprises in Vietnam.

PROVIDING INTERNATIONAL BANKING SERVICES – OPPORTUNITIES AND CHALLENGES FOR VIETNAMESE COMMERCIAL BANKS IN THE INTERGRATION PERIOD

Vu Thi Thu Hoa
vuhoa1284@gmail.com
Luong Thi Thu Hang
hangluongktqd@gmail.com
National Economics University, Hanoi, Vietnam

Abstract

Subject to the current trend of globalization and international trade market opening, providing international banking services to clients not only increases income but also affirms and enhances Vietnamese commercial banks' competitiveness. The opportunities that Vietnamese commercial banks receive from providing international banking services can be mentioned such as: expanding international correspondent banking network, improving competitiveness and improve management capacity by applying and developing products to meet international demand… However, banks also face many challenges. Taking advantage of opportunities and overcoming challenges will help commercial banks develop international banking services, thereby promoting the overall development of the entire banking system. Because of the above reasons, in this working paper, the author focuses on assessing the current situation of providing international banking services, recognizing the opportunities and challenges for Vietnamese commercial banks in the current economic integration period.

Keywords: *Competitiveness, international banking services, import-export, integration*

1. Introduction

In the context of economic integration, countries are trying to develop, open up and cooperate with other countries. The movement of goods between countries and the relationship between countries in transportation, insurance and payment has created the need to use international banking services. The process is to conduct payment activities between entities in different countries to form and develop international banking services, in which the bank is an intermediary bridge between the parties. According to Nguyen Van Tien (2007), international banking service is an important service of commercial banks, bringing significant revenue for banks. In particular, international payment is an important link in connecting and promoting the development of other business activities of the bank such as foreign currency trading, import and export financing, international guarantee and credit. According to Nguyen Thi Cam Thuy (2012), banking services are divided into two segments: domestic banking services and international banking services. International banking services are activities related to money transfer transactions beyond national borders to integrate and transact with other banks in the world (Le Van Tu, 2009). In which, international banking services include: international payment, card, guarantee, factoring, capital mobilization, import and export financing, foreign exchange business… The international banking services mentioned in this study are the banking services related to foreign currency provided by the Vietnamese banks.

Today, when a series of trade agreements come into force such as the Trans-Pacific Strategic Partnership Agreement (Comprehensive and Progressive Agreement for Trans-Pacific Partnership - CPTPP), the Free Trade Agreement between Vietnam and the European Union (EVFTA), … have promoted import and export activities of businesses, thereby promoting the use of international banking services at Vietnamese commercial banks. It is increasingly meaningful that commercial banks become a bridge for organizations, businesses and individuals to carry out business activities beyond national borders. Therefore, international banking services tend to increase in terms of revenue, profit as well as the number of customers and agency relationships, helping commercial banks establishes a foothold in the market. Implementing international banking services, the bank can monitor the business situation of import-export enterprises, facilitating effective management and coordination of import-export activities in the country according to the foreign policy that has been determined. At the same time, international service helps create a closed business chain for other services of the bank to have the opportunity to develop. However, with the presence of a large number of foreign banks with potential to participate in the domestic market, Vietnamese commercial banks have to face many challenges.

The provision of international banking services in Vietnam has recently attracted more attention to investment for development than ever before. However, commercial banks have only focused on expanding the scope and limiting operational risks without paying attention to the analysis and evaluation of the economic efficiency of this activity. Therefore, this issue was chosen to discuss in order to assess the opportunities and challenges of commercial banks.

2. Literature Review

There have been many domestic and foreign studies on international services in recent years. Some foreign studies mention solutions to develop international banking services at commercial banks to increase competition by focusing on strategies to attract customers. Research by Friederike Niepman (2014) mentions the significant cost factor that affects customers in using two main international payment instruments, which are letters of credit (L/C) and documents. With great value in export, the use of this payment instrument requires customers to choose a large and competent bank.

Some other studies mention that commercial banks can achieve higher benefit of scale when all their assets are fully exploited on a global scale (Nguyen Thi Cam Thuy, 2012). Economic integration has been creating conditions for banks and commercial banks to develop. According to Vu Thi Thu Hoa and Nguyen Thi Thanh Phuong (2018), the development of foreign trade finance is increasingly proving its important role and position in contributing to the success of the current Vietnamese commercial banks. Pham Huyen Trang (2016) also pointed out that international trade finance business increasingly accounts for around 20-30% of Vietnamese commercial banks. According to Le Van Tu (2009), international banking services strongly promote the import and export activities of the country and at the same time are a positive factor in stimulating the circulation of international investment capital flows into that country. Through international banking services, businesses and investors quickly grasp and master international financial practices, so that they can perform well and compete on the integration process with developed countries. Commercial banks have therefore sought all ways to improve competitiveness, market share and operational efficiency. Huynh Thi Huong Thao (2017) studies the impact of international banking services on the bank's operating system during a time of changes from regional and international partners.

However, commercial banks always face difficulties and challenges when participating in integration (Ho Nguyen Phuong and Nguyen Viet Trung, 2019). Established FTAs put competitive pressure on Vietnamese commercial banks at all three levels, country, enterprise and product (To Huy Vu, 2019). Vietnamese commercial banks must find ways to mitigate risks, handle challenges in order to strengthen internal resources, competitiveness and develop new factors while still ensuring the common goal of stabilizing the macro-economy and building flexible industry system to respond to global and regional economic fluctuations.

3. Results

3.1. Current situation in providing international banking services in Vietnam

Currently, Vietnam has international trade relations with more than 180 countries and territories, focusing on a number of partners such as the EU, the US, Japan, ASEAN and China, etc. Competitive pressure among commercial banks (Thoraneenitiyan and Avkiran, 2009) is therefore increasing, requiring commercial banks to continuously expand their interbank network, and attracting a large number of customers in different industries. Thus, the scope of international banking activities of Vietnamese commercial banks is wider. Therefore, taking care and maintaining customer relationships is more and more difficult, requiring banks to have reasonable strategies to meet the needs of the market and the wishes of customers in providing international banking services.

Table 1. Types of International Banking Services in Vietnamese commercial banks

Name of bank	Types of International Banking Services
Vietcombank	For Buyers: Letter of Credit (L/C Issuance, L/C Amendment, Bill of Lading endorsement/Delivery authorization/Shipping guarantee, L/C Settlement, UPAS/UPAS Plus L/C,…), Import Collection, Outward Remittance (T/T, Bank draft); For Sellers: Letter of Credit (L/C-L/C amendment advising, L/C confirmation, Document checking and forwarding,…), Export Collection (D/A-D/P, Collection export bills negotiation with recouse), Inward Remittance, Factoring.
BIDV	International payment service: Import-Export payment, Border Payment; Export financing: Factoring, discount of recouse for debt collection by L/C deferred payment, Discount bill of exchange with export documents, export finance; Import financing: UPAS, Letter of Credit service, Import finance secured by imported goods; Domestic L/C Financing.

(Sourse: vietcombank.com.vn, bidv.com.vn)

The market share of international banking services focuses on large commercial banks such as Vietcombank, BIDV, Vietinbank, Eximbank... Each bank has different size, strategy and competition policy in attracting customers to use international banking services. It can be said that, in recent years, Vietnamese commercial banks have always actively changed customer policies, diversifying the portfolio of products and services to meet the maximum needs of customers. Through the provision of international banking services to customers, the bank collects fees to offset the bank's expenses and generate revenue and profit for the bank. Depending on the type of international service, the business environment and the credibility of the customer, the applicable service fee schedule is different.

Therefore, in the context of foreign market integration, commercial banks are constantly looking for solutions to increase capital, improve financial capacity, and enhance the diversity of international banking services to be able to compete with foreign organizations through specific strategies as well as KPI planning.

In terms of organizational structure, commercial banks have built specialized departments to develop international banking services. Viettinbank has an International Financing Processing Center, Vietcombank has a Trade Finance Center, MB Bank has a Payment Center… Commercial banks have all realized that a specialized management model for international banking services to develop the scale of operations without being constrained by other activities. From there, specialized divisions set forth their standards, product plans, and working capital. In terms of market share, the commercial banks have access to different fields such as exporting rice, shrimp or processed products, to diversify international banking services according to international trading practices and customs. Vietnamese commercial banks have enhanced payment and import-export finance operations: money transfer, collection, L/C, pre- and post-delivery financing, etc. Banks have oriented towards a full package of import and export financing services to meet the maximum of clients' requirements.

Some results can be mentioned that, in terms of sales, in 2019, Vietcombank achieved international payment and trade finance sales of USD 85.4 billion, increasing by 9.03% compared to 2018. Vietinbank achieved $60.2 billion in sales. These figures can show that international transaction sales at leading commercial banks prove the importance of international banking services in the operation of Vietnamese commercial banks.

3.2. Opportunities and Challenges for Vietnamese commercial banks in providing international banking services in the intergration period

Integration and changes in the domestic market have made international banking increasingly important to both customers and banks. The increase in the number of customers in Vietnamese commercial banks shows that the demand for international banking services is increasing. Therefore, the provision of international banking services has created many opportunities for Vietnamese commercial banks, but also poses many challenges that banks have to face.

3.2.1. Opportunities

Firstly, with 13 FTAs that have been in effect since 1993, it has promoted the development of Vietnam's import-export activities of goods and services. According to the General Statistics Office, from 2016 to now, the trade balance of import and export of goods has been continuously in surplus. Total import-export turnover in 2020 reached USD 543.9 billion, of which goods export will reach USD 281.5 billion, up 6.5%, import reached USD 262.4 billion USD, up 3.6%. That result is thanks to the implementation of business integration and FTAs. With the current number of businesses at about 85,000, the demand for international banking services of Vietnamese commercial banks is very large. Therefore, integration helps Vietnamese commercial banks have a large number of customers, import and export enterprises using international services. Integration with FTAs has opened up many opportunities for Vietnamese commercial banks to access the international market in an equal and favorable manner, in order to strengthen cooperation and increase market share. According to the content negotiated in the financial sector in the Agreements, a service supplier of one country can provide financial services in the market of another country if it ensures that it is allowed to operate the service. Therefore, Vietnamese commercial banks expand their international interbank network to develop agency activities, open relationships with foreign banks through modern technologies such as SWIFT, Telex, NOSTRO and VOSTRO accounts…Within recent 5 years, Vietnamese commercial banks have actively exploited and expanded the foreign banking market, opening representative offices and branches as well as connecting agency relationships.

Table 2: The number of agents in foreign countries of Vietnamese commercial banks in 2020

TT	Name of bank	The number of agents
1.	BIDV	1700 agents in 122 countries and territories
2.	Vietinbank	1000 agents in 90 countries and territories
3.	Vietcombank	1800 agents in 176 countries and territories
4.	Agribank	1100 agents in 100 countries and territories
5.	MB Bank	700 agents in 80 countries and territories
6.	Sacombank	278 agents in 90 countries and territories
7.	DongAbank	250 agents in 60 countries and territories

(Sourse: Annual reports of banks)

In addition, commercial banks also have the opportunity to diversify activities and linkages. Vietinbank has had export support funds, export insurance funds, financial institutions such as SEK (Sweden), JBIC (Japan), Eximbank (USA), KEIC (Korea)... since 2010 (Phan Thi Hong Hai, 2010). Vietinbank is also the first Vietnamese bank to be selected by the Export Credit Company (CCC) of the US Department of Agriculture to participate in the GSM - 102 program implemented by the US Department of Agriculture to promote US agricultural exports by guaranteeing the US bank to lend to the importer's bank... along with many remarkable results and achievements of other banks. Vietcombank is "Vietnam's best foreign exchange service provider" awarded by The Asian Banker magazine in 2019.

Secondly, integration is to promote the competitiveness of Vietnamese commercial banks, helping to improve the operation of the commercial banking system. The change in the number of banks through restructuring in recent years when there was the intervention of the Prime Minister, led to a change in governance and operations of Vietnamese commercial banks. By 2020, the charter capital of the top 10 Vietnamese commercial banks including: BIDV, Vietinbank, Vietcombank, Techcombank, Agribank, VPbank, MB, Sacombank, ACB, SCB, in which the highest is BIDV, reaching VND 40,220 billion. The 10 banks with the highest profit after tax include Vietcombank, Vietinbank, Techcombank, VP Banh, MB, BIDV, ACB, HD Bank, VIB and TP Bank, up 14% over the previous year. The 10 most prestigious banks based on 3 criteria (1) Financial capacity and efficiency, (2) Media credibility and (3) Surveys on customer satisfaction including: Techcombank, VP Bank, ACB, TP Bank, HD Bank, Sacombank, VIB, SHB, OCB and MSB. It can be seen that, not only banks with large capital have the opportunity to expand and promote international banking services, but also small commercial banks also try to access and expand international banking products, in order to compete and attract customers. Although Eximbank has a charter capital of VND 12,355 billion in 2020, it has also been very active in diversifying the portfolio of international banking services, actively trading in foreign currencies as well as using Swap, Forward, and Option tools for transactions, or make payment, finance import and export and make money transfer via SWIFT system, pay L/C, D/A, D/P, T/T, P/O, etc...Eximbank has achieved Outstanding International Payment Quality Award (STP Ward) awarded by Bank of New York Mellon (USA) in 2020, or Excellent Bank for International Payments awarded by Wells Fargo in 2019,…VietAbank with charter capital of VND 3500 billion also diversified the international banking services portfolio in trade finance, system design and operation, developed the international banking department in depth, increased exploitation and cross-selling of digital banking products. to maintain the brand name of one of the banks with the most sustainable growth rate.

Thirdly, integration helps Vietnamese commercial banks improve their banking governance capacity following international standards, improve business activities to help commercial banks stand firm in the market. Commercial banks may face a number of risks such as market risk, operational risk, etc. when providing international banking services. Then, improving risk management capacity according to international standards will help limit risks in general and risks in providing international banking services in particular. Vietnamese commercial banks have focused on strengthening risk management skills, developing customer policies, approaching the 3 pillars of Basel II approved by the SBV in Circular 41/2016/NHNN and Circular 13 of the State Bank. This is a change that has a great impact on the operations of commercial banks. Which focuses on 3 pillars: (1) Regulation of minimum capital adequacy according to standardized approach, advanced approach for credit risk, operational risk and market risk; (2) Internal assessment of capital adequacy, thereby standardizing processes, risk measurement tools, capital endurance testing, capital planning according to market scenarios and monitoring; (3) Transparency and market discipline. The investment in capacity building and operation platform, digital banking transformation has been widely implemented. Nowadays, competition by technology has become a direct weapon for banks through digital banking services, especially in the field of payment for import and export enterprises. E-commerce activities are changing day by day and the trend of e-commerce is the key trend with modern technology application solutions.

Fourth, integration gives commercial banks the opportunity to access and develop a variety of products and services, to attract customers and promote customers to cross-buy other products and services. The provision of international banking services in the dynamic international market, with many participants, with more modern products and services is what VCB is aiming for. This not only increases income for Vietnamese commercial banks, but also increasingly affirms and enhances the competitiveness of banks in the face of the trend of opening up for integration and increasing competition. In addition to the difference in the form of distribution of international banking services in each Vietnamese commercial bank, the fees and policies for international banking services in each bank are also different. The lending taste of each commercial bank depends on the price policy, capital as well as the fields and strengths of the business. The international banking policy for export activities of rice, shrimp, fish, or processed and processed products that Vietnam commercial banks provides to import-export enterprises, although bringing different revenue but altogether these fields play an important role for the economy. Currently, with a large number of import-export enterprises, the development strategy of focusing on customers of import-export enterprises is particularly focused by commercial banks. Vietinbank has launched a product package for newly opened business customers (Combo 6 in 1 plus), SME credit card….Techcombank focuses on the corporate customer segment to help meet the growing financial needs of exporting enterprises. Therefore, right from 2013, 2014, with this strategy, Techcombank was the first official member in Vietnam of IFG (International Factors Group) providing comprehensive import-export packaging solutions, awarded “Award for achieving high electricity rate” by Citibank.

Fifth, integration gives Vietnamese commercial banks the opportunity to enhance the legal system to help commercial banks have a more favorable and clear operating platform. In addition to the basis of international banking activities, it is based on 3 groups: (1) International laws and conventions, (2) National laws and regulations of the State Bank of Vietnam (Civil Law, Law on Credit Institutions, and Ordinance on Foreign Exchange). , Circulars...) and (3) International practices and practices (Incoterms, UCP, URR, ...), the state's supplement, amendment and systematization of documents to implement international banking services such as: TT03/2012/TT-NHNN, TT32/2013/TT-NHNN, etc. are increasingly flexible, specific and in line with international practices, helping import-export enterprises to have a clearer legal basis in operating in the Vietnamese market. Moreover, the commercial banks have grounds to resolve legal conflicts in international trade relations, in accordance with the Vietnamese legal system, customs and development level of the country in expanding relations with foreign partners.

3.2.1. Challenges

Firstly, competitive pressure on Vietnam commercial banks is significant when participating in integration. The accession to WTO in 2007 has made the banking market more vibrant and competitive because of the presence of 100% foreign-invested banks: HSBC, ANZ, etc. Therefore, Vietnamese commercial banks are facing pressure from competition and forced to increase capital, cooperate with foreign banks to limit the loss of market share. It can be seen that the number of foreign banks and foreign bank branches has changed very clearly, which requires banks to face competitive pressure on capital, policy mechanisms, and services.

Table 3: The number and types of banks

Types of banks/Year	2013	2014	2015	2016	2017	2018	2019	2020
State owned commercial banks	5	5	7	4	4	4	4	4
Joint Stock commercial banks	33	33	28	31	31	31	31	31
Foreign banks and branches of foreign banks	58	54	50	51	49	49	61	61
Joint venture bank	4	4	3	2	2	2	2	2
Total	**100**	**96**	**88**	**88**	**86**	**86**	**98**	**98**

(Sourse: sbv.com.vn)

Moreover, the financial capability of Vietnamese commercial banks is still small compared to foreign banks, the assets and product portfolio are still simple, the quality is not high, the professional level and organizational structure are not really as good and professional as the other regions and the world.

Secondly, integration increases capital transactions and increases risks for Vietnamese commercial banks while the management mechanism is not really complete, lacks scientific and close coordination between departments in the bank. With the familiarity with traditional banking services in the country, the trend of integration and wide opening has made it impossible for commercial banks to prepare well and respond promptly to market changes and familiarize themselves with the foreign markets. While import-export enterprises are rapidly approaching and looking for overseas partners every day, the framework, mechanism, and professional qualifications to support import-export enterprises in Vietnamese commercial banks does not have a methodical and timely response. The standardization of processes, methods, and services for measuring credit risk, market risk and operational risk has not been well prepared and publicly disclosed by commercial banks. According to statistics from the US Federal Reserve, from 2013 to 2016, there were about 22,000 scams causing losses of more than USD 3 billion taking place in 79 countries. While in Vietnam, import-export enterprises tend to choose money transfer payment or direct payment, rarely use hedging methods and strict international banking services, high fees to pay through banks or credit institutions. International banking is characterized by being affected by many random factors, world political economy, so commercial banks are prone to face market risks and operational risks. Therefore, import and export enterprises have to face the risk of cybercriminals attacking through accounts, creating fake emails, and luring victims to send money to hacker accounts. Commercial banks also cannot measure all the risks to advise and protect import-export enterprises.

Third, the big requirements is for the inspection and supervision mechanism of the team, professional expertise in handling and consulting international banking services as well as good technology operation. When opportunities open up, banks actively provide international banking services, including small banks, while lacking in understanding of international law, limited in technology and professional skills of weak staff. Inspection and supervision work requires commercial banks to have sufficient capacity, understanding of international business practices and supervision standards in foreign partner markets. Challenges with legal pressures, international laws and conventions, national laws, international practices as well as regulations of the banking industry that require commercial banks to ensure sufficient resources (capital, technology, professional qualifications,…) to be able to ensure the best possible consulting and support for import and export enterprises.

4. Discussion and Conclusion

Faced with opportunities and challenges in providing international banking services, first of all, commercial banks need to propose to the Government and the State Bank to create a proper legal system and practices to have a basis for promotig the reform and improvement of banking operation. There should be a macro inspection and supervision mechanism based on the requirements and regulations of groups of laws and practices to serve as a foundation for the operation of Vietnamese commercial banks.

In addition, commercial banks themselves need to not only try their best to maintain traditional customer service, but also to evaluate and determine their capacity in taking advantage of opportunities to improve competitiveness, develop international banking services to support import-export enterprises. Vietnam commercial banks need to develop specific customer policies in order to diversify operations and use capital effectively in foreign trade finance. It is necessary to form and scientifically operate a specialized international banking business model and be included in the operating chain of the bank itself. Commercial banks also need to further improve risk management capacity, management of system operations to respond to risks at a timely manner. Commercial banks also need to be more active in business, taking advantage of specialized products and services to best serve the needs of import-export enterprises.

International banking services are increasingly affirmed in national economic relations in general and foreign economic activities in particular. Especially in the current integration context, each country places foreign economic activities in a priority position, so commercial banks need to recognize opportunities and challenges to have their own international banking development strategy.

Abstract

In the last decade, Laos'agriculture has been commercialized faster and has gained given achievements. From a self-sufficiently agricultural country, Laos'has become one of the net exporters of agricultural products. However, commercial agriculture in the nation is still less competive due to poor irrigation and trasportation systems; small-scale production, limited agro- processing, week linkages bettween stakeholders within value chains, etc. Therefore, it would be neccessary for the country to upgrade agricultural and rural infrastructure; apply widenlly new technologies and GAP standards; improve skills of farmers through education and extention systems; strengthen the linkages within agricultural value chains; and improve continuously policies to facilitate commercialization of agricultural products.

Keywords: *Cash crops & livestocks, commercial agriculture, export, Lao PDR.*

1. Introduction

Agriculture is the mainstay of the economy of Laos (officially the Lao People's Democratic Republic - Lao PDR). In the early 21st century the sector generated nearly half the country's gross domestic product (GDP) and employed some three-fourths of the labor force. The expansion of land under cultivation has been impeded. The great majority of Laos's farmers are engaged in rice agriculture. Lowland farmers generally plant irrigated paddy fields, while upland dwellers cultivate rain-fed swiddens. Many farmers in the uplands practice subsistence agriculture. In years with "normal" harvests, Laos is self-sufficient in rice production. However, a shift toward market-based and commercial agriculture in the recent decade has been gaining momentum, propelled primarily by the government's modernization initiatives.

Unlike subsistence and nature-based agriculture, commercial agriculture is likely to result in welfare gains through the realization of comparative advantages, economies of scale, and technological dynamism (Gebremedhin and Jaleta, 2010). Policies for commercial transformation of smallholder agriculture are often aimed at promoting household market participation" (Gebremedhin and Jaleta, 2013).

This paper aims to overview development of commercial agriculture in the last decade in Lao PDR and disscuss key factors influencing this process as well as several recommendations to speed up the renovation in agricultural sector in the country.

2. Method

The study is mainly based on secondary data gathered from FAOSTAT and Laos' relevant agencies. Descriptive statistical methods and expert consultation were used to analyse the development of Laos' commercial agriculture, and to give comments and conclusions.

3. Results

3.1. Development of commercial agriculture in Laos in the recent decade

As shown in Table 1, in the 10-year period of 2010-2019, the area harvested of almost cash crops in Laos have been increasing while the annual growth rate in harvested area of food crops have reduced. The annual increase in area was especially high for cassava (14.55%), sugar cane (8.44%), tea (7.44%), and coffee (6.32%). The negative growth in area of food crops such as rice and maize reflected that there were transitions from the self-sufficiency to cash crops in the nation during the decade.

Table 1: Area harvested of main crops in Laos in the last decade (ha)

Year	Cassava	Coffee	Maize	Rice	Sugar cane	Taro	Tea	Tobacco

Thanks to intensive farming and application of new technology in cultivation, the yield of all crops has been increasing, especially in case of coffee with annual growth rate of 8.39%, tea (6.33%) and cassava (3.22%/year) (Table 2).

Table 2: Yield of main crops in Laos in the last decade (hg/ha)

The increase in production of cash crops were rather high in the decade as a result of improved farming practices associated with expanded cultivating areas (table 3). After 9 years since 2010, cassava production increased more than 4.5 times in 2019 (with annual growth rate of 18.24%), coffee production increased about 4 times (with annual growth rate of 15.24%), sugar cane production increased about 2.5 times (with annual growth rate of 10.25%), and tea production increased nearly 4 times (with annual growth rate of 14.24%). Most of the increases in these crops were geared toward exports to China, Thailand, and Vietnam where with improving transport connections, are becoming increasingly viable markets.

Figure 1 below shows increasing in area of some cash crops such as coffee, tobaco, cassava, vegetables and sugarcane in the 23-year-period of 1995-2018. Cutivation of coffee, tobaco, cassava, vegetables, sugarcane were mainly in the southern provinces while banana and maize were mainly in the north provinces of Laos.

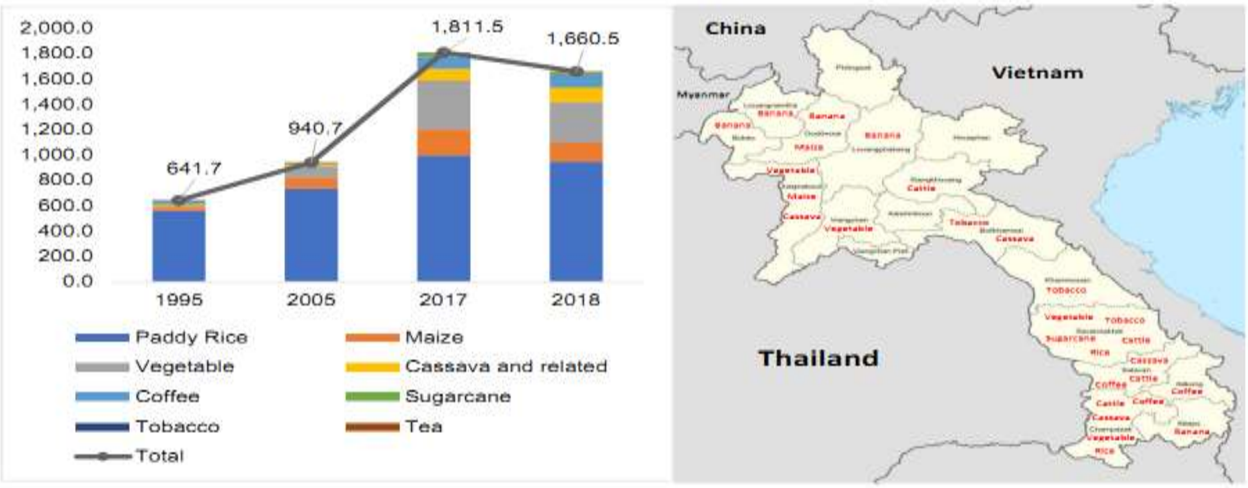

Figure 1: Allocation and cultivating areas of main crops in Lao PDR
Source: Lao's Ministry of Agriculture and Forestry (MAF, 2019)

There are also opportunities for Lao PDR in trading livestock products with its neighboring countries, especially China and Vietnam, where with high rates of economic growth, increasing prosperity, and growing market demand for protein. Moreover, further land conversion opportunity exists in the Lao PDR to expand both cash crops and livestock production. The livestock sector growth is especially rapid. Table 3 and table 4 illustrate that there was notably significant growth for goat, chicken, pig, and cattle population as well as production.

Table 3: Growth in population of major livestocks in the last decade (head)

Year	Buffalo	Cattle	Chicken (000')	Goat	Pig

Livestock are particularly important in the more poverty-prone Northern provinces, where there is less land available for cropping due to the mountainous terrain. Some 89% of farm households own one or more types of livestock, and where possible, many households will have fishponds. Smallholder farmers dominate livestock production, accounting for approximately 95% of national herd. The feeding of animals includes (1) fallow cropland; (2) communal areas along roads and rivers, and areas around fields and villages; (3) dedicated grazing land; (4) secondary forests; and (5) other uncropped communal lands. Crop by-products such as rice straw are also fed to ruminants.

Commercial livestock production has developed around major towns and cities such as Vientiane, supplying meat, eggs, and milk to the urban population. Significant cross-border livestock trade is expanding to China and Vietnam since 2014 (Table 5 and Table 6) with further potential growth if reproductive and survival rates continue to improve, ensuring livestock health and easing the sale and transport of stock. Current livestock trade is significantly underreported with cross-border movement of livestock mostly avoiding international border gates.

Laos' export of agricultural products has rapidly increased in the last decade, especially with presence of cassava, coffee roasted, cattle and chicken since the year of 2014.

Annual growth rates of agricultural export in terms of quantity and value were very high in 5 recent years, typically by 182%/year and 145.33%/year for cattle.

The production and export of agricultural products are considered crucial for livelihood improvement of Lao people since the majority of them are dependent on agriculture as the main source of income. However, the export of agricultural products is relatively small compared with that of the non-agriculture which is driven by electricity and copper concentrate or ores. Its share was 16% of the total export during 2012-2018 (Figure 2). Nevertheless, the export of agriculture products increased strongly with an average 25.4% annual growth during 2012-2018. Among exporting products, the export of banana and live animal were the most promising with high market demand in China and Vietnam. In 2018, the main commercial agriculture and forestry for export were banana, rubber, tobacco, coffee bean, cassava, and sugar. Meanwhile, the export of banana and rubber has surpassed the previous longstanding export champions such as coffee and wood product that used to be the top agricultural exports in 1990s and 2000s.

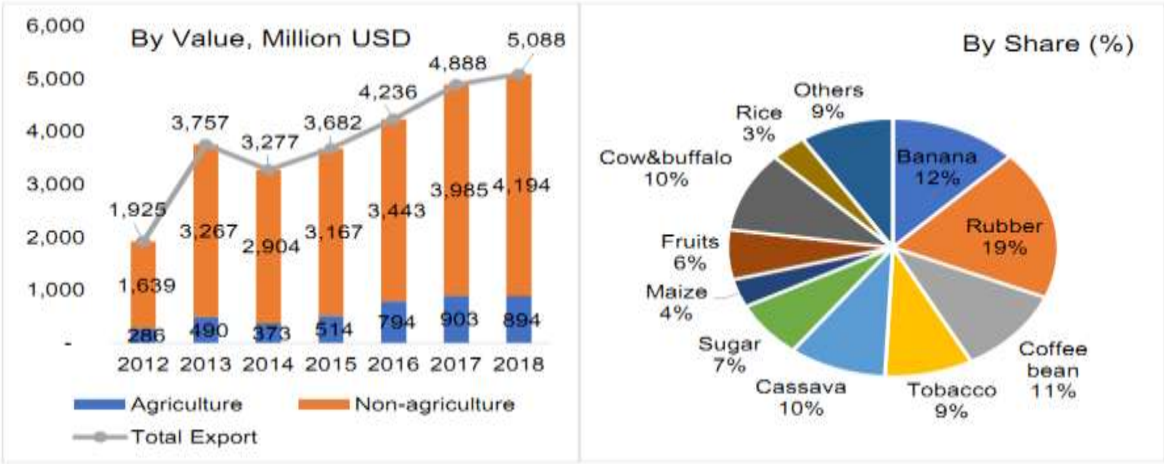

Figure 2: Laos' agricultural export in total export during 2012-2018

Source: Lao PDR's Ministry of Industry and Commerce (MoIC, 2019)

Overall, major markets for Lao agriculture exports are Vietnam, China, and Thailand (Table 7). Vietnam is the main market for various agro-products except banana (China), maize (China), and tea (Thailand). Nonetheless, Chinese market has a potential to grow in the future, with an outstanding demand to import 50,000 cattle from Lao PDR and 50,000 tons of rice since the mid of 2019. For other crops such as sugarcane, the negotiations are still underway.

Table 7: Major markets for Lao agricultural export by share (%) during 2014-2018

Importers	Banana	Live Animal	Maize	Cassava	Tea	Rubber	Rice	Tobacco	Coffee
Thailand	4.80	0.00	20.10	0.50	78.00	0.60	9.10	5.70	9.30
China	93.50	16.20	41.60	25.50	9.00	43.80	27.80	2.60	1.40
Vietnam	1.60	83.80	34.90	66.60	2.90	52.80	51.20	66.90	50.10

These production increases, often aimed at export markets, demonstrates that, development of commercial agriculture played a major role in improving Laos' farmer households' living standards as well as reducing poverty in the rural area. Table 8 showed that after 20 years since 1992-1993, the poverty rate in Laos' rural area reduced from 51.8% to 28.6 % in 2012-2013. At the ending of 2019, the poverty rate in Lao's rural area was only 23.8%.

Table 8: Laos' Poverty Incidence, from 1992–1993 to 2019 (%)

	1992–1993	1997–1998	2002–2003	2007–2008	2012–2013	2013*	2019*
Rural	51.8	42.5	37.6	31.7	28.6	31.4	23.8

3.2. Some factors impeding development of commercial agriculture in Laos

Firstly, physical constraints arise from the Lao PDR's geographic characteristics and climate such that: (a) rugged mountainous terrain reduces the amount of arable land and soil quality in many areas, and makes the provision of infrastructure expensive, particularly for transport; (b) limited availability of water during the dry season reduces the area of land that can be irrigated; (c) the dispersion of population with long travel times between settled areas, largely over hilly and mountainous terrain, increases travel costs, consequently limiting access to socioeconomic opportunities and services; and (d) vulnerability to climate instability and natural disasters, especially severe floods during the rainy season, exposes the country, its population, and cropland to catastrophic climate events.

Secondly, socio-economic constraints include (a) a production base oriented to subsistence agriculture practiced by farmers who lack experience and basic technical, production, and market skills; (b) low productivity and low market prices and competition from neighboring countries; (c) underdeveloped value chains for cash crops and livestock; (d) limited access to agriculture inputs due to cost and logistical constraints; (e) limited access to irrigation facilities; (f) poor physical access that leads to postharvest losses and increased cost to move and process outputs; (g) insecure land ownership and property rights, which reduces investment in, and protection of, land and water resources; and (h) lack of access to financing for agriculture and agribusiness, which hampers investment and trade.

Thirdly, capacity constraints include (a) poorly educated farmers with low levels of literacy and numeracy, who lack access to training on improved practices; (b) poorly defined and inconsistently applied policies, rules, and regulations, creating uncertainty in the market; (c) limited institutional capacity of government agencies to address infrastructure, trade, and economic challenges; (d) limited capacity of financial institutions to provide services in support of agriculture; (e) inefficient practices throughout the input and output value chains; (f) the inability of farmers and agribusinesses to meet technical and Sanitary and Phytosanitary standards (SPS), compromising food safety and reducing opportunities for export; and (g) shortfalls in government budgets needed to support the sector.

3.3. Some recommended solutions to speed up the development of agribusiness in Laos

(1) Improving agricultural and rural infrastructure

Figure 2 above indicates only few agricultural products such as banana, cassava, vegetable and rubber are produced in the North with easy access to the railway while more products such as rice, sugarcane, tobacco, cattle, vegetable and coffee are produced in the Central and Southern parts of the country. More market opportunities would be obtained if the Laos-China railway is linked with better transport infrastructure from the South. The construction of Laos-China railway started in the end of 2016 and expected to be completed by December 2021. Improving rural transportation systems in the Central and Southern parts, therefore, is very necessary to enable agricultural products access easily to potential market of China. Cross-border logistics would also be developed to facilitate regional trade. Besides that, irrigation systems need to be constructed and upgraded reasonably to expand cultivating area and improve agricultural yield and production.

(2) Applying widenlly new technologies and Good Agricultural Practice (GAP) standards

To enhance the compatitiveness of agricultural products in the regional and international markets, together with develop larger-scale agricultural production and improve products'quality by applying new inputs, it is necessary for Laos to enforce standards and regulations on agricultral practice, and guarantee food safety through compliance with basic SPS standards and GAPs. Strenthening agricultural research as well as transfering research results of the new knowledge and technologies to farmers should be more supported by Lao's government in the comming years.

(3) Improving skills of farmers through education and extention systems

According to the World Bank (2018), the Lao PDR's average nationwide adult literacy rates are 50% for women and 67% for men, and these figures are lower in rural and remote areas. Inadequate education is a contributing factor for all poverty subgroups. Most farmers lack basic literacy and numeracy skills, which are essential to operate effectively in modern commercial agriculture. Therefore, three major issues to deal with to improve skill of farmers in the longterm are: (i) increasing the number of people being educated and trained, (ii) upgrading the quality of training and relevance to modern commercial agriculture, and (iii) delivering better training programs to those that need it through improvement of agricultural extension.

(4) Developing the linkages within agricultural value chains

Main stakeholders in agricultural value chains include input suppliers, farmers, traders, processors, exporters, transport companies, shipping companies. Laos' agricultural business shares characteristics with other countries in Sub-Mekong region in terms of weaknesses or constraints including (1) high production cost, (2) low productivity and quality, (3) weak forward and backward linkages among all actors, and (4) limited access to finance (Leelawath, 2019). Most of agro-products were produced and exported in form of raw.materials, thus, Lao PDR only gains a small fraction of benefit in the value chain of agricultural business. Expanation of contract famings; encouragement of private investment in value-added processing of agro-products; and improvement of linkages between all partners within agricultural value chains by creating the mechnism of reasonable benefit sharing are priority solutions to speed up Laos' high value and commercial agriculture.

(5) Improving continuously policies to facilitate developmen of commercial agriculture

The Lao PDR's Agricultural Development Strategy to 2025 and Vision 2030 emphasizes the encouragement of international trade of non-rice agriculture products, the recognition of the need to improve and ensure food quality both for national consumption and export. In order to implement the strategy, it is neccesary to legalize land tenure and improve regulation on land manangement, encourage private sector to invest in agricultural production and procesing for export by renovating trading policies, especially in better sharing information of the annual quota available to traders and producers and develop technical assistance from international communities in penetrating internatinal markets.

4. Conclusion

In the last decade, Laos'agriculture has been commercialized faster and has gained significant increases in terms of cultivated areas, yields and productions of cash crops & livestocks. Thanks to this process, from a self-sufficiently agricultural country, Laos has become one of the net exporters of agro-products. However, commercial agriculture in the nation is still less competive due to many difficulties expecially poor irrigation and rural trasportation infrastructures; small-scale production, limited agro- processing, and week linkages bettween stakeholders within agricultural value chains. Therefore, in the comming years, it would be neccessary for the country to upgrade agricultural and rural infrastructure; apply widenlly new technologies and GAP standards; improve skills of farmers through education and extention systems; strengthen the linkages within agricultural value chains; and improve continuously policies to facilitate commercialization of agricultural products./.

Abstract

Currency manipulation is a trade imposition by the U.S. Government in general and the U.S. Department of Treasury in particular for trading partners with the U.S. This shows signs of intentionally creating a competitive advantage for commercial gain. A bilateral trade surplus with the U.S, a current account surplus, and continuous one-way foreign exchange activity for a period of time are the conditions set out by the U.S. Treasury Department in the Omnibus Trade and Competitiveness Act of 1988. Every year, the U.S. Secretary of the Treasury issue a report analyzing the exchange rate policies of trading partners to promptly prevent unfair trade competition. In December 2020, the U.S. Treasury Department released a study that included a list of economies engaging in currency manipulation, including Vietnam. However, in the report on April 2021, the U.S. Treasury Department concluded that there was not enough evidence to prove that Vietnam manipulated the currency to create a competitive advantage in trade. Switzerland was labeled as a currency manipulator and was removed from the list in the same period as Vietnam (December 2020 - April 2021). By gathering the existing data sources, this paper researched the case of Switzerland, clarifying why this economy hit the mark in all 3 criteria of currency manipulation as well as what the Government and Central Bank of Switzerland carried out to remove the currency manipulation label, thereby giving lessons for Vietnam.

Keywords: *current account, currency exchange rates, currency manipulation, trade balance.*

1. Introduction

1.1. The necessity of the research

After more than 25 years of normalizing relation, bilateral economic and trade relation between Vietnam and the United States have made great progress. Vietnam is one of the most important trade allies of the U.S., and the U.S. is Vietnam's main export market.

However, The U.S. Treasury Department accused Vietnam of currency manipulation on December 16, 2020. If the U.S. applies specific sanctions, such as imposing taxes on billions of dollars of Vietnamese goods exported to the U.S. market, the Vietnamese economy will suffer from heavy economic losses. Therefore, although the currency manipulation label was removed in April 2021, Vietnam still needs to be proactive in the future to avoid falling into the currency manipulation trap and remove the label soon in case of being blacklisted again.

This paper systematized the theoretical basis of currency manipulation, the criteria for evaluating a currency manipulator set forth by the U.S. Treasury Department. In addition, the authors focused on processing and analyzing the data as well as experiences from the Swiss case, including the violation of the U.S. Treasury Department's criteria, the main causes leading to this behavior. Thereby, it provided conclusion about whether Switzerland intended to manipulate the currency or not. Finally, this paper drew on necessary experiences for Vietnam.

1.2. Theoretical basis of currency manipulation

Currency manipulation is the U.S. Treasury Department’s decision for countries that may engage in "unfair monetary policies" to achieve unfair competitive advantages in foreign trade.

According to Brad W. Setser and Dylan Yalbir (2020), currency manipulation was one way that countries can shift patterns of trade in their favor. By purchasing foreign currency in the market, they can artificially change the price of its imports and its exports. In fact, they do so to boost their exports, otherwise they might have trouble generating the demand their economies need to grow.

Michael W. Klein (2015) indicated that currency manipulation was the effort to keep exports cheap by intervening in the foreign exchange market, and it was hard to define and even harder to prove this behavior. Then, to some extent, any country that has a fixed exchange rate - such as France, Germany, Greece, and China - is, by definition, a currency manipulator.

As mentioned by Matthew Johnston (2020), currency manipulation was an effort to tinker with the value of a nation's currency in relation to foreign currency exchange rates to boost exports in international trade or reduce its debt interest burden.

Currency manipulation appraisal requirements were first adopted by the U.S. Treasury Department in the Omnibus Trade and Competition Act of 1988 and later amended in the Trade Facilitation and Trade Enforcement Act of 2015.

In which, the criteria for assessing currency manipulation include:

(i) The bilateral trade surplus with the US of at least 20 billion USD in 12 months

(ii) Current account surplus greater than 2% of GDP

(iii) One-way and long-lasting intervention in the foreign exchange market, as demonstrated by net purchases of foreign currencies for at least 6 months greater than 2% of

GDP in 12 months

However, the three criteria set forth by the U.S. Treasury Department is not a solid basis to determine whether a country is a currency manipulator. As noted above, for the U.S, the term "currency manipulation" is used to define a country's intervention in the foreign exchange rate, which reduces the value of its domestic currency relative to the U.S. Dollar (nominal or actual value) to boost exports, especially to the United States.

In fact, there is no international economic-financial theory that can confirm the "correct exchange rate" between two currencies, as well as the criteria to determine this exchange rate. A country’s monetary policy depends on many specific factors of the economy, such as the level of development, average income, and the composition of the respective basket of goods.

2. Method

The authors used qualitative method through descriptive statistics; systematic observation, meta-analysis, and comparison. Secondary data was used as a basis to explain why Switzerland was accused of manipulating and how it removed the label. On this basis, recommendations are given to Vietnam for avoiding currency manipulation-related risks in the future. The secondary data was collected and aggregated from actual data in US Department of Finance's reports and financial statements of the Swiss National Bank. In addition, data was also gathered from official reports, websites, and scientific works related to the research topic.

3. Results

3.1. Overview of Swiss economy

Switzerland is one of the most stable economies in the world. Its main trading partners are also major economies such as the U.S., France, Germany, Italy, Russia, the UK and Austria. One of the reasons why Switzerland attracts a large amount of FDI is due to the monetary security policy and the political stability. That has made Switzerland an ideal destination for investors.

However, in recent times, with the spreading of the pandemic, there has been a surge in safe-haven capital flows into Switzerland, putting pressure on the Swiss Franc to appreciate and leading to a domestic deflationary trend. The Swiss National Bank (SNB) has used a variety of instruments to counteract upward pressure on the Franc and limit negative effects on inflation and economic growth. Switzerland undertook a large-scale one-way intervention in the second half of 2019 and particularly in the first six months of 2020, considerably greater than the previous period, to fight Franc's appreciation and reduce the possibility of deflation, as the SNB's policy interest rate was substantially negative at the time. The most obvious expression is in the USD/CHF exchange rate. Whereas the COVID-19 pandemic has wreaked havoc on Swiss business, the U.S. Dollar is gradually recovering after continuously falling in price in December. The USD Index has surpassed the level of 90, trading around 90.4.

According to a report by the U.S Treasury Department, Switzerland meets all three criteria in the Trade Facilitation and Trade Enforcement Act of 2015, therefore it is included in the list of currency manipulators. As a result, the U.S Treasury Department conducted an advanced analysis of Switzerland's international trade and strengthened its bilateral commitments with signatories to the Trade Promotion and Enhancement Act 2015.

3.2. Criteria for making Switzerland as a currency manipulator

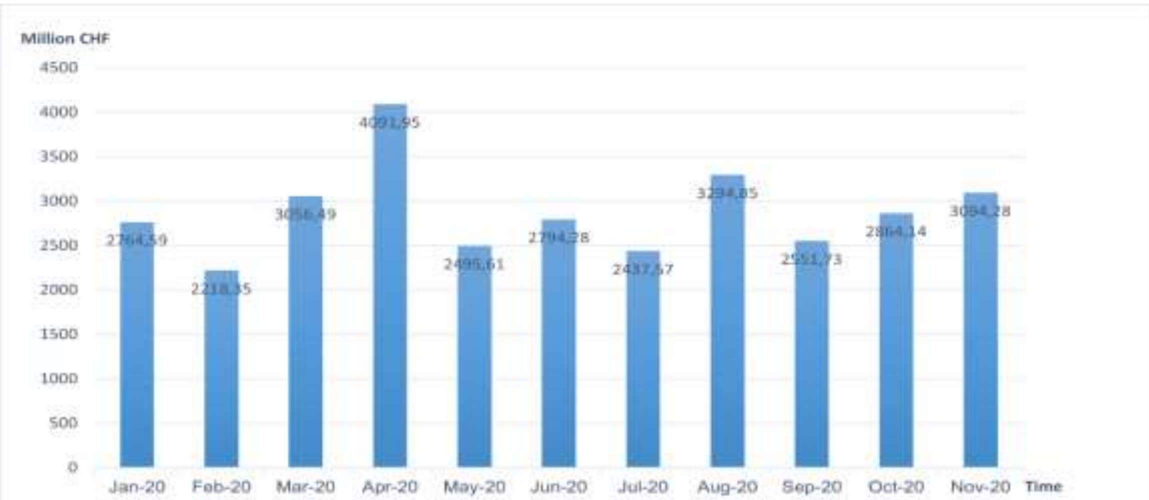
➢ **Trade surplus with the U.S.**

According to the December 2020 report of the U.S. Treasury Department, Switzerland's goods trade surplus with the United States is expected to hit $57 billion in 2020, up from $27 billion in 2019. According to the U.S. Treasury Department, Switzerland's trade surplus in goods with the US in the first 10 months of 2020 was 51.1 billion USD, exceeding 20 billion USD, one of the criteria for assessing a currency manipulator.

Switzerland's trade surplus with the U.S. increased to CHF 3.1 billion in November 2020, and peaked the highest level since August 2020. Higher sales of chemical and pharmaceutical products, machinery and electronics, watches and metals pushed exports up 4.8 percent month on month to CHF 18,8 billion. Exports to China, Japan, the U.S., the European Union, and the UK rose. Meanwhile, imports rose by 4.2 percent to CHF 15.7 billion, with chemical and pharmaceutical goods, machinery and electronics, metals, and automobiles accounting for the majority of the rise. Imports from the EU, the UK, China, Japan, and the U.S. have risen. The trade surplus rose to CHF 31.7 billion in the first 11 months of the year, which was upward from CHF 23.7 billion in the same timeframe last year.

Figure 1: Trade balance of Switzerland – U.S. 2020

(Unit: Million CHF)



Source: Federal Customs Administration

➢ **Current account surplus**

Switzerland has had significant current account surpluses for many years, with the surplus hitting 10.9 percent of GDP in 2019. For the four quarters leading up to June 2020, the current account surplus decreased slightly but stayed high, at 8.8% of GDP. While the criterion set forth by the U.S. Treasury Department was a current account surplus greater than 2% of GDP, Switzerland, therefore, violated the criteria and was placed on the U.S. Treasury Department's currency manipulation watch list.

Other factors were high per capita wages, a strong prime-saving-age and ageing population, a high household savings rate (almost double the developed economy average according to OECD data), small domestic investment options, calculation problems, and a large net foreign investment status (NIIP), in which returns further lift the income balance. Despite major downward adjustments due to adjustments in foreign profits, Switzerland's current account surplus has averaged over 8% of GDP since 2010, though it has decreased since the global financial crisis (when it reached nearly 15 percent of GDP). The structure of the current account has changed since the global financial crisis, with primary income and services trade surpluses diminishing and the goods surplus expanding due to merchant and the pharmaceutical industry (U.S. Treasury Department, 2021).

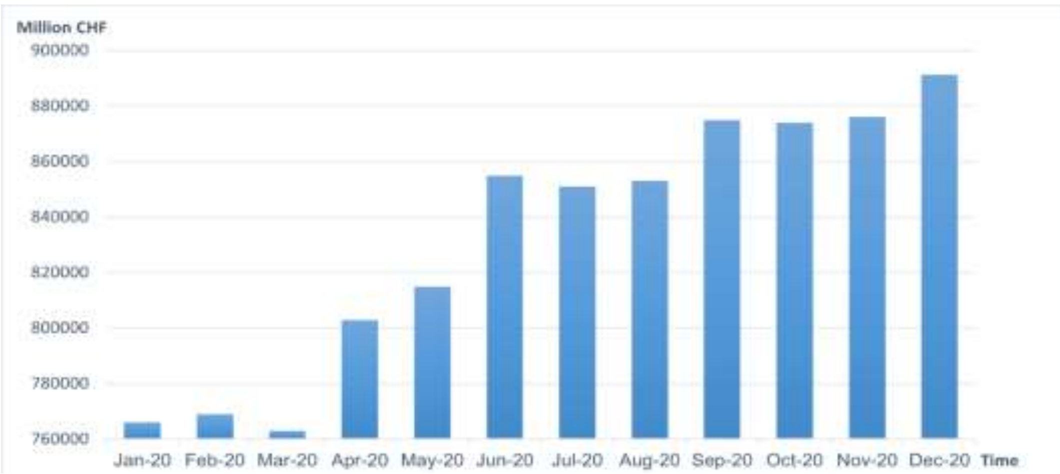
➢ **One-way intervention in the foreign exchange market**

The SNB announced in September 2020 that it would begin publishing the number of foreign exchange market operations quarterly (compared to its previous annual disclosure). In 2020, the SNB spent $115 billion on currency interventions (109.7 billion francs, or 15.3 percent of GDP). The U.S. Treasury Department reported that SNB net foreign acquisitions totaled $112 billion between January and December 2020. (or 14.9 percent of GDP). The U.S. Treasury Department reports that SNB net foreign sales totaled $103 billion (or 14% of GDP) between July 2019 and June 2020, above the U.S. Treasury Department's criteria of 2% of GDP.

Switzerland's foreign currency reserves were $1 trillion at the end of December 2020, which increased from $798 billion at the end of 2019. Gold and highly valued sovereign bonds, which make up a smaller part of the SNB's reserves portfolio, have also risen.

Figure 2: Foreign exchange reserves of Switzerland 2020

(Unit: Million CHF)



Source: Swiss National Bank

3.3. Causes of Switzerland's violation of the three currency manipulation criteria

The U.S. Treasury Department acknowledged that the Swiss economy is "special" and the way Switzerland conducts monetary policy is also constrained by the low domestic wealth.

Switzerland is a small, flexible economy under various foreign influences, so exchange rate fluctuations can have a noticeable effect on inflation. During a period of economic fluctuations and impacts from the COVID-19 pandemic, the Swiss Franc became a safe haven for investors around the world. Big haven inflows will place significant appreciation pressure on the Franc in periods of increased regional and global danger, and sustained appreciation would weigh on domestic inflation. The exchange rate would be affected if the SNB changes interest rates or intervenes in the foreign exchange market. The sudden appreciation of the Swiss Franc causes the Swiss economy to experience many negative effects, which is the problem of deflation, which is a vicious cycle of economic contraction.

The Franc's safe-haven symbolism means it is appreciated during times of economic and political uncertainty. The demand for the Swiss Franc as a labor-market value-added safe haven boosted its value in the foreign exchange market considerably. Since the high currency value makes foreign imports cheap in Switzerland, it harms domestic exporters and the Swiss tourism industry by making Swiss-made goods and services costly. Global investors' rush to the safe-haven Swiss Franc, which has lifted the currency's value, has taken a toll on Switzerland's economy, which is heavily dependent on exports and tourism.

The exchange rate of CHF and USD is also significantly affected by the EUR/CHF rate. EUR/CHF has fallen to its lowest level since early 2017 on concerns that the U.S. Treasury Department is closely monitoring SNB intervention on a large scale. Against a backdrop of global risks and political tensions along with monetary stimulus measures by the ECB have increased the value of the Franc against the Euro and lifted other Swiss exchange rates. Those factors have reduced the cost of Swiss imports and, in turn, the consumer price index, keeping the SNB from hitting its target.

- **Trade surplus with the U.S.**

The COVID-19 pandemic has skewed trade flows and widened U.S. deficits with trading partners. Since October 2020, the number of infections in Europe and the United States has risen exponentially, and efforts to deter the disease's dissemination have been implemented, putting a damper on economic growth. Although the exceptional financial uncertainty that resulted from the COVID-19 crisis in the first half of 2020, the intervention was made in the sense of an extraordinarily broad current account surplus and an increasing bilateral trade surplus with the United States, and it helped to save the Franc from appreciating on an actual, trade-weighted basis.

Despite maintaining a large and increasing commodity trade surplus with the United States, Switzerland still has a trade deficit in services from this partner for many years. The extraordinarily high rise in the goods surplus in 2020 can be traced in part to a spike in private Swiss gold exports to the U.S. as the COVID-19 pandemic intensified and U.S. buyers boosted gold bullion purchases in the first half of the year. Notably, Swiss gold exports to the U.S. increased to $15.4 billion in 2020, up from $1.2 billion in 2019. The bilateral services trade deficit between Switzerland and the United States was $21 billion in 2020, down from $22 billion in 2019. Except for 2020, the U.S. trade deficit with Switzerland has been closer to equilibrium in recent years when services data were included.

- **Current account surplus**

The criteria set by the U.S. Treasury Department do not match the economic characteristics of Switzerland. Switzerland's current account surplus is larger than the violation criterion because this country has a surplus of goods to the U.S. but may have a trade deficit in U.S. services. The high current account surplus is due to the high savings rate, not the undervalued Franc.

Switzerland was one of the first European countries to be affected by COVID-19, prompting the government to declare a national emergency in mid-March 2020. In April 2020, the number of active and new cases fell sharply but began to rise again in June as officials relaxed public health and accessibility constraints. The number of new COVID-19 cases began to rise in October, with new infections dramatically above spring 2020 highs. As a result, the Swiss Federal Council reintroduced multiple containment and lockout policies, which were eventually eased as COVID-19 cases began to decrease beginning in March 2021. However, the recent increase in cases has put a stop to any further reopening. Switzerland has greatly loosened macroeconomic policy in order to mitigate the economic effects of the pandemic. Switzerland's traditionally strict monetary stance has resulted in a strong and stable current account surplus. The U.S. Treasury Department reported that Switzerland has announced fiscal stimulus totaling approximately 11% of GDP since the start of the COVID-19 crisis, including both overt and indirect interventions, but less than half of the funds made available have been used so far. Partially compensating unemployed workers and providing assistance to impacted enterprises are examples of direct fiscal interventions. These initiatives are combined with broader indirect fiscal measures such as debt subsidies for small to medium-sized enterprises and startups, as well as the indefinite postponement of small business social security payments. Taxes and other fees to the federal government would be deferred by the involved businesses. However, the acceptance of bridge loans under the federal guarantee scheme, as well as freelance business funding, has fallen short of expectations.

Switzerland has long been one of the world's most prosperous, productive, and creative economies. Switzerland has the fourth-highest GDP per capita in the OECD, thanks to its strong labor productivity and high job rates. Switzerland has a strong and prosperous banking market, making it a major global financial center. Over the last two decades, the Swiss authorities have a tradition of prudent macroeconomic management, especially a cautious fiscal policy stance that has prioritized debt reduction and a highly competitive corporate tax system. That has made Switzerland a destination for multinational businesses, contributes to Switzerland's global leadership in a number of high-value-added industries. Over the last four decades, these trends have led to steady, and sometimes incredibly high, current account surpluses.

- **One-way intervention in the foreign exchange market**

The Swiss National Bank tends not to issue bonds to limit the budget deficit. Therefore, instead of issuing bonds, the Swiss National Bank switched to foreign exchange intervention to stabilize the macro-economy and help the economy avoid deflation.

To mitigate the impact of COVID-19 on activity, restrict Franc appreciation, and fight deflationary threats, the SNB eased monetary policy substantially in 2020 through a variety of interventions. In the first half of 2020, as a global reserve currency issuer, Switzerland was under increased pressure from safe-haven inflows as a result of the COVID-19 crisis. To combat Franc inflation and deflationary pressure, the SNB raised its foreign exchange purchases considerably in the spring of 2020 and greatly increased its participation in foreign exchange markets.

The Swiss National Bank has maintained a zero-inflation policy for several years, along with this country's political neutrality makes the Franc a strong and exceptionally stable currency. Since Switzerland has a very low inflation rate, also negative at the moment, the SNB has long retained its readiness to engage more forcefully in the foreign exchange market to prevent deflation. The inflation forecast remains unclear in the current scenario. The outlook for 2020 is bleak (-0.7 percent). Next year's inflation rate is expected to be high (0.0 percent) and marginally positive in 2022. (0.2 percent). The conditional inflation projection is based on the premise that the SNB's policy rate will continue at -0.75% for the duration of the forecast. To improve the inflation rate, the bank has no choice but to depend directly on monetary intervention. The reason for the intervention is to adjust the inflation rate transparently.

3.4. Switzerland's measures to remove the label of currency manipulator

Switzerland has interfered in foreign exchange markets on a regular basis to save the Swiss Franc from appreciating too much toward the U.S. dollar. The Swiss National Bank refuted the charge while promising to keep intervening in the currency market to prevent the Franc from being too powerful.

The SNB targets stable inflation in the future, Switzerland is still fighting deflation and the threat of outright deflation, which could make the Franc stronger. Despite Switzerland's reputation as a currency manipulator, the SNB is adamant about not changing monetary policy and is prepared to participate in the foreign exchange market.

Under the 2015 Act, the U.S expanded its bilateral contribution to Switzerland in early 2021. The U.S. Treasury Department is in talks with Swiss officials about taking concrete steps to fix the root causes of Switzerland's external deficit.

According to a December 2020 report released by the U.S. Treasury Department, Switzerland violated all three criteria for assessing a currency manipulator. As a result, the

U.S. Treasury Department conducted advanced analysis and intensified bilateral negotiations with Switzerland. In early 2021, the U.S. Treasury Department began to strengthen its bilateral engagement with Switzerland and further discuss with Swiss authorities the causes of imbalances in the economy leading to microfinance. violated the currency manipulation criteria, and offered a solution for Switzerland.

The Omnibus Trade and Competition Act of 1988 was introduced to examine whether countries manipulate currencies intending to facilitate unfair trade competition. However, in the April 2021 report, for the case of Switzerland, after a period of data analysis and strengthening of bilateral commitments, the U.S. Treasury Department concluded that there was not enough evidence to allege. Switzerland is a currency manipulator for unfair trade gain.

4. Discussion and Conclusion

In summary, researchers have systematized the theoretical basis of currency manipulation and the criteria to evaluate a currency manipulator set forth by the U.S. Treasury Department. In addition, this paper analyzes collected data and studies experience from Switzerland - a country that was labeled a currency manipulator by the U.S. Treasury Department. From the case of Switzerland, several measures can be drawn for Vietnam to be proactive in the future, to avoid falling into the currency manipulation trap, and to remove the label soon in case of being labelled:

Firstly, balancing and adjusting the exchange rate to be compatible with the actual situation of the economy.

This is an important action to stabilize Vietnam's macro policies such as stabilizing inflation, developing the economy, and limiting the one-way impact on the currency market. Currently, Vietnam is anchored under the central exchange rate mechanism - applying a fixed exchange rate with a change of ±2%.

In order to be flexible and proactive in adjusting exchange rates, the government should pay attention to the following factors:

*Interest rates of VND and USD***:** This interest rate affects the equivalent strength value of the two currencies. Currently, depositing USD in Vietnamese banks has a 0% interest rate, which means that the depositor will not have any profit from this deposit. As for VND savings in banks, there are many different interest rates, at the time of research in 2021, this interest rate will be around 5-6%/year. This is an attractive thing for assets denominated in VND, reducing the psychology of speculative hoarding in foreign currencies. From there, the State Bank of Vietnam will be flexible and maintain in stabilizing the exchange rate.

Foreign exchange reserves of the State Bank of Vietnam: The State Bank of Vietnam would be able to maintain a stable USD/VND exchange rate, eradicate black markets for foreign currency exchange, and effectively satisfy market demand and supply if it has sufficient foreign exchange reserves. The State Bank of Vietnam would be able to balance the exchange rate and the power of the VND by applying pressure to sell foreign exchange. 92 billion USD is the number of foreign exchange reserves in the first 8 months of 2020. By March 2021, this number has reached 113 billion USD. Maintaining high foreign exchange reserves and trade surplus are good conditions for exchange rate stability, however, increasing foreign exchange reserves and trade surplus may bring Vietnam closer to the currency manipulation trap. Therefore, the State Bank of Vietnam should propose proactive and flexible measures according to the general situation of the market.

The problem of inflation targeting expectations: Because the U.S. is the country with the leading economy in the world, the U.S. dollar is a strong currency, accounting for nearly 90% of currency transactions in the world. But expected inflation here is the level of inflation that makes the economy the most dynamic, making people believe in the strength of their national currency. The State needs to come up with macroeconomic policies, balance inflation so that VND does not lose value, maintaining a stable USD/VND exchange rate.

*Import and export status***:** Vietnam's trade surplus with the United States exceeds monetary criteria; but, given the current state of the economy, increasing exports will help stabilize the price ratio, but only to a small extent until Vietnam is placed on this list again.

Secondly, actively collaborating in the process of explaining and negotiating

If once again labelled a currency manipulator, Vietnam will have one year to negotiate on currency manipulation before there are official U.S. trade sanctions. Therefore, the Government needs to coordinate with the U.S. Treasury Department to provide information and evidence to prove that Vietnam is not a currency manipulator. Although Vietnam is no longer on the list of currency manipulators, the negotiation will help strengthen the relationship between the two countries. Diplomacy is always an important measure in all disputes, helping to neutralize adverse situations and come together to agree to take common action. This is a job that reflects Vietnam's goodwill to exchange and cooperate in trade negotiations, bringing the two countries' bilateral relationship closer, co-operating for mutual development. Vietnam needs to tell the U.S. Treasury Department that the operating goal of the State Bank of Vietnam is stabilizing the macro economy and following the market's trend, not a proactive move to devaluation to achieve unfair commercial advantages. Because Vietnam's policies are flexible and anchored to the market, not coercive, they will indirectly weaken the national currency. At the same time, the expansionary monetary policy reduces the domestic interest rate, stimulates the economic market, creates more job opportunities, develops markets such as securities and foreign exchange, and increases circulation leading to the growth of the economy. These are all reasonable actions of the State Bank, indirect intervention in exchange rates is allowed but not intended to spark a war on currency manipulation. Therefore, we have confidence in the policy and guidance of the state, which is completely in line with and follows the market principle.

Thirdly, preventing foreign goods disguised as Vietnamese goods for export

Under the influence of the U.S.-China trade war, there appeared a situation where Chinese goods disguised themselves as Vietnamese goods to export to other markets in order to evade taxes, typically taking the Made in Vietnam label to import into the U.S. avoid 25% tariffs due to trade sanctions. This is an act that causes great damage to Vietnam's goods and import-export reputation, this action needs to be coordinated by authorities and businesses to denounce. Vietnam needs to tighten the stages in the management of import and export of goods, and at the same time propose measures to strictly handle acts of disguise, aiding Chinese goods into Vietnam to label domestic goods. The export of goods that are not from our country may lead to a violation of the free trade agreement (FTA) signed previously. Management levels need to proactively propose measures and regulatory corridors so as not to cause damage to goods before being applied with trade remedies from abroad.

Fourthly, increasing imports from the U.S.

In addition, it is necessary to take measures to increase the import of goods and services from the U.S., especially specific groups of U.S. goods such as agricultural products, aircraft, energy, pharmaceuticals, production equipment, etc. technology. These are goods that the U.S. has abundant supply, competitive prices while being essential to the Vietnamese economy. In fact, Vietnam has signed a contract to buy U.S. aircraft worth billions of dollars along with projects in the field of energy and LNG (Liquefied Natural Gas). In addition, Vietnam focuses on overcoming limitations in technology, trade in services, expanding integration opportunities for Vietnam and easier access to U.S. goods. Vietnam needs to show its importance to bilateral trade relations between the two countries. If the same product has the same commercial value, Vietnam should increase imports of high-quality goods from the U.S. to create trade opportunities and expand connection opportunities for Vietnamese businesses.

Pham Thi Tue
phamthitue@tmu.edu.vn
Thuongmai University, Hanoi, Vietnam

Abstract

Private enterprises in Vietnam as well as in other countries play the important role in economy, but they have actually encountered several barriers in their development at both micro and macro levels in fact. Inquires of these barriers is meaningful in making policy recommendations to remove barriers to private enterprise development in countries where the State/Government is considered a major actor. This study focuses on evaluating factors affecting the micro-barrier system that hinder the development of private enterprises in Vietnam to answer two research questions: which factors influence micro-barriers that hinder the development of private enterprises in Vietnam and what is the degree of influence of those factors? The study applies quantitative research methods to measure the impact of factors on the micro-barriers system that hinder private enterprise development based on the survey sample of 392 private enterprises in Vietnam, which are mainly small and medium-sized private enterprises (most affected by micro barriers). Research findings indicate that state management policies; legal and tax systems, expanding scientific research and technological innovation activities are the main factors affecting the micro barriers that hinder the development of private enterprises in Vietnam. These results could become the experiences for other countries like Vietnam.

Keywords: *Tectonic government; Tectonic state; Innovative government; Remove barriers; Private enterprises; Barriers to businesses*

1. Introduction

Both economists with a free market perspective and economists with modern perspectives agree that the role of the state as a regulatory actor is a natural need of the market (Leach, Raworth, & Rockstrom, 2013). Therefore, creating a healthy development environment for economic sectors is both a task and a goal of the State/Government when intervening in a market economy. How the state/government (depending on the political institutions of each country) intervenes in the economy is usually a topical question; especially in recent years, when economies are increasingly dependent on each other in bilateral and multilateral trade relations, this questions becomes even more important.

In Vietnam, despite significant achievements in socio-economic development since the introduction of the "Doi Moi" (Renovation) strategy and policy in 1986, Vietnam continues to face many development challenges. Per capita income is below the national expectation, leading to a high risk of falling into the middle-income trap. Productivity growth has slowed down in recent years, and social and environmental problems in economic development are emerging, such as environmental pollution, social evils and increasingly extensive inequalities, weak economic and governance institutions were honestly admitted by the Party and Government of Vietnam (Congress, 2016). In order to achieve the objectives, set out in the 5-year socio-economic development plan 2020-2025 with a vision to 2035, Vietnam needs to accelerate its institutional improvement and more effective access to opportunities, and actively participate in solving global challenges if they do not want to lag behind other economies in the region and the world.

In addition, Vietnam has acknowledged that the market economy can only mature when it is led by the private sector, competition and deeper integration into the global economy. This is a significant stage that all economic models must go through. The way the Government intervenes in a market economy to promote the development of the private sector, especially private enterprises, is a topical issue not only for Vietnam but also of many other developing countries. It is strong development of private enterprises that can drive the national economy to break from a developing economy to a developed one. Therefore, the case study of Vietnam is not only meant to be a typical representative for a developing country desiring to become a developed country, choosing to encourage the development of private enterprises economy with small and medium-sized enterprises as key players; but also marks a great transformation of the role of the state/government in the economic development of a specific economic model (socialist-oriented market economy).

Many researchers studying Vietnam's economy think that this is a dynamic and emerging developing economy in Southeast Asia and Asia with an increasingly important role in the international arena, but there are significant barriers that hinder the development of private enterprises at both micro and macro levels (OECD, 1995). At the micro level, (OECD, 1995) or (Wang, 2016) identifies possible barriers as banking system and financial/credit market (Department of Enterprise Development, 2017); competitive pressures under market mechanism (VCCI & USAID, 2018); slow growth of the input market (CIEM, 2017); limited confidence among workers; the lack of governance capacity and poor cooperation in application research (Kiều, 2012); limited trust in entrepreneurs and poor establishment of entrepreneurship culture as well as uniformity in organizational structure are micro barriers to the development of private enterprises (Chung, 2017; Kazemi, 2013). The study of these barriers for each economy is important in making policy recommendations to remove barriers to private enterprise development in countries where the role of the State/Government is considered as a key factor. Therefore, the purpose of the study is to assess the factors affecting the micro-barrier system that hinders the development of private enterprises in Vietnam. To achieve the purpose of the research, the research needs to answer two research questions: which factors influence micro-barriers that hinder the development of private enterprises in Vietnam and what is the degree of influence of those factors? The study used the method of measuring the level of the impact of micro-barrier factors on the development of private enterprises based on the survey sample of 392 Vietnamese private enterprises nationwide, mainly private small and medium enterprises (the type of enterprise most affected by micro barriers).

2. Theoretical framework

There are many studies that address the barriers to private enterprise development in developing countries, especially small and medium-sized private enterprises. The most extensive study, Wang (2016) used the cross-country data obtained from the World Bank's Enterprise Survey of 130,000 businesses in 135 countries and the multivariable regression model investigating barriers to small and medium-sized enterprises in developing countries. The study found five main factors affecting businesses including access to finance, tax rates, competitive pressure, electricity prices, and political factors. The two most influential factors are access to finance and competition. Also study of (EBRD, 2005, 2009, 2012, 2014 and 2020) of the Egyptian economy analysed and identified major barriers affecting private sector development in the country as difficult access to finance; policy instability and vulnerability in macroeconomic shocks; limited support for private enterprise development by the legal system; lack of market-driven competitiveness in the real estate and energy sectors; weakness of domestic value chains; and financial institutions. The study also identifies barriers by sector such as energy, banking and finance, industry, and agribusiness.

In addition, the research of Amentie, Negash, and Kumera (2016) using Ethiopian interdisciplinary data and the sampling method combined with descriptive statistics identified nine major and moderate factors influencing the development of small and medium enterprises in Ethiopia, including micro barriers such as competitive pressure, high interest rate, debt payment problem of customers, unavailability of raw materials, weaknesses of the banking system and unavailability of corporate credit systems; and the market’s low demand for enterprise products. Agreeing with the above study, Adewale (2015) when studying business development barriers in the printing industry in Nigeria based on the interview method showed that poor infrastructure and limited finance, weak management ability and the absence of supporting information as well as low entrepreneurial spirit greatly hinder the development of enterprises in the industry. Even if credit is available to small and medium-sized businesses, it is still difficult to access and use this credit flow (Salami., 2003).

Continuing to explore in-depth the internal factors of the enterprise itself as a barrier to private enterprise development, Kazemi (2013) conducted a survey of Iranian biotechnology product manufacturers and found five main groups of barriers related businesses themselves: limited trust and encouragement for employees, the absence of corporate culture with poor cooperation, solidarity and cultural diferences; lack of confidence in entrepreneurs; weak business skills and coordination in the organizational structure as well as poor corporate governance. The research also emphasized the importance of building a startup culture that significantly affects the development of private enterprises. Levy (1992) in his study of the furniture industry in Tazania shows that the lack of credit financing in the market makes it difficult for both large and small enterprises to develop. Meanwhile, in Sri Lanka, small and medium enterprises have difficulty accessing the inputs that are the advantages of state-owned corporations. With the ambition to find out if access to finance is a major constraint for small and medium enterprises in most countries, (EBRD, 2005, 2009, 2012, 2014 and 2020) conducted a survey about business environment and enterprise performance in many countries around the world. Research findings show that in countries with underdeveloped capital markets, the central bank tends to prioritize loans for state-owned enterprises or large enterprises designated by the Government instead of promoting capital for small and medium enterprises. Agreeing with the above conclusion, Chavis, Klapper, and Love (2011) use world bank business survey data to conduct research and find that 31% of businesses consider credit access as the main concern; even the financial barrier causes more serious effectons on small and medium-sized private enterprises than larger firms and this barrier is more impactful than other factors (Beck & Torres, 2007).

Studies into the development of private enterprises and the private sector in Vietnam in recent decades generally conclude that private enterprises are facing many development barriers. Sơn (2017) states that there are many points of disagreement between the perception of private economic thinking and the development prospect of this economic sector. There is not even a clear definition of private enterprises, which makes it difficult for statistical and research activities. Sơn (2017) pointed out that difficulties in accessing private credit are still seen. Only 40% of operating enterprises are able to access bank loans. Many private businesses find it difficult to meet lending regulations of credit institutions because they are not transparent and fully aware of their financial situation. Chung and Phan (2018) also believed that private enterprises have high average business costs that reduce competitiveness such as transportation and personnel costs; or the slow and inconsistent development of the input market and the production auxiliary market (CIEM, 2017) has caused significant obstacles for the development of Vietnamese private enterprises. Kiều (2012) argued that barriers to corporate governance are also the reason why the private sector has not yet reached its full potential.

To sum up, studied micro-barriers that can impede the development of private enterprises in Vietnam are shown in the following table:

Table 1: Micro barriers restricting the development of Vietnamese private enterprises

Abbreviation	Barriers restricting enterprise development (micro level)	Literature
RCMI 1	Banking system and financial/credit market	Amentie et al. (2016); Levy (1992); Chavis et al. (2011); (Beck & Torre, 2007); VCCI and USAID (2018)
RCMI 2	Competitive pressure in the market mechanism	Wang (2016)
RCMI 3	Input	Kiều (2012); Levy (1992)
RCMI 4	Absence of workers' confidence	Kazemi, 2013); Adewale (2015)
RCMI 5	Lack of cooperation, governance capacity	Kazemi (2013); Adewale (2015); Kiều (2012);
RCMI 6	Lack of confidence in entrepreneurs and entrepreneurship culture	Kazemi, 2013); Adewale (2015)
RCMI 7	Lack of uniformity in organizational structure of enterprises	(Kazemi, 2013)

Source: Theoretical Framework

3. Method

3.1. Samples

Samples of the study were selected based on the convenient method, one of the non-probability sampling approaches. According to the convenient sampling method, selected subjects were accessible objects (Tho & Trang, 2009). The survey subjects of this study are managers and employees in enterprises. According to Tho (2011), in EFA, sampling is usually based on (Congress, 2016) minimum size and the number of measurement variables in the analysis. Hair, Anderson, Tatham, and Black (1998) suggests that in order to use EFA, the sample size should be at least 50, preferably 100 and the observed/measurement ratio should be 5:1, meaning that a measurement variable needs at least 5 observations. In this study, the total number of observed variables is 42, so the minimum number of samples to achieve is 210. For multivariable regression analysis: the minimum sample size to achieve is calculated by the formula of 50 + 8*m (m: number of independent variables) (Tabachnick & Fidell, 1996). Thus, in order to identify the factors affecting business development barriers, the study conducted in-depth interviews and used 400 structured questionnaires for management leaders and workers in private enterprises in Vietnam. The findings were from 400 questionnaire samples collected. Of which 392 were valid, 3 were invalid, 4 were incomplete, and 1 was rated at the same score.

3.2. Data analysis method

In this study, the authors applied the Structural Equation Modelling (SEM) with SPSS 22.0 software and AMOS version 22.0, with 4 steps: analysing Cronbach's Alpha, Exploratory Factor Analysis (EFA); Confirmatory Factor Analysis (CFA), and Structural Equation Modelling (SEM), specifically as follows:

Step 1: Evaluation of the reliability of the scale. Cronbach's Alpha (CA) was used to evaluate the reliability of the scale for each observed variable belonging to the factor groups. Peterson Peterson (1994) (Peterson) suggests that any factor with CA less than 0.6 should be excluded from the research model. According to (Nunnally, Bernstein, & J.C., 1994), observed variables with a total correlation coefficient less than 0.3 are considered as garbage variables, which were also excluded.

Step 2: Exploratory Factor Analysis (EFA). The EFA allows describing the correlation between the impact variables, referred to as "factors". EFA is used in cases where the relationship between observed and latent variables is unclear or uncertain. EFA is thus conducted in a discovery manner to determine the range and degree of relationship between observed variables and the underlying factors. The number of basic factors depends on the research model in which they are bound by rotating orthogonal vectors so that correlation does not occur. EFA discovery factor analysis is useful in the initial empirical step or test extension. Meyers, Gamst, and Guarino (2016) reported that in the EFA, the Principal Component Analysis extraction method with Varimax rotation is the most commonly used method. A condition for EFA analysis is to meet the following requirements: Factor load coefficient > 0.3; $0.5 \leq KMO \leq 1$; Bartlett test has statistical significance (Sig. < 0.05); percent total variance > 50%.

Step 3: Confirmation factor analysis (CFA). The affirmative factor analysis (CFA) is appropriate when researchers have some knowledge of the underlying variable structure. In which the relationship or hypothesis (derived from theory or experiment) between the observed variable and the base factor is accepted by the researchers before conducting statistical testing. Thus CFA is the next step of EFA to test whether there is a prior theoretical model that underlies a set of observations. CFA is also a form of SEM. In CFA development, the observed variables are also indicator variables in the measurement model, because they "upload" the conceptual basis theory. The factor analysis asserts that CFA accepts the hypotheses of the researchers, determined by the relationship between each variable and one or more factors. Indicators for measuring the suitability of the model with data include Chi squared (CMIN); Chi square adjusted according to degrees of freedom (CMIN / df); Comparability index (CFI); Tucker & Lewis index (TLI); and Root Mean Square Error of Approximation (RMSEA). According to Hair Jr. et al. (1998), if 1 < CMIN / df < 3, the model is considered to be a good fit. (Tho, 2011) suggested that if the model receives CFI values, TLI ≥ 0.9; RMSEA ≤ 0.08, and P > 0.5, the model is suitable for the data.

Step 4: Structural equation modeling (SEM). Structural equation modeling (SEM) helps test a set of regression equations at the same time. In this study, the SEM model was implemented with the aim to identify the influencing factors and the degree of influence of each factor on the micro-barriers that limit the development of private enterprises.

4. Results

4.1. The results of the reliability testing of scales by Cronbach's Alpha

To ensure the reliability of the scale, the author evaluated the reliability of the scale through Cronbach's Alpha for each group of observed variables of different factor groups; if any factor had a small Cronbach's Alpha coefficient more than 0.6, it would be excluded from the research model (Peterson, 1994) and observed variables with a correlation coefficient less than 0.3 were considered as garbage variables, also removed from the scale of individual factors (Nunnally et al., 1994).

According to Table 1, Cronbach's Alpha results for "Micro barriers limiting the growth of private enterprises" showed that the CA coefficient was 0.870; observed variables had a coefficient of 0.6 < CA < 0.870, and the correlation number of the total variable was greater than 0.3. To conclude, variables RCMI1; RCMI2; RCMI3; RCMI4; RCMI5; RCMI6; RCMI7 were qualified to move on to the next step. Cronbach's Alpha results for "Competitiveness in production - business areas" showed that the CA coefficient was 0.853, the observed variables had a coefficient of 0.6 < CA < 0.853, and a large correlation coefficient of the total variables was higher than 0.3. So variables CTDB1; CTDB2; CTDB3; CTDB4 met the requirements to continue to the next step. Cronbach's Alpha results for "Increasing support for scientific research and technological innovation activities" showed that the CA coefficient was 0.850, the observed variables had a coefficient of 0.6 <CA

<0.850, and the correlation number of the total variable was greater than 0.3. So the variables KHCN1; KHCN2; KHCN3; KHCN4 were qualified to be taken to the next step. Cronbach's Alpha results for "Expanding cooperation and international integration" showed that the CA coefficient was 0.925, the observed variables had a coefficient of 0.6 < CA and a correlation coefficient of the total variable was greater than 0.3. So the variables HTHN1; HTHN2; HTHN3 met the requirements to move to the next step.

Table 2: Results of assessing the reliability of the scale

No	**Observed variables**	**Abbreviation**	**Coefficient of correlation of total variables**	**Cronbach's Alpha**
1. Micro barriers limiting the growth of private enterprises - RCMI **Cronbach's Alpha: 0.870**				
1	Banking system and financial/credit market	RCMI1	.515	.869
2	Competitive pressure according to market mechanism	RCMI2	.619	.855
3	Input	RCMI3	.653	.851
4	Lack of confidence among workers	RCMI4	.756	.836
7	Lack of cooperation, governance capacity	RCMI5	.652	.851
8	Lack of confidence in entrepreneurs and entrepreneurship culture	RCMI6	.681	.847
9	Lack of uniformity in organizational structure of enterprises	RCMI7	.653	.851
2. Competitiveness in production and business areas - CTDB **Cronbach's Alpha: 0.853**				
10	Favorable policy creates a healthy	CTDB1	.637	.836

	competition in the area, giving priority to the Private Enterprise			
11	Policies to protect local businesses with tax support	CTDB2	.713	.805
12	Policies to protect local businesses with price and fee subsidies	CTDB3	.713	.805
13	Policies to protect local businesses by supporting long-term land lease	CTDB4	.714	.804
3. Increasing the support for scientific research and technological innovation activities **Cronbach's Alpha: 0.850**				
14	The impact of science and technology innovation policies on the development of enterprises	KHCN1	.707	.803
15	The impact of payment methods on the development of businesses	KHCN2	.795	.765
16	The impact of information sharing methods on enterprise development	KHCN3	.670	.817
	Infrastructure's impact on the development of the business	KHCN4	.595	.846
4. Expanding cooperation and international integration - HTHN **Cronbach's Alpha: 0.925**				
17	Impacts of science and technology innovation policies on the development of enterprises with international commitments to the development of enterprises	HTHN1	.881	.865
18	The impact of international integration on the development of	HTHN2	.887	.859

	enterprises			
19	Effective implementation of multilateral and bilateral commitments to the development of the business	HTHN3	.782	.942
5. State management policy - CSQL **Cronbach's Alpha: 0.835**				
20	Transparency of state management policies	CSQL3	.698	.771
21	Consistency in understanding and applying policy regulations	CSQL4	.719	.751
22	The impact of tax policies and tax incentives on the development of enterprises	CSQL5	.674	.794
6. Law and tax - PLT **Cronbach's Alpha: 0.806**				
23	Impact of domestic laws on the development of enterprises in the area	PLT1	.587	.861
24	Impact of tax barriers on the development of businesses in the area	PLT2	.723	.686
25	Open policy creating favorable conditions for production and business units to develop in the area	PLT3	.717	.686

Source: Analyses of data from authors

Cronbach's Alpha results for "Macro barriers limiting the development of private enterprises" showed that the CA coefficient was equal to 0.840, the observed variables had a coefficient of 0.6 < CA < 0.840, and the correlation number of the total variable was greater than 0.3. So the variables RCMA1; RCMA2; RCMA3; RCMA4; RCMA5; RCMA6; RCMA7 were qualified to go to the next step. Cronbach's Alpha results for "State management policy" show that the CA coefficient was 0.633. CSQL1 variable was eliminated because of CA factor > 0.633. After removing CSQL1, the author ran the SPSS for the second time, the CA factor was 0.708, the variable CSQL7 was eliminated because the CA factor was greater than 0.708. After removing the CSQL7 boundary, the author re-ran SPSS for the third time, CA = 0.732. CSQL6 variable was rejected because it had CA factor> 0.732. After removing CSQL6, the author re-ran SPSS for the fourth time, the CA coefficient was 0.763, the variable CSQL2 was eliminated because the CA factor was greater than 0.763. After removing CSQL2 variable, the author reran the SPSS 5 times, CA = 0.835 and found that the observed variables all had a coefficient of 0.6 < CA < 0.835, and had a total correlation coefficient greater than 0.3. To conclude, variables CSQL3; CSQL4; CSQL5 were satisfactory to take on next step. Cronbach's Alpha results for "Law and Tax" showed that the CA coefficient was 0.806 and the observed variables had a coefficient of 0.6 < CA <0.806, and a total correlation coefficient greater than 0.3. So the variables LTPL1; LTPL3; LTPL4 met the requirements to move to the next step.

4.2. Explore factor analysis (EFA)

The EFA factor analysis method belongs to a group of interdependence techniques, which means that there are no independent and dependent variables, but it is based on the correlation between variables. EFA is used to shorten a set of k variables into set F (F < k) of more meaningful factors. The basis of this reduction is based on the linear relationship of the factors with the measurement variables. According to (Hair et al., 1998), loading factor (load factor) is an indicator to ensure the practical significance of EFA. KMO coefficient calculated by principal axis factoring method, the Promax rotation, is greater than 0.5, and the factor analysis is appropriate for the research data. The process of eliminating measurement variables to conduct EFA discovery factor analysis of the study was carried out. In addition to basing on Cronbach's Alpha reliability index, the study also based on two principles to eliminate variables: (i) The measurement variables converge on the same factor, the factor loading must be larger. 0.5. (ii) "Distinctive Value" is ensured: The measurement variables belong to this factor and must be distinguished from other factors.

The results of testing the appropriateness of the exploratory factor analysis model:

Table 3: KMO and Bartletl's Test results of CFA model

KMO and Bartlett's Test

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.860
Bartlett's Test of Sphericity	Approx. Chi-Square	8113.876
	df	595
	Sig.	.000

Source: Analysis of data from authors

The KMO measure (Kaiser-Meyer-Olkin) analyzed the factor of the study with the value 0.860 satisfying the condition of $0.5 \leq KMO \leq 1$, and led to the conclusion that factor analysis was appropriate with the actual data. Testing the correlation between measurement variables (Bartletl's Test) with hypothesis H0 resulted in the correlation of zero. Bartletl's Test results were Sig. = 0.000 <0.05, and the conclusion was that measurement variables correlated with each other in the factor group. Testing the % cumulatative variance showed that in the table of Total Variance Explained, the criteria to accept cumulative variance was > 50%. The results of EFA analysis for the independent variables of the rotated factor matrix showed that the loading factor of the measurement variables was all qualified when loading factor was ≥ 0.5 and after factor analysis, there were 8 factors with 35 measurement variables. The indicators of the first CFA model all met the criteria to assess the suitability of the model (Table 3). Regression values of variables in each factor were in the range of 0.5 -1 (Hair et al., 1998).

Table 4: Regression values for each factor for the measurement variables

Variables			Estimate
TVRC1	←	TVRC	.706
TVRC2	←	TVRC	.806
TVRC3	←	TVRC	.741
TVRC4	←	TVRC	.840

TVRC7	←	TVRC	.836

Source: Analysis of data from authors

4.3. Structural equation modeling (SEM)

Structural equation modeling (SEM) was the next step of factor analysis, helping to research and test a set of regression equations at the same time. The SEM model specified the relationship between latent variables and measurement variables. It also indicated the relationship between predictive latent variables that researchers were interested in. In this study, the SEM was applied with the aim to identify the influencing factors and the degree of influence of each factor on "Micro barriers limiting the growth of private enterprises"; "Macro barriers limiting the development of private enterprises"; "Prospected outcome of removing government barriers to private enterprises". The SEM model was analyzed starting with the original proposed research model, then adjusted for a better model.

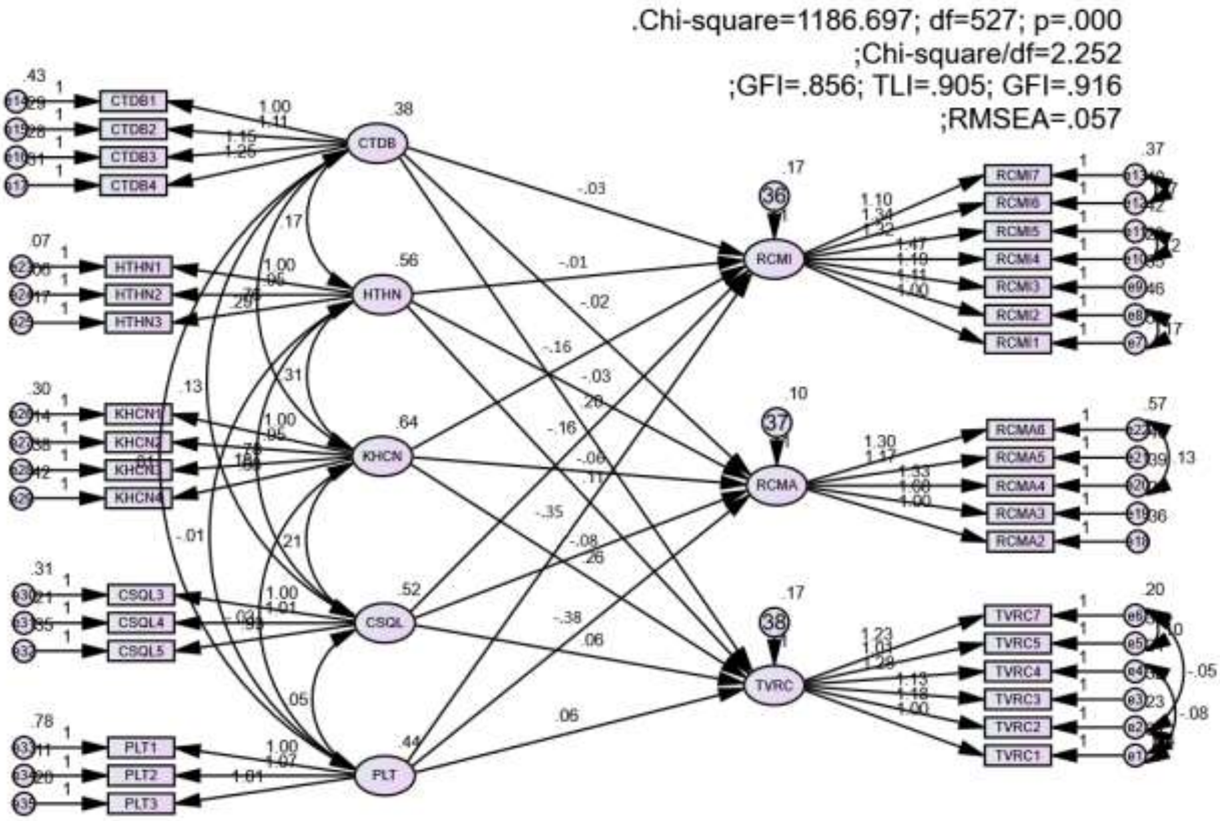

Figure 1: Results of testing the theoretical model

Source: Analysis of data from authors

CFA test by AMOS software was based on the principle of adjusting relationships with MI> 4 (MI-Indice Modification, which is the adjustment coefficient corresponding to the change of $\chi 2$ on a degree of freedom) but the adjustment had to be in line with the theoretical basis and had the practical value. After the adjustment, the CFA results showed that the indicators evaluating the suitability of the theoretical model were significantly improved as shown in Figure 1 ($\chi 2$ / df = 2,252; GFI = 0.916; TLI = 0.9095 ; CFI = 0.862; RMSEA = 0.054). Therefore, this model was suitable for real data. Moreover, the regression coefficients between factors "Micro barriers restrict the development of private enterprises"; "Macro barriers limiting the growth of private enterprises"; "Prospected outcome of removing government barriers to private enterprises in the next 5 years" and the impact factors of "State management policies", "Laws and taxes", "Expanding international cooperation and integration", "Increasing support for scientific research and technological innovation activities", "Competitiveness in production and business areas" were all smaller than 1 and different from 0 in a statistically significant way (Table 4). Therefore, it can be concluded that the measurement components "Macro barriers limit the growth of private enterprises"; “Micro barriers limit the growth of private enterprises”; “Prospected outcome of removing government barriers to private enterprises in the next 5 years” with independent factors achieved discriminant value (Tho, 2011).

Table 5: Regression values

			Estimate	S.E.	C.R.	P	Label
RCMI	<---	CTDB	-.025	.058	.436	.003	par_36
RCMI	<---	HTHN	-.014	.042	.345	.030	par_37
RCMI	<---	KHCN	-.163	.050	3.227	.001	par_38

RCMI	<---	PLT	-.352	.057	6.203	***	par_40

Source: Analysis of data from authors

Based on P-Value in Table 4, it can be seen that all the hypotheses are satisfactory, that is, independent variables had an effect on the dependent variable. The research results showed that factors affecting" Micro barriers limiting the growth of private enterprises" were as State management policy: -0.164, Law and tax: - 0.352, International cooperation and integration: -0.014, Science and technology: -0.163, Competitiveness in production - business areas: -0.025. The above results showed that the independent variables had counter effect or negative impacts on factor "Micro barriers limiting the growth of private enterprises", in other words when the government creates, improves and invests in the following factors: State management policies; Law and tax system; Expanding international cooperation and integration; Increasing support for scientific research and technological innovation activities; Competitiveness in production and business areas, barriers can be removed, thereby promoting the development of enterprises (in micro level).

5. Discussion and Conclusion

The research has synthesized and analyzed micro-barriers that limit the development of private enterprises, including banking system and financial/credit market; competitive pressure under the market mechanism; Source of inputs; Lack of confidence among workers; Lack of cooperation, governance capacity; Lack of confidence in entrepreneurs and entrepreneurship culture; and Lack of uniformity in organizational structure of enterprises. The analysis results show that the factors affecting the micro barriers that limit the development of private enterprises such as State management policies, Legal system and taxation, Expanding international cooperation and integration, Increasing support for scientific research and technological innovation activities and Competitiveness in production - business areas all have counter or negative impacts on the factor "Micro barriers limit the development of private enterprises". In other words, when the government creates and supports the development of private enterprises, including good state management policies; transparent and consistent legal and tax system; strengthened international cooperation and integration; increased support for scientific research and technological innovation activities; and increased support for businesses to improve competitiveness in production and business areas, barriers will be removed, thereby promoting the development of private enterprises better.

In order for the private sector to grow, the Government of each country needs to continue its administrative reform, creating a favorable business environment for businesses to develop. At the same time, the Government needs to improve its mechanisms and policies to encourage and facilitate strong development of the private economy; develop policies to support the development of small and medium-sized enterprises and start-ups; and develop legal regulations related to business investment, avoiding overlapping, causing difficulties for private enterprises. In doing so, micro-barriers that limit the development of enterprises will be gradually removed, paving the way for more sustainable development of private enterprises in the future.

This study was conducted in Vietnam, a strongly growing economy in Southeast Asia thanks to drastic reforms of the Vietnamese government in managing and operating the economy for a favorable environment for the private sector. Therefore, the study can be considered as a meaningful lesson of experience of Vietnam for other countries in the region and in the world with similar conditions. Apparently, changing the factors of micro barriers to the development of private enterprises requires a strong innovation of the government role, and the tectonic government is a direction with a lot of advantages. The study also provided similar findings to previous studies on tectonic government in the countries.

Abstract

The study investigates the key factors included knowledge and experience, workload, time pressure and incentives that affect the professional skepticism of independent auditors in Vietnam. The authors have utilized quantitative and qualitative analyses in combination with a logistics regression model and other available analytical tools for conducting the research in SPSS software. All statistics processed in the paper were based on 90 independent auditors in 2021. The results reveal that factors like knowledge and experience, incentives positively affect the professional skepticism, while workload and time pressure negatively impacts PS. The findings suggest Vietnamese law-makers should regulate annual training courses for auditors to enhance their professional ability and reasonably encourage the auditor's motivation while it is necessary to minimize workload and time pressure for auditors in order to maintain and improve the audit quality. This implication could be applied for other firms in Vietnam and for enterprises in other countries.

Keywords: *Independent auditors, Professional skepticism, Vietnam*

1. Introduction

Over years, a lot of research has been conducted to define the term "professional skepticism" properly and figure out how to measure factors affecting professional skepticism in auditing. One of the prominent studies is the Nelson study (2009) that provided comprehensive models on professional skepticism in auditing and emphasized the significance of implementing an appropriate level of professional skepticism when carrying out the auditing process. Based on that study, Hurrt (2010) had developed the scale of professional skepticism of independent auditors. Various studies have provided a significant information source in professional skepticism, such as Robinson et al Robinson et al (2015), Quadackers et al (2014), Hurtt (2010), Nelson (2009) and Hurtt et al (2013.

Most of the research related to professional skepticism is conducted in developed countries such as Australia, The US, Britain where they have a closely established audit system. In Vietnam, Phan Thanh Hai et al (2018), Nguyen Thi Phuoc (2018), Tong Thanh Tien (2018), Nguyen Vinh Khuong (2018), (2020), Tran Khanh Lam, Le Thi Tuyet Nhung (2020) research have mentioned some factors affecting professional skepticism in Vietnam and Ho Chi Minh City. However, previous researches only concentrate on the analysis of different factors influencing the nature of professional skepticism of general auditors and show general theories to improve the PS of auditors, there are no studies which introduced the specific policies to maintain, develop and apply professional skepticism for various objects in the case of Vietnam. Therefore, in this study, the authors will analyze factors influencing three main characteristics of PS.

Based on the topic of the published studies, the author classifies previous studies around the PS topic into three main research directions as follows: Firstly, the publications focus on the purpose of doing research. Clearly, the concept of PS of auditors is based on psychological theories. However, both angles are less volatile, so the publications under this topic focus on analyzing the components of PS and comparing these components under different perspectives to build the scale. Secondly, the publications focus on identifying factors that influence PS. This is the topic of most interest because PS is considered as a factor affecting the quality of Auditors' work (Hurtt et al., 2013; Nelson, 2009). Claims under this topic can consider factors affecting PS according to the grouping patterns of factors. Two models that systematically synthesize the publication on this issue in the leading journal in the auditing field: A Journal of Practice & Theory including Hurtt et al (2013); Nelson (2009). Thirdly, the statements focus on considering the influence of PS or other concepts in the audit, such as the behavior of the auditor.

The author inherits two formal synthesis claims on the subject of factors influencing previous auditors' PS since they are both closely related to the subject and no other synthesis research is currently available. Nelson's (2009) model divides variables into three categories: traits, knowledge, and incentives. Hurtt et al (2013) developed a model based on Nelson (2009) that included four classes of factors: auditor characteristics, proof characteristics, consumer characteristics, and external influences. Following that, the author, inheritance, and re-classification of the factors influencing PS according to the subjects that specifically affect the auditor's PS, such as the auditor's characteristics such as expertise and experience, the assigned workload, and time pressure from businesses or customers, as well as policy incentives.

Professional Skepticism (PS): When the auditor has a doubt about anything during the audit process, particularly when gathering audit evidence to support a mistake or material misstatement, skepticism is required (McMillan & White, 1993). This is due to the fact that audit work necessitates the collection of appropriate, genuine, and relevant evidence to support an audit opinion. The attitude raises concerns, which show the auditors' ongoing distrust and suspicion of any audit findings. Hurtt (2010) identified six skepticism characteristics in the audit community, including questioning mind, suspension of judgment, looking for information, knowing interpersonal relationships, self-determination, and self-confidence.

Knowledge & Experience of independent auditors (KT): Since the majority of auditors have never witnessed fraud in their careers, Griffith et al. (2012) suggested that knowledge is directly related to PS, mainly 21 by assessing knowledge related to gathering additional evidence. The auditor's ability to influence PS: Castro (2013) claim that experience has no effect on PS; Grenier (2014) thinks that technicians with in-depth knowledge of the customer's business will have a high PS; Kim and Trotman (2014) conclude that the auditor responsible for the results will have a high degree of skepticism and the less experienced auditor has a higher PS than the more experienced auditor. Conclusion of Peecher et al (2010) that if auditors are trained to change cognitive thinking processes or biases affect the PS level of auditors. Besides, instead of asking auditors to focus on acting based on their skepticism, other publishers have considered training auditors to form many different ways of thinking to help the auditor build the level of skepticism. Carpenter et al (2013) found that auditors increased their ability to perceive fraud risks after completing a course in investigative accounting.

Workload of independent auditors (CV): Prior study has backed up questions about the potential implications of excessive workloads. Sweeney and Summers (2002) assessed hours employed, position stressors, and career burnout among 142 auditors, tax accountants, and consultants from a national firm before the busy season began and again at the end of the busy season in a public accounting environment. Fogarty et al., (2000) investigated the association between work and task traits, burnout, and job outcomes in a cross-sectional sample of 188 AICPA participants. Almer and Kaplan (2002) build on the work of Fogarty et al. (2000) by looking at how fluid work conditions affect task tension and burnout.

Time Pressure of independent auditors (TP): Many auditors accept that in times of pressure to complete the audit and the number of working hours required during the busy season creates a willingness to accept customer-modified financial information to accomplish the goal (Hurtt , 2013; Glover, 1997). When stress increases, initial performance increases, as stress continues to increase, performance begins to decline. Currently, very little is known about the relationship between time pressure and PS. Enlightenment Coram et al. (2004) concluded that under time constraints, auditors are more likely to engage in quality-degrading activities, such as accepting suspicious information or performing less audit procedures.

Incentives of independent auditors (DL): Motivation is described as the psychological processes that create the initiation, direction, intensity and persistence of behavior (Klein, 1989). Motivation improves when employees work with clear goals (Locke, 1997). In particular, discussion clearance can enhance motivation to improve performance by providing more specific information about audit tasks, reducing task uncertainty, increasing task performance. duties (Earley, 1988; Sullivan, 1988). The company's performance evaluation and incentive system is an important component of the internal quality control that rewards actions based on the auditor's skepticism towards the firm's interests.

The topic's overall research objectives are to investigate the factors influencing professional skepticism of independent auditors in Vietnam. Therefore, the thesis is divided the general objectives into specific research objectives as follows: clarifying factors including knowledge & experience, workload, time pressure, incentives; which affect PS of independent auditors; and determining the level of influence of each factor including: knowledge & experience, workload, time pressure, incentives to PS of independent auditors.

2. Method

2.1. Data collection

The author collected data from the auditors currently working directly in the auditing firms in Vietnam via online questionnaires through Google Forms and video call-in interviews or by removing duplicate and inhomogeneous elements. Finally, SPSS Statistics 20 software is exploited for regression analysis and descriptive statistics.

2.2. Sampling method

In this research, the sample is chosen according to the convenient sampling method by selecting non- probability samples. Independent auditors selected to survey are individuals who are working in Vietnam and directly participating in the audit. The formula for determining the minimum sample size for research to achieve reliability. The size of the sample applied in the study is based on the requirements of Exploratory Factor Analysis (EFA) and multivariate regression: Technique 1: For exploratory factor analysis EFA: According to Hair, Anderson, Tatham and Black (1998), the minimum sample size is 155 samples. The sample size (157) should be larger than the standard to avoid losses during the survey. Technique 2: the minimum sample size is 82 samples for 4 independent variables (Tabachnick and Fidell, 1996). Therefore, 157 respondents satisfy both above formulas and 90 official respondents used in regression analysis are sufficient.

2.3. Regression model

The author used regression with the dependent variable as professional skepticism (PS) to assess the effect of variables on independent auditors' professional skepticism. The factors described in the exploratory analysis (EFA) above are the independent variables affecting. The following is regression model:

$$PS = \beta_0 + \beta_1 KT + \beta_2 CV + \beta_3 TP + \beta_4 DL$$

Where as, **PS** refers to Professional skepticism; **KT** presents Knowledge & Experience of independent auditors; **CV** indicates Workload on independent auditors; **TP** shows Time Pressure on independent auditors; **DL** shows Incentives of independent auditors. The values βi (i = 1:4) are regression coefficients, which represent the impact of each independent factor on the dependent variable's fluctuation. When the regression coefficients are significant (as determined by measuring the significance of the regression coefficient) and the *m* is large, the regression model is considered suitable. Professional skepticism includes 3 characteristics: Questioning mind (G1), Suspension of judgment (G2), Search for knowledge (G3). Therefore, in this study, we use 3 sub-regression models to reflect the influence of the independent variables on each characteristic of professional skepticism.

$$G1 = \beta_{0a} + \beta_{1a} KT + \beta_{2a} CV + \beta_{3a} TP + \beta_{4a} DL$$

$$G2 = \beta_{0b} + \beta_{1b} KT + \beta_{2b} CV + \beta_{3b} TP + \beta_{4b} DL$$

$$G3 = \beta_{0c} + \beta_{1c} KT + \beta_{2c} CV + \beta_{3c} TP + \beta_{4c} DL$$

2.4. Scale of variables

Researchers designed a questionnaire with 31 observations including 1 dependent variable and 4 independent variables, using the 5-level Likert scale (Score 1: Absolutely disagree, Score 5: Absolutely agree). Dependent variable is Professional Skepticism. Model HEP measured professional skepticism by six characteristics. In this study, the research team decided to measure the professional skepticism with 12 items according to three main characteristics of PS (a questioning mind, suspension of judgment, search for knowledge).

Independent variables are variables that affect the dependent variable, in other words, the dependent variable is determined by the independent variable. In this research, there are four (4) variables considered four factors that are knowledge & experience (H1) with 5 observations, workload (H2) with 5 observations, time pressure (H3) with 5 observations and incentives (H4) with 4 observations. The scales of variable are inherited from previous studies by Nelson (2009); Hurtt et al (2010, 2013), Arumega Zarefar et al (2016), Brazel (2018), HEP Model (Hurtt, Eining, and Plumlee, 2003), Durtschi & Fullerton, (2004), Noviyanti (2008) and Supriyono (2014), Nguyen Vinh Khuong (2018).

3. Results

3.1. Descriptive Statistical Analysis

The table below illustrates the general information related to the demographic information of independent auditors such as gender, working experience, working position, level of education and professional qualification.

Table 1: Demographic information of respondents

Working position					**Education degree**		**Professional Certificate**	
Junior / Assistant	**Senior**	**Manager**	**Director**	**Partner**	**Bachelor**	**Master**	**Yes (ACCA, CPA, ICAEW,...)**	**No**
11	37	25	9	8	74	16	70	20
12.22	41.11	27.78	10.0	8.89	82.22	17.78	77.78	22.22

	Gender		**Working experience**			
	Female	**Male**	**Less than 5 years**	**from 5 years - 7 years**	**from 7 years - 10 years**	**Over 10 years**
Observation	42	46.67	45	27	10	8
Percentage (%)	48	53.33	50	30	11.11	8.89

3.2. Reliability Analysis - Cronbach's Alpha

The Cronbach's Alpha coefficient for all items is higher than 0.6. The Corrected Item-Total Correlation of each observed independent and dependent variable is greater than 0.3 except for KT1. As a result, the study's scale only remained 30 observations for subsequent EFA review.

Table 2: Cronbach's Alpha

Variables	Symbol	Number of observed variables	Cronbach's Alpha	Cronbach's Alpha if Item Deleted
Dependent variables				
Professional skepticism	PS	12	0,881	
Independent variables				
Knowledge & experience	KT	5	0,635	0,704 (KT1)
Workload	CV	5	0,793	
Time Pressure	TP	5	0,747	
Incentives	DL	4	0,715	

3.3. Exploratory factors analysis

The KMO coefficient computed from the sample is 0.798 greater than 0.5, according to the Table of KMO and Barlett's test results (Table 3). The Bartlett test has a p-value of 0.000 <0.05, % of variance > 50%, the factor loading is greater than 0.5 and the coefficient Eigenvalue > 1. Thus the criteria for using the EFA discovery analysis show that the factors are consistent with the data set of the study. As a result, the survey sample size is sufficient for factor analysis. The correlation between observed factors is zero in the overall statistically significant since the P-value (Sig.) determined from the sample is 0.00 less than a significance level of 0.05, according to Barlett's test with the hypothesis H0 (or 5 percent).

Table 3: Rotated Component Matrixo

	Component		
	1	2	3
PS7	0.812		
PS4	0.774		
PS8	0.729		
PS5	0.701		

PS6	0.665		
PS9		0.788	
PS12		0.754	
PS11		0.735	
PS10		0.734	
PS2			0.860
PS1			0.718
PS3			0.572

The analysis results show that with 12 items to evaluate professional skepticism of independent auditors and three main factors can be extracted. According to the calculation results from the sample, these 12 factors explain 64.346% of the variation of the data set.

3.4. Pearson Correlations

The results of correlation analysis revealed that all independent variables influencing the dependent variable PS were statistically significant at the 5%. Many of the Sig values have a high correlation with the independent variables (KT, DP, CV, DL).

Table 4: Pearson Correlations

	PS	**KT**	**TP**	**CV**	**DL**
PS	**1**				
KT	.482**	**1**			
TP	-.432**	-.218*	**1**		
CV	-.499**	-.123	.426**	**1**	
DL	.365**	.097	.213*	.003	**1**

The author team used the Pearson coefficient of correlation to analyze the correlation between quantitative variables. In the table above, the coefficients of correlation indicate the relationship between the variables, which is rational in both sign and level. Specifically, the values of coefficient of correlation (KT, DL) are greater than 0; The coefficients of correlation are positive which show the positive relationship. The coefficients of correlation (CV, TP), on the other hand, are less than 0; the coefficients of correlation are negative, suggesting a negative relationship.

3.5. Regression Analysis

The value of determination coefficient Adjusted R Square is 0.585, which shows the regression model of the relationship between the four main factors to the PS which can explain 58.5% of the variation of the PS. In the F-test in the ANOVA table, an observed F value of 32.305 with a P-value (Sig.) of 0.000 is less than the significance level of 0.05. The regression model is suitable to describe the relationship between factors to the PS of independent auditors.

Table 5: Coefficient

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
	B	Std. Error	Beta			Tolerance	VIF
(Constant)	3.101	.345		8.982	.000		
KT	.261	.055	.337	4.758	.000	.931	1.075
CV	-.212	.049	-.329	-4.340	.000	.810	1.234
TP	-.196	.051	-.303	-3.815	.000	.738	1.354
DL	.255	.046	.398	5.602	.000	.925	1.081

Based on the P-value values corresponding to each independent variable in Table 5 it can be seen that all the independent factors have P-value values less than the significance level of 0.05. It can be said that, with the sample, there is enough evidence to reject the H0 hypothesis. The sign of the regression coefficients reflects the impact of independent factors on dependent factors. The values of βi of these two factors (KT, DL) have positive signs, indicating that these factors have a positive impact on the PS, according to the survey results. Otherwise, these two variables (CV, TP) have negative βi values, meaning that they have a negative effect on the PS. The standardized regression coefficient (Beta) is used to evaluate the impact of each independent factor on PS. The DL factor has a standardized regression coefficient of 0.398, which is higher than the KT factor's standard regression coefficient, indicating that the DL factor has a greater effect on the independent auditors' PS. The VIF of variables affecting less than ten shows that there is no multi-collinear phenomenon. The regression equation of the PS: ***PS = 0.337KT - 0.329CV - 0.303TP + 0.398DL***

About sub - regression model: The values of βi of these knowledge and experience variables (KT) and the incentives (DL) have positive signs, indicating that they have a positive effect on the PS. However, the other independent variables (CV, TP) indicate that they influence negatively on the PS. B2 = -153<0 indicates that when CV increases by 1 unit, the professional skepticism - PS decreases by 0.153 units; standardized β of the CV variable affects 15.3% on the level of PS. B3 = -0.271<0 indicates that when TP increases by 1 unit, the professional skepticism - PS decreases by 0.271units; standardized β of the TP variable affects 27.1% on the level of PS. The effect of each independent factor on Questioning mind is measured using the standardized regression coefficient (Beta). VIF of factors affecting less than 10 proves no multi-collinear phenomenon. The regression equation of three characteristic of the PS:

$$G1= 0.34KT - 0.153CV - 0.271TP + 0.286DL$$

$$G2= 0.196KT - 0.229CV - 0.303TP + 0.378DL$$

$$G3= 0.301KT - 0.313CV - 0.283TP + 0.312DL$$

All independent variables both have an impact on the three features of the PS. The sign of the regression coefficients reflects the impact of independent factors on dependent factors. According to the survey results, the βi values of these two factors (KT, DL) have positive signs, suggesting that these factors have a positive effect on the PS. The standardized regression coefficient (Beta) is used to evaluate the impact of each independent factor on three characteristics. VIF of factors affecting less than 10 proves no multi-collinear phenomenon.

Research hypothesis testing results: All of the hypotheses that include knowledge and experience, workload, time pressures and incentives are initially accepted. It turns out that H1 and H4 have a positive impact on professional skepticism while H2 and H3 have a negative influence on professional skepticism.

Independent sample T-Test: Independent Samples T-Test is used to compare mean values of male and female groups with professional skepticism. Because of the sig value = 0.816 > 0.05, so we conclude that there is no significant difference in the mean of the two populations. In other words, between the two gender groups of auditors, there is no evidence to show a difference in professional skepticism. Specifically, in the mean column in the Group statistic table below, the average value of professional skepticism for men is 3.5749 and for women is 3.5545. Moreover, the authors use independent Samples T-Test to compare the mean of two groups of certified and non-certified auditors affecting professional skepticism. The table indicates that there is no substantial difference in the mean of the two populations because the Sig value = 0.379 and F = 0.782 in Levene's Test for Equality of Variances > 0.05. In other words, there is little distinction between the two groups of independent auditors who have gained and have not gained the qualification certificate in terms of professional skepticism

Table 6: Independent Samples Test

Group Statistics - PS				
		Mean	**Std. Deviation**	**Std. Error Mean**
Gender	**Male**	3.5749	.41932	.06052
	Female	3.5545	.39787	.06139
Professional Certifications	**Yes**	3.5619	.42179	.05041
	No	3.5775	.36159	.08085

4. Discussion and Conclusion

4.1. Conclusion

Through linear regression results, two factors, Knowledge & experience and Incentives have positive impacts while workload and time pressure have been negative influences on the professional skepticism of independent auditors.

Previous researches indicated that PS is affected by knowledge in both positive and negative ways in audit practice, specialization in fundamental Nelson (2009), Griffith et al. (2012), Peecher et al (2010) and Carpenter et al (2013) found that auditors increased their ability to perceive fraud risks after completing a course in investigative accounting. Otherwise, a lot of previous research results showed opposite sides of opinion, such as Castro (2013), Kim and Trotman (2014) conclude that the less experienced auditor has a higher PS than the more experienced auditor, Phan Thanh Hai et al (2018), also indicated that knowledge and experience despite their influence, have not yet reached the level of confidence in the significance level. Applying to the Vietnam situation, many audits are usually being carried out in particular months of the year, in a peak season, auditors have to work for more than one job at the same time, therefore, experienced trained auditors have higher probability to discover misstatements and tend to have advantages when communicating with clients about their doubtful issues. On top of that, auditors may not only raise their abilities to acknowledge every detailed problem, detect misstatements and combined evidence, but also they are not easily being disturbed by inappropriate information in order to find out misstatement as soon as possible.

Related to incentives, the result pointed out that this factor has a positive influence on professional skepticism of independent auditors which is agreed with previous studies such as motivation is described as psychological processes creating initiation, direction, intensity and persistence of behavior (Klein, 1989), (Locke, 1997), (Sullivan, 1988), and most of the PS related statements in the audit examined in Nelson would inspire auditors to select a higher degree of suspicion due to personal motivation. On the other hand, Phan Thanh Hai et al (2018) which have the same research subject in Vietnam which showed incentive of auditing firms, have not yet reached the level of confidence in the significance level, despite their influence. The findings of this research are in line with the majority of previous studies around the world. The company's performance evaluation and incentive system is an important component of the internal quality control that rewards actions based on the auditor's skepticism towards the firm's interests, namely contribute to effective audit (Baiman, 1990; IAASB, 2009).

However, workload and time pressure have been negative influences on the professional skepticism of independent auditors. In previous research, there are many controversial results on the impact of time pressure on professional skepticism, whether it is positive and negative. Typically, Nelson indicates time has a positive effect on PS as well as Phan Thanh Hai's research, they indicate that time and both workloads have a positive impact on professional skepticism. In the study, the results confirm that time pressure has a negative impact on PS. Time pressure is a common problem in the working environment (Glover, 1997) and arises from the conflict between completing an effective but timely audit. Audits and the number of working hours required in the busy season creates a willingness to accept financial information modified by customers' target achievement (Hurtt, 2013; Glover, 1997). Time pressures cause performance degradation and cause joint stress practice for the auditor (McDaniel, 1990), also Kelley and Margheim (1990) found that when faced with high time pressure, 31% of auditors would reduce audit steps than usual. Low and Tan (2011) argue that the difference between time restriction be informed and random time pressure. When confronted with a sudden increase in time pressure, the auditor is more likely to rely on previous year's audit procedures, which means the auditor is less likely to show PS as Disclosure Coram et al (2004). Similarly, workload factor, according to Nasution and Fitriany (2012); Murtisari and Ghozali (2006), the pressure of employment that results in excess jobs will decrease job satisfaction and performance auditor.

4.2. Recommendation

Firstly, for practicing partnerships: Recruitment policies may affect professional skepticism by evaluating knowledge and personal traits. Auditing firms need to emphasize the significance of assessing professional skepticism in the employment process in order to select the auditors whose professional skepticism is suitable with the policy of the corporate. The auditing firm must create a working environment as well as a sense of solidarity among auditors and leaders to foster professional skepticism. Consequently, the training policies play a key role in determining PS in knowledge, skills, and personal incentives of auditors. There should be a reduction in the amount of time it takes to complete tasks and reduce the amount of time it takes to record progress. Until conducting the end-of-fiscal-year audit, auditing companies should conduct interim audits during the year.

Secondly, for governmental agencies, especially the Ministry of Finance and association of chartered auditors: Propagating and strictly enforcing the administrative penalties clauses of the Government's Decree No. 41/2018 / ND-CP dated March 12, 2018 on the sanctioning of administrative irregularities in accounting and independent audit, thus raising awareness about auditing laws; at the same time, deterring auditors from breaking the rule; Arranging daily workshops, instruction, or knowledge sharing sessions relating to professional skepticism so that auditors can exchange and gain realistic experiences.

Finally, for universities and training institutions: Universities should expand their training courses of professional skepticism in combination with professional Independent Audit certification to facilitate the improvement of professional qualifications and skills for independent audit professions. Using advanced management practices to be able to deeply participate in the international market in the integration process. The Government agencies, entities and universities should coordinate based on the roadmap, plan and apply international practices in accordance with the conditions of Vietnam for the development of Vietnam's Independent Audit.

FOREIGN DIRECT INVESTMENTS AND SPILLOVER EFFECTS IN VIETNAM

Le Ngoc Thom
ngocthomlee@gmail.com
University of Finance and Business Administration, Vietnam

Abstract

Foreign direct investment (FDI) plays an important role in developing countries in general and Vietnam in particular. It not only provides a large source of investment capital, increase density contribution to growth in GDP, but also affects the process of restructuring the economy, contributes to solving the problem about employment in the economy. In addition, FDI enterprises are also factors that promote export activities as well as bring spillovers to the economy on changes in technology or modern management skills to the host country. However, attracting FDI does not always create positive spillover effects, but there are still some limitations. That reduces the efficiency of the FDI sector, or does not make full use of this resource in terms of productivity growth and economic efficiency. Therefore, researching and evaluating the spillover effects of FDI on the economy in order to offer solutions to promote the efficiency of the FDI sector is a necessary issue in the current period.

Keywords: Foreign direct investment, Spillover effects, FDI

1. Introduction

Today, developing countries are competing fiercely to attract foreign investors by offering different fiscal incentives in the expectation of improving productivity through technology spillover from foreign direct investment (FDI) to domestic enterprises. Local governments have used the different investment strategies in a bid to obtain more FDI. And FDI attraction depends on the existence and magnitude of the positive spillover effects from that FDI capital. Empirical studies on the evidence surrounding FDI spillover effects have not reached consensus. The further research is therefore need to determine the impact of FDI on the development of the social economy in a country.

Most empirical studies on the spillover effects of FDI have tend to bring about positive effects of the FDI sector on the domestic economy through a classical production model which measures the productivity of local firms. Empirical studies of spillovers have not found effective interactions between local firms and foreign firms. This paper examines the spillover effects of the FDI sector on the domestic sector in Vietnam in the past period.

2. Literature Review

2.1. Spillover effects from FDI

The role of FDI in the spillover of skills, knowledge and technology has been recognized in many studies in the regional development literature . In researches of many authors as: Martin and Ottaviano (1999), Lucas (2001), Baldwin and Martin (2004), and Audretsch and Feldman (2004)) have combined theory of endogenous growth and models position to consider the impact of spillovers to the development economy. They point out that firms location is important for stronger growth and spread in certain gaps. More specifically, they show that the spillover of knowledge or technology which occur through a variety of mechanisms, such as skill acquisition , competition and production integration are more likely to materialise and be more efficient when the companies are located in close proximity.

An important influence of geographic proximity lies in the concept of industrial zones and industrial clusters (Porter, 2000). Driffield and Girma (2003) and Driffield (2006) argued that cluster give rise to agglomerate externalities because the local market is specialized for labor and intermediate goods. Geographic proximity may also aid in the diffusion of knowledge between companies, for example making communication less expensive. The roles of geographical distance has also gained attention in the FDI literature. Baltagi, Egger, and Pfaffermayr (2007) and Blonigen, Davies, Waddell and Naughton (2007) found that the space of interdependence has a significant effect on the distribution of FDI between neighboring countries . Blonigen et al. (2007) pointed out that spatial econometrics can provide useful techniques that can be applied to many countries as well as regions within a given country to explain spatial interdependence. Driffield (2006) publishes the first study to incorporate spatial modeling in the study of spillover FDI . The results show that conflicting findings in previous studies on the spillover effects of FDI were due to the failure in capturing spatial dependence. This is demonstrated by using the estimation model which allows detecting the spatial dependence among firms in examining the spillover effects of FDI.

2.2. Social interaction and spillover

Social interaction refers to specific types of externalities, in which the actions of a reference group, usually family, neighbours, friends or colleagues, influence an individual's preferences (Scheinkman, 2002). The main theoretical discussion on this issue can be found in Topa (2001), Manski (2000), Jackson (2009) and Easley and Kleinberg (2010). They propose three specific forms of social interaction; namely the binding interaction, the expectation interaction, and the preferred interaction which have positively impact productivity. According to experience, social interactions have been noted in a number of studies from different economists. In the literature on economic growth and technology transfer, Antonelli and Scellato (2013) found that a company's productivity is significantly affected by localized social interaction, both in terms of spillover and creative response.

Vietnam's recent experience in attracting FDI and achieving rapid economic growth has generated great interest to many researchers. Most studies focused on considering the determinants of FDI (Nguyen & Nguyen, 2007 ; Pham, 2002 ; Vu, Le & Vo, 2007). Others investigated the contribution of FDI to job creation, poverty reduction and economic growth (Pham, 2003). Some studies on the spillover effects in Vietnam include Nguyen, Nguyen, Vu, and Nguyen (2006), Tran (2001), and Anwar and Nguyen (2014) about the current situation of foreign direct investment (FDI) in Vietnam.

3. Results

3.1. Foreign Direct Investment (FDI) in Vietnam

After more than 30 years of attracting FDI, Vietnam became one of the successful countries after all of government efforts to attract FDI with policy system which were consistent, but flexible, suitable for each period of development of the country. FDI has proven its important role through not only direct effects but also indirect effects in the economy.

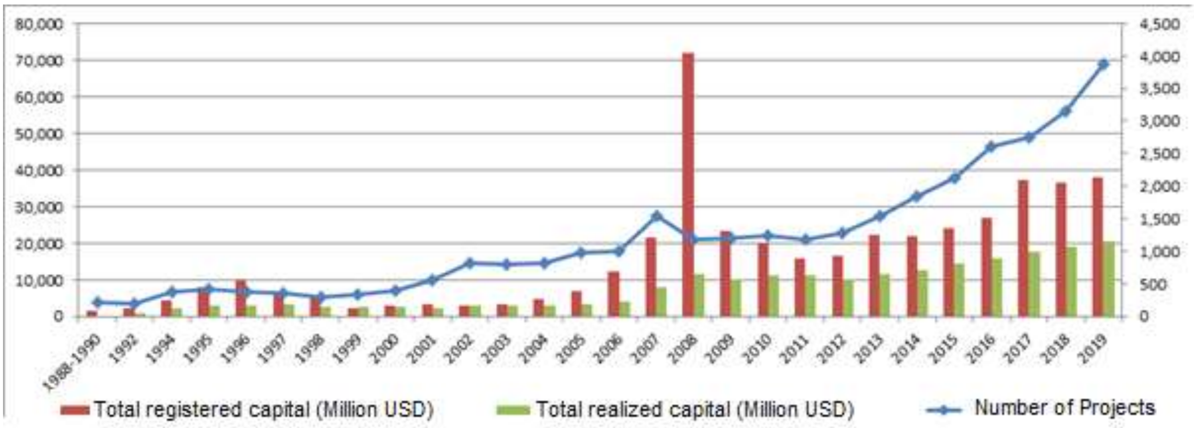

Figure 1: FDI growth rate between 1988 and 2019

Source: Foreign Investment Department - Ministry of Planning and Investment

In early years of attracting FDI, from 1988 to 1990, although it was a difficult period in the beginning of innovation, Vietnam attracted 213 FDI projects with a total registered capital of nearly 1.8 billion USD. However, after that, with the gradual changes, Vietnam increasingly integrated with the development of the world and the region. Vietnam had joined regional and international trade organizations such as ASEAN, WTO ... or bilateral and multilateral free trade agreements to integrate deeper into the international playing field. In addition, the Government has continuously revised and supplemented the Law of Investment and in 2005 has agreed on a common investment law with many changes in decentralization of investment licensing and project management. In 2014, Law of Investment Law was born and replaced the 2005, which continued the open policy in accordance with the economic capacity and the purpose of attracting FDI in each phase of the country. Beside policy corridors, Vietnam also changed and prepared both hard and soft infrastructure which created a pull point to attract FDI and promote FDI effectively as for investment, management qualifications, or quality human resources ... In 2019, the Law of Public Investment was born that showed a new direction in investment in general and foreign direct investment in particular.

During 30 years of FDI attraction, the average growth rate of Vietnam is 1,000%, was showed that Vietnam was one of the attractive destinations with foreign investors. In the early years of attraction, the growth rate increased with slight fluctuations. From the 2000s, the growth rate started to increase gradually, especially in the period from 2006 to 2008, when the capital flowed to Vietnam which had a growth rate 3 times. This was time that Vietnam officially became a member of the International Trade Organization WTO (2007). However, after that, dueing to the impact of the world economic crisis (2008), the growth rate of FDI had gradually decreased. However, Vietnam appeared a number of large million-dollar projects such as Nui Phao Mineral Mining and Processing Joint-Venture Company with USD 147 million or Thanh Cong Investment and Development Company with 114,58 million USD. It may be said that in this period, Vietnam had significantly improved the investment - business environment, and had flexible policies to suit the world's development flows. Therefore, big investors from developed countries such as the US, Japan, Korea ... started to come and pour capital into Vietnam. In 2018, summarizing 30 years of investment attraction, FDI accounted for 55% of industrial production, 70% of revenue from exports, 18% of tax revenue, creating 3.7 million jobs. The year 2019 was again an important step when the highlight of FDI disbursement at a record high of 20.38 billion USD. Currently, by the end of 2019, the total newly registered, adjusted and contributed capital and purchased shares of foreign investors had reached 38.02 billion USD, up 7.2% over the same period in 2018. Total projections valid projects were 30,827 valid projects with a total registered capital of 362.58 billion USD. Implementation of capital projects accumulated foreign direct investment estimated at 211.78 billion US dollars, by 58,4 % of the total registered capital in force. In 2020, due to the influence of Covid epidemic in the first months of the year, the situation of attracting FDI had decreased significantly. In the first three months of the year, "the total newly registered, adjusted and contributed capital and purchased shares of foreign investors reached 8.55 billion USD, equaling 79.1% as compared to the same period in 2019".

About investment field: until now, FDI had invested in 19/21 sectors in the sub-sector system of the national economy of Vietnam, in which FDI enterprises still prioritized investment in the field of processing and manufacture industries which accounted for the highest proportion with 214.2 billion USD or 59.1% of total investment capital. The following was the business areas of real estate with 58.4 billion (accounting for 16.1% of total investment); then production and distribution electricity with 23.65 billion USD (accounting for 6.5% of total investment capital).

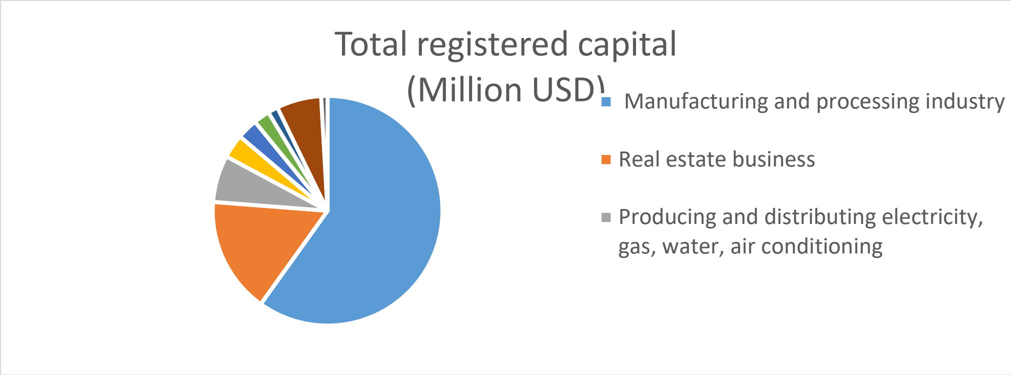

Figure 2: FDI by investment field

Source: Foreign Investment Department - Ministry of Planning and Investment

About foreign investors: by the end of 2019, Vietnam had welcomed investors from 135 countries and territories. In which, Asian countries were the the largest proportion of FDI to Vietnam, the first by South Korea with a total registered capital of 67.71 billion USD (accounting for 18.7% of total investment capital); followed by Japan and Singapore, Taiwan, Hong Kong.

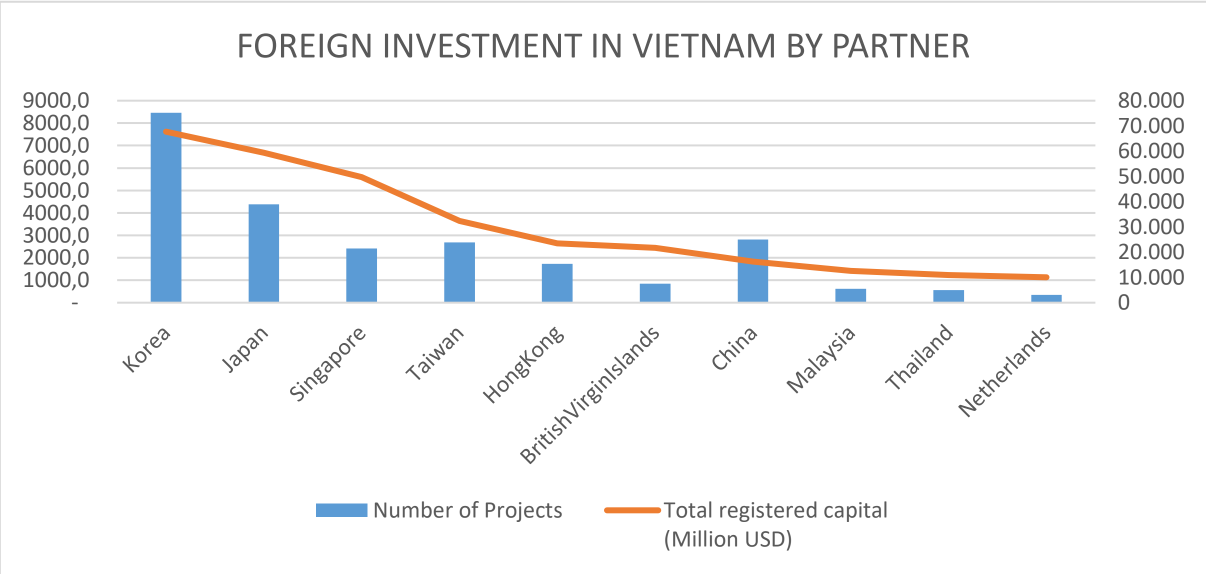

Figure 3: FDI by major foreign investors

Source: Foreign Investment Department - Ministry of Planning and Investment

About investment locations: FDI had been present in all 63 provinces and cities nationwide. FDI was still looking to cities that were political and economic centers of the country such as: Ho Chi Minh City, Hanoi, Hai Phong ... And Ho Chi Minh City was still the leading province in attracting foreign investment with 47.34 billion USD (accounting for 13.1% of total investment capital); followed by Binh Duong with 34.4 billion USD (accounting for 9.5% of total investment capital); Hanoi with 34.1 billion USD (accounting for 9.4% of total investment capital).

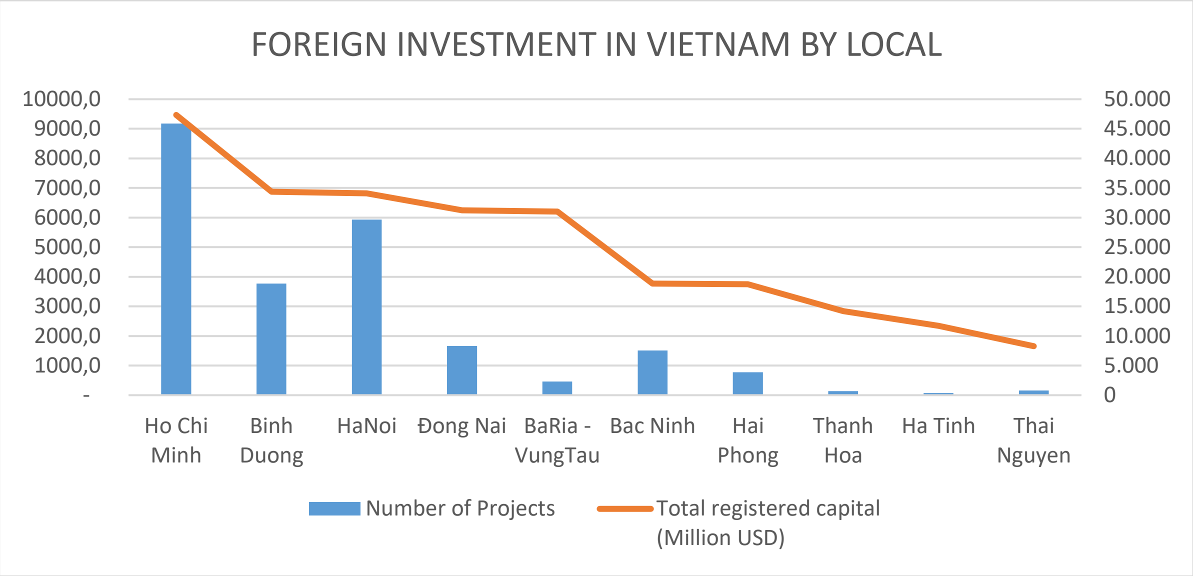

Figure 4: FDI by localities

Source: Foreign Investment Department - Ministry of Planning and Investment

Despite the impressive results of FDI, Vietnam had gradually realized that it was necessary to have strategic policy change to maintain competitiveness in ASEAN and ensure sustainability FDI inflows received and accelerated FDI with higher added value to achieve development goals. The Government of Vietnam wisely judged about 5-6 years ago that the quality of FDI which needed to be improved in terms of value-added enhancement and spillover benefits, as reflected in Resolution No. 103. / NQ-CP issued by the Prime Minister at the end of August 2013. Over 30 years with many changes, efforts moving towards a complete environment have brought remarkable results with Vietnam.

3.2. Spillover effects of FDI in the Vietnamese economy

Currently, the spillover effects in Vietnam are done most through 4 ways, which are: labour movement, technology dissemination & transfer, production linkage and competition.

Labour movement

Positive effects were created when the employmees was trained on skills, qualifications and absorb the knowledge or technology from FDI enterprises, then they moved from FDI to sector in domestic firms. When employees used the knowledge, skills there and applied to the domestic enterprises, it meaned generate spillover effect was positive for investment-receiving countries. These employees could set up their own companies or work for domestic enterprises in the same industry in which FDI enterprises are operating.

Technology transfer

This is considered as an important positive spillover effect of the FDI sector. Currently, the commonly indicator which was used to measure technology absorption from FDI enterprises, was the education level or the professional qualifications of the labour force and the technology innovation of the business through indicators for activities of R&D. FDI enterprises' ability absorbed new technology was also an important factor creating spillover effects. The parent companies were the places that created new technologies, so the higher the absorption of new technologies by subsidiaries, the more beneficial spillover effects were.

Over the past years, FDI enterprises had stimulated and encouraged domestic enterprises to innovate and improve their technological capacities. FDI enterprises created opportunities for domestic enterprises to acquire the most favorable scientific and technological achievements. Many modern technological lines of many industries such as information technology, light industry, agriculture ... had been put into production, thereby increasing labour productivity and enhancing commodity competitiveness of Vietnam on the world market.

Production association

Spillover effects were created mainly through production association. In the production linkage, there were two forms such as: vertical linkage and horizontal linkage, so there are two ways of spillover effects: (1) Horizontal spillover effect which was affected to companies in the same industry; (2) The vertical spillover effect which was the spillover effect from FDI enterprises to regional enterprises in another sector which provided inputs material to this FDI or from FDI enterprises to regional enterprises in another sector which FDI firms provide inputs.

Another type of interdisciplinary spillover effect is suplybackward: FDI firms can also create demand for local output. These "backlinks" can increase strengthen supply industries, which in turn supplies the material (via downlink) to other local companies.

Competitive environment

FDI enterprises created great competitive pressure for domestic enterprises, that increased the competitiveness of the domestic economic sector. It was a positive spillover effect on the economy. Domestic firms in the same industry would had to innovate if they did not want to lose the market. Domestic businesses could have to improve product quality, change management forms, marekting, technology ... to have a chance to compete. Since then, domestic enterprises gradually aimed to compete with the international market. In addition, FDI enterprises also had to compete with domestic enterprises in terms of products such as types, designs, customers, price .. which made the product quality increasing and consumers will be using more quality products.

In general, the emergence of FDI enterprises had pushed Vietnamese enterprises, especially large enterprises made efforts to invest in production, innovate product designs, develope brands, and expand distribution to dominate domestic and international market share. Domestic enterprises had become more professional, increasingly responding to market fluctuations and increasing competition with international businesses.

Over the years, FDI has created a positive spillover effect on the economy in Vietnam, but there are still some limitations such as:

The competitiveness of Vietnamese enterprises was still limited in receiving spillover effects from FDI. Vietnamese enterprises were mainly small and medium enterprises, so the appearance of FDI enterprises made domestic enterprises more fierce competition. This was a playground for large businesses or businesses that had internal resources and businesses with poor "resistance" were easily eliminated or reduced their production scale.

The dissemination and transfer of technology from foreign enterprises to domestic ones was also problematic. Domestic enterprises - which received investment, had wanted to receive technology transfer, need to depend on their internal technological capacity or their ability to absorb technology and the level of technology difference between FDI enterprises and domestic enterprises. Many domestic enterprises still have limited technological capacity, technical qualifications and human resources, so they cannot accept technology transfer from FDI enterprises.

Vietnamese enterprises still have limited autonomy in raw materials and input factors. The association in spillover effects requires development of supporting industries to facilitate the development of businesses in general. However, some production and business industries in Vietnam are not proactive in raw materials and depend on imports, leading to spillover effects that are not really effective.

Participating in the global supply chain of Vietnamese enterprises was low. According to economists, Vietnam had 21% of enterprises participating in the global supply chain, while in Thailand this rate was 30%, Malaysia was 46%. Some industries in Vietnam, our businesses mainly focused on low value-added stages such as garment, footwear, raw product processing ... Also due to this lack of tight association, Vietnamese enterprises had relatively low competitiveness while labor productivity had not improved much.

4. Discussion and Conclusion

In order to promote the positive spillover effects and overcome the limitations of the FDI sector spillover effects, some solutions was offered as:

Firstly, improving the competitiveness of domestic enterprises. Enterprises need to be confident and proactively participate in the global supply chain and have a strategy to develop and adapt to FDI enterprises. In addition, domestic enterprises may be increased to regularly renew and improved their management skills to meet general international requirements.

Secondly, promoting the development of high-quality human resources: Human resources are considered the decisive factor to take advantage of and exploit the positive spillover effects of FDI on Vietnam. Therefore, improving the quality of human resources in terms of physical strength, mental strength and skills is an urgent requirement for Vietnamese businesses today. In addition, it is necessary to have a policy to "retain" labor, prevent "brain drain" and attract workers from the FDI sector.

Thirdly, increasing investment in science and technology development and improving the quality of technology transfer. Improving the level of technological equipment in parallel with the improvement of the quality of human resources are the basic conditions for improving technology absorption and management skills from the spillover effects of FDI on Vietnamese enterprises. .

Fourthly, to develop supporting industries, strengthen linkages in production and supply of raw and auxiliary materials for Vietnamese textile and garment enterprises. Supporting industries are an important industry in the production chain. This is both a pull factor to attract FDI and a bridge between domestic enterprises and the FDI sector. Therefore, supporting industry development should also be given attention and priority to develop in the coming time.

The last, developing industrial clusters/ zone production toward creat value.

The impact of this trend on FDI was through improving competitiveness compared to enterprises outside the cluster. From the perspective of economic development and FDI Attraction Strategy, Vietnam would have opportunities to attract businesses specializing in supporting industries to increase the ability that created value for the cluster and favorable business environment, especially in skills development and streamlining start-up and business processes. And the formation of cluster groups is required the participation of the management and initiation of the state to avoid the over-formation and not achieve the desired effect.

Conclusion: FDI has shown its role in the economic growth of countries. The correct assessment of the effects of FDI including spillover effects has a great influence on promoting the efficiency of the FDI sector. That is also the basis for giving effective solutions to the development of enterprises in the economy in the coming period.

Abstract

It is widely accepted that corruption is a problem of institutional failure, and better governance positively leads to lower corruption. As a proxy of governance, proactive leadership of the local governance theoretically associates with corruption, but this impact is complex and non-linear because of the spatial dependence of corruption. This study presents a spatio-temporal model to investigate the impacts of proactivity of provincial leadership on corruption in Vietnam. Using data adapted from 63 provinces during 2006-2017, the study indicates that the provincial corruption levels are clustered in space and time. Also, there are indirect impacts of proactivity of provincial leadership on corruption in the short run and direct impacts in the long run. These impacts are inverted-U shape. This empirical result provides new evidence and sheds light on anti-corruption policy design in Vietnam.

Keywords: *Corruption, Proactivity of provincial leadership, Spatio-temporal dependence*

1. Introduction

Corruption is one of the obstacles to economic and social development. Despite anti-corruption measures and initiatives at the different levels have been applied, corruption is still a worldwide phenomenon in 2020, especially in emerging and transitional countries (Transparency International, 2020). It is one of the main social factors impeding the sustainable development of a region (Frolova et al., 2019). Thus, curbing corruption is as a solution for the economic and social development of countries around the world. There is strong and robust evidence that the higher quality of governance strongly associates with lower levels of corruption, and corruption is a problem of institutional failure. According to Rose-Ackerman (2004), poor governance contributes to low growth and to other harmful outcomes, and that weak underlying economic and institutional conditions facilitate corruption. Many studies also find poor governance is a cause of corruption prevalence. For example, Lambsdorff (2003) finds that weak law and order and insecure property rights encourage corruption; a low level of democracy facilitates corruption (Rose-Ackerman, 2004); a lack of transparency and a lack of control by supervisory institutions also generates corruption (Šumah, 2018).

As a proxy for governance, the proactivity of local leadership strongly associates with the corruption levels. Proactive leadership of the local government means its policy should promote the development of the private sector. In Vietnam, all policies are centrally promulgated, and interpretation and implementation are conducted by the local government to support the private sector. In this sense, more proactive leadership leads to less corruption in the local government. This study investigates the impacts of proactivity of local government leadership on corruption in the localities with a focus on the spatial dependence of corruption. With data adapted from the Provincial Competitiveness Index survey and General Statistics Office of Vietnam for 63 provinces in Vietnam during 2006-2017, empirical results show that the corruption levels of provinces are positively influenced by spatio-temporal dependence of neighboring province corruption and inverted-U shaped impacts of proactivity of provincial leadership.

It is believed that corruption is a global problem, and it requires global issues. This point is supported by economists who have examined how corruption is spread across borders describe a contagion effect whereby domestic corruption takes on the characteristics of corruption in geographically proximate countries (O'Trakoun, 2017). The level of corruption differs not only between countries but also between subnational regions within a country (Borsky & Kalkschmied, 2019). Spatial dependence of corruption is explained by (i) Economic by openness and integration between economies/regions or resource allocation as Goel and Nelson (2007); Goel and Saunoris (2014), (ii) Society by the spatial sharing of institutional, cultural, or other hidden values by migration (Dong et al., 2012). However, previous studies still have some limitations. O’Connor and Fischer (2012) believe that cross-sectional analyses provide an inadequate understanding of what influences corruption over time. This limitation is explained by the effect of spatio-temporal dependence from source regions is very complex. It includes short-term direct, long-term direct, short-term indirect, and long-term indirect effects (Elhorst, 2014). But economic theory is often quite helpful to entail long-term equilibrium relationships. It has little to say about the short-run dynamics, and this equilibrium is approached (Elhorst, 2001). Existing empirical studies have relied on Spatial Durbin Model incapable of capturing short-term effects because this model cannot estimate those effects (Elhorst, 2014). This study relies instead on the spatio-temporal dependence approach and, as one of the earliest papers in the economic field, fills the above gap.

Vietnam is an active country and has made great efforts in combating corruption. The anti-corruption legal system has been increasingly completed to narrow the policies’ discretion, and administrative reforms reduce the discretion of civil servants, controlling conflicts of interest to minimize corruption based on the collusion between enterprises and civil servants, etc., but corruption is still rampant. Further, the government has multiple-goal programs, both economic development and corruption prevention, but previous studies focus less on the relationship between corruption and proactivity of provincial leadership. It raises the problem of continuing research on this relationship, which provides appropriate evidence for designing the anti-corruption program.

Following this instruction, Section 2 mentions methodology, including the development of the spatial weight matrices, spatial correlation test, estimated models, and variables used. Section 3 presents the estimated results and discussion, and Section 4 concludes the paper.

2. Method

Data and estimated model

The estimates of the spatio-temporal dependence of corruption and investigate how proactivity of provincial leadership spatially affect corruption have three steps: (i) test the best fit model with research data; (ii) investigate the impacts of proactivity of provincial leadership on spatio-temporal dependence of corruption.

Spatial weight matrix

Estimation of a spatio-temporal model requires a spatial weight matrix. It is a square matrix with a dimension of $N \times N$, where N is a number of geographical areas/regions. Previous studies have provided several ways to build a spatial weight matrix. In this study, inverted distance weight matrix is used. Inverted distance weight matrix, W , then has spatial weights of the form: $w_{ij} = \begin{cases} \frac{1}{d_{ij}} \; if \; 0 \leq d_{ij} < d_{max} \\ 0 \; if \; d_{ij} \geq d_{max} \end{cases}$, where d_{max} is the distance band.

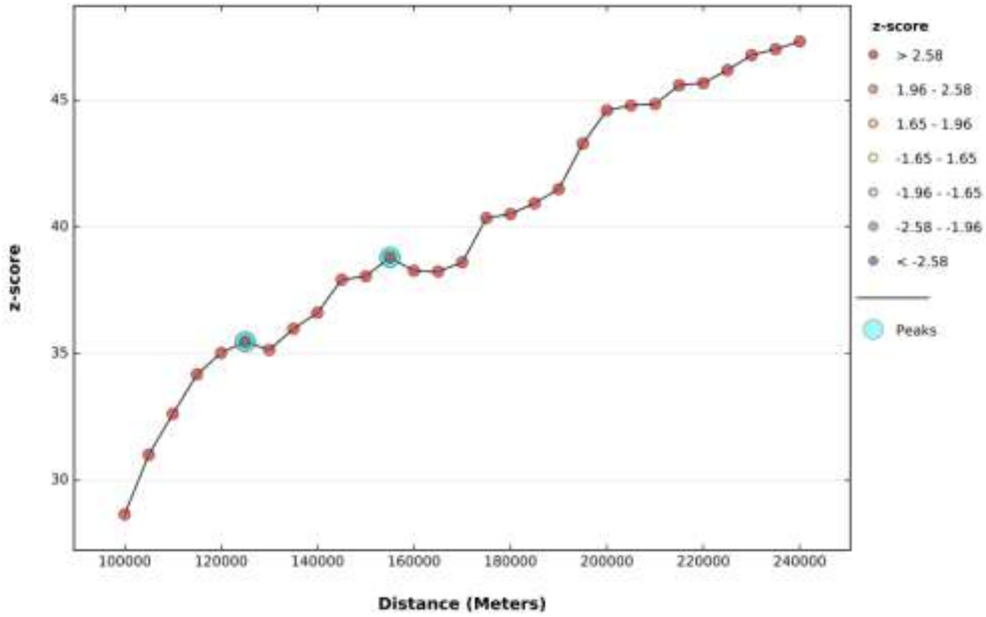

Figure 1: Incremental Spatial Autocorrelation by distance

In which the distance between provinces is calculated by Great circle distance. The great circle distance is calculated using the Haversine formula as follows: $d_{ij} = r * arccos\left[\cos\left(Lon_{r(i)} - Lon_{r(j)}\right) * \cos Lat_{r(i)} * \cos Lat_{r(j)} + \sin Lat_{r(i)} * \sin\ Lat_{r(j)}\right]$, where d_{ij} is usually computed as the distance between their centroids or another important unit; $Lon_{d(i)}$ and $Lon_{d(j)}$ be the longitude and $Lat_{d(i)}$ and $Lat_{d(j)}$ the latitude coordinates of region i and j measured by degrees, respectively; $Lon_{r(i)}$ and $Lon_{r(j)}$ be the longitude and $Lat_{r(i)}$ and $Lat_{r(j)}$ the latitude coordinates of region i and j measured by radians, respectively; and r is the Earth's radius. The distanced band (d_{max}) is measured by Incremental Spatial Autocorrelation (Spatial Statistics) from ArcGIS Pro. The result shows that 125 kilometers is the best distance band with this data sample (Figure 1).

Estimated model

The Spatio-temporal model can be described as follows:

$$Y_{i,t} = \varphi Y_{i,t-1} + \delta WY_{i,t-1} + \rho WY_{i,t} + \theta WX_{i,t} + X_{i,t}\beta + u_{i,t}$$
$$u_{i,t} = \lambda Wu_{i,t} + \varepsilon_{i,t} \quad (1)$$

Where Y is the dependent variable as corruption, X is a vector of explanatory variables, and proactivity of provincial leadership is an interested variable, W is the spatial weight matrix, u is the error terms. $\varepsilon = (\varepsilon_1, \ldots \varepsilon_N)$ is a vector of disturbance terms, and ε_i are independently and identically distributed error terms for all i with zero mean and variance σ^2. φ is a serial autoregressive parameter showing the dependent variable lagged in time. δ is the space and time autoregressive parameter measuring the dependent variable lagged in both space and time. ρ is called the spatial autoregressive coefficient measuring the dependent variable lagged in space. λ is the spatial autocorrelation coefficient; θ measures the exogenous interaction effects among the independent variables; β measures the impact of the independent explanatory variables.

Control variables and data

Because corruption is an attribute influenced by many factors, equation (1) is augmented by including other regional characteristics. As mentioned above, according to previous studies, the spatial dependence of corruption is often caused by three mechanisms: (i) Economic factors proxied by openness and integration between economies/regions; (ii) Society by the spatial sharing of institutional, cultural, or other hidden values, proxied by in-migration rate, freight traffic; and (iii) the governance of regions/countries that is usually proxied by transparency and proactivity of local leadership.

The dataset is adapted from two sources of Vietnam Provincial Competitiveness Index (PCI) and the General Statistics Office of Vietnam (GSO) during 2006 – 2017. The definitions, measures, and descriptions of variables are presented in Table 1.

Table 1. Describe the variables (2006-2017)

Variables	Description	Mean	Std. Dev	Source
Corruption	Corruption is measured by asking if "enterprises in your line of business have to pay for informal charges."	60.59	10.86	Provincial Competitiveness Index
In-migration rate	The number of people from different territorial units in-migrates to a territorial unit in the reference period on average per 1,000 people of the in-migration territorial unit.	5.86	8.24	General Statistics Office of Vietnam
Openness	Openness is the ratio of export and import to provincial gross regional domestic products.	1.09	1.66	General Statistics Office of Vietnam
Log of Freight traffic	Log of freight traffic, which is calculated by multiplying the volume of freight carried with the actual transported distance.	8.95	1.12	General Statistics Office of Vietnam
Transparency	Transparency is a measure of whether firms have access to the proper planning and legal documents necessary to run their businesses, whether those documents are	5.91	0.83	Provincial Competitiveness Index (PCI)

	equitably available, whether new policies and laws are communicated to firms and predictably implemented, and the business utility of the provincial webpage.			
Proactivity of provincial leadership	A measure of the creativity and cleverness of provinces in implementing central policy, designing their own initiatives for private sector development, and working within sometimes unclear national regulatory frameworks to assist and interpret in favor of local private firms.	5.05	1.29	Provincial Competitiveness Index

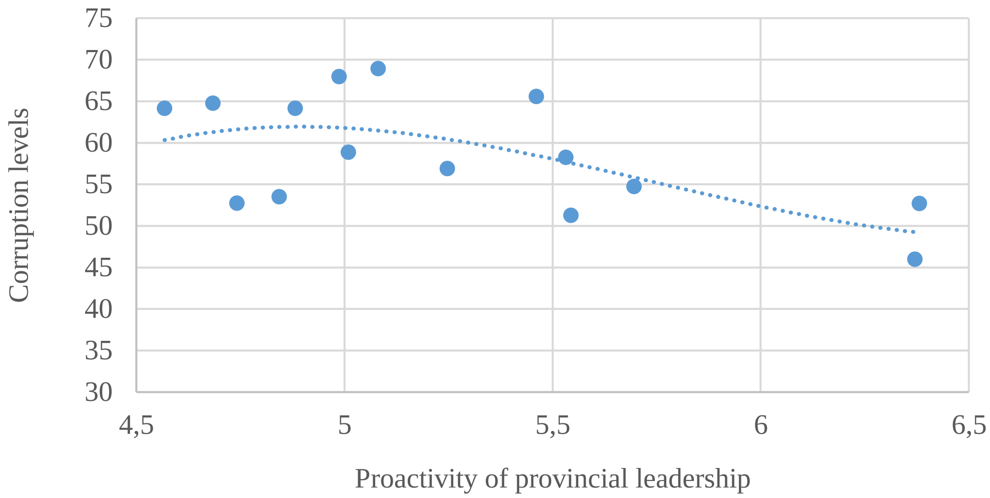
3. Results

Proactivity of provincial leadership and corruption in Vietnam

Corruption in Vietnam persists, although much anti-corruption effort has been conducted. The introduction of new Anti-Corruption Law with a strong will to combat corruption; many actions have been introduced and implemented. For example, the Vietnamese government applied a comprehensive administrative reform and reduced public officials' discretion of policy and discretionary decisions. It also controls for conflict of interests in doing public work and requires and discloses public officials' assets declaration. In addition, many corruption cases have been brought to the course and strictly sentenced. Hence, it creates corruption "deterrent effects" that help reducing corruption. It eventually reduces the perception and experience of corruption among firms and citizens in Vietnam for the last three years. These anti-corruption results have been recognized by Transparency International in the Corruption Perceptions Index ranking when Vietnam increase the index from 31 in 2015 to 36 in 2020, ranking 104 out of 179 surveyed countries.

The proactivity of provincial leadership is a measure of the creativity and cleverness of provinces in understanding and implementing central policy to support private sector development. According to the PCI ranking published by the Vietnam Chamber of Commerce and Industry, the proactivity of provincial leadership was around 4.6 to 5.5 during 2005-2014, and it continuously increased to 6.4 in 2020. The correlation between corruption levels and the proactivity of provincial leadership is presented in Figure 1.

Figure 1: Correlation bet ween corruption levels and proactivity of provincial leadership



Descriptively, the proactivity of provincial leadership has a quadratic correlation with provincial corruption levels. It means that, at the lower levels of proactivity of provincial leadership, an increase in proactivity of leadership positively associates with a higher corruption level. However, when proactivity of provincial leadership is sufficiently high, an increase in proactivity of leadership positively is negatively associated with the lower corruption levels. It is good evidence for specifying estimated models and guidance for anti-corruption policy design.

Testing for the fitted model

Follow the guidance from Belotti et al. (2017), to determine which spatial econometric model is the best fit for the sample, we first estimate the Spatial Durbin Model (SDM) (LeSage & Pace, 2009) and then test for the exclusion of variables by using LR tests for nested models while using the modified AIC criterion as in Burnham et al. (2004) for the Spatial AutoCorrelation Model (SAC). The test results are presented in Table 2.

Table 2. Spatio-temporal dependence – Test for model selection

	χ^2	P-value	AIC
SAR vs Dynamic SAR	458.40	0.000	.
SDM vs Dynamic SDM	442.21	0.000	.
SEM vs Dynamic SDM	483.18	0.000	.
Dynamic SAR vs Dynamic SDM	22.16	0.001	.
SAC	.	.	5007.1
Dynamic SDM	.	.	4595.8

The test results indicate that the Dynamic SDM model is the best fitted model to investigate the impacts of proactivity of local leadership on corruption in Vietnam.

Estimated results

The testing results show that the Dynamic SDM model is an appropriate model to explore impacts of proactivity of provincial leadership on corruption in Vietnam. Estimates from the dynamic SDM regression model described in equation (1) are presented in Table 3.

Table 3. The estimation results of the Dynamic SDM model

Spatio-temporal						

Rho (ρ)	0.473***
	(0.046)
Lambda (λ)	44.699***
	(2.223)

Note: Proactivity of PL 2 represent quadratic term of Proactivity of PL.

Standard errors in parentheses, *** p<0.01, ** p<0.05, * p<0.1.

The statistically significant Rho (ρ) parameter and the construction of the distance weight matrix mean that the corruption in Vietnam has spatial dependence across provinces, and the effects are smaller when the distance between provinces is higher. The statistically significant parameter of Lagged corruption (φ) means the corruption has the temporal effect over the years in each province, and the effect is smaller when the lag of time is higher. Especially, the parameter of spatially lagged corruption (δ) is statistically significant. It means local corruption is not only influenced by spatial effect and temporal effect but also by spatio-temporal effect by neighboring provinces.

The estimated results also indicate that the proactivity of provincial leadership has an inverted-U- shaped effect on corruption levels. These effects are indirect in the short run but direct in the long run. In the short run, the corruption level of a province is positively affected by the proactivity of provincial leadership of the neighboring provinces if the levels of proactivity of provincial leadership are low; but this effect is negative if the levels of proactive of provincial leadership are sufficiently high. However, in the long run, indirect effects of proactivity of provincial leadership no longer exist, and the direct effects are present. It implies that the proactivity of provincial leadership will determine the provincial corruption levels. The estimated results also indicate that when the levels of proactivity of provincial leadership improve, the corruption of both province and neighboring provinces tend to decrease. It is a good signal that the actual average levels of proactivity of provincial leadership in Vietnam (5.53) are currently higher than the short-run threshold level of 4.05 and the long-run threshold level of 3.66. It means higher proactivity is negatively associated with lower corruption levels.

The result implies that in the short run, control of corruption in Vietnam should focus on coordination in anti-corruption measures among provinces, the control of how provinces interpret and implement to support the private sector for personal gains of the provincial officials. However, the anti-corruption should shift to promote proactivity of provincial leadership, and in turn, more proactive leadership would decrease the corruption levels in the long run. These empirical results should provide more evidence for the anti-corruption policy design in Vietnam in the years ahead.

4. Discussion and Conclusion

Corruption impedes economic growth and development, and anti-corruption is a priority in many countries. Although, many anti-corruption initiatives have been applied, corruption is still rampant since the spatial dependence of corruption has not been sufficiently investigated and solved, especially when self-interested rent-seeking behavior among local government officials occurred via their proactivity. By using a Spatio-temporal dependence model, this study shows that corruption levels differ among provinces within a country, and they are clustered in space and time. With data adapted from the Provincial Competitiveness Index survey and General Statistics Office of Vietnam for 63 provinces in Vietnam during 2006-2017, empirical results show that the corruption levels of provinces are positively influenced by Spatio-temporal dependence of neighboring province corruption and inverted-U shaped impacts of proactivity of provincial leadership. These impacts are indirect in the short run and direct in the long run.

This study may have a limitation that the spatio-temporal model is not really complete because it only estimates the fixed effect models. In addition, the perceived corruption is used in this study, and it may contain some drawbacks. Respondents from different sub-national regions may perceive corruption differently due to social norms and local tolerance of corruption. Further, perception survey may be affected by socially desirable answers.

Although the study has some limitations, its empirical results still provide merit values. From a theoretical perspective, corruption is clustered in space and time, meaning that corruption levels of a region are affected by region-specific corruption and neighbors' corruption levels over time, and those effects are simultaneous. Once estimating the impact of corruption, it should use the Spatio-temporal dependence models to avoid underestimating the effects, measure the spatial externality effects from neighboring regions, and get unbiased estimates. Furthermore, the role of proactivity of local leadership determines corruption of the locality and corruption levels of neighboring provinces. Thus, investigating the impacts of proactivity of local leadership on corruption should consider the spatio-temporal effects.

From a managerial perspective, the empirical results may have several political applications. Our results emphasize the spatio-temporal of sub-regions research on corruption, which is important to understand how proactivity of provincial leadership affects corruption and can thus provide important policy lessons for central and local governments.

- First, the anti-corruption policy should take Spatio-temporal dependency of corruption levels into account. It means that anti-corruption actions should be coordinated outside the administrative border of provinces, at least at the regional levels.

- Second, in the short run, provinces should focus on the indirect effects of proactivity of provincial leadership on corruption by controlling policy interpretation and implementation of provincial governments to avoid personal rent-seeking behaviors of provincial officials. The Vietnamese government should vigorously and strictly implement policies that help control for personal rent-seeking activities of the officials. They include the control of conflict of interests, asset declaration, strict moral requirements of the government officials at all levels, and a strong inspectorate system.
- Third, in the long run, anti-corruption measures should focus on promoting the proactivity of provincial leadership to promote the direct effects of the proactivity of leadership on corruption. Some issues should be considered to improve the proactivity of local government leadership: (i) having a strong and transparent legal framework supporting the private sector. This framework helps to guide what local government officials can do to support the private sector. (ii) consistently and predictably implementing the private-supporting policies. It would help firms have long-run investment and development strategies. (iii) increasing the roles and responsibility of the local government leader in their tasks, especially in supporting the development of the private sector.

Abstract

This study aims at pointing out the impact of technology on the imbalance of labor structure in Manufacturing and Processing Industry of Vietnam. Empirical analysis is implemented by using a panel dataset carefully integrated from the annual labor data and value added (VA) data from 2012 to 2018 and the statistic of technology data from 2012 to 2018 of the Vietnam General Statistics Office (GSO). The paper tested the endogeneity in the model, overcame the defects of the model and selected the fixed effect model to assess the impact of external technology acquisition, research and development activities. Imbalance index (d) used to measure the level of structural unbalance of labor in manufacturing Industry of Vietnam. The results show that general technology, including purchasing technology and R&D activities had an effect on d index.

Keywords: *acquisition technology, Imbalance index, R&D activities, structural unbalance of labor and technology*

1. Introduction

The manufacturing industry plays an important role in the development of Vietnam's economy because it always contributes the largest percentage to the country’s gross domestic product (GDP). Moreover, the manufacturing industry also contributes a large of VA value and the number of jobs to the economy.

The imbalance in the labor structure is the situation of redundancy labor or labor shortage in some economic sectors in manufacturing and processing industry of Vietnam. Acemoglu and Autor (2011) show that new technologies increasingly substitue routine jobs and tasks in the US. As a result, the demand of middle-skilled and low - skilled people has decreased while the demand of both high-skilled and low-skilled ones has increased. In Vietnam, there is a labor shortage in the industry group using high technology while the industry group using low technology is having serious redundancy.

In term of technology, the different options can be classified according to the importance and level of compromise of technological investments in the firm. Firms can acquire technology by accessing from not only internal sources through efforts R&D activities but also external sources through transfer of technology, technical licensing agreements or import of capital goods (Tambunan, 2009). However, firms cannot afford to develop or create all the strategically needed technologies through in-house R&D activities owing to high risk, high cost, and restricted time (Cho and Yu, 2000; Whangthomkum et al., 2006). Meanwhile, external technology acquisition is the purchase of technology from domestic enterprises, universities or foreign enterprises. This not only helps firms avoid exposure to the costs and risks associated with domestic development (Jones and Jain, 2002), but also deals with customer requirements for timely and better services, to enhance product complexity, and to sustain competitive advantages under further increased competitive pressures (Jagoda et al., 2010).

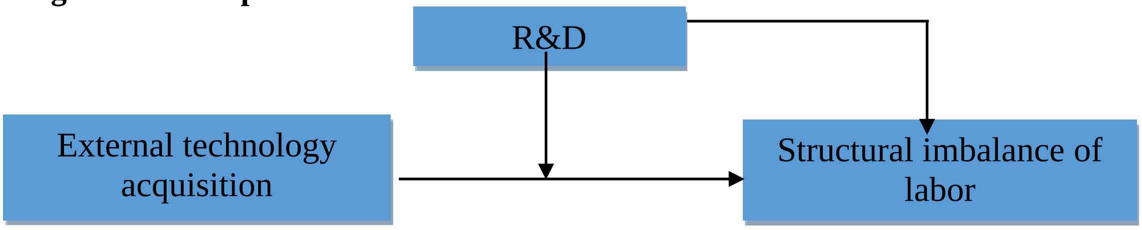
Therefore, in this study, analyze the recent data on technology to show the impact of it on labor structure in Manufacturing Industry of Vietnam. In particular, we propose the effect of external technology acquisition and domestic R&D on the change of the number of labors among economic industries.

2. Method

2.1. Conceptual framework and theoretical prediction

This study evaluates the impact of technology factor on structural imbalance of labor in Manufacturing and Processing Industry of Vietnam with the theoretical framework as shown in Figure 1.

Figure 1: Conceptual framework



The above model shows that structural imbalance of labor is affected by external technology acquisition and internal R&D activities. Moreover, the R&D is also a control variable in the relationship between external technology acquisition and structural imbalance of labor**.** Although domestic R&D activity is not used much by a lot of enterprises and have no meaning in model, we still discuss it as an important issue.

The following section discuss the theory of technology, the theory of the structural imbalance of labor, the impact technology on structural imbalance of labor in manufacturing and processing industry of Vietnam.

2.1.1. The theory of technology

The modern theory of the process of technological change can be traced to the ideas of Schumpeter (1942), who distinguished three steps or stages in the process by which a new technology permeates the marketplace. The first stage is invention – the first development of a scientifically new product or process. The inventions may be patented, though many may be not. Eitherway, most inventions never actually develop into a innovation, which is accomplished only when the new product or process is commercialized and made available on the market. The second step is invention and innovation that carried out in private firms via a process called as "research and development". Lastly, a successful innovation gradually comes to be widely available for use in relevant applications through adoption by firms or individuals, a process labeled diffusion.

2.1.2. The theory of the structural imbalance of labor

The imbalance in the labor structure is the situation of redundancy labor or labor shortage in some economic sectors. In this study, the imbalance between secondary industries in manufacturing industry is considered. However, study aimed considers the difference between industries according to technology level. Therefore, we will focus on assessing the imbalance in secondary industries divided according to using technology level.

2.2. Methodology and data

This section discusses the sample selection procedure, variables selection, the model used for the research and the statistical techniques.

2.2.1. Measures

We use an index to measure the level of structural imbalance from Ando and Nassar (2017). The imbalance is considered by the author based on assessing the balance of productivity in difference group in the overall economy. We suppose that the economy consists of n sectors. VA_s and E_s respectively the value added and the number of employees of the s sector (s = 1,…, n). The meaning of d is as follow:

$$d \coloneqq \sqrt{\sum\nolimits_s d_s^2} \qquad (3.1)$$

d_s is determined by:

$$d_s \coloneqq \frac{E_s}{\sum_k E_k} - \frac{VA_s}{\sum_k VA_k} \qquad (3.2)$$

According to (3.2) can be easily switch to (3.3):

$$d_s = -\frac{E_s}{\sum_k E_k}\left(\frac{P_s - P}{P}\right) \qquad (3.3)$$

Overall, d includes both the labor structure and the added value of all economy. d > 0 is labor redundancy, d < 0 is labor shortage.

2.2.2. Sample and Data set

Empirical analysis is implemented by using a panel dataset carefully integrated from the annual labor data and value added (VA) data from 2012 to 2018 and the statistic of technology data from 2012 to 2018 of the Vietnam General Statistics Office (GSO). The static and copper models are estimated based on data collected from 24 industries in the manufacturing sector in Vietnam for the period 2012-2018. It's all 485 observations.

2.2.3. Research model

To consider the factors affecting the imbalance of labor structure, we use this model:

Model 1: Empirical model without interactive variables

$$d_{it} = \alpha_0 + \alpha_1 tech\_vsic_{it} + \alpha_2 patents_{it} + \alpha_3 dactrung_{it} + \alpha_4 Trade_{it} + \alpha_5 LI_{it} + c_{it} + u_{it}$$

Model 2: Empirical model with interactive variables

$$d_{it} = \alpha_0 + \alpha_1 tech\_vsic_{it} + \alpha_2 patents_{it} + \alpha_3 dactrung_{it} + \alpha_4 congnghe*hapthu_{it} + \alpha_5 tlCN\_R\&D_{it} + \alpha_6 Trade_{it} + \alpha_7 LI + c_{it} + u_i$$

Where:

- cit+uit is measurement error that is assumed to have independent distribution. To overcome the regression error according to cross data, the study uses panel data to regress.
- Other variables are explained in Table 1.

Table 1: Description of variables used in analysis

STT	Variable name	Description	Expected dimensional impact
1	**Variable show technology**		
	tech_vsic	External technology acquisiton of enterprises	+/-
	patents	The total number of patens	+/-
2	**Group of interactive variables between technology and absorption capacity: congnghe_hapthu$_{it}$ equal congnghe*hapthu**		
	CN_sxtt	The proportion of technology acquisition if manufacturing machinery is modern	-
	CN_tttt	The proportion of technology acquisition if communication equipment is modern	+

	tlMuaCN_dnnn	The proportion of technology acquisition from state owned enterprise	+
	tlMuaCN_dncp	The proportion of technology acquisition from joint stock enterprise	-
	tlMuaCN_dnFDI	The proportion of technology acquisition from FDI enterprise	+
3	**Interactive variable between muaCN and the moderating role of internal R&D: tlCN_RD**		
4	**Variable show trade technology**		
	Trade	The total of import and export value	-
5	**Interactive variable between muaCN and the structural change of labor**		
	LI	Structural change of labor index	+

3. Results

3.1. Structural imbalance of labor in manufacturing and processing industry of Vietnam

Figure 3.1.1: Proportion of labor and proportion of VA in the industry group using low technology

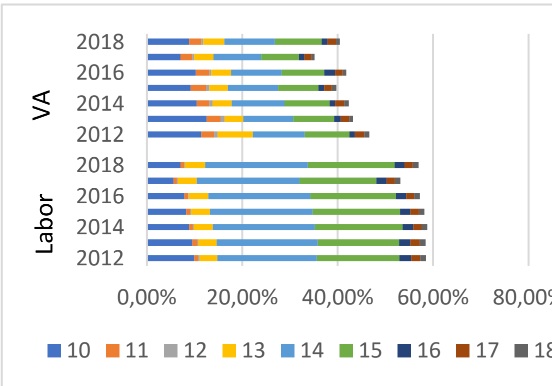


Figure 3.1.2: Imbalance index of the industry group using low technology in manufacturing industry

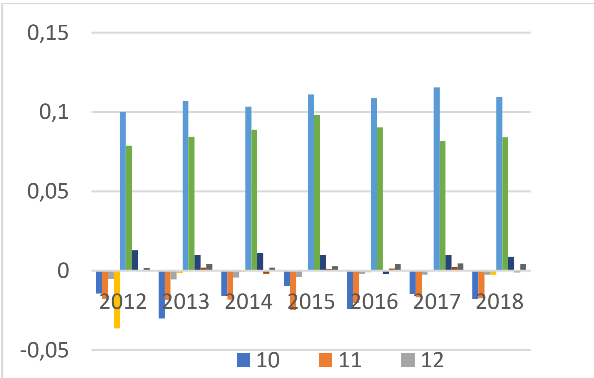

Source: Author's calculations from the Enterprise Survey data

There are 4 industries using low technology have proportion of labor higher than proportion of VA, including sectors 14, 15, 16, 18. However, there are only sectors 14 and 15 have a serious difference between proportion of labor and proportion of VA. Moreover, it tends to rapidly increase. Sectors 10, 11, 12, 17 tends to reduce both proportion of VA and proportion of labor. The proportion of VA is also decrease but this change is not as high as the proportion of labor so the proportion of VA is higher than the proportion of labor.

According to Figure 3.1.2, sectors 14, 15 are the most structural imbalance of labor with the most redundant labor. Moreover, it tends to rapidly increase. Sector 16, 17, 18 are also redundant labor but d – index is low. The others are short of labor. Specially in sector 13, is decrease from -0,036 to (2012) to (-0,002) in 2018. The reduce rate is 93,29% in 2018 vs. 2012

Figure 3.1.3: Proportion of labor and proportion of VA in the industry group using high technology

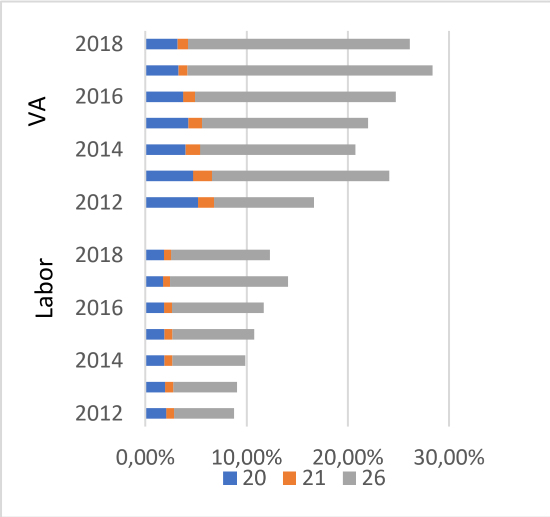

Figure 3.1.4: Imbalance index of the industry group using high technology in manufacturing industry

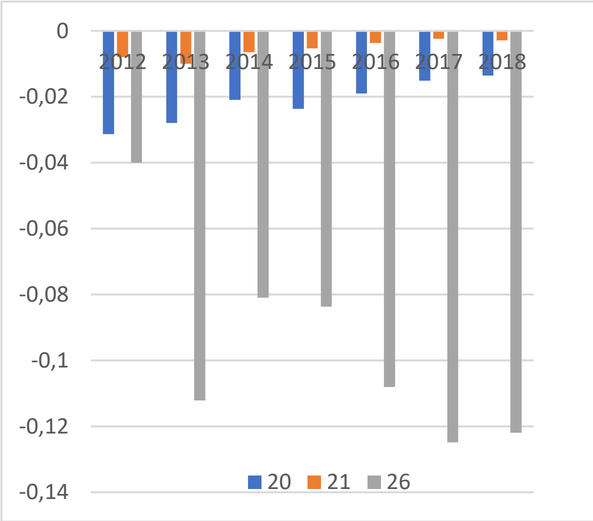
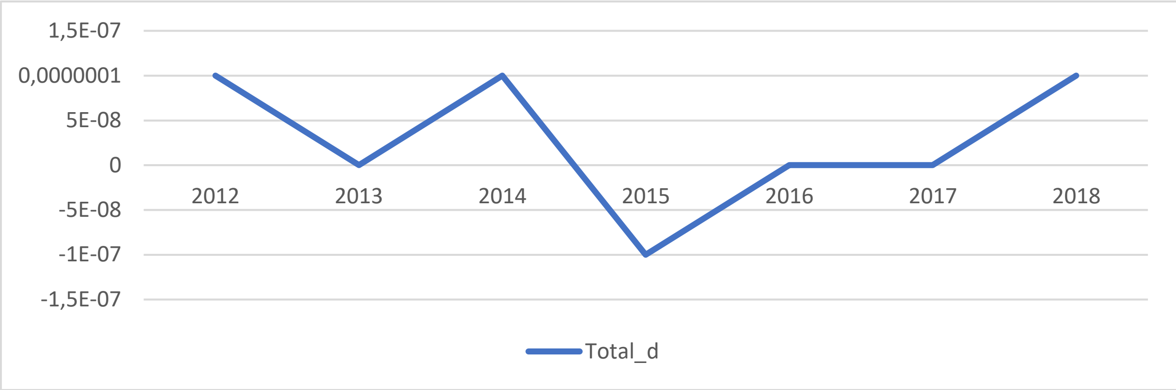


Source: Author's calculations from the Enterprise Survey data

For the industries group using high technology, the proportion of VA is always higher than the proportion of labor. Specially in sector 26, the proportion of VA is rapidly increase about 2,4 times in 7 years. In the opposite, sectors 20 and 21 tends to decrease in both the proportion of VA and the proportion of labor in the research period.

According to Figure 3.1.4, all of sectors in the industry group using high technology fell into the situation of labor shortage. Specially in sector 26, it tends to rapidly increase. d index in sector 26 is increase from -0,04 in 2012 to -0,12 in 2018, increase 3 times in 7 years. Although sectors 20, 21 have d – index < 0, the labor shortage is improving and tending to approach 0.

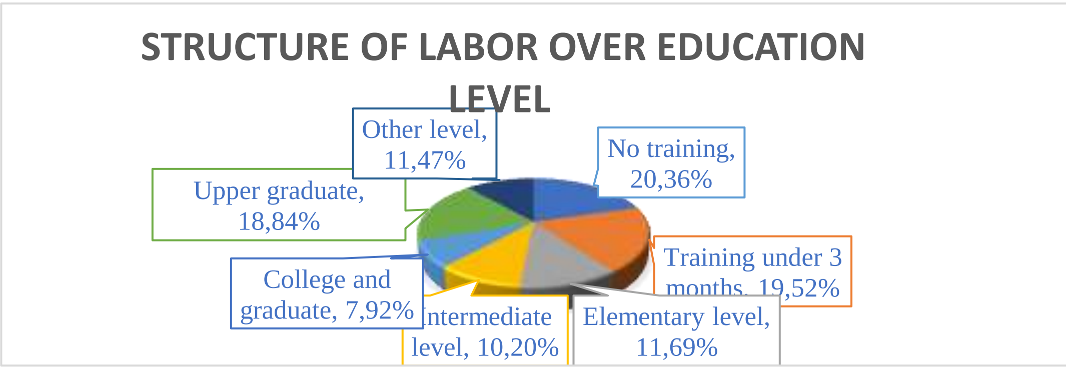
Figure 3.1.5: Imbalance index in manufacturing and processing industry



Source: Author's calculations from the Enterprise Survey data

From 2015, d – index is rapidly increase in manufacturing industry, the industry is more and more fall into redundant labor. The reason of this problem can be explained as: Firstly, labor productivity in manufacturing and processing industry tends to increase. The growth rate of labor productivity in the period 2012 – 2015 is 4,05% per year and reach 5,86% per year in the period 2016 – 2018. Secondly, the industry group using high technology have high labor productivity so that it can improve production efficiency, increase VA value. However, in this group, the labor must have high qualification to operate technology while the qualification of the labor in manufacturing industry is hardly high.

Figure 3.1.6: The labor qualification in manufacturing industry of Vietnam



Source: Author's calculations from the Enterprise Survey data

Thirdly, most of labor in this industry work in the industry group using low technology. Labor productivity is low because the labors have low qualification so the VA value is low.

*Notes: '***', '**' and '*' show estimated coefficients statistically significant at 1%, 5% and 10%*

Source: Author's calculations from the Enterprise Survey data

From the regression results through SGMM method and spatial method in tables 3.2.1 and 3.2.2:

- External technology acquisition has a negative impact on the structural imbalance of labor in the manufacturing industry of Vietnam. Specially in the group industry using high technology. External technology acquisition can improve production efficiency, increase VA value. However, the qualification of the labor in manufacturing industry is hardly high, therefore it is difficult for enterprises to recruit workers. This is the reason why the coefficient of the variable Tech_vsic has a positive value. The variable Tech_vsic is measured through the total value of purchasing technology.

- Group of interactive variables between technology and absorption capacity

The coefficient of the variable tlCN_sxtt has a positive value, which indicates that this variable has a negative impact on the imbalance. That is, technology bought from developed countries will increase the structural imbalance of labor. This can be explained by the fact that Vietnam's labor force is not good enough to absorb this type of technology, so the number of employees meeting the requirements for this technology is not high, therefore it is difficult for enterprises to recruit workers. The dummy variable tlCN_sxtt represents modern manufacturing machinery, while the variable tlCN_tttt represents modern communication equipment.

In contrast, the variable tlCN_tttt has a positive impact on the structural imbalance of labor. This can be explained by the fact that modern communication equipment such as personal computers and Internet are very popular in Vietnam. Therefore, workers in Vietnam can easily absorb this type of technology.

The coefficient of the variable MuaCNdnnn and MuaCNhnFDI has a positive value, which indicates that this variable has a negative impact on the imbalance. In contrast, the coefficient of the variable MuaCNdncp has a positive impact on the structural imbalance of labor with negative value. The dummy variable MuaCNdnnn, MuaCNdnFDI, MuaCNdncp represent technology bought from state owned enterprise, FDI enterprise, joint stock enterprise.

- Interaction variable between external technology acquisition and research and development activities.

The variable tlCN_RD has a negative coefficient, showing that research and development activities complement the acquisition of technology of the enterprise and decrease the structural imbalance of labor in the use of technology.

Meanwhile, research and development activities are not much developed in Vietnamese enterprises. The number of patents is very low, the proportion of enterprises conducting research and development activities only accounts for nearly 50%, the technology transfer ability of enterprises on R&D products is also very low, including the operation of domestic and foreign transfer (this rate is only about 1%). These may explain why the research and development activities of manufacturing industry don’t have much impact on the imbalance of labor structure.

- Group of variables showing the impact of export – import activities

The coefficient of the variable Trade has a negative value, which indicates that this variable has a positive impact on the imbalance. Export activities in manufacturing industry are primarily export product of the industry group using low technology such as wearing apparel or leather and related product. As the results above, this group have low VA in spite of using lots of labor so this is the reason why variable Trade has a positive impact on the imbalance. This result is consistent with the study of Hoang Manh Hung and Nguyen Khac Minh (2018) about the impact of trade openness on structural imbalance of labor.

- Group of variables showing structural change of labor impact on d – index

The coefficient of the variable LI has a negative impact on the imbalance. If the structural change of labor is increase, the structural imbalance of labor will be increase, too.

4. Conclusion

According to the results of regression by SGMM method and spatial method for the whole industry, it can be determined that there are always 10 technological factors affecting the imbalance of labor structure of the industry divided into 4 groups: Group of interactive variables between technology and absorption capacity, Interactive variable between muaCN and the moderating role of internal R&D, trade technology, Structural change of labor within industry

From the above analysis, a number of following recommendations are made. The first and foremost thing is the role of the government in implementing the education and training system that provides the source of qualified workers to meet the labor demand of enterprises. Secondly, the selection of which technology to buy should also be examined to suit the specific conditions of each enterprise. Finally, the government should adopt incentive policies to encourage FDI enterprises to take advantage of their abundant capital to promote research and development activities.

Abstract

This study analyzes a number of factors affecting the satisfaction of businesses in Hanoi. The research identifies six influential factors including Attitude; Suitability for working environment; Awareness; Relationship; Skills; Knowledge. The research also shows that there is a divergence in the degree of firm-level satisfaction with university graduates, different types of businesses, and the different work experience of new job seekers. Such findings allow the authors to propose management implications to improve the satisfaction level of businesses with the career adaptability of university students in Economics.

Keywords: *Firm satisfaction, Graduates, Job adaptability, University in Economics*

1. Introduction

Today, in the context of increasingly fierce competition, human resources, particularly managerial personnel, play more important role in business success. Universities in the field of Economics, which offer training courses regarding management human resources, have been making efforts to improve the quality of training, implementing the training motto in order to satisfy social and business needs. However, according to some reported results, the transition of human resources from universities to enterprises is still inadequate. In 2014, the Vietnam Development Report showed that most businesses have had difficulty in the recruiting process because candidates lacked skills appropriate to the industry, such as cognitive ability, social behavior skills and technical expertise. For the economics sector, although the supply of human resources is abundant, mainly coming from the leading public universities in Economics in Vietnam, the quality is far below the minimum standards. At a seminar on training and researching the market economy in Vietnamese universities in 2016, Ms. Vu Van Hoa, deputy general of the State Auditor General, said that there are many shortcomings in human resource training in the domestic economy leading to the high – level retraining. The above opinions are timely, but the question on where the problem comes from is still left unanswered? Is it possible that the training quality of universities still ensures the improved output standards, but the job adaptability of students does not meet the requirements of businesses?

To address the above mentioned research problem, recently in Vietnam, there have been several studies related to the job adaptability of new graduates and assessment of the satisfaction level of enterprises industry including the works conducted by Nguyen Thi Ngoc Bich (1982), Le Thi Minh Loan (2009), Nguyen Quoc Nghi et al. (2011), Tran Thi Thuy Trang et al. (2018), Tran Cong Hau and Huynh Minh Hien (2020), etc… Unfortunately, while the unit analysis of these studies target students in some fields of pedagogy, tourism, accounting, or non-public schools in some localities, there is no research on students in Economics in Hanoi.

Therefore, this study was conducted to explore the impacts of the factors constituting the graduates' job adaptability from public economic universities on the satisfaction level of enterprises in Hanoi. We propose some research questions as follows: What factors do businesses use to assess the adaptability of students? How do these factors affect the satisfaction level of enterprises? Is there any difference in the satisfaction level of enterprises for students from different universities?

2. Theoretical Framework and Research Model

2.1. Job adaptability

Today, career adaptability is no longer a new terminology. As early as 1895, Herbert Spencer, an influential British psychologist proved that life is a constant adaptation of internal and external relationships. Savickas (2012) suggests that career adaptability refers to the state of preparation and necessary resources to adapt with missions on developing current and proposed careers, including attitudes, abilities, and behaviors that individuals need to tailor for each job. Career adaptability, as proposed by Ferreira (2012) is an attribute that helps maintain the match between people and the surrounding working environment, presented by the attitude, capacity, and behavior that the individuals use in different working environments. Career adaptability is not only skills but also the reaction of the (human) subject to constant changes. The young now focus not only on gaining learning-related knowledge, but also developing career-related knowledge and skills. Therefore, students need to build up career-relevant resources to ensure that they can apply what they learn at the university to have a successful transition from school to labor market.

Career adaptability is an extremely important and necessary factor for employees in general and younger ones in particular in the contemporary world. Pulakos et al. (2002) show that employees who are able to adapt well to a new environment, such as a new workplace, new job requirements or unusual situations, have higher levels of job performance, thereby increasing business satisfaction from their own perspective. In 2003, Chen et al. showed that there is a positive relationship between the emotional commitment of the firm and the employees' performance.

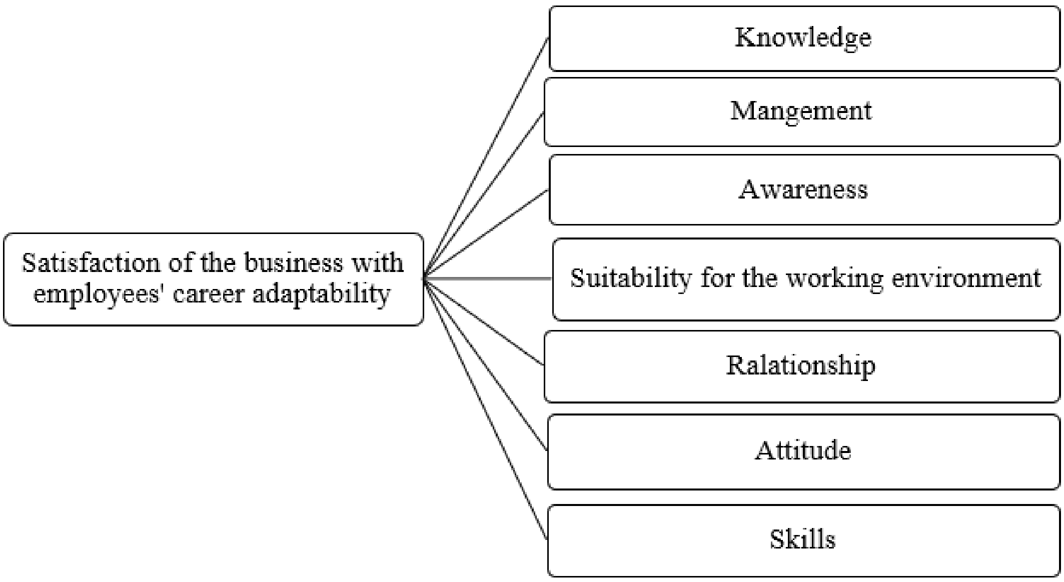
There are many factors affecting job adaptability in several studies in the existing body of literature. Specifically, the World Bank (2012) surveyed the level of shortage in skills of university graduates compared to the requirements of employers in seven East Asian countries (including Vietnam). The World Bank's 2012 survey showed that requirements that employers are always looking for including professional knowledge, creativity, negotiation and communication ability, leadership, problem-solving ability, logical thinking ability, teamwork skills and the work autonomy, computer skills, foreign language and writing skills, time management ability. Many employers tend to prefer education and practical work experience to social skills. Some other studies show that, in the trend of an increasingly competitive developing economies, the assessment of the employee's ability at the firm level no longer depends mainly on professional ability. Instead, the top priority is on employees who possess many skills necessary for the job position. Archer et al. (2008), pointed out that many businesses today focus on soft skills of employees. Employees who possess such skills can contribute positive innovation to outcomes of the organization. In 2017, in the study "Employer's satisfaction on the performance of new college graduates" Randy. A. Tudy conducted a survey of managers and recruiters at 40 companies and organizations in Cor Jesu. Accordingly, the factors that companies or organizations consider when assessing satisfaction regarding employees are very diverse, including Specific skills related to the job; The ability to communicate directly; Ability to communicate in writing; Knowledge; Math skills; IT skills; Critical thinking skills; Problem-solving skills; Research and problem analysis skills; Teamwork skills; Organizational, work arrangement, and planning skills; Time management skills, Performance; Proactivity at work; Creativity and innovation at work; Adaptation to the working environment; Job Responsibility and Interesting Personality.

2.2. Research Model and Hypothesis

According to B.P. Allen (1990), the basic condition of students' job adaptation takes different forms such as Skills in using personal time; Skills in learning actions and other qualities; Skills to deal with negative emotions; Skills to actively practice and form professional behavioral habits. According to this perspective, the adaptation (or non-adaptation) of students is mainly explained by the fact that students have (or lack) some of above mentioned skills with little attention paid to the organizational aspect of their universities in the educational system. Research of CRDule (2002) has measured students' perception of career through 59 variables formed in 10 groups including leadership, communication, personal interaction, analysis, decision making, technology, global perception, ethics, business awareness, practical issue and personality. Research by MRHyman (2005) has explored the factors including 17 variables in 5 groups: Management (decision making, leadership, planning, organization, time management); Cognitive (problem-solving, critical thinking, analysis); communication (speaking, writing); Connectivity (foreign language, cross-functional work, multicultural); personal interaction (teamwork, negotiation, networking, socializing).

In Vietnam, studies by Nguyen Thi Ngoc Bich (1982), Le Thi Minh Loan (2009), Nguyen Quoc Nghi et al. (2011), Tran Thi Thuy Trang et al. (2018) have suggested different criteria to assess the job adaptability of students. In 2020, the study of Tran Cong Hau and Huynh Minh Hien titled "Evaluating employer satisfaction with job adaptability of private university graduates: a case study from Dong Nai." was carried out using 7 factors.

Based on the review and qualitative analysis above, the current research team built a research model on business satisfaction with factors that reflect aspects of students' job adaptability. In the research model, the dependent variable is the firm-level satisfaction while the independent variables include knowledge, awareness, management, suitability with the working environment, relationships, attitudes and skills (see further in Appendix 1). The research model on business satisfaction regarding students' job adaptability is shown in Figure 1 below.



The hypotheses that need to be tested are presented in Table 2.

3. Method

3.1. Research background

The research area is the capital city of Vietnam. The unit of analysis is the firm in all different business sectors that employ new graduates of public universities in Economics in the last 04 years. Due to time bound and limited research capacity, the research team only focused on surveying the job adaptability of graduates from 6 universities in Hanoi, including National Economics University, Foreign Trade University, University of Commerce, Academy of Finance, Banking Academy, VNU University of Economics and Business. In addition, the research team conducted in-depth interviews with a number of business managers and students from universities in Economics in Hanoi. The survey and interview process was carried out from November 2020 to the end of March 2021.

3.2. Research Methods

The study used quantitative methods collecting primary data from a survey with 198 enterprises in Hanoi. The survey questionnaire was designed on a 5-point Likert format. In the survey, in addition to questions related to independent and dependent variables, some demographic characteristics are also mentioned.

The research process is divided into 3 steps as follows:

- Step 1: Preliminary research: In order to search for available information and documents in order to synthesize and form a theoretical framework, and then draft survey questionnaire.

- Step 2: Empirical study: empirical survey with 48 questionnaires, including 22 online questionnaires and 26 face-to-face questionnaires. From the results obtained, the questionnaire was completed to be used for official research.

- Step 3: Formal research: The research team sent 725 ballots to 198 businesses in the area and collected 595 votes, of which 510 were valid, eligible for synthesis and subsequent analysis through scale reliability testing, EFA factor analysis, and multivariable linear regression.

3. Results

3.1. Descriptive statistics of the survey sample

Descriptive statistics of the observed samples are shown in Table 1.

Table 1. Demographic characteristics of the sample

Criteria		Frequency	Percentage (%)
Type of business	Limited Liability Company (LLC)	109	21.4
	Private enterprise	119	23.3
	Joint stock company	265	52.0
	State – owned enterprise	11	2.2
	Partnership	6	1.2
Business industry	Services and commercial	397	77.8
	Agriculture – Aquaculture – Fishery	28	5.5
	Industry and construction	85	16.7
Firm size	Small	140	27.5
	Medium	209	41.0
	Large	161	31.6
Training institutions	National Economics University	99	19.4
	Foreign Trade University	94	18.4
	Thuong Mai University	72	14.1
	Banking Academy	82	16.1
	Academy of Finance	79	15.5
	VNU University of Economics and Business	84	16.5
Work experience at the current position	1 year	194	38.0
	2 years	122	23.9
	3 years	157	30.8
	4 years or more	37	7.3

Source: Compiled from survey data

3.2. Exploratory factor analysis

First, the research team performed a preliminary scale reliability test to remove the observed variables that are not reliable (Cronbach's Alpha < 0.7) and redundant (the Corrected Item-Total Correlation is less than 0.3). Through Cronbach's Alpha, the group found that all 33 observed variables of 7 factors and 4 variables measuring satisfaction are qualified to be included in further analysis. The results of testing the reliability of the scale are shown in Table 2.

Table 2. Results of testing of scale reliability

Factors	Number of observed variables	Cronbach's Alpha coefficient	Hypothesis
Knowledge	5	0.783	+
Management	3	0.801	+
Awareness	4	0.751	+
Suitability	5	0.807	+
Relationship	4	0.602	+
Attitude	6	0.827	+
Skill	6	0.810	+
Satisfaction	4	0.765	Dependent variable

Source: Compiled from survey data

Performing results of EFA is used to check the sampling adequacy. Bartlett's test has Sig. = 0.000 shows that factor analysis is suitable. KMO index at 0.886 > 0.5 shows that sufficient conditions for factor analysis are appropriate with the data collected. The total variance extracted is 64.131 % (greater than 50 %) and the Eigenvalue of 7 groups of variables is greater than 1. At the same time, the loading coefficients show that observed variables in the same group have a strong correlation. Therefore, the research team concludes that the group's model is appropriate, 7 factors are suitable for further analysis. For the Satisfaction variable, the test results show that all items meet EFA standards. In which, the KMO coefficient is 0.722 (greater than 0.5), the Bartlett test has Sig. = 0.000 (less than 0.05), the total variance extracted is 59.168% (greater than 50%) and the Eigenvalue is 2.367. The results of factor analysis (EFA) for the scale of Job Adaptation and the Satisfaction variable are shown in Appendix 3. Thus, after removing 4 observed variables including Knowledge_5, Skill_5, Attitude_5, and Relationship_4, the remaining 29 observed variables ensure convergence.

3.3. Multivariate regression analysis

The formula of the regression model is presented as follows:

$$\textit{Satisfaction} = \beta_0 + \beta_1\,\textit{Attitude} + \beta_2\,\textit{Suitability} + \beta_3\,\textit{Awareness} + \beta_4\,\textit{Relationship} + \beta_5\,\textit{Skill} + \beta_6\,\textit{Management} + \beta_7\,\textit{Knowledge}$$

Of which: Satisfaction is the dependent variable. Attitude, Suitability, Awareness, Relationship, Skill, Management, and Knowledge are independent variables.

Regression results are shown in Table 3. Specifically, the independent variable in the model explained 73.2% of the variation of the dependent variable (adjusted R square equal to 0.732). Sig. value in ANOVA is 0.000 < 0.05, showing that the linear regression model is suitable for the database. With the regression coefficient estimates, the Sig. in the t-test of 6 variables (knowledge, awareness, suitability, relationships, attitude, and skill) are all < 0.05, and the regression coefficients are all > 0. It shows that these independent variables have a significantly positive effect on the dependent variable (Satisfaction). Particularly for the management variable, the value Sig. = 0.113 > 0.05 shows that this variable has no statistically significant effect on the dependent variable and we remove management from the model. It also shows that the VIF coefficients of the independent variables (with a statistically significant regression coefficient other than 0) are all less than 3, showing that there is no multicollinearity between the explanatory variables.

From there, there is a standardized regression equation reflecting the relationship between the dependent variable, which is the level of business satisfaction, and the independent variables (Component factors of student job adaptability) as follows:

Satisfaction = 0.302 Attitude + 0.225 Suitability + 0.174 Awareness + 0.137 Relationship + 0.122 Skill + 0.112 Knowledge

Table 3. Multivariable regression results - Coefficient

Model	Unstandardized Coefficients		Standardized Coefficients	T	Sig.	Collinearity Statistics	
	B	Std. Error	Beta			Tolerance	VIF
(Constant)	-.543	.121		-4.507	.000		
Knowledge	.104	.028	.112	3.678	.000	.564	1.773
Management	.040	.025	.051	1.587	.113	.513	1.949
Awareness	.161	.025	.174	6.316	.000	.696	1.436
Suitability	.230	.036	.225	6.383	.000	.423	2.365
Relationship	.128	.025	.137	5.033	.000	.705	1.418
Attitude	.317	.036	.302	8.735	.000	.440	2.274
Skill	.137	.036	.122	3.800	.000	.510	1.960

a. Dependent Variable: Satisfaction

Based on the results of the regression analysis, it can be seen that, among the factors affecting the satisfaction of the business, attitude is the most important factor, with an impact rate of 26.89%, followed by the suitable for working environment (20.04%), awareness (15.49%), relationship (12.20%), skill (10.86%), knowledge (9.98%).

To take a closer look at specific aspects, the research team performed ANOVA and Independent Sample T-Test analysis to test the difference between the values of qualitative variables and quantitative variables. For the difference between graduates from different universities, the test results have Sig. values (in the test of homogeneity of variance) of 0.492 > 0.05, Sig. (in the ANOVA table) of 0.000 < 0.05, so it is concluded that there is a certain difference in the satisfaction of enterprises with the job adaptability of graduates from different educational institutions. Similarly, there is a difference in adaptability between students with different work experience at the firm. Specifically, the longer an employee has worked for the firm, the greater the satisfaction of adaptability. Moreover, there is also a difference in the average value of the satisfaction of the enterprises on the adaptability of the students. The state-owned enterprises that have a higher level of satisfaction than other types of enterprises.

4. Discussion and Conclusion

4.1. Conclusion

Career adaptability is one of the most important factors for the workforce in general and young workers in particular in the contemporary world. New graduates may have a sense of satisfaction when they can adapt to the job. In order to verify the scale reflecting the students' job adaptability, the research team has surveyed businesses and tested the scale. The results show that the scale includes 7 factors with 29 observed variables and the test shows that the survey data of the group is suitable for exploratory factor analysis. This result is also consistent with the research results of Tran Cong Hau and Huynh Minh Hien (2020), World Bank (2012), M. R. Hyman (2005), Tran Thi Thuy Trang (2018).

The study also proved that there is a causal relationship between business satisfaction and student’s job adaptability. Accordingly, the higher the student's job adaptability is, the greater the business satisfaction will be. This is confirmed by the hypothesis testing that is accepted, the estimated values in the multivariable regression model are positive and statistically significant. This result is consistent with the study of Pulakos (2002).

Based on the estimated value of the standardized regression coefficient, the study shows the factors affecting the satisfaction of enterprises in order of importance. Accordingly, factors such as attitude, suitability, awareness are commonly used, especially attitude, which is the highest-rated factor in the ranking of the degree of influence on business satisfaction with the adaptability of graduates. Surprisingly, the knowledge factor is not paid much attention by businesses even though it is one of the most important factors in the ASK professional standards model. In particular, professional background knowledge is not extremely valued and is the lowest rated in the average assessment of businesses on the knowledge factor. This may be explained by many reasons that come from both sides including businesses and employees. For many businesses, in the current context of open knowledge and the increasing trend of students going to opposite industries, knowledge is an element that candidates can completely cultivate and improve over time. Additionally, universities offer courses with the purpose to provide employees not only for businesses but also for other professional organizations Therefore, student's knowledge may be not suitable for business activities. After the recruiting process, enterprises are likely to offer training courses for their new employees

In fact, in the current segment of the enterprise labor market, employers pay more attention to factors such as attitude, suitability, and awareness. These factors are directly attached to each stage of the job, which are the foundation that helps employees solve practical problems in the business environment. Many managers believe that, if employees have a good working attitude and awareness, the acquisition of knowledge will not become a big obstacle for them. This conclusion is also consistent with the statements of the Business/Higher Education Roundtable (1991, 1992, 1993), the Association of Graduate Employers (1993, 1995), Sausman et al. 1997), AC Nielsen Research Services (2000), recognized that a strong disciplinary background by itself does not guarantee employability for fresh graduates. It can be seen that in addition to knowledge, each student must cultivate other skills by himself, and at the same time have a good working attitude to adapt to their job as well as the dynamic environment of the economy. This is something that universities need to pay more attention in order to develop suitable teaching methods for the current labor market.

Besides, the study also shows that for each factor constituting job adaptability, enterprises show different evaluations of graduates from different universities. This difference may stem from training objectives, different teaching methods between universities, teaching facilities as well as the ability to integrate and absorb new trends of the labor market.

In addition, there are different levels of satisfaction among graduates with different work experience. The next generation of workers tends to be more talented, dynamic, better adaptable to market fluctuations. However, when it comes to job adaptability satisfaction, many managers still value employees who have worked longer for the enterprise. For graduates who have worked for 3 or 4 years, in addition to the knowledge and skills that have been nourished at university, they also accumulate experience, skills, and commitment to the business. Therefore, it can be affirmed that besides improving knowledge and skills at university, the skills and professional knowledge accumulated during the working process are indispensable for employees to improve their workability

The ANOVA test on satisfaction among different enterprises also shows that the satisfaction of enterprises of different types is also different. State-owned enterprises have the highest level of satisfaction with the adaptability of students, followed by limited liability companies, private enterprises, joint-stock companies, and finally partnerships. One hypothesis to explain this difference is that due to the "easiness" in recruitment, state-owned enterprises set lower requirements than other enterprises in the private sector because of the less competitive environment. In addition, inertia in the environment of State-owned enterprises easily reduces the competitiveness of employees, leading to lower adaptability than in non-state enterprises.

In general, this study has shown that the job adaptability of economic graduates is increasingly improved, however, in terms of the business segment, the level of satisfaction of enterprises with the ability to adapt to the work of fresh graduates is just fairly average. Although it can be seen that universities and students are constantly improving the skills and knowledge required for the work, the results of this study show two problems. Firstly, in a competitive market, businesses require more abilities from students. Secondly, the current higher education programs of universities have not really kept up with the practical needs of businesses.

4.2. Recommendations

In order to increase the level of satisfaction of businesses, the research team proposes the following 3 recommendations:

4.2.1. For the universities

With the trend towards deeper integration, advances in technology affect the corporate governance process, some elements of the business environment and universities. The university needs to complete the training program, regularly update the needs of the market even according to each training and course. In particular, besides equipping specialized knowledge, it is necessary to equip students with the ability to us English, informatics, and soft skills.

Training content and programs need to be diversified and structured in a way that not only providing learners with a knowledge base but also enhancing appropriate skills and practical experience for students by encouraging and supporting students to do scientific research and find suitable part-time jobs in the final years of the course. At economics universities in particular and educational institutions in general, participation in scientific research, internships, and practice are essential for students to experience the real world. Student internships usually take place at the end of the third or fourth year. This is the time when students choose and search for internships, get acquainted with the actual working environment after a period of studying and accumulating knowledge in the lecture hall. If students take advantage of the internship period, they will be likely to have many development opportunities later in their lives. In the first 3 years of university, students use most of the time in the lecture hall to receive and cultivate specialized knowledge. An internship is a compulsory subject in the training program that students must complete. The internship period is an opportunity for students to directly apply the knowledge in the school to the real working environment. Although in the position of interns, students will have to complete the assigned work following their capacity and requirements as an employee.

In addition to scientific research, the university should also put more resources into organizing relevant competitions to find talented students, share experiences, and help students practice their skills and knowledge learned in school. At the same time, participating in the contest also helps students improve their problem-solving and critical-thinking abilities. These are two necessary capabilities and are highly appreciated by businesses. In addition, the university should cooperate with businesses to better understand the businesses' requirements for the required skills of a candidate. Thereby reducing the gap between the curriculum and the job requirements, helping students to adapt more quickly in their work. As a result, businesses are satisfied with the adaptability of students.

There are also differences between universities in curricula and teaching methods. This leads to disparities in the adaptability of students, making their career opportunities and the level of businesses' satisfaction with students also different. Therefore, each university needs to regularly review training programs and teaching methods to equip students with a comprehensive foundation in terms of knowledge, skills and attitudes.

4.2.2. For the students

Firstly, students need to have ambitions, clearly define their own orientations and goals. From the cost-benefit analysis, if students are aware of their self-worth, their strengths, weaknesses, as well as abilities, they can improve their performances more effectively by reducing costs and time caused by wrong choices. At the same time, being ready and prepared in advance will help students adapt more quickly to work.

Second, students actively accumulate knowledge, skills, experiences, to facilitate self-development from the time they are at school. However, having a knowledge base from the school may be not enough. Each student should practice and learn by himself to supplement himself with other skills, working attitude, awareness, and relationships. Management capacity, first of all, self-management, is how to behave flexibly with the actual environment. Advances in technology could create favourable conditions for students to not only develop self-learning skills but also widen their knowledge

Third, taking advantage of scientific and technological innovations in the process of learning and training through social networking platforms such as Facebook, Zalo, Instagram, Twitter... could help students gain knowledge, widen their social circles, exchange ideas, access and update information quickly. But not all information posted on social media is accurate. Therefore, students are required to selectively absorb as well as not to share unverified and incorrect information with the community.

Fourth, once the job has been determined, students should spend time experiencing the real world with part-time jobs or internships. The practical experience helps students redefine whether they are suitable for this job or not and have a good grasp of job requirements so that they could be well - prepared for a long-term job in the future.

Finally, in addition to going to work, participating in clubs, competitions, especially scientific research not only gives students benefits in terms of grades but also trains them with attitudes and necessary skills, which they cannot learn from attending lectures. Also, it is a valuable opportunity for each student to get to know themselves better.

4.2.3. For the business

Enterprises as young employers - graduates - high-quality human resources, after all, could be benefited the most when students' job adaptability is improved. Therefore, enterprises not only are the beneficiaries but also have the responsibility to contribute to the process of expressing their social responsibility

Accordingly, on the one hand, enterprises need to be ready to link up with universities, set requirements in training content and programs and are responsible for creating favorable conditions for university students to consolidate their knowledge taught by their teacher at school. With practice, on the other hand, it is necessary to create a favorable working environment for students to utilise their knowledge and skills when recruiting them to work at enterprises. Businesses and social organizations should create opportunities for students to meet and exchange ideas with experienced employees so that new staff could improve their skills. Also, there should be a reliable job search information network, so that students could have the access to find jobs. In addition, businesses and social organizations should pay attention to help students who want to start a business, set up a fund to support students with preferential loans, and promote creativity in students.

For fresh graduates, enterprises should create favorable conditions for them to develop their abilities. In addition to the remuneration regimes, there should be a team of experienced people Who teach and train new employees so that recent graduates can adapt quickly to the job and be highly motivated to drive their businesses successfully.

4.3. Limitations of the study

Firstly, the research is conducted based on enterprise survey data in Hanoi related to graduates from 6 universities in Economics. Although the sample size can ensure the quality of the analysis, however, due to time constraints, limited capacity, and limited resources, the survey subjects are not large enough to ensure a higher level of reliability for the sample conclusions drawn from the study. In addition, the interview and survey process related to personal assessment may face risks such as the answers do not really reflect the real thoughts of the respondents, biased judgments. For the process of analyzing and processing data, it is difficult to avoid certain errors.

Secondly, there are many factors affecting business satisfaction, but due to limited resources as well as knowledge, the selected factors included in the model are not really complete so these factors just explain 73.2% change of dependent variable. Some conclusions and judgments of the research team are based on assessments from some students and managers, so it is difficult to avoid subjectivity and one-sidedness.

Finally, this study only focuses on the scope of so these factors just business enterprises, not all types of organizations. Meanwhile, the training programs of the universities in research are not only aimed at businesses but also meet the needs of high-quality human resources for all types of organizations in society. The research conclusions on the impact of the factors mentioned above applying only to businesses, especially private enterprises and do not reflect the entire social demand for public job adaptability.

IMPACTS FROM THE FOURTH INDUSTRIAL REVOLUTION TO INDUSTRIAL ECONOMIC RESTRUCTURING IN PRESENT VIETNAM

PhD Student. Phung Quang Phat
phathvct@gmail.com
Political Academy, Hanoi, Vietnam

Abstract

The fourth industrial revolution based on digital technology and integrating smart technologies is fundamentally changing the world's production. Under the strong impact of the fourth industrial revolution, economic restructuring is an indispensable requirement of all countries. In particular, industrial economic restructuring is considered a basic necessity, playing a very important role in mobilizing, exploiting, and using resources for economic growth. On the basis of qualitative and quantitative research methods, the author focuses on clarifying the concept and characteristics of the fourth industrial revolution and its impacts on the restructuring of Vietnam's industrial economy over the past time. From there, the research paper draws out the advantages and limitations of the model. The research also suggests some solutions to accelerate the restructuring of Vietnam's industrial economy in the current period.

Keywords: *industry, restructuring, industrial economy.*

1. Introduction

The issue of renovating the growth model and restructuring the economy was officially proposed by the Communist Party of Vietnam from the 11th National Congress, in which industrial-economic restructuring is a major policy to promote economic restructuring. It helps improve the quality of growth, increases labor productivity and competitiveness of the industry in the global value chain. Over the two terms of the XI and XII Congresses, the process of restructuring the economy in general and the restructuring of the industrial economy, in particular, have achieved many important results, contributing to economic development with a high growth rate. Especially the economy has strongly changed from broad-based development to in-depth and sustainable development. “The processing and manufacturing industry develops rapidly. Supporting industries have developed, contributing to improving the localization rate and added value of products” [9]. However, restructuring the industrial economy has not yet made fundamental changes in the growth model, productivity, quality, and efficiency. The competitiveness of the economy is not high. “The industry is still mainly processing and assembling. The added value is not high. Supporting industries develop slowly. The localization rate is low. The effectiveness of participation in the global value chain is still limited” [10].

In the new and volatile context, the economy is affected by many factors, especially the impact of the fourth industrial revolution and the global Covid-19 pandemic. The guidelines and policies of the government must take into account the opportunities and challenges to implementing a proactive plan for restructuring the industrial economy. Congress XIII emphasized the need to make good use of the opportunities offered by the new context: “Science, technology, innovation and the fourth industrial revolution is unfolding very quickly. They have far-reaching and multi-dimensional impacts on a global scale. Science, technology, and innovation are increasingly becoming decisive factors for competitiveness among countries. Digital technology will promote the development of the digital economy and digital society. It will change state management methods, production and business models, consumption and cultural and social life” [8]. In particular, it is necessary to take advantage of the achievements of the fourth industrial revolution to apply the latest breakthrough technologies in industries. It helps create rapid and sustainable development.

The article approaches the process of economic restructuring industry under the impact of the industrial revolution the fourth time from the perspective of political economy. From clarifying the concept and characteristics of the fourth industrial revolution and the concept of restructuring the industrial economy, the research paper would point out the impact of the fourth industrial revolution on the process of restructuring the industrial economy. The article analyzes all elements of the productive forces to point out the specific impacts of the fourth industrial revolution on the economy. It proposes some orientations, goals, and policy solutions to accelerate the process of restructuring Vietnam's industrial economy in the coming time.

2. Method

2.1. Research Method

To study the impact of the fourth industrial revolution on the process of restructuring the industrial economy in Vietnam, the author uses a combination of research methods. The article emphasizes the scientific abstraction method that is a specific research method for political economy. In addition, it combines quantitative and qualitative research, methods of analysis, synthesis, statistics, comparison, and description.

2.2. Data collection method

This study uses secondary data collected from reports of related tumor studies including scientific works published in specialized journals, articles on economic restructuring published in newspapers and official websites, and legal documents of state management agencies such as the General Statistics Office, Ministry of Industry and Trade, Ministry of Planning and Investment, and Institute for Industrial Policy and Strategy.

2.3. Data analysis method

Method of synthesizing and analyzing data:

On the basis of collected documents, the author synthesizes and explores issues related to restructure the industrial economy. Thereby, the author standardizes conceptual data and generalizes it into scientific arguments. The research focuses on the reality of restructuring the industrial economy under the impact of the fourth industrial revolution.

Statistical and comparative methods:

The author uses statistical data from many different sources along with the author's calculations to analyze, evaluate, and compare the actual situation of the process of restructuring the industrial economy in recent times. Thereby, the author proposes solutions to promote the process of restructuring the industrial economy in our country in the coming time. The data is divided in a detailed manner through the stages, ensuring the series comparison. It is illustrated by diagrams and tables. The article uses time-series and point-in-time data for vertical and cross-sectional comparisons across sectors and industries.

3. Results

3.1. Concept and characteristics of the fourth industrial revolution

The concept of “Industrial Revolution 4.0” was coined by Klaus Schwab, Founder and Executive Chairman of the World Economic Forum. "The Fourth Industrial Revolution is blossoming from the third revolution. It connects all technologies altogether, blurring the boundaries among physics, digital and biology” (Economic World Forum (WEF) 46th in Switzerland). Thus, the focus of the fourth industrial revolution is on inventions. It also creates the combination of the three "great trends" of physics, digitalization, and biology, which changes qualitatively the development of productive forces.

The essence of the fourth industrial revolution is based on digital technology and integrated all smart technologies, optimizing production processes. The technologies having the greatest impact are 3D printing, biotechnology, new material technology, automation technology, and robotics. The characteristics of the industrial revolution can be generalized as follows:

First, the combination of technology, physical, and biological digital alters production methods of the world.

In the field of physical technology, key technologies have been established such as self-driving cars, 3D printing, advanced robotics, and new materials. Digital technology is a combination of physical and digital applications to create the Internet of Things, sensors, and solutions that connect the real world to the virtual one. Nanotechnology and new materials allow the creation of new material structures with wide application. Artificial intelligence and cybernetics have made great progress, allowing people to remotely control everything. It is unlimited in space and time. It also helps interact faster and more accurately. The fourth industrial revolution will open a new era of choosing business investment options, optimizing the use of resources, and promoting labor productivity and efficiency. It helps create a breakthrough in the speed of development and the scope of the impact that "fundamentally transforms the social production and management system in both breadth and depth" [3].

Second, the scale and pace of development unprecedented in human history.

The speed of development in the fourth industrial revolution has never occurred before. If the previous industrial revolutions took place in arithmetic progression, the growth rate of the fourth industrial revolution took place exponentially. From the birth of ideas of technology and innovation, actualizing these ideas takes a shorter time. The pace at which disruptive technologies are invented today is so fast. It is disrupting the structure of almost every industry in every country. The breadth and depth of these changes create transformations in the entire production, management, and governance systems.

Third, the fourth industrial economy creates a manufacturing process that is smart and flexible. It integrates technology that is environmentally friendly.

The fourth industrial revolution focuses on smart manufacturing processes to create smart products in a smart factory. If the steam engine ushered in the mechanical industry, the smart factory is the key factor in opening the era of the "smart industry". In the smart industrial environment, smart factories are connected with smart services such as smart logistics, smart grid, and smart transportation to form a smart production chain. The smart factory model will be automated fully, which replaces the old mode of production. Jobs related to direct production are replaced by intelligent robots. Therefore, only designers, engineers, information technology experts, logistics, and marketing staff work in the offices. Thanks to connectivity on the Internet, there are many jobs that people can work from home.

The characteristic of industrial production in the fourth industrial revolution is that products are produced in a flexible environment. The manufacturer is located in the consumer market so the products can adjust quickly to the changes of demand in the market. The highly developed automation technology allows the application of "self-optimization", "self-configuration", and "self-testing and monitoring" methods. It helps the products adapt to the market when there are changes in production requirements. The needs of customers are stored and processed by big data technology. Customer demand data is connected to production by cloud computing and virtual reality systems, so production can react quickly to changing demand.

The core of the fourth industrial revolution is the integrated use of new technologies on the basis of Internet connectivity. These are environmentally-friendly technologies that save energy and fuel (for example, smart grids allow maximum loss of electricity in loading electricity) and minimize emissions. The fourth industrial revolution is also a green industrial revolution, associated with flexible energy and transport integration. Green, environmental-friendly, high-yield products and services will be the key products of the fourth industrial revolution era.

3.2. Concept of industrial economic restructuring

In terms of terminology, "restructuring" means adjusting the strategic orientation, vision or changing the entire structure of the system such as re-adjusting the resource framework, operating mechanism, re-adjusting models of a specific field in order to suit the requirements and circumstances at that time. The objective of economic restructuring can be viewed from the following three angles:

First, from the perspective of resource allocation, economic restructuring is a change in institutions, mechanisms, and tools for allocating, managing, and using national resources, especially investment capital, shaping the country's economy to be more rational and efficient.

Second, from the perspective of the State's role in the economy, economic restructuring is understood as reducing the State's control towards investors and owners of enterprises. The State enhances orienting and managing macroeconomics.

Third, from the perspective of growth drivers, economic restructuring is the transformation of the growth model. It changes the driving force of growth from mainly based on increasing the size of inputs to mainly relying on growing efficiency and labor productivity. It ensures the benefits that are distributed more rationally and equitably among regions and classes of the population.

Restructuring the industrial economy is a deliberate activity by rearranging basic elements of the productive forces to form a modern, efficient and sustainable new industrial economic structure.

Restructuring the industrial economy is a component of the overall restructuring of the national economy, consistent with developing the economic societal strategy of the country. It is the process of renovating the old, outdated, and unsuitable industrial economic structure in order to build a new and appropriate industrial economic structure. The objective of industrial economic restructuring is to promote economic restructuring, improve growth quality, and increase labor productivity and industry competitiveness in the global value chain.

The process of restructuring the industrial economy must focus on improving the state management capacity, organizing the apparatus rationally through mechanisms and policies, clearly defining the roles and functions of the state and the market. These functions should be oriented in the direction of minimizing barriers, administrative interventions, creating incentives, shifting, and allocating resources according to market signals.

3.3. The impact of the fourth industrial revolution to restructure economic industry in Vietnam

The impact of the fourth industrial revolution on the process of restructuring the industrial economy in Vietnam is demonstrated by rearranging the layout and basic elements of the force production.

This impact is objective. It takes place in many directions, both positive and negative. The results of the impact can be recognized immediately. The achievements of the fourth industrial revolution are foundational to accelerate the process of restructuring the industrial economy. When the modern industrial economy develops, it will be a condition to receive the achievements of the fourth industrial revolution more conveniently and effectively.

Specifically, the impact of the fourth industrial revolution on the process of restructuring the industrial economy over the past time is shown in the following contents:

** Impact on labor in the industry:*

The fourth industrial revolution is considered as the highlight of the digital era. It has a strong impact on many industries in the economy. It influences directly Vietnam, a country with an abundant and stable labor supply with more than 55,8 million workers, workers in the construction industry are about 16.5 million people (30.2% of the total workforce) [5]. Those impacts are shown clearly through job requirements, strategies, orientations, and plans in the development of the labor market.

The fourth industrial revolution affects the quantity and quality of jobs through the replacement of living labor with machines, robots, artificial intelligence, and the application of information technology in many industries. At the same time, its impact changes the nature of the job that some jobs are disappeared, and there are more new jobs joining the market. It is essential to recognize the risk of replacement workers in textile, leather, and footwear. This industry is in danger of losing jobs the most under the influence of technological breakthroughs. This percentage will turn into a large absolute number because this sector is the industry creating jobs for many workers (about 2.3 million people, of which about 78% are female workers). According to the forecast of the International Labor Organization (2019), in the next 10 years, Vietnam will face the replacement of labor because of digital technology applications. It leads to a change in the production model, business culture, and organizational model. Up to 70% of jobs are at high risk (with a probability of being replaced over 70%), 18% have a medium risk (with a probability of being replaced from 30-70%) and 12% are low risk (with a probability of being replaced less than 30%). This requires businesses to handle and adapt to this change.

Table 1. Industries with a high rate of job displacement in Vietnam

Branch	Rate of substitution
Agriculture, forestry, and fisheries	83. 3%
Manufacturing and processing industry	74.4%
Wholesale and retail	84.1%
Textile industry	83%
Electronics	75%

Source: Forecast of the International Labor Organization (2019)

The fourth industrial revolution has an impact on the quality of human resources because labor skills are needed in the new technological era not only requires technical skills (specialized knowledge and skill in technical expertise to perform specific jobs) but also needs soft working skills such as creative thinking ability, teamwork skill, and skill in using computers, the internet, foreign language ability, teamwork skills, safety skills, labor discipline compliance, problem-solving skills, time management skills, and concentration skills.

** Impact on investment capital for industrial production*

Under the impact of the fourth industrial revolution, investment capital has shifted in both quantity and field of investment. As reported by the GSO, the total capital of foreign investment increased continuously. Between 2016 and 2020, it reached 92.76 billion dollars, up 64.64% compared to the period of 5 years from 2011 to 2015 (59.96 billion USD).

Table 2. Number of project capital and FDI in Vietnam during the period 2011 - 2020

Year	Total registered FDI capital (Billion USD)	Realized FDI capital (Billion USD)	Number of newly registered projects
2011	15.60	11	1186
2012	16.35	10.46	1287

Year	Total registered FDI capital (Billion USD)	Realized FDI capital (Billion USD)	Number of newly registered projects
2013	22.35	11.5	1530
2014	21.92	12.5	1843
2015	22.70	14.5	2013
2016	26.90	15.8	2613
2017	30.80	17.5	2741
2018	26.30	19.1	3147
2019	38.95	20.38	3883
2020	28.53	19.98	2523

Source: Author's compilation from Foreign Investment Department

In the field of investment: In the period from 2011 to 2020, foreign investors have invested in 19 industry sectors. The processing and manufacturing industry has always been the field of attracting more attention from foreign investors with the total newly registered capital that is always fluctuated in the range of USD 13 - 24 billion. It accounts for a high percentage of the total registered investment capital (40 - 70%). In 2020, the processing and manufacturing industry is the field that attracts the most FDI with 800 new projects, 680 projects with adjusted investment capital, and 1268 times of capital contribution and share purchase with a total capital of 13,601 billion USD. It accounts for 47.67% of total investment capital. The production and distribution of electricity, gas, and steam ranked second with US$5.1426 billion, accounting for 18.03% of total investment [7].

In the era of the fourth industrial revolution, the trend of moving FDI capital also takes place flexibly, requiring Vietnam to have a specific strategy to ensure the sustainability of the new generation of high-value FDI. Vietnam should ensure a high growth rate, achieving the goal of significantly raising the level of technology and transferring technology through FDI enterprises. At the same time, it is necessary to be sensitive to overcome the tendency that relies heavily on foreign investment, destroys the environment, and exhausts the national resources of FDI projects.

** Impact of engineering technology on industrial production*

The fourth industrial revolution will contribute to the shift of national industrial production from a low -productivity economy to a high-productivity economy (with more opportunities for innovations and added value). higher increase). Specifically, low-tech industries (textiles, footwear, etc) are still dominant in Vietnam and other developing countries. However, in the context of the fourth industrial revolution, this will be one of the great challenges, as labor is gradually replaced by robots and smart factories. Therefore, an important factor in the coming time is to gradually focus on improving technology and improving labor quality. Medium industries (intermediate goods: iron and steel, cement, rubber, packaging, and non-metallic mineral industries) need to focus on improving labor quality and improving production technology. export. For the high-tech industry: should focus on investment in the development of science and technology, innovation and application of technology advance; strong shift to high-tech industries; select and focus on exporting products with high added value, Vietnam has advantages; rapidly reduce the export of raw resources and minerals.

At the production level, important applications from the fourth industrial revolution include quality control, traceability, predictive maintenance, sorting, and unloading. chemistry, IIoT, Big Data, and AI.

** Impact on industry structure*

The fourth industrial revolution will create great changes in the structure of industries as well as the contribution of each industry in the growth of the entire economy in the coming time. In the current industrial production structure, the industries that account for a large proportion are the food processing industries (always accounting for the highest proportion, although tended to decrease slightly at over 17%), followed by manufacturing electronics, computers, and telecommunications equipment (over 12%). In addition, there are other industries such as textiles (8.12%), transportation equipment (4.85%), computers and electronics (3.54%), etc. Low-tech industries continue to account for a high proportion, accounting for about 65% of the total processed and manufactured products in Vietnam, while this figure of the world is only 18% [6]. These are labor-intensive industries or produce low-value-added end products, leading to slow growth in value-added in Vietnam's industrial production. This is one of the major obstacles to industrial development as Vietnam needs to gradually shift to high-tech industries, producing high value-added products, to accelerate growth.

General assessment: under the strong impact of the fourth industrial revolution, in recent times, the process of restructuring our country's industrial economy has reoriented in the right direction. Accordingly, the industrial structure has had a positive shift, towards gradually reducing the proportion of the mining industry, rapidly increasing the proportion of the processing and manufacturing industry in line with the goal of sustainable development. Specifically, the proportion of the processing and manufacturing industry in GDP increased continuously at a relatively high rate.

Table 3. The proportion of processing and manufacturing industry in GDP in the period of 2015 - 2020

Year	2015	2016	2017	2018	2019	2020
%/GDP	1 3.69	14.27	15.28	16.00	16.48	16.58

Source: Compiled by the author from the General Statistics Office

Meanwhile, the share of the mining industry has decreased from 8.1% in 2016 to 6.0% in 2020 [2]. A number of large-scale, competitive industries and strong positions in the market have been formed. Some domestic industrial enterprises already have good competitiveness such as VinGroup and Truong Hai (in the field of manufacturing and assembling cars), Vinamilk, TH True Milk (in the field of producing and processing milk and food), Hoa Sen Group, Hoa Phat Group, Pomina Steel Company (in the field of iron, steel, and metal).

Supporting industries have gradually developed, contributing to raising the localization rate and added value. The proportion of processed exports in total export value has increased from 65% in 2016 to 85% in 2020. The proportion of exports of high-tech products in the total product value has increased from 44,3% in 2016 to 49,8% in 2020. The global competitiveness of the Vietnamese industry has increased from the 58th position in 2015 to the 42nd position in 2019 according to the ranking of the United Nations Industrial Development Organization (UNIDO).

However, industrial development has not yet met the requirements of industrialization and modernization. It just mainly develops on short-term goals, lacking sustainability. A highly competitive domestic industry has not yet been created. A spearhead industry has not played a leading role. Industrial production is still mainly processing and assembling, with low added value. The development of supporting industries is still slow. Raw materials and components for domestic production are still heavily dependent on outsiders, not paying enough attention to the value chain and domestic supply. The rate of localization of industrial products is still low, which is highly dependent on foreign-invested enterprises. The agricultural, forestry, and fishery processing industry is still underdeveloped, especially in the stages of preservation and deep processing.

4. Discussion and Conclusion

4.1. Some industrial development orientations in the fourth industrial revolution

The Industrial Development Strategy to 2025, with a vision to 2035, has identified strategic directions for Vietnam's industrial development: " Effectively mobilize all resources from domestic and external economic sectors to develop and restructure the industry towards modernity; Focus the training of industrial human resources on the qualities of skillfulness, disciplined, and creative capability; Prioritize the development and transfer of technology to industries and fields with competitive advantages and advanced technologies in the fields of agricultural, forestry, fishery processing, electronics, telecommunications, new and renewable energy, mechanical engineering and pharmaceutical chemistry; Reasonably adjust the distribution of industrial space so as to promote the strength of linkages between industries, regions, and localities to foster deep engagement in the global value chain ” [4]. In line with the strategic vision to 2035, Vietnam's industrial development will fundamentally incorporate the growth of industries where advanced technology, internationally qualified products (in compliance with international standards), extensive involvement in the global value chain, commercial and efficient use of energy, and equitable competition in globalization are facilitated.

This strategy also sets many specific goals such as The growth rate of industrial value-added in the period of 2021-2025 will reach 7.0-7.5%/year and the period 2026 - 2035 will reach 7.5- 8.0%/year. The growth rate of industrial production value in the period 2021-2025 will reach 11.0-12.5%/year and the period 2026-2035 will reach 10.5-11.0%/year. The 2025 outlook aims at a restructured sectoral economic composition where the construction and industry sectors account for 40-41% in 2035. The proportion of exported industrial goods/total export turnover by 2025 will reach 85-88%, after 2025 it will reach over 90%. In addition, the Government has also set a target that the value of high-tech industrial products and high-tech applied products will reach about 45% of GDP by 2025, and over 50% after 2025. Industrial ICOR index for the period 2011-2025 will reach 3.5-4.0% rate; in the period 2026 - 2035 reaching 3.0-3.5%... [4].

Resolution No. 23-NQ/TW on orientations of formulating national industrial development policies to 2030, with a vision to 2045, has defined the goal of Vietnam's industrial development by 2030: The share of industry in GDP exceeds 40%; The proportion of the processing and manufacturing industry in GDP is about 30%, of which the manufacturing industry is over 20%. The value proportion of high-tech industrial products in the processing and manufacturing industries achieves 45% at minimum. The growth rate of industrial added value reaches an average of 8,5 %/year, with the processing and manufacturing industry averaging over 10%/year. The growth rate of industrial labor productivity reaches an average of 7,5 %/year. The Industrial Competitiveness Performance Index (CIP) ranks among the top three in ASEAN countries. The employment rate in the industrial and service sectors exceeds 70% [1]. Establish a number of industrial clusters, large-scale, multinational domestic industrial enterprises with international competitiveness.

4.2. Some solutions to focus on implementation

Renovate the industry development plans and improve the business environment

Initiate a comprehensive review of all legal documents related to the planning, structuring, and policies for restructuring the industrial economy. Rule out documents that directly interfere with product development, such as product industry planning. Currently, the draft Law on Planning is being submitted to the National Assembly with the main subject being to eliminate product sector planning due to the excessive formation of sectoral plans that lack feasibility and violate regulations of the World Trade Organization.

The spatial arrangement of the territory in the planning work needs to be seriously and drastically considered, where it is necessary to close the polluting facilities and relocate the industrial facilities to the periphery, separating them from densely populated areas. Build environmental criteria for industrial facilities. These environmental standards must be on par with those of the World Health Organization (WHO).

Completing the State management mechanism in order to overcome and limit policy overlap, ensure stable, consistent, and simple policies on administrative procedures to encourage product development. Continue to reform customs procedures to create favorable conditions and reduce costs for businesses carrying out import and export procedures. At the same time, create equality between economic sectors, and specifically focus on enhancing the role of the private sector through effective enforcement of property rights protection and equality in the economy. access to resources.

Choosing an industrial development model suitable to Vietnam's strategic orientation and advantages

Model selection is very important as it creates a framework and ideology for the accompanying industrial development policy. In the era of globalization, industrial structure models need to aim at building international competitiveness in line 04 requirements: (i) understanding regional and global trends; (ii) analyzing competitors' competitiveness; (iii) locating the current position; (iv) designing concrete and practical solutions to improve competitiveness. Accordingly, priority should be given to developing industries that can create diversity in industrial production. At the same time, aim towards a production model in the global competition in an integrated form, in line with its dynamic competitive advantages (the processing and manufacturing industry is highly-skilled, capable of absorbing high technology from the FDI sector).

Continue to implement guidelines and issue appropriate policies to build and develop industries in the direction of modernity, increase the content of science and technology and the proportion of domestic value in products, focus on the industries that have foundational, comparative advantages and strategic significance for rapid and sustainable development, enhancing the independence and self-reliance of the economy, be able to participate deeply and effectively. into the global production and distribution network. Review and select worthy products, with a large scale in terms of both output and quality, typical and representative, in line with international practices, in line with the Party's guidelines and governmental interests. In particular, pay attention to high-tech industrial products.

Investing in the development of foundational industries, spearhead industries, new technologies, high technologies, and supporting industries

Develop fundamental industries such as energy, mechanical engineering, metallurgy, chemicals, fertilizers, and materials. Prioritize the development of spearhead industries, new technologies, high-tech industries, and supporting industries such as information and telecommunications; electronic; artificial intelligence; manufacturing robots; car; automobile industry supporting industry; biotechnology; biomedical electronics; software production; digital products; clean energy and renewable energy. Strongly concentrate on developing the processing and manufacturing industry associated with smart technology; focus on developing the green industry.

Strengthening linkages between regions and economic zones to bring into play their advantages to speed up the process of restructuring the industrial economy.

Pilot cluster models in priority industries. Promote the progress of large industrial projects with spillover effects; at the same time, drastically handle slow-moving and inefficient projects. To develop large-scale industrial production in coastal economic zones, with emphasis on heavy industry production, deep processing, and the formation of value chains.

Strengthen linkages between the foreign-invested sector (especially multinational corporations) and domestic enterprises in the supply chain development of industries. Arouse internal resources, strongly encouraging the development of domestic private enterprises, especially in the fields of manufacturing and processing industry, high technology, information technology industry; form domestic and international supply chains and value chains, quality assurance, and regulations on traceability. Develop a number of key enterprises in the fields of telecommunications and information technology so as to achieve the leading role in technology infrastructure, create a foundation for the development of the digital economy and digital society in the current era of the fourth industrial revolution.

Can Tho City Institute for Socio - Economic Development Studies, CanTho, Vietnam

Abstract

Based on an approach from six factors that make up local brands: human resources (people), investment, tourism, cultural heritage, trade-export and public management ability, study focuses on analyzing the strengths, weaknesses, opportunities and challenges that affect the place marketing strategy of Can Tho city. The study uses the SWOT matrix and Quantitative Strategic Planning Matrix (QSPM matrix) to propose and select strategies for SO, ST, WO, WT. The study results show that the optimal place marketing strategies of Can Tho city with orientation towards 2030 include: development of Can Tho city into a trade and export lead center in the Mekong Delta, development of supporting tourism activities and services, development of Can Tho city into a lead center for training of high quality human resources with international standards and branding typical products for export.

Keywords: *place marketing, QSPM matrix, SWOT matrix.*

1. Introduction

In the context of more and more globalization and international integration, the competition is becoming more and more fierce not only at the enterprise level but also at the local and national level. It is becoming more and more difficult to find resources for growth. Therefore, each locality must actively build and promote their locality into an attractive "product" to potential customers and partners. Localities need to develop place marketing strategies to achieve that goal. These strategies are a set of activities carried out to build and promote the locality to make it more unique and engaging, contributing to improved competitiveness and economic development. The reality shows that there are a number of countries, territories, cities... have applied the Place Marketing theory very successfully, creating an advantage in taking advantage of investment to develop quickly even if they have a low starting point in terms of natural resources (e.g. Japan, Korea, Singapore...). In addition, paying attention to building a place marketing strategy also helps the locality to strengthen its position and reputation for domestic and international partners, businesses, investors and tourists, and to preserve and promote the cultural identity and arouse pride among all classes of people.

Can Tho is a city under the Central Government, which has a central location in the Mekong Delta. Can Tho city has many attractive features of a river city in the southwestern region as well as potentialities and advantages for socio-economic development. However, Can Tho City's image and brand name have not been widely known in recent years. Can Tho's position, central role and pervasive power are limited. It has not really met as expected in attracting investment in the city. Although the city has made many efforts, communication, advertising and promotion activities for inviting partners have not been highly effective. The reason is attributed to the fact that the city has not clearly defined its strengths, weaknesses, opportunities, and challenges; therefore, synchronous place marketing strategies have not been created to properly address key issues of the city.

In this situation, the application of the SWOT matrix and the QSPM matrix for building and selecting a place marketing strategy of Can Tho City with orientation towards 2030 is highly necessary, especially in the context that the Politburo (the 12th Politburo) has recently issued Resolution No. 59-NQ/TW dated August 5, 2020 on the construction and development of Can Tho city to 2030, with orientation towards 2045 [1].

2. Method

2.1. Approach method

Approach method of this study is the local (or national) brand hexagonal model of Simon Anholt. The model consists of six elements: human resources (people), investment, tourism, cultural heritage, trade - export, and public management ability (see Figure 1 below).

Source: [4]

Figure 1. Brand Hexagonal Model of Simon Anholt

Based on the six elements of the model, the study will analyze the current place marketing situation of Can Tho city, identify the main strengths, weaknesses, opportunities and challenges of six factors, and then propose place marketing strategies for Can Tho city with orientation towards 2030.

2.2. Data collection method

Primary data for the period 2014 - 2018 (with update and adjustment to year of 2019 and expansion for previous periods) on six elements that make up local brands including: human resources (people), investment, tourism, cultural heritage, trade - export and public management ability was collected from the Statistical Yearbook, official reports of departments, scientific works, which have been published.

Primary data was collected in 2020 through in-depth interviews with 30 representatives of government agencies (departments, branches, districts) of the city and consultation with 30 experts from relevant fields. The content of consultation mainly scores strengths, weaknesses, opportunities, challenges, strategic groups of SO, ST, WO, WT.

2.3. Data processing method

- Descriptive statistical method: methods such as statistics table, relative number comparison, average value... are used to reflect and cite the analytical contents.

- SWOT matrix: is used to analyze, evaluate and list the strengths, weaknesses, opportunities, challenges that affect the place marketing strategy of Can Tho city, then to propose strategic groups of SO, WO, ST, WT.

- QSPM matrix: is used to score and select the most feasible strategies from the proposed strategic group (SO, ST, WO, WT).

3. Results

3.1. Analysis of strengths, weaknesses, opportunities, and challenges of Can Tho City's place marketing strategy

For human resource factor (people), Can Tho plays a role as the center for education, training and science and technology of the Mekong Delta with a more complete educational infrastructure system than other provinces in the region. The city has a large contingent of educational and scientific human resources, and system of large universities, which play a key role in training human resources for the whole region. Human Development Index (HDI) of the Can Tho City has continuously increased over the years and has always been higher than the national HDI. Can Tho people have a specific character of the Southern people, that is kindness, generosity, honesty, respect for gratitude... Besides, the city is striving to build Can Tho people according to criterion of “Wisdom - dynamism - kindness - generosity – elegance”. However, the city's labor productivity and the quality of human resources are still poor compared to that of cities under the Central Government. In the context of the current revolution in science, technology and knowledge economy, the city needs to pay more attention to training to improve the quality and productivity of the workforce.

For Investment factor, the city has about 8,600 active enterprises, 102 off-budget investment projects, 246 projects in export processing zones and industrial zones, 87 foreign direct investment projects, 18 projects from non-governmental aid by the end of 2019 [5]. In addition, there are about 13 intermediaries operating in support of startups, 02 investment funds and start-up development and more than 82 startup projects with creative elements, in which, many projects have started to have products and started to reach the market. The city has applied many mechanisms and policies to support investment, set up a specialized agency to carry out investment promotion with a variety of activities to increase investment attraction. However, the city's investment costs are not as attractive as compared to neighboring provinces in the region.

For Tourism factor, Can Tho plays a central and coordinating role in tourism for the whole Mekong Delta thanks to favorable technical infrastructure and transportation (international airport, accommodation system,). Can Tho's tourism industry has unique tourism products such as river tourism and MICE tourism [6]. Tourism brand is interested in building and developing with an identity system including the logo and slogan of "Can Tho - River Region". The tourism industry focuses on the image of "An ideal - safe - friendly tourist destination" to become convergence place of 'Western River Civilization".

For Cultural Heritage factor, Can Tho currently has 104 types of intangible cultural heritages (including 04 national intangible cultural heritages), 36 ranked monuments (including 13 national monuments, 23 city monuments). In general, Can Tho has plentiful and diversified culture, which is the harmony, interference and convergence of many cultural features from traditional to modern and from rural, horticultural region to urban area. In which, the main and most prominent thing is river culture. However, the role of the Can Tho City in general is not really clear despite being identified as the cultural center of the Mekong Delta. In addition, the development of cultural industry has not been compatible with the position of the city.

For the Trade - Export factor, Can Tho has great advantages in terms of economic geographic factors for the development of trade - services such as being located at a commercial lead center connecting the provinces with many key projects such as Can Tho bridge, international airport, Cai Cui port... The city's commercial system is diversified, including a wholesale and retail system with a full range of types including traditional markets, supermarkets, trade centers, convenience stores, grocery stores... However, the development of infrastructure, especially transport infrastructure and supporting services, is not commensurate with its potential; therefore, the trade - export sector has not been promoted to maximize their advantages.

For public management ability factor, economic growth is stable and national defense and security are guaranteed under the management and administration of the city government. Thereby, Can Tho creates a safe and secure environment for people living, working and investors coming to production and business. In recent years, PAPI and PCI indicators have both shown improvements and are quite high in the country [2,3]. However, in-depth analysis of the component indicators shows that people and businesses expect authorities to be more active and promote e-governance in order to better interact with people and businesses.

3.2. SWOT matrix

The SWOT matrix is built on the main strengths, weaknesses, opportunities, and challenges of each element as proposed by representatives of government agencies and assessment of experts.

Table 1. SWOT Matrix for Can Tho City's Place Marketing Strategy

	Strengths (S)	**Weaknesses (W)**
	S1. Having great economic geographic advantages for trade and service development and being located at a trading lead center of the region. S2. Role of Center for Education – Training and Science – Technology of the region. S3. Situation of political security, social order and safety is guaranteed, creating a safe and secure environment for living, working, investing and doing business. S4. Having an attractive “Market” and “Infrastructure” for investment.	W1. Tourism activities and supporting tourism services (such as nightlife, shopping and tourism) are overlapping, monotonous, and have not met the needs of tourists W2. The city's export capacity is still low due to the lack of large corporations, especially in the export processing sector. The value of the city's exports is not high. W3. There are very few famous domestic and international brands of products, goods and services. W4. Can Tho still has low labor productivity.
Opportunities (O) O1. Completion of transport infrastructure projects, especially highways as well as opening new flight routes, is an opportunity for the city to expand the	**Strategy SO** - Combine S1 with O2, O3 to form ***Development Strategy to make Can Tho City become a lead center of trade and export in the Mekong Delta.***	**Strategy WO** - Combine W2, W3 with O2, O3 to form ***Strategy for Branding of Featured Export Products.*** - Combine W1 with O1 to form ***Development Strategy***

market and welcome more tourists. O2. Completion and operation of the transport and logistics infrastructure works will promote the circulation of goods and significantly reduce costs for exporters in the region. O3. Participation in FTAs creates opportunities to expand and diversify the trade - export market, making Can Tho City's products and goods participate more deeply into the entire production and supply chain. O4. Development potential of the economy as well as each industry and each field is still quite large.	- Combine *S4 with O4 to form* ***Investment Attraction Strategy with a focus on leading industries.***	***of supporting tourism activities and services.***
Challenges (T) T1. Climate change, environmental degradation caused by tourism exploitation is not combined with renewable investment; the spread of global epidemics... T2. Common international standards for human resources. T3. The Fourth Industrial Revolution creates challenges for the workforce (the ability to grasp, adapt, apply and master science and technology). T4. Non-traditional security challenges, especially climate change, environmental pollution, cybersecurity, and dangerous epidemics that spread globally are increasing.	**Strategy ST** - Combine S2 with T2, T3 to form ***Development Strategy of Can Tho City to become a center for training high-quality human resources with international standards.*** - Combine S3 with T4 to form ***Strategy for Public Management Ability Enhancement in the New Situation***. Source: Compiled by author, 2020

SWOT matrix includes 08 strategies. Specifically:

- Strategic group of SO includes 02 strategies in the field of Trade - Export and Investment. These strategies use key strengths such as “Having great economic geographic advantages for trade and service development and being located at a trading lead center of the region” and “Having an attractive “Market” and “Infrastructure” for investment” to take advantage of external opportunities such as “Completion and operation of the transport and logistics infrastructure works will promote the circulation of goods and significantly reduce costs for exporters in the region”, “Participation in FTAs creates opportunities to expand and diversify the trade - export market, making Can Tho City's products and goods participate more deeply into the entire production and supply chain” or “Development potential of the economy as well as each industry and each field is still quite large”. Strategies such as *“Development Strategy to make Can Tho City become a lead center of trade and export in the Mekong Delta” and “Investment Attraction Strategy with a focus on leading industries”* are formed.

- Strategic group of WO includes 02 strategies in the field of Trade - Export and Tourism. These strategies use key opportunities such as “Completion and operation of the transport and logistics infrastructure works will promote the circulation of goods and significantly reduce costs for exporters in the region”, Participation in FTAs creates opportunities to expand and diversify the trade - export market, making Can Tho City's products and goods participate more deeply into the entire production and supply chain” or “Completion of transport infrastructure projects, especially highways as well as opening new flight routes, is an opportunity for the city to expand the market and welcome more tourists” to improve the weaknesses as “The city's export capacity is still low due to the lack of large corporations, especially in the export processing sector. The value of the city's exports is not high”, “There are very few famous domestic and international brands of products, goods and services” and “Tourism activities and supporting tourism services (such as nightlife, shopping and tourism) are overlapping, monotonous, and have not met the needs of tourists”. Strategies such as *“Strategy for Branding of Featured Export Products” and “Development Strategy of supporting tourism activities and services”* are formed.

- Strategic group of ST includes 02 strategies in the field of Human Resources and Public Management Ability. These strategies use key strengths as “Role of Center for Education – Training and Science – Technology of the region” or “Situation of political security, social order and safety is guaranteed, creating a safe and secure environment for living, working, investing and doing business” to cope with challenges such as “Common international standards for human resources”, “The Fourth Industrial Revolution creates challenges for the workforce (the ability to grasp, adapt, apply and master science and technology)” or “Non-traditional security challenges, especially climate change, environmental pollution, cybersecurity, and dangerous epidemics spreading globally are increasing”. Strategies such as “*Development Strategy of Can Tho City to become a center* *for training high-quality human resources with international standards"* and *"Strategy for Public Management Ability Enhancement in the New Situation"* are formed.

- Strategic group of WT: includes 02 strategies in the field of Tourism and Human Resources. These are strategies aimed at overcoming such weaknesses "Tourism activities and supporting tourism services (such as nightlife, shopping and tourism) are overlapping, monotonous, and have not met the needs of tourists" and "Can Tho still has low labor productivity". At the same time these strategies are to cope with or dodge with challenges such "Climate change, environmental degradation caused by tourism exploitation is not combined with renewable investment; the spread of global epidemics..." or "Common international standards for human resources", "The Fourth Industrial Revolution creates challenges for the workforce (the ability to grasp, adapt, apply and master science and technology)". Strategies such as "*Strategy for Development of Typical, Green and Sustainable Tourism Products of Can Tho city*" and "*Strategy for accelerating the transfer and application of science and technology with purpose of labor productivity improvement*" are formed.

3.3. QSPM matrix

On the basis of strategic groups of SO, WO, ST, WT formed from the SWOT matrix, the study construct QSPM matrix. In which:

- Coefficient: average score of experts for each strength, weakness, opportunity and challenge.

- AS: attraction score, showing the correlation of strength, weakness, opportunity and challenge with strategic plans.

(AS: 1 = less attractive; 2 = medium; 3 = attractive)

-TAS: total attraction score, which is determined by the result of multiplication of weight by attraction point.

- Average score: the average of total attraction point. The higher the average value, the more attractive that strategic plan is.

Strategy SO:

Table 2. QSPM matrix for strategic group of SO

Important factors	**Coefficient**	**Strategic plan**			
		Development Strategy to make Can Tho City become a lead center of trade and export in the Mekong Delta		Investment Attraction Strategy with a focus on leading industries.	
		AS	**TAS**	**AS**	**TAS**

Strength					
- S1 Trade - export	3.00	3	9	-	-
- S4 Investment	2.70	-	-	3	8.1
Opportunity					
- O2 Trade - export	3,00	3	9	-	-
- O3 Trade - export	2.87	3	8.61	-	-
- O4 Investment	2.60	-	-	3	7.8
Average point	**-**	**-**	**8.87**	**-**	**7.95**

Source: Compiled by author, 2020

According to results in 2, we can see that "Development Strategy to make Can Tho City become a lead center of trade and export in the Mekong Delta" reached 8.87 points. "Investment Attraction Strategy with a focus on leading industries" reached 7.95 points.

Strategy WO:

Table 3. QSPM matrix for strategic group of WO

Important factors	**Coefficient**	**Strategic plan**			
		Strategy for Branding of Featured Export Products		Development Strategy of supporting tourism activities and services	
		AS	**TAS**	**AS**	**TAS**
Weakness					
- W1 Tourism	2.73	-	-	3	8,19
- W2 Trade - export	2.67	3	8.01	-	-
- W3 Trade - export	2.67	3	8.01	-	-
Opportunity					
- O1 Tourism	3.00	-	-	3	9
- O2 Trade - export	2.87	3	8.61	-	-
- O3 Trade - export	3.00	3	9		
Average point	**-**	**-**	**841**	**-**	**8.60**

Source: Compiled by author, 2020

According to results in Table 3, we can see that "Strategy for Branding of Featured Export Products reached 8,41 points. "Development Strategy of supporting tourism activities and services" reached 8,60 points.

Strategy ST:

Table 4. QSPM matrix for strategic group of ST

Important factors	Coefficient	Strategic plan			
		Development Strategy of Can Tho City to become a center for training high-quality human resources with international standards		Strategy for Public Management Ability Enhancement in the New Situation	
		AS	**TAS**	**AS**	**TAS**
Strength					
S2 Human Resources	2.9	3	8.7	-	-
S3 Public management ability	2.73	-	-	3	8.19
Challenge					
T2 Human Resources	2.77	3	8.31	-	-
T3 Human Resources	2.77	3	8.31	-	-
T4 Public management ability	2.73	-	-	3	8.19
Average point			**8.44**		**8.19**

Source: Compiled by author, 2020

According to results in 4, "Development Strategy of Can Tho City to become a center for training high-quality human resources with international standards" reached 8.44 points and "Strategy for Public Management Ability Enhancement in the New Situation" reached 8.19 points.

Strategy WT:

Table 5. QSPM matrix for strategic group of WT

Important factors	Coefficient	Strategic plan			
		Strategy for Development of Typical, Green and Sustainable Tourism Products of Can Tho city		Strategy for accelerating the transfer and application of science and technology with purpose of labor productivity improvement	
		AS	**TAS**	**AS**	**TAS**
Weakness					

W1 Tourism	2.73	3	8.19	-	-
W4 Human Resources	2.67	-	-	3	8.01
Challenge					
T1 Tourism	2.80	3	8.40	-	-
T2 Human Resources	2.77	-	-	3	8.31
T3 Human Resources	2.77	-	-	3	8.31
Average point			**8.30**		**8.21**

Source: Compiled by author, 2020

According to results in 5, "Strategy for Development of Typical, Green and Sustainable Tourism Products of Can Tho city" reached 8.30 points and "Strategy for accelerating the transfer and application of science and technology with purpose of labor productivity improvement" reached 8.21 points.

For ensuring the concentration of the strategy, four strategies with the highest average point were selected from the average point of the eight strategies.

Table 6. Synthesis of average ratings of the strategies

Name of strategy	Average point
Development Strategy to make Can Tho City become a lead center of trade and export in the Mekong Delta.	**8.87**
Development Strategy of supporting tourism activities and services.	**8.60**
Development Strategy of Can Tho City to become a center for training high-quality human resources with international standards	**8.44**
Strategy for Branding of Featured Export Products.	**8.41**
Strategy for Development of Typical, Green and Sustainable Tourism Products of Can Tho city	**8.30**
Strategy for accelerating the transfer and application of science and technology with purpose of labor productivity improvement	**8.21**
Strategy for Public Management Ability Enhancement in the New Situation	**8.19**
Investment Attraction Strategy with a focus on leading industries	**7.95**

Source: Compiled by author, 2020

From the ranking results shown in Table 6, the selected strategies are:

Strategy 1. Development Strategy to make Can Tho City become a lead center of trade and export in the Mekong Delta.

Strategy 2. Development Strategy of supporting tourism activities and services.

Strategy 3. Development Strategy of Can Tho City to become a center for training high-quality human resources with international standards.

Strategy 4. Strategy for Branding of Featured Export Products.

3.4. Solutions for strategy performance

3.4.1. Solution group for performance of Strategy 1

- Continue to implement and effectively apply a number of specific mechanisms on investment, finance, budget and decentralized management for Can Tho City to create a breakthrough in calling for and mobilizing resources for the implementation of infrastructure projects that make sense for the city's trade - export development such as seaport logistics and aviation logistics projects, high-tech parks...

- Develop a reasonable medium-term plan for public investment for the period 2021 – 2025; allocate resources and avoid spreading, dispersing, speeding up the disbursement of capital; ensure correct completion of the set schedule of traffic infrastructure works managed by the city in order to increase the synchronization and connectivity of the city's infrastructure system.

- Promote the implementation of the shared economic model, especially in the field of commerce, logistics with models such as for lease of space, offices, apartments, warehouses, vehicles...

3.4.2. Solution group for performance of Strategy 2

- Study, formulate and approve the Nighttime Economic Development Project in Can Tho City to from legal basis to exploit the potential of the nighttime economy, create more attractive tourism products for tourists and job opportunities, improve income and living standards of people by participating in providing services to tourists.

- Develop more specialized streets, upgrade current night markets, study to restore a number of streets with traditional, long-standing and branded stores of the city to serve shopping needs of visitors.

3.4.3. Solution group for performance of Strategy 3

- Speed up the implementation of projects in the field of education in the city. Continue to call for the development of a system of high-quality private educational institutions.

- Encourage initiatives of an advanced educational model that is appropriate to the needs of development in the new situation. Promote the application of information technology in teaching. Strengthen foreign language capacity for students in the city.

- Propose to the competent authority to allow the city to implement experimental model of application of special higher education standards for one or a number of higher education institutions under city government according to international models and standards to create a breakthrough in the training of high-quality human resources for the city.

3.4.4. Solution group for performance of Strategy 4

- Enhance the application of science and technology in production and business processes such as the application of IoT in the field of crop production to increase automation, apply blockchain to product traceability, apply timelapse technology to track farming, processing...

- Organize training courses, advise businesses on packaging design, branding, logo, identification system, website interface, booth decoration ...; support enterprises in trademark registration.

- Enhance promotion through social media, especially social networks such as Facebook, Weibo... Apply virtual reality technology to advertise and promote export goods and call for investment.

4. Discussion and Conclusion

By the SWOT matrix method and the QSPM matrix method and thanks to the consultation of 30 government representatives and 30 experts, the study has identified the main strengths, weaknesses, opportunities and challenges, thereby building and selecting 4 marketing place strategies of Can Tho City, including: (i) Development Strategy to make Can Tho City become a lead center of trade and export in the Mekong Delta; (ii) Development Strategy of supporting tourism activities and services; (iii) Development Strategy of Can Tho City to become a center for training high-quality human resources with international standards and (iv) Strategy for Branding of Featured Export Products. Besides, the study has proposed 04 groups of solutions for strategy performance. Thereby, the study has completed Place Marketing Strategy of Can Tho City with orientation towards 2030.

SOME SOLUTIONS FOR TRAINING HIGH QUALITY HUMAN RESOURCES TO MEET THE REQUIREMENTS FOR SUSTAINABLE DEVELOPMENT IN VIET NAM TODAY

MA. Nguyen Dinh Nguyen

nguyen37mta@gmail.com

Military Technical Academy, Hanoi, Vietnam

Abstract

Human resources, especially high-quality human resources, play a decisive role in the sustainable development of each country. In the context of the strong development of modern science and technology, especially the Fourth Industrial Revolution, along with the strong trend of globalization and international integration, the impact on human resources, especially high-quality human resources. To adapt with the Fourth Industrial Revolution and the current development trend, our Party and Government have paid special attention to improve the quality of human resource training, especially high-quality human resources to meet the requirements of sustainable development of the country.

Keywords: *Human resources, human resource training, high quality human resources, sustainable development*

1. Introduction

Facing the great and strong impact of modern science and technology, especially the Fourth Industrial Revolution; globalization has become an inevitable trend, the knowledge economy has become a prominent feature of the world economy, and the training and development of human resources, especially high-quality human resources, has become more important than ever among countries around the world. In our country, our Party determines: "Create a breakthrough in fundamental and comprehensive reform of education and training, develop high-quality human resources, attract and utilize talents. Promote research, transform and strongly apply the achievements of the Fourth Industrial Revolution to all areas of social life…”[1]. It can be said that investment in education and training development to meet the requirements of high-quality human resources is a strategic investment, the most effective investment to exploit and use internal resources for the sustainable development of the country currently and onwards.

Around the issue of training high-quality human resources to meet the requirements of sustainable development in the world as well as in Vietnam, there have been many scientific works, articles published in numerous journals which discuss human resources in different aspects. Notable examples include: Greg G.Wang và Judy Y.Sun (2009), “Perspectives on Theory Clarifying the Boundaries of Human Resource Development”,. Kelly D.J (2001), “Dual Perception of HRD: Issues for Policy: SME’s, Other

Constituencies, and the Contested Definitions of Human Resource Development", Human Resource Development outlook, Pacific Economic Cooperation Council Development Task Force 2000- 2001. Kristine Sydhagen - Peter Cunningham (2007), Human Resource Development international, The Academy of human resource Development.. Julia Storberg và Walker Claire Gubbins (2007), "Social Networks as a Conceptual and Empirical Tool to Understand and "Do' HRD", Advances in Developing Human Resources, The Academy of Human Resource Development Vol. 9 Number 3, August, 2007, Sage Publications, Georgia; Chu Van Cap (2012), "Developing high-quality human resources contributing to the sustainable development of Vietnam". Le Thi Hong Diep (2009), "Developing high-quality human resources to form a knowledge-based economy in Vietnam", PhD Thesis Political Economy, Hanoi.

Pham Minh Hac (2003), "Going into the twenty-first century to develop high-quality human resources to serve the country's industrialization and modernization", Labor - Society Magazine, No. 215. Pham Thi Khanh (2007), "Developing high-quality human resources to meet the requirements of international economic integration", Labor and Social Journal, No. 325, December.

The works and articles mentioned above mainly discuss the issues of human resources, the development of high-quality human resources and its role in socio-economic development in various aspects. However, there are no works or articles that specifically state the solution to train high-quality human resources to meet the requirements of sustainable development in our country today. On the basis of inheriting the research results of published works and articles, the author focuses on the interpretation of a number of issues about the role and status of high-quality human resources in our country. Since then, some solutions are proposed to further improve the quality of training high-quality human resources to meet the requirements of sustainable development in our country today.

2. Methods

The article is based on the methodology of Marxism - Leninism; and published scientific works related to the research topic being sources of reference for the author to complete this article. In the research process, the author uses a combination of different methods such as analysis, synthesis; generalization, abstraction; statistics; comparison, compare… Specifically:

Methods of analysis and synthesis: Research, analyze and evaluate the quality of high-quality human resources, the current situation of high-quality human resources; draw the advantages and limitations of high-quality human resources to meet the requirements of sustainable development in Vietnam today.

Abstraction and generalization method: The article uses a combination of both abstraction and generalization to clarify the manifestation of high quality human resources, thereby determining the direction to propose measures in order to improve the quality of training high-quality human resources to meet the requirements of sustainable development in Vietnam today.

Statistical method: Through assessing the current situation, the article has listed some advantages and limitations of high quality human resources. From there, some solutions are proposed to improve the quality of training high-quality human resources to meet the requirements of sustainable development in Vietnam today.

Comparing and contrasting methods: From analyzing the roles and manifestations of high-quality human resources, the article compares the current situation of the quality of high-quality human resources in Vietnam to see problems for high-quality human resources to meet the requirements of sustainable development in Vietnam. On that basis, propose a number of measures to improve the quality of training high-quality human resources to meet the requirements of sustainable development in Vietnam today.

3. Results

3.1 Some problems of high-quality human resources to meet the requirements of sustainable development in our country

3.1.1 The role of high-quality human resources in sustainable development in our country

The concept of Marxism-Leninism always emphasizes the position and role of people in the development process of social history. At the same time, it is affirmed that human plays a decisive role in the constitutive elements of the productive forces. The American futurist, Alvin Toffler also emphasized the role of intellectual workers: “Money will be spent forever, power will be lost; Only human intelligence, when used, not only does not lose but also grows"[2]

Therefore, it is admitted that there is a close relationship between human resources, capital, natural resources, material and technical foundations, science, and technology, etc. promoting the sustainable development of the country. But in which human resources, especially high-quality human resources, are considered as endogenous driving forces that dominate other resources and play a decisive role in the sustainable development of each country. In that relationship, high-quality human resources with the leading factor being intelligence and gray matter have outstanding advantages and will never be exhausted if they know how to foster, exploit, and use them appropriately; and other resources, no matter how many, are only limited factors and can only be effective when combined with human resources effectively. High-quality human resources are a decisive factor in the exploitation, use, protection, and regeneration of other resources.

The fact shows that a country may not be rich in resources, unfavorable natural conditions, but the economy can grow quickly and develop sustainably provided that country knows how to set a correct economic policy, how to organize the successful implementation of that line; with a team of leading cadres, managers and intellectuals who are worthy; a large number of highly skilled technical workers and talented entrepreneurs.

In the contemporary world, with the strong impact of modern science and technology, especially the fourth industrial revolution, the trend of globalization and international integration is deepening, knowledge economy as a feature of the economy, human resources, especially high-quality human resources, increasingly play a decisive role. Recent growth theories indicate that an economy that wants to grow rapidly and at a high rate must be based on at least three basic pillars: the adoption of new technologies, the development of modern infrastructure, and the development of modern infrastructure. improve the quality of human resources. In particular, the most important driver of sustainable economic growth is people, especially high-quality human resources, that is, those who are invested in development, have skills, knowledge and skills, experience, creative capacity to become "capital - human capital, human capital". Given the fluctuations and fierce competition in the world, the victory will belong to countries with high-quality human resources, a favorable legal environment for investment and a socio-political environment stability for socio-economic development.

In our country, throughout the process of leading the Vietnamese revolution, we have always been consistent in our view of putting people at the center of the development process, considering people as both the goal and the driving force of development. It can be affirmed that the cause of national renewal, accelerating industrialization, modernization and international integration will not be successful without human resources, especially high-quality human resources, with talented people fully converging on moral qualities, having wisdom, good professional capacity, and good health... Our Party states: "Continue to synchronously innovate goals, contents, programs, methods, educational and training methods in the direction of modernity, international integration, comprehensive human development, meeting new requirements of socio-economic development, science and technology, adapting to the Fourth Industrial Revolution. Paying more attention to education on morality, personality, creative capacity and core values, especially education on patriotism, pride, national pride, tradition and national history, and a sense of social responsibility for all classes of people, especially the young generation…”[3]. Therefore, in the new historical context, our Party always focuses on training human resources to meet the requirements of sustainable development of the country.

3.1.2. The current situation of high-quality human resources to meet the requirements of sustainable development in our country today

Currently, with the strong development of modern science and technology, especially the fourth industrial revolution, it has had a significant impact on human resources, especially high-quality human resources to meet the requirements of the sustainable development in our country today.

Firstly, the impact of the fourth industrial revolution has been rapidly changing the structure and labor market. Manual labor will gradually be replaced by automation systems, machines and artificial intelligence will replace human power; In the labor market, the demand for high-skilled workers will increase while the demand for low-skilled workers will decrease. This is the main cause of labor surplus and rising unemployment, especially in developing countries. And so, cheap labor will no longer be a competitive advantage of developing countries' markets. What is more special, under the impact of the fourth industrial revolution, it not only threatens the employment of low-skilled workers, but even middle-skilled workers will also be affected. That raises a big question for the human resource training process in our country today. Because, for Vietnam from the past to the present, the economy has mainly relied on industries that use cheap labor and exploit natural resources with outdated levels. This is one of the major challenges for sustainable development in our country today.

In fact, although we are in the "golden population" period - the period when the population of working age is the highest "in 2016, the labor force of the whole country reached about 54.4 million people, accounting for about 58.9% of the total population"[4], however, our country's human resources, especially high-quality human resources, are severely lacking. The rate of trained workers with diplomas and certificates is still low, the goal is that by 2030 "the proportion of trained workers with degrees and certificates will reach 35-40%"[5]. The shortage of labor skills and skills in some industries is typical of Vietnamese workers today. For example, for information technology human resources, currently 72% of IT students do not have practical experience, 42% of students lack teamwork skills. Professional qualifications of workers have not met the actual requirements, the skills of learners after graduation are still limited, not keeping up with the trend of the times. The adaptability of employees to the job is not high, the reception, application, and creativity of employees in the working process are still low. A current reality, while employers are "thirst" for high-quality human resources, the unemployment rate among people with college and university degrees or higher in our country accounts for the highest rate. As of the first quarter of 2017, "the number of unemployed people with a university degree or higher was 138.8 thousand people, the unemployment rate of this group was 2.79%. The group with college degrees has 104.2 thousand unemployed people, the unemployment rate for this group is 6%. The group of intermediate level has 83.2 thousand unemployed people, the unemployment rate is 3.08%"[6]. On the other hand, according to feedback from employers, most learners who are recruited to work after graduation have to be retrained. According to the assessment of the World Bank (WB), "the quality of human resources in Vietnam currently reaches 3.39/10 points and the competitiveness of the Vietnamese economy ranks 73 out of 133 countries ranked in the list of top 10 countries in the world. rank"[7]. Therefore, "Vietnam's labor productivity is nearly 17 times lower than that of Singapore, 11 times lower than Japan's, and 10 times lower than Korea's, equal to 1/5 of the labor productivity of Malaysia and 2/5 of the labor productivity of Thailand"[8]. That fact shows that Vietnam's competitiveness is still weak and the risk of falling behind of our economy is obvious. Besides, the proportion of workers trained according to professional and technical qualifications in Vietnam is also not reasonable. According to a recent statistic, "the number of doctors is more than 14,000 people, but up to 70% hold management positions, only 30% do professional work... out of 11.73 million workforces. There are 5.12 million people who have been trained through training with degrees and certificates from elementary and equivalent or higher, university and post-graduate degrees; college level has

1.80 million people; the intermediate level has 3.03 million people; elementary level has 1.78 million people”[9]. That fact has reflected quite clearly the imbalance in the structure of trained labor between vocational education and higher education in Vietnam today. On the other hand, the current high-quality human resources in our country are not properly distributed, with more than 92% of the staff with doctorate degrees or higher concentrated in Hanoi and Ho Chi Minh City; while in the Central Highlands, Northwest and Southwest, this rate is less than 1%.

Regarding the state management, especially the planning and development orientation of human resources of the sectors, there are still many shortcomings and lack of synchronization. The forecasting of long-term human resource needs for socio-economic development is also unrealistic even limited and weak; The structure of training by industry, profession and level of training is not specifically planned for a long time. That leads to training institutions which have not enough information about labor supply and demand, which inevitably leads to the result that the construction of industries, occupations, targets, and annual training levels is unrealistic. According to experts' forecasts, under the impact of the fourth industrial revolution, soon, many workers in Vietnam's industries and occupations may be unemployed. Currently, according to estimates of the International Labor Organization (ILO), up to 86% of workers in Vietnam's textile and footwear industries are at high risk of losing their jobs. This will cause significant damage when this number of workers currently accounts for a fairly large proportion of the labor force of our country today.

Given the impact of the fourth industrial revolution, education must be improved to train qualified and capable human resources to meet the requirements set forth. Our Party clearly states: "Building synchronously institutions and policies to effectively implement the policy of education and training together with science and technology is the top national policy and a key driving force for land development. country. Continue to synchronously innovate educational and training objectives, contents, programs and methods towards modernity, international integration, comprehensive human development, and meeting new requirements of economic development. - society, science and technology, adapting to the Fourth Industrial Revolution”[10]. The goal of education and training is to form Vietnamese people to meet the requirements of fast and sustainable development of the country and in line with the trend of the times, in the immediate future is to promote the process of industrialization and modernization. modernize the country.

3.2. Some solutions to improve the quality of training high-quality human resources to meet the requirements of sustainable development in our country today

To further improve the quality of training, especially training high-quality human resources to meet the requirements of sustainable development in our country today, we need to enhance and implement effectively the following solutions:

3.2.1. Continuous innovation in fundamental and comprehensive education and training

This is the most important solution to improve the quality of high-quality human resource training before the impact of the fourth industrial revolution. The essence of the fourth revolution is based on the foundation of digital technology and integrating smart technologies to optimize the production process, increasing the social labor productivity. So, it will create new occupations, new technologies, techniques and even the labor market. This requires employees to also be equipped with new knowledge, skills, and qualities to meet the requirements of practice. To do so, it is necessary to quickly complete the education system in the direction of openness and integration, urgently arrange and rearrange the education system in a reasonable manner, especially higher education, and vocational training. Overcoming the unreasonableness of training scale, structure of professional qualifications and regional and regional structure in education and training; linking training with scientific research and technology application. Focusing on key fields that have great influence on the country's socio-economic development in the context of the fourth industrial revolution such as automation, information technology, and biotechnology … and the integration between industries and fields.

Renovation of education and training needs to properly identify training capabilities and needs; pay special attention to the formulation of plans and forecasts of social human resource needs, especially the needs of businesses, localities, fields, and branches in society... from which to have a plan. Adjust the training process accordingly. In the current conditions, it is necessary to attach importance to improving the quality of education and training according to regional and international standards, thereby creating a change in the training of high-quality human resources. In the current trend, the implementation of promoting socialization, giving autonomy to universities, colleges and vocational training; encouraging enterprises to participate in vocational training is the right direction for innovating and improving the quality of education and training in the context of the fourth industrial revolution.

Renovating the content and training program must be based on the requirements of society, the ability and requirements of learners to ensure streamlining, modernity and practicality in accordance with the spirit of the Party as determined by our Party: "To strongly shift the educational process from mainly equipping knowledge to comprehensively developing learners' capabilities and qualities; from studying mainly in class to organizing diverse learning forms, paying attention to teaching and learning online, via internet, television, social activities, extra-curricular activities, scientific research; School education combines with family education and social education"[11]. The training content should be responsive and equip learners with both knowledge and skills suitable for the rapid change of the fourth industrial revolution. The training program must be a program aimed at developing both capacity and quality of learners, ensuring a harmonious combination of moral, intellectual, physical, and aesthetic aspects; teaching people, teaching literacy and vocational training; In particular, it is necessary to increase the teaching time of foreign languages, informatics, and technology in a practical way. Implement an open training program, ensuring flexibility and flexibility, in line with the rapid transformation of the fourth industrial revolution. Only then, education deserves to be given the priority in socio-economic development programs and plans as determined by our Party.

To further promote international cooperation in education and training, science and technology, create a favorable environment and conditions to attract talented, reputable and experienced teachers and scientists of foreign; attracting overseas Vietnamese to participate in the process of education, training and scientific research in the country. Implement international cooperation programs with prestigious educational institutions, send Vietnamese students abroad to study and foster…

Upon the rapid development of modern science and technology, especially the fourth industrial revolution, associated with content innovation, the program is the innovation of teaching methods and standardization of teaching staff. current instructors. The requirements of current teaching methods need to focus on teaching learners how to learn, how to think; in which the promotion of self-study and lifelong learning is particularly important. That requirement requires us to "continue to strongly innovate teaching and learning methods towards modernity; promote the positive, proactive, creative and apply knowledge and skills of learners; overcome the one-way imposed transmission, remembering machines. Focus on teaching how to learn, how to think, encourage self-study, create a basis for learners to update and renew knowledge, skills, and capacity development"[12]. In the current information explosion condition, the amount of human knowledge is increasing very rapidly with many new knowledges. Therefore, the basic thing of education is to form for learners the habit of systematically thinking, synthesizing, and applying knowledge into practice, the teaching process of teachers must inspire learners in self-study and self-study to find new things and solve problems with the highest efficiency without being constrained, mechanically stereotyped according to the existing ones. The assessment of learners' ability should be done in the direction of assessing the ability of learners to apply, not just reconstructing in purely theoretical evaluation. Teachers need to stimulate and nurture students' critical and creative thinking; On the contrary, learners must be active in a free creative environment. Because only in that environment can people's capacity for cognitive and practical activities be highly promoted. In the digital economy, creativity is an outstanding feature of human resources. Accordingly, creativity is considered the most important criterion to assess the level of development and adaptation of education and training in the context of the fourth industrial revolution.

In Vietnam, the quality of education and training over the past time has made positive changes, but compared to the development requirements of practice, there are still many shortcomings. According to the "Report of the World Economic Forum (WEF) in Davos (Switzerland) in January 2018 entitled "Readiness for future manufacturing" clearly indicated, Vietnam is one of the groups of countries that do not have a readiness for the industrial revolution 4.0. In 2018, the WEF conducted an analysis of 100 countries and economies representing more than 96% of global market value added (MVA) and more than

96% of global gross domestic product. WEF ranks Vietnam in the group of weak countries, ranking only 75/100 for the quality of university training, 68100 for the quality of math and science education (3.7/7 points). The factors of technological innovation and education in preparation for Vietnam's 4.0 revolution are low. Specifically, Vietnam ranks 90/100 in terms of technology and innovation; 92/100 on background technology; 77/100 on the ability to create sitting; 70/100 on human resources. In total, Vietnam only scored 4.9 on a 10-point scale in terms of readiness for the 4.0 revolution, equivalent to Cambodia, inferior to Singapore, Thailand, the Philippines, and Malaysia"[13]. This is really a big challenge that Vietnam's education system needs to urgently overcome to improve the quality of human resource training, especially high-quality human resource training, thereby, speeding up the socio-economic development.

*3.2.2. Further investment in technical facilities for the education and training process***.**

To improve the quality of human resource training, especially today's high-quality human resources, it is necessary to create conditions for education and training to rapidly modernize facilities and promote integration. international; on the other hand, it also requires education and training methods and methods to change in the direction of strongly applying the achievements of modern science and technology, especially information technology, technical technology. digital and computer network systems into the teaching process in current training institutions. Modern technological means have become an element, an indispensable feature of modern education.

The development of modern science and technology has brought great changes to education in general and teaching and learning methods. The use of modern technological devices, cloud computing technology and internet connection to the world has allowed teachers to provide materials to learners in a rich, diverse, and fast manner; On the contrary, learners can choose appropriate teachers, have the conditions to interact with teachers and fellow learners at anytime, anywhere. Therefore, the teacher is not only a guide and intellectual enlightenment for learners, but also an active collaborator with learners, helping and supporting learners to further develop their learning skills. suitable set.

Additionally, training institutions need to invest more in facilities to serve the appropriate teaching and learning process. The trend of modern education requires that educational institutions need to be modernized to serve the teaching and learning process. From the classroom, the learning environment, and the teaching facilities, all need to be invested in a modern way to build a smart teaching and learning environment before the impact of the fourth industrial revolution. In fact, learning has never been easier than it is today, from e-learning to sharing educational resources between cultures. This has created for learners to increase their initiative, self-study and they can interact with any teacher they want, creating opportunities for learners to be suitable for themselves, to meet their needs. requirements of today's learning society. Therefore, if invested in an effective and appropriate way, the implementation of the social philosophy of learning and lifelong learning will be firmly established and vividly realized in life.

On the other hand, investing in facilities for the implementation of online training is the way and the right direction for the fourth industrial revolution. Therefore, the development trend of education and training has been pointed out by our Party: “Building an open education system, lifelong learning and building a learning society; conduct training according to the needs of the labor market”[14]. It is this that has made the social nature of the productive forces through the process of education and training more and more developed, surpassing the scope of each country, making the relations between countries in all fields more and more developed. The field of education and training, including the education and training field, is becoming increasingly corelative and extensive, contributing to promoting the increase in adaptability to the ever-improving trend of education and training. create Vietnam before the impact of the fourth industrial revolution.

3.2.3. Perfecting the system of mechanisms and policies for training and developing high-quality human resources

This is one of the important solutions, creating a direct motivation to promote the process of socio-economic construction and development of the country in general and the development of high-quality human resources to meet the requirements of sustainable development firmly in our country. In the past time, our Party and State have paid great attention and promulgated many appropriate mechanisms and policies that have had a positive impact on the process of training and developing high-quality human resources to meet development requirements. sustainability in our country. However, in the implementation process, those policies have revealed several limitations and inadequacies that have not had commensurate positive effects. Therefore, for the training of high-quality human resources to develop and achieve positive results, we need to regularly adjust, supplement and perfect the system of appropriate remuneration mechanisms and policies to further improve the quality of training high-quality human resources to meet the requirements of sustainable development in our country today.

The improvement of the system of mechanisms and policies for training and developing high-quality human resources needs to be implemented synchronously in all areas such as career development orientation, quality of education and training, and policies. job development, working conditions and environment; accompanying it are policies, social security activities, insurance regimes, social protection, health care, remuneration and benefits regimes, etc. In which, special attention is paid to Vietnamese attractiveness., using and treating to create motivation to promote the process of striving, learning, training to improve the qualifications of workers in all aspects to adapt to the requirements of the fourth industrial revolution.

The process of training, recruiting, and arranging to use high-quality human resources should be implemented in an open, transparent, and objective manner, ensuring accuracy, based on actual qualities and capabilities. of workers. It is necessary to do a good job of orienting career trends after training. Training institutions need to be intricately linked to employers; Leaders and managers need to boldly use high-quality young human resources who are well-trained through schools as prescribed. Appreciate the treatment and honor high-quality human resources, implementing a flexible salary and remuneration policy according to the criteria of talent and contribution efficiency in work. Building a favorable working environment, plans and criteria for promotion and promotion to motivate and stimulate employees to work effectively and creatively. To ensure maximum conditions, facilities and working facilities for scientists and young talents. Honoring and encouraging both materially and spiritually to those who have made great contributions to bringing benefits to the collective and society**.**

Constantly perfecting the legal framework, ensuring a safe and favorable working environment for the process of training and developing high-quality human resources, encouraging the development of the high-quality human resource market; building an environment and a legal corridor for new industries born from the fourth industrial revolution as defined by our Party: "Improve the institutions for development, application of science and technology, and education. - training and developing human resources, especially high-quality human resources”[15].

Pay attention to and have supportive policies for start-up activities in university training institutions. Strengthen cooperation activities between the State, enterprises, and universities. Orienting and promoting training development of key and spearhead industries to meet the requirements of the fourth industrial revolution. Improve the operation quality of technology incubators. Continue to effectively implement the project of building high-tech centers; adopt appropriate and effective policies in technology import activities. Implement preferential regimes for excellent scientific and technological works of organizations and individuals.

4. Discussion and Conclusion

In summary, the trend of global integration and international integration, along with the strong development of modern science and technology, especially the fourth industrial revolution, has had a strong impact on the entire process of international integration. education and training programs, especially training high-quality human resources to meet the requirements of sustainable development of the country. Therefore, in order to match it, the education and training requirements must change in the direction of improving the quality commensurate with the needs of the current labor market. To radically and comprehensively renovate education and training; invest in material and technical foundations for education and training activities; perfecting the system of mechanisms and policies for high-quality human resource training is an indispensable and objective requirement in order to create breakthrough changes in Vietnamese education and training in the new era. digital era. In other words, success or failure, making good use of opportunities, overcoming difficulties and challenges before the impact of the fourth industrial revolution for sustainable development in Vietnam today depends greatly on the exploitation of human resources, especially the improvement of the training quality of high-quality human resources.

ANALYSIS THE IMPACT OF MACRO FACTORS AFFECT TO DEVELOPMENT OF HIGHLY QUALIFIED HUMAN RESOURCES IN NAM DINH

Hoang Thi Loan

loanht.86@gmail.com

Financial Accountant, Department of Quality Management for Harmonized Product Quality, Hanoi University Of Home Affair, Vietnam

Co Huy Le

huyle.noivu@gmail.com

Faculty of Human Resource Management, Hanoi University Of Home Affair, Vietnam

Abstract

In fact, there are many different factors affect the development of highly qualified human resources in Nam Dinh province, including both micro and macro factors that have an influence. With the research approach to state management in human resource development, the influencing factors considered are macro factors. In this content, the authors study the macro factors affecting the province's highly qualified human resources development, including: State management of central high qualified human resources development; Education-training factor; Economic factors; Labor force; Science and technology; Socio-culture... to build a linear regression function to determine the degree of influence of quantitative factors on the development of highly qualified human resources of Nam Dinh province.

Key words: *Human resource, high quality human resource, industrialization and modernization, development, high quality human resource, Nam Dinh province.*

1. Introduction

In the context of the rapid development of science and technology revolution and the trend of economic globalization to promote the rapid spread of knowledge economy, Vietnam in general and Nam Dinh. Nam Dinh is a province in the Red River Delta with a natural area of 1,669.2 km2 and has a population of about 2,200,000 people. Geographical position is located at the end of the Red River, on 1A Highway, and Nam Dinh province is about 90 km distance to the center of Hanoi city, which is very convenient for economic development. However, at present, the socio-economic development level of Nam Dinh is still poor due to the shortage of highly qualified human resources and the weakness in the organization to develop highly qualified human resources. Therefore, the quantitative analysis, building regression function, determining the influence of the factors affecting the development of highly qualified human resources in Nam Dinh is urgent and meaningful for research.

2. Methods

The paper is carried on basing on a combination of both qualitative and quantitative research methods closely in the research process with the desire to not only describe the theoretical picture of the impact of developing highly qualified human resources, but also quantify this impact through reliable statistics of Nam Dinh province. These methods include some steps as follows:

Collect primary documents at: Provincial Party Committee, Office of Provincial People's Committee, departments, departments, branches, some universities, colleges, hospitals and businesses, offices of People's Committees of districts, functional departments of People's Committees of districts in Nam Dinh province.

Determine the number of survey forms for this research: Based on the overall scale of the highly qualified human resources of Nam Dinh province available in 2019, which is 179,337 people, The expected confidence level when survey is 91.5%, error 8.5%: . Look up the normal distribution table with 91.5% confidence, get the variable value: Z=2.58. Ratio of random survey sample with probability p = q = 0.5. The expected number of survey samples to study the thesis topic is determined by the formula and must survey:

$$n = \frac{N.Z^2.p*q}{N*\varepsilon^2 + Z^2.p.q} = 230 \quad \text{(samples)} \qquad \text{(Nguyen Thi Canh, 2016)}$$

Data processing: Primary information and datas are collected through surveys, then (1) review and screen information, documents and data that are unclear, dishonest, and inaccurate, then collect and synthesize information, documents and raw data by manual method. (2) Edit and encrypt information, documents and data by computer and application software. (3) For primary data, after being cleaned, coded and analyzed, evaluated by scales, model tested and presented into an official research report on SPSS 21 software, AMOS software for quantitative analysis.

3. Results

In fact, there are many factors affecting the development of highly qualified human resources in Nam Dinh province, including groups of micro factors such as employment position, recruitment, training, personnel arrangement, working environment, salary, remuneration, remuneration policy in organizations, enterprises and group of macro factors as mentioned above. In the scope of research on state management on the development of highly qualified human resources, the authors focus on researching and measuring the impact of macro-environmental factors affecting the development of qualified human resources. Nam Dinh province consists of 6 factors: State management factors on human resource development at central level; Education and training factors; Economic factors; Labor force factor; Scientific and technological factors; Cultural and social factors are the official factors used for quantitative analysis in this research.

3.1. Research scale and measure influencing factors

To evaluate the factors affect the development of highly qualified human resources (HQHRs) in Nam Dinh province, we first build a scale to measure them. These scales are built in the form of a 5-point Likert scale, specifically:

3.1.1. Research scale

*** Scale of developing HQHRs of Nam Dinh province (6 observed variables)**

Encode	**Content / Observable Variables**
PTNNL1	Developing HQHRs of Nam Dinh province in terms of scale
PTNNL2	Developing HQHRs of Nam Dinh province in terms of quality
PTNNL3	Developing HQHRs of Nam Dinh province in terms of structure
PTNNL4	Program to develop HQHRs of Nam Dinh province
PTNNL5	Planning for developing HQHRs of Nam Dinh province
PTNNL6	Policy in developing HQHRs of Nam Dinh province

*** Scale of economic variables (4 observed variables)**

Encode	**Content / Observable Variables**
KT1	The level of economic growth affects the development of HQHRs in terms of size, quality and structure of Nam Dinh province
KT2	Economic activities of the agriculture, forestry and fishery sectors affect the development of HQHRs in Nam Dinh in terms of structure, scale and quality.
KT3	Economic activities of industry and construction have an impact on the development of structure, scale and quality of HQHRs of Nam Dinh province.
KT4	Economic activities of the service-commercial sector affect the development of structure, scale and quality of HQHRs in Nam Dinh province.

*** Scale of state management variables on human resource development at central level (5 observed variables)**

Encode	Content / Observable Variables
QL1	The central level human resource development strategy affects the planning, plans and policies in developing HQHRs of Nam Dinh province.
QL2	The central human resource development plan affects the planning, plans and policies for the development of HQHRs in Nam Dinh province.
QL3	The central planning of human resource development affects the planning, plans and policies in developing HQHRs of Nam Dinh province
QL4	The central-level human resource development policy affects the planning, policies and programs for the development of HQHRs in Nam Dinh province.
QL5	The central-level human resource development program affects the master plans, plans and policies in developing HQHRs of Nam Dinh province

*** Scale of labor force variables of Nam Dinh province (4 observed variables)**

Encode	Content / Observable Variables
LD1	Abundant labor force affects the development of HQHRs in terms of scale and structure of Nam Dinh province
LD2	The labor force participation rate affects the structure of HQHRs development in Nam Dinh province
LD3	Human resource HDI affects the development of HQHRs in Nam Dinh province
LD4	The qualified level of labor force affects the development of HQHRs in Nam Dinh

*** Scale of education and training variables of Nam Dinh (5 observed variables)**

Encode	Content / Observable Variables
GD1	The system of colleges and universities affects the development of scale, quality and structure of HQHRs in Nam Dinh province.
GD2	The training professions of colleges and universities affect the development of the structure of HQHRs in Nam Dinh province.
GD3	Training programs of colleges and universities in the province affect the development of the quality of HQHRs in Nam Dinh province.

GD4	Training methods and forms of colleges and universities affect the development of the quality of HQHRs in Nam Dinh province.
GD5	The teaching staff of colleges and universities have an impact on the quality development and structure of HQHRs in Nam Dinh province.

*** Scale of science and technology variables of Nam Dinh (4 observed variables)**

Encode	Content / Observable Variables
CN1	The level of investment in science and technology of the province affects the development of scale and quality of HQHRs of Nam Dinh province.
CN2	The level of scientific and technological development for the agriculture, forestry and fishery sectors affects the development of scale, quality of HQHRs of Nam Dinh
CN3	The level of scientific and technological development for industry and construction affects the development of scale and structure of HQHRs of Nam Dinh.
CN4	The level of scientific and technological development for the service and trade sectors affects the development of the scale and structure of HQHRs of Nam Dinh.

*** Cultural and social scale of Nam Dinh province (5 observed variables)**

Encode	Content / Observable Variables
VH1	Regional culture affects the development of HQHRs in Nam Dinh province in terms of quality and structure.
VH2	Humanistic culture affects the development of HQHRs in Nam Dinh in terms of quality.
VH3	Behavioral culture of human resources affects the development of HQHRs in the province in terms of quality.
VH4	Social background affects the development of HQHRs in Nam Dinh province in terms of quality and structure.
VH5	Cultural and social characteristics affecting the development of HQHRs in Nam Dinh in terms of quality and professional quality.

3.1.2. Measure influencing factors

To measure the factors affecting the development of HQHRs in Nam Dinh as a basis for testing the validity and reliability of the research scales, the authors conducted a practical survey at 60 agencies and enterprises in Nam Dinh, with the number of survey votes is 300. The purpose is to survey the level of impact of factors affecting the development of renewable energy in Nam Dinh with 33 observed variables. Using survey results to test the validity and reliability of 7 scales by exploratory factor analysis (EFA) and Cronbach coefficient α. Considering the relationship between 33 observed variables in the population by KMO and Bartlett's test with the support of the statistical software SPSS, it shows that there is a correlation between the variables (significance level sig. = 0.000 < 0.05, KMO coefficient = 0.676 (0.5<KMO<1.0), proving that EFA analysis for grouping these observed variables together is appropriate:

a. Preliminary check the reliability of 7 scales with 118 questionnaires, the survey was put into use, ran the data and obtained the following results:

1. Education and training scale (GD)

Reliability Statistics

Cronbach's Alpha	N of Items
.801	5
The reliability of the education and training (GD) factor shows that the variables in the scale have Cronbach's Alpha coefficient = 0.801 > 0.6 to ensure reliability.	

[Source: Analytical results from SPSS 21]

2. Science and technology scale (CN)

Reliability Statistics

Cronbach's Alpha	N of Items
.786	4
The reliability of the science and technology (CN) factor shows that the variables in the scale have Cronbach's Alpha coefficient = 0.786 > 0.6, which ensures reliability.	

[Source: Analytical results from SPSS 21]

3. Labor force scale (LD)

Reliability Statistics

Cronbach's Alpha	N of Items
.732	4
The reliability of the labor force factor shows that the variables in the scale have Cronbach's Alpha coefficient = 0.732 > 0.6 to ensure reliability.	

[Source: Analytical results from SPSS 21]

4. Socio-cultural scale (VH)

Reliability Statistics

Cronbach's Alpha	N of Items
.597	5
The reliability of cultural and social factors shows that the variables in the scale have Cronbach's Alpha coefficient = 0.597 < 0.6 (not guaranteed). Removed variable VH.	

[Source: Analytical results from SPSS 21]

5. State management scale on human resource development at central level (QL)

Reliability Statistics

Cronbach's Alpha	N of Items
.798	5
The reliability of the state management factor on human resource development at the central level shows that most of the variables in the scale have Cronbach's Alpha coefficient = 0.798 > 0.6, ensuring reliability.	

[Source: Analytical results from SPSS 21]

6. Economics scale (KT)

Reliability Statistics

Cronbach's Alpha	N of Items
.750	4
The reliability of economic factors shows that most of the variables in the scale have Cronbach's Alpha coefficient = 0.750 > 0.6 to ensure reliability.	

[Source: Analytical results from SPSS 21]

7. Scale of development of highly qualified human resources of Nam Dinh (PTNNL)

Reliability Statistics

Cronbach's Alpha	N of Items
.803	6
The reliability of the HQHRs development factor of Nam Dinh shows that most of the variables in the scale have Cronbach's Alpha coefficient = 0.803 > 0.6, which ensures high reliability.	

[Source: Analytical results from SPSS 21]

Below is a summary table of Cronbach's Alpha coefficient and the preliminary total correlation coefficient of the scales of 118 questionnaires.

Bảng 3.32. Cronbach's Alpha coefficient and the preliminary total variable correlation of the scales

Factors	Number of variables	Cronbach's Alpha	Coefficient of correlation of total variables (min & max value)	Number of variables removed
GD	5	0,801	0,395; 0,523	0
CN	4	0,786	0,398; 0,541	0
LD	4	0,732	0,452; 0,573	0
VH	5	0,579	0,286; 0,427	1
QL	5	0,798	0,390; 0,568	0
KT	4	0,750	0,429; 0,595	0
PTNNL	6	0,803	0,335; 0,561	0

[Source: Analytical results from SPSS 21]

b. Evaluation of the reliability of the official scales with the number of questionnaires put into use is 566 questionnaires and surveys

1. Education and training scale (GD)

Reliability Statistics

Cronbach's Alpha	N of Items
.819	5
Total correlation coefficient (corrected item-total correlation with 5 observed variables: GD1, GD2, GD3, GD4, GD5), the lowest at 0.547, is higher than 0.3, showing that all observed variables are used for analysis. exploratory factor analysis EFA.	

[Source: Analytical results from SPSS 21]

2. Science and technology scale (CN)

Reliability Statistics

Cronbach's Alpha	N of Items
.782	4
Total correlation coefficient (corrected item-total correlation with 4 observed variables: CN1, CN2, CN3, CN4), the lowest reached 0.442, all higher than 0.3, showing that all observed variables are used for multivariable analysis. EFA discovery factor.	

[Source: Analytical results from SPSS 21]

3. Labor force scale (LD)

Reliability Statistics

Cronbach's Alpha	N of Items
.775	4
Total correlation coefficient (corrected item-total correlation with 4 observed variables: LD1, LD2, LD3, LD4) was 0.553, all > 0.3, showing that all observed variables were used for factor analysis. Discover EFA.	

[Source: Analytical results from SPSS 21]

4. State management scale on human resource development at central level (QL)

Reliability Statistics

Cronbach's Alpha	N of Items
0.801	5
Total correlation coefficient (corrected item-total correlation with 4 observed variables: QL1, QL3, QL4, QL5), the lowest was 0.345, all higher than 0.3, showing that all observed variables were used for multivariable analysis. EFA discovery factor. However, removeing variable QL2 (Cronbach's Alpha coefficient = 0.806 > 0.801)	

[Source: Analytical results from SPSS 21]

5. Economics scale (KT)

Reliability Statistics

Cronbach's Alpha	N of Items
.768	4
The lowest item-total correlation coefficient (corrected item-total correlation with 3 observed variables KT1, KT2, KT4) is 0.532, all higher than 0.3, showing that all observed variables are used for exploratory factor analysis. EFA. However, removing variable KT3 (Cronbach's Alpha coefficient = 0.797 > 0.768).	

[Source: Analytical results from SPSS 21]

6. Scale of development of highly qualified human resources of Nam Dinh (PTNNL)

Reliability Statistics

Cronbach's Alpha	N of Items
.803	6
Total correlation coefficient (corrected item-total correlation with 6 observed variables: PTNNL1, PTNNL2, PTNNL3, PTNNL4, PTNNL5, PTNNL6), the lowest reached 0.444, all higher than 0.3, showing that all observed variables were used. for exploratory factor analysis EFA.	

[Source: Analytical results from SPSS 21]

3.1.3. Exploratory factor analysis (EFA)

The first EFA analysis for the groups of factors, the results show that KMO = 0.855 > 0.5, the Sig of Bartlett's test = 0.000 < 0.05 is satisfied. However, the observed variable

QL5, PTNNL4 in the Pattern Matrix[a] table is not satisfied with the factor loading factor >0.5. Therefore, these variables are in turn excluded from the model.

KMO and Bartlett's Test

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.855
Bartlett's Test of Sphericity	Approx. Chi-Square	5193.628
	df	351
	Sig.	.000

Pattern Matrix[a]

	Factor					
	1	2	3	4	5	6
GD5	.732					
GD4	.721					
GD1	.718					
GD2	.670					
GD3	.616					
KT1		.879				
KT2		.761				
KT4		.681				
LD3			.751			
LD2			.664			
LD4			.655			
LD1			.652			
PTNNL1				.739		
PTNNL2				.666		
PTNNL6				.555		
PTNNL3				.511		
PTNNL5						
QL4					.712	
QL3					.676	
QL1					.592	
QL5					.471	

CN3						.653
CN4						.632
CN1						.611
CN2						.509
PTNNL4						.423

Thus, the data is suitable for EFA factor analysis, the significance level is sig < 0.05, so it can be concluded that the observed variables are correlated with each other. Through the table, we see that the proposed factors explain 56,198% > 50% of the variables with the stopping point used reaching 2,680 > 1, satisfying the requirements.

Pattern Matrix[a]

QL1						.581

Extraction Method: Principal Axis Factoring.

[Source: Analytical results from SPSS 21]

Thus, through testing the reliability of the scale, analyzing factors, factors and the remaining 24 observed variables, 6 factors were obtained, of which 5 factors are independent variables affecting development. The HQHRs of Nam Dinh province are as follows:

Factor 1: GD5, GD1, GD4, GD2, GD3 ; Factor 2: LD3, LD2, LD1, LD4

Dependent factor 3: PTNNL1, PTNNL2, PTNNL6, PTNNL3, PTNNL5

Factor 4: KT1, KT2, KT4; Factor 5: CN3, CN4, CN1, CN2

Factor 6: QL4, QL3, QL1

3.2. Research hypothesis and proposed research model

The research hypotheses (H) include: (H1): Eucation and training have a positive impact on the development of HQHRs in Nam Dinh province; (H2): The characteristics of the labor force have a positive impact on the development of HQHRs in Nam Dinh province; (H3): The economy has a positive impact on the development of HQHRs in Nam Dinh province; (H4): Science and technology have a positive impact on the development of HQHRs in Nam Dinh province; (H5): State management of HRs development at the central level has a positive impact on the development of HQHRs in Nam Dinh province.

- Proposed research model:

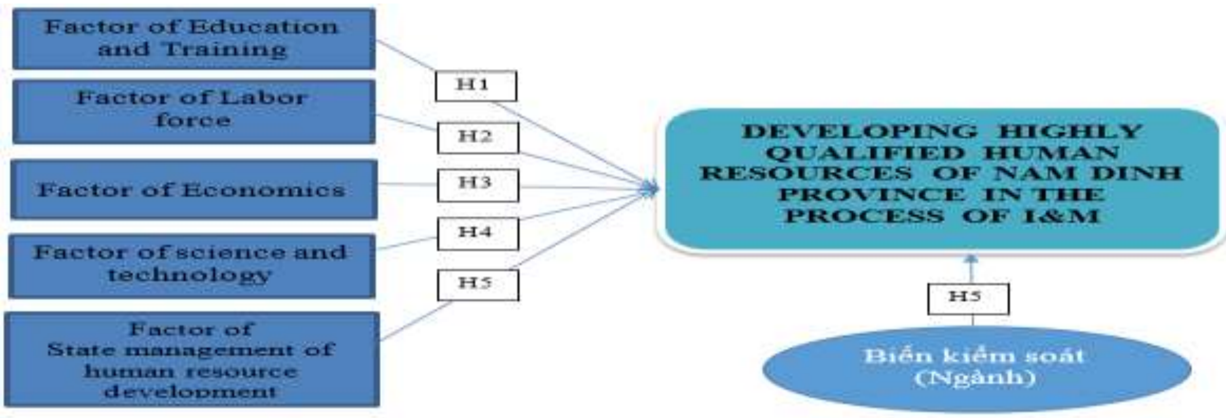

Diagram No1. Proposed research model

With the above model structure, studying the factors affecting the development of highly qualified human resources in Nam Dinh province has the form of a linear regression function:

$$\mathbf{Y = \beta o + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4 + \beta_5 X_5 + Ui \quad ;}$$

Independent variables (X1): GD5, GD1, GD4, GD2, GD3

Independent variables (Y): LD3, LD2, LD1, LD4

Dependent factor 3: PTNNL1, PTNNL2, PTNNL6, PTNNL3, PTNNL5

Independent variables (X3): KT1, KT2, KT4;

Independent variables (X4): CN3, CN4, CN1, CN2

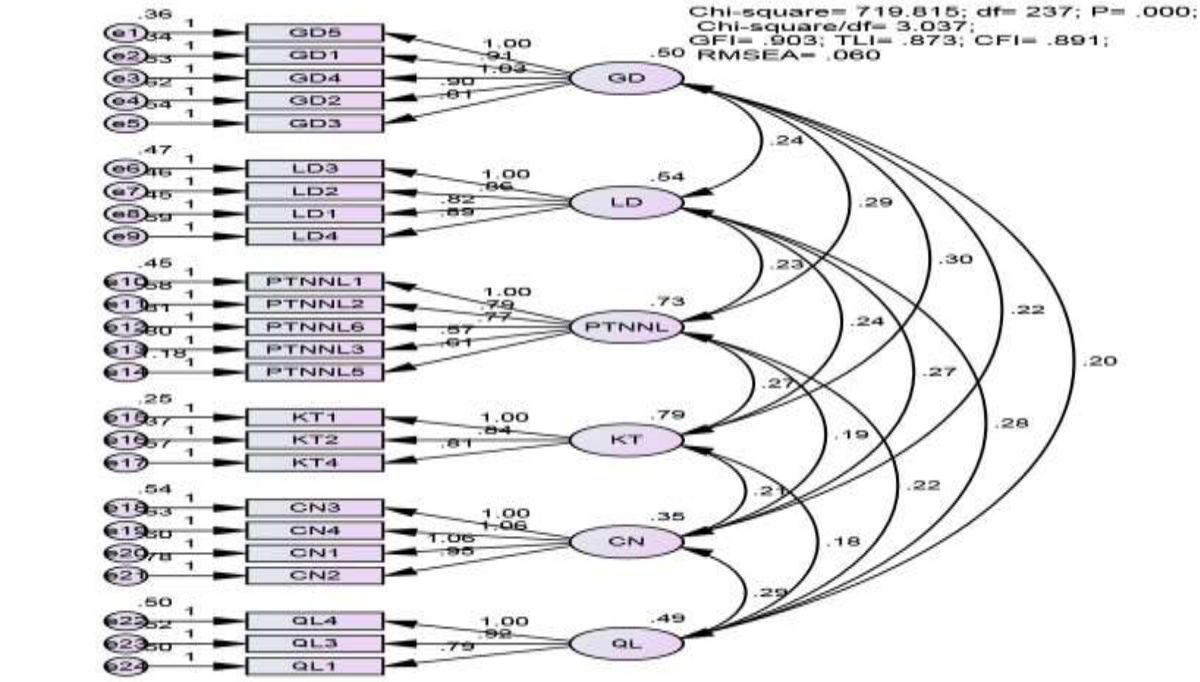
Independent variables (X5): QL4, QL3, QL1

Control variable (Ui): In the research model, the control variable is the industry for the development of highly qualified human resources in Nam Dinh province.

3.3. Confirmatory factor analysis results CFA

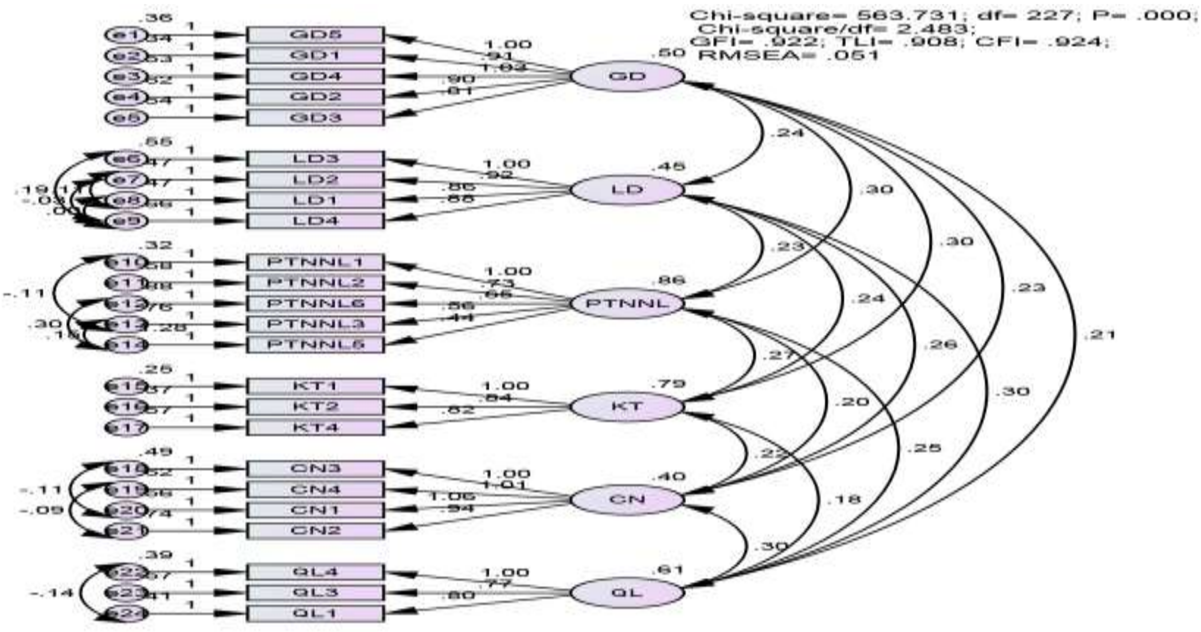
To measure the fit of the scale with the collected data, confirmatory factor analysis (CFA) method was used through AMOS software version 21.

After testing the scale and analyzing the EFA exploratory factor, the authors conducted a confirmatory factor analysis CFA with 6 factors including 24 observed variables. These factors create groups of scales and are included in the CFA analysis to consider the fit of the model to market data. The evaluation criteria include: unidirectionality, convergent value, discriminant value and theoretical correlation value. Criteria from 1 to 3 are evaluated in the critical scale model, while the theoretical correlation value is evaluated in the theoretical model.



[Source: Analytical results from SPSS 21]

The first CFA results of the scale model are presented in Fig. This model has 237 degrees of freedom. The figure above shows the value of the Chi-squared index = 719,815 with p = .000. Other indicators: Chi-squared/df = 3.037, GFI = 0.903 higher than 0.9 (Bentler & Bonett, 1980), RMSEA = 0.060 < 0.08 (Steiger, 1990). However, TLI = 0.873, CFI = 0.891 do not satisfy the condition. So to improve the model in Covariances concatenate the following observations: e22-e24; e19-e21; e18-e20; e13-e14; e12-e14; e10-e13; e8-e9; e7-e9; e7-e8; e6-e9.

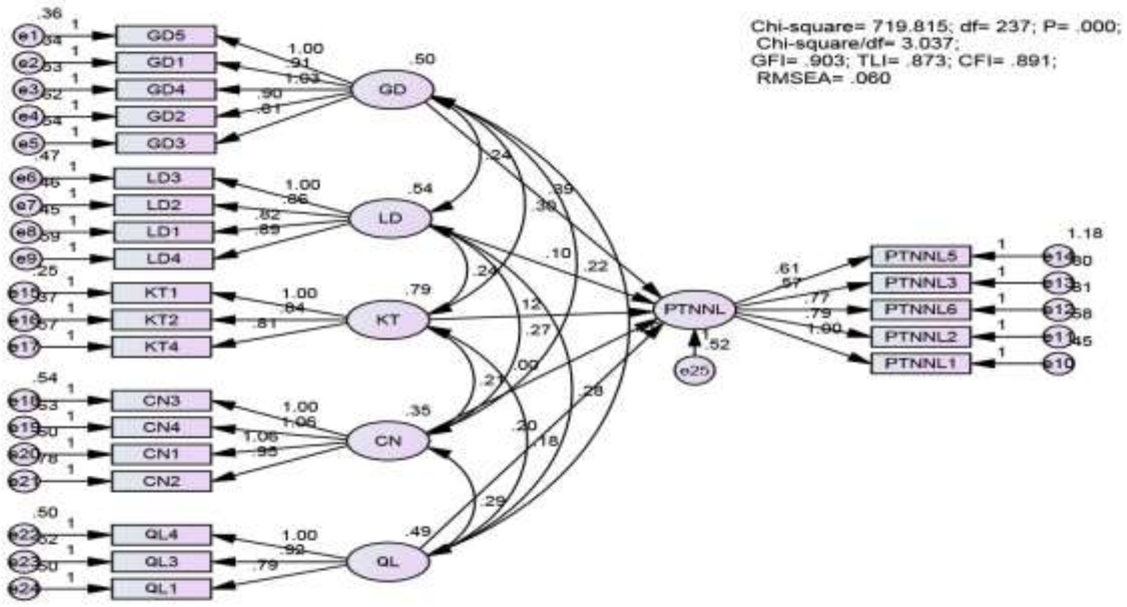


[Source: Analytical results from SPSS 21]

The results of the CFA confirmatory factor analysis of the scale model are presented in the figure above. This model has 227 degrees of freedom. The figure above shows the value of the Chi-squared index = 563,731 with p=000. Other indicators: Chi-squared/df = 2.483, GFI = 0.922, TLI = 0.908, CFI = 0.924 are all higher than 0.9, RMSEA = 0.051 < 0.08. This can infer that the model is considered suitable for the market data because it ensures unidirectionality, convergent validity and discriminant validity.

3.4. Analysis of the linear structural model SEM

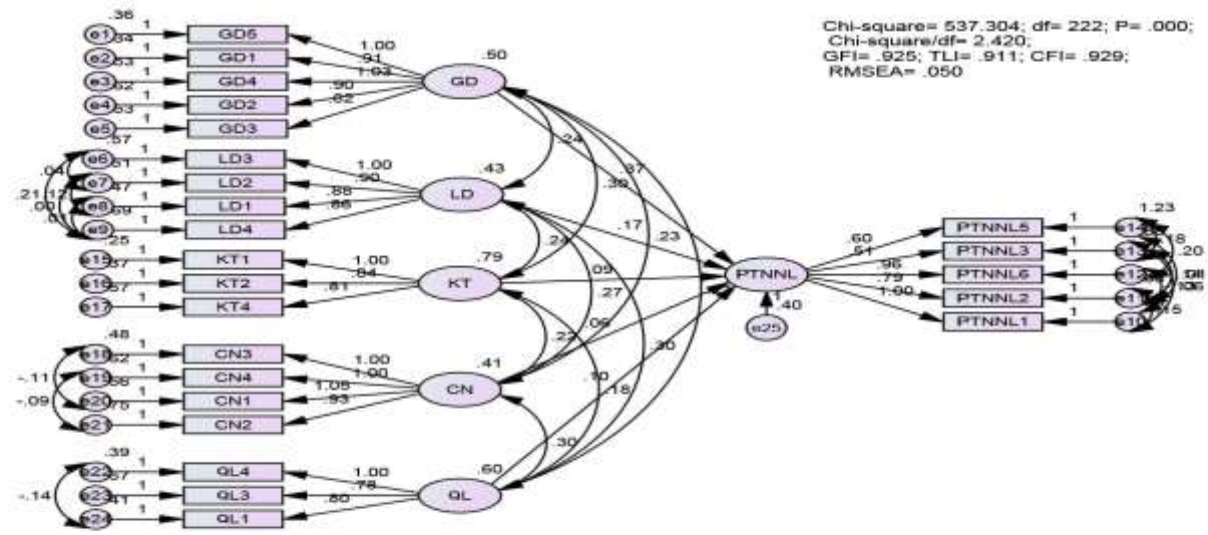
After running on the software, we obtain the SEM model for analysis below:



[Source: Analytical results from SPSS 21]

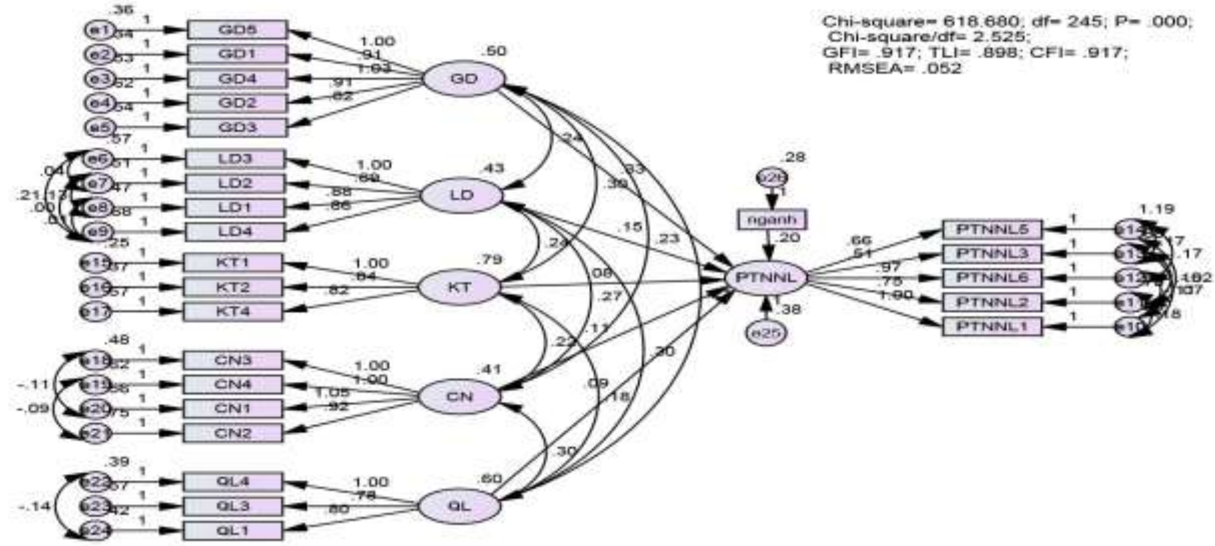
The results of running the 1st SEM model of the scale model are presented in the figure. This model has 237 degrees of freedom. I see the value of the Chi-squared index = 719,815 with p=000. Other indicators: Chi-squared/df = 3.037, GFI = 0.903 higher than 0.9 (Bentler & Bonett, 1980), RMSEA = 0.060 < 0.08. However, TLI = 0.873, CFI = 0.891 do not satisfy the condition. So to improve the model in Covariances concatenate the following observations: e22-e24; e19-e21; e18-e20; e13-e14; e12-e14; e11-e14; e11-e13; e11-e12; e10-e14; e10-e13; e10-e11; e8-e9; e7-e9; e7-e8; e6-e9.

The results of running the 2nd SEM model of the scale model are presented in the figure below. This model has 222 degrees of freedom. The figure above shows the value of the Chi-squared index = 537,304 with a value of p=000. Other indicators: Chi-squared/df = 2.420, GFI = 0.903, TLI= 0.911, CFI=0.929 all higher than 0.9 (Bentler & Bonett, 1980), RMSEA = 0.050 < 0.08 (Steiger, 1990). Thus, this research model achieves compatibility with market data.



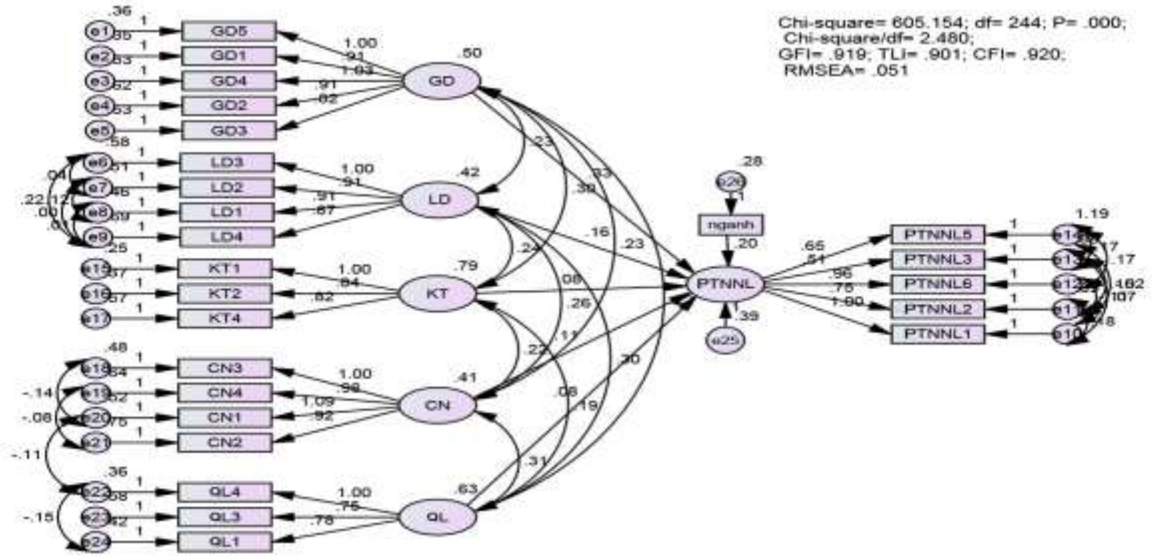
[Source: Analytical results from SPSS 21]

To test the influence of the industry control variable on the development of highly qualified human resources in Nam Dinh province, we run the 3rd SEM model with the following results:



[Source: Analytical results from SPSS 21]

The results of running the 3rd SEM model of the model with industry as the control variable in the figure. This model has 245 degrees of freedom. The figure above shows the value of the Chi-squared index = 618,680 with a p=000 value. Other indicators: Chi-squared/df = 2.525, GFI = 0.917, CFI = 0.917 higher than 0.9, RMSEA = 0.052 < 0.08 (Steiger, 1990). However, TLI= 0.898 < 0.09 is not satisfied. Therefore, to improve the model, we proceed to join e in Covariances' suggestion that is e20-e22 concatenation.



The results of the last SEM model run of the model with industry as the control variable are presented in the figure. This model has 244 degrees of freedom. The figure above shows the value of the Chi-squared index = 605,154 with p=000. Other indicators: Chi-squared/df = 2.480, GFI = 0.919, TLI= 0.901, CFI=0.920 all higher than 0.9 (Bentler & Bonett, 1980), RMSEA = 0.051 < 0.08 (Steiger, 1990). Thus, this research model achieves compatibility with market data.

3.5. Research hypothesis test results

Regression Weights: (Group number 1 - Default model)

			Estimate	S.E.	C.R.	P	Label
PTNNL	<---	GD	.428	.177	4.251	***	
PTNNL	<---	LD	.363	.112	3.673	***	
PTNNL	<---	KT	.252	.152	3.535	***	
PTNNL	<---	CN	.210	.107	2.034	***	
PTNNL	<---	QL	.185	.075	1.576	***	
PTNNL	<---	nganh	.127	.062	1.101	.006	

[Source: Analytical results from SPSS 21]

The results of SEM analysis show that there are 6 factors in the model that have an impact on the development of highly qualified human resources in Nam Dinh province, including factors of education-training, labor force, economy, science and technology, and state management of human resource development. central and sectoral levels. All 6 factors are at 10% significance level due to P-value < 0.1. The above regression weights all have positive signs, showing that the above factors have a positive influence on the development of highly qualified human resources in Nam Dinh province.

Table of Hypothesis test results

Hypotheses	***Result***
(H1): Eucation and training have a positive impact on the development of HQHRs in Nam Dinh province.	Accept
(H2): The characteristics of the labor force have a positive impact on the development of HQHRs in Nam Dinh province.	Accept
(H3): The economy has a positive impact on the development of HQHRs in Nam Dinh province.	Accept
(H4): Science and technology have a positive impact on the development of HQHRs in Nam Dinh province.	Accept
(H5): State management of HRs development at the central level has a positive impact on the development of HQHRs in Nam Dinh province.	Accept
With the industry control variable included in the analysis, and the sector factor also has a positive impact on the development of resettlement human resources of Nam Dinh province.	Have a positive impact

We see that all five hypotheses are initially accepted, the factors of Education and training, Labor force, Economics, Science and technology, State management on human resource development at central level and one more factor is considered as a control variable. Industry" also has a positive and positive impact on the development of highly qualified human resources in Nam Dinh province with the results of quantitative research with linear regression equations as follows:

$$\mathbf{PTNNL = 0{,}428.GD + 0{,}363.LD + 0{,}252.KT + 0{,}210.\ CN + 0{,}185.\ QL + 0{,}127.nganh}$$

3.6. Discuss research results

Thus, through the results of quantitative research, it shows that the development of highly qualified human resources in Nam Dinh province is influenced by the following factors: Education and training factor contributes 0.428 points; the labor force factor of Nam Dinh province contributed 0.363 points, the economic factor contributed 0.252 points; science and technology factor contributed 0.210 points; State management factor on human resource development at the central level contributed 0.185 points and lastly, the sectoral factor contributed 0.127 points to the development of highly qualified human resources in Nam Dinh province. Thus, the theoretical model tested in Diagram No1 is the only and official model used and explains the factors affecting the development of highly qualified human resources in Nam Dinh province.

4. Conclusion

Theoretical and practical research shows the important role of HQHRs in socio-economic development at provincial level. In order to ensure that there is enough scale, structure and quality of HQHRs for the realization of the I&M goals, the work of developing HQHRs has a fundamental position and is an important basis for promoting I&M promote socio-economic development at provincial level in the direction of industry and modernity. In this paper, we focus on researching the macro factors affect to the development of HQHRs of Nam Dinh province to caculate the degree of each factor which contributes into developing HQHRs for socio-economic development in Nam Dinh.

SESSION 2:

BUSINESS ADMINISTRATION

STATEGIC RISKS OF REAL ESTATE ENTERPRISES IN VIETNAM MARKET

Assoc. Prof. Dr. Nguyen Minh Ngoc
nmngoc@ufm.edu.vn
University of Finance - Marketing, HCMC, Vietnam
Dr. Nguyen Hoang Tien
vietnameu@gmail.com
Saigon International University, HCMC, Vietnam

Abstract

In recent years, our country's economy has made great progress, the economic growth rate of the following year is always higher than that of the previous year. The real estate market (real estate) also develops strongly and extensively, is considered a market full of potentials and opportunities. Many domestic and foreign investors have seen and grasped these opportunities, a series of new urban areas, supermarkets, hotels, shopping malls, offices for lease, .. have sprung up in succession at Big cities meet the increasing demands of the people. The volatility of the real estate market happens very complicatedly, with erratic heat and cold, sometimes there is a "fever", sometimes "freezing". Because this is a large capital-occupying market, negative changes in the real estate market will strongly affect the economy, which can cause crises to the economy. Therefore, it is necessary to identify strategic risks in order to have appropriate solutions to avoid and minimize losses and damages. Subject: "Strategic risk analysis of domestic and foreign real estate businesses operating in the Vietnamese market" will highlight common strategic risks in the real estate market, as well as provide solutions to solutions and recommendations to effectively prevent and overcome risks.

Keywords: *strategic risks, real estate market, Vietnam market*

1. Introduction

The real estate market is the place where real estate activities and goods exchange between related parties take place, where the purchase, sale, transfer, lease, mortgage and other adversities take place. cases related to real estate such as intermediaries, brokers, consulting ... among actors in the market where the role of State management has a decisive impact on the promotion of development or inhibiting activities doing business in the real estate market. In 1986 Vietnam transformed its centrally planned economy into a socialist-oriented market economy. A series of domestic real estate companies have been established and operated very effectively such as: Vingroup, Sun Group, Vihajico, Novaland, Sunshine Group, ...

Vietnam has been increasingly integrated with the world economy, especially the process of attracting foreign investment and absorbing modern science and technology, increasing demand for industrial real estate, many corporations. Large foreign countries are choosing Vietnam as a country to place production plants and make long-term investments, becoming the premise and conditions for forming industrial real estate demand. Typically Keppel Land is one of the early foreign real estate investors in Vietnam, with 20 licensed projects and a development orientation plan of more than 25,000 housing units in Vietnam, Keppel Land affirms its name, is a leading foreign real estate developer. Typical projects of this developer include Saigon Center (commercial complex, office and apartment), The Estella, Estella Heights, Villa Riviera Point…; CapitaLand Vietnam is a member of Singapore-based CapitaLand Real Estate Group, to date, CapitaLand has provided the housing market in Ho Chi Minh City and Hanoi about 8,000 quality apartments with 12 housing projects, two retail zones. Ascott Limited, a 100% owned subsidiary of CapitaLand, has a portfolio of more than 4,800 serviced apartments in 21 buildings in the above big cities and provinces; ... Foreign investors' investment in Real estate in Vietnam is an opportunity but also a great challenge for the sustainable development of the Vietnamese economy.

However, for input product markets that have important implications for the development of production and business such as capital markets, labor markets, especially the real estate market, is only in the early stages. formation and development, with many limitations and existing risks. Stemming from that fact, it is extremely necessary to analyze the risks and find solutions to perfect the development of the real estate market.

2. Method

The process of analyzing and synthesizing:

+ Analysis research the documents, theoretically from different sources like the newspaper books, the Internet. Next we divide them into separate parts, separate classes to find out specific and profound about the strategic risk of domestic businesses.

+ The synthesis method: is linking each side, each part of the analyzed information creates a new complete and profound theoretical system on the above risks.

+ System protocol: to arrange knowledge to be a system on a basis of a theory that would make sense of the thorough strategic risk. The statistical method is to gather data from different sources later, and then arrange them to establish their own level. A little influence or a lot of business interests, this method will help us determine the risk that affects a lot, the risk that affects less, The degree of influence is how many words come out of prevention options as well as maximum restrictions of risk to business. The methods of efficiency, the overall means to illuminate the problems of reasoning, are to collect the number of all the facts. In fact, through business reports, documents, documents from the professionals, And then rewind it to ascertain the abnormal risk, the cause of the risk, the level of risk of risk, how other businesses, the risk, the success, and the failure of another enterprise, learned to business.

3. Results

3.1. Theoretical basis

3.1.1. Risk

Risk is understood as the quantification of the likelihood of any damage occurring or a lower return than expected. There are many types of risks such as exchange rate risk, market risk, legal risk, credit risk, interest rate risk, real estate risk ...

Risk management is the process of identifying risks and finding ways to manage and limit those risks to the organization. In general, it is the process of looking at the overall performance of the organization, identifying potential hazards and their likelihood. Since then there is the preparation of appropriate actions to minimize those risks to the lowest level. In the past, when it comes to risk management, most people thought of insurance activities. These are package services, in which the insurance buyer will not bear the risk in case it happens. However, the concept of risk management today has changed a lot. With the requirements of the law, the requirements of the employees, risk management has become an increasingly important management factor such as financial management or the management of other resources in the organization.

Real estate investments can make great profits but also face a lot of risks. Real estate risk is expressed through 4 aspects: capital safety, reliability of expected returns, degree of conversion to money and complexity of asset management. These risks can be grouped into two categories: factors affecting investment items that the investor cannot control, called systemic risks and factors that affect only one or two items. The investment can be controlled, called individual risks.

+ Systemic risk: It is difficult for investors to judge and deal with systemic risks such as inflation risk, market supply and demand, conversion into money, interest rates, policy and caused by disasters.

+ Specific risks: Most of the individual risks are related to the misjudging analysis of certain factors of the market such as wrong valuation, incorrect prediction of consumer tastes, inaccurate location selection ...

3.1.2. Real estate management

Real estate business administration of a business is a process of continuous, organized, targeted impact of the real estate corporate governance level in a scientific and artistic way to the process. Real estate business to best use all potentials and opportunities to best perform all real estate production and business activities of the enterprise, in order to achieve the goals set out in accordance with the Law on Real Estate Business and social rate in the volatile conditions of the real estate business environment, with optimal efficiency.

Real estate business activities include: real estate trading and real estate services business:

- Real estate trading is the investment of capital to carry out construction activities, buy, sell, receive transfer for sale. transfer; lease, sublease, lease purchase real estate; real estate brokerage services; real estate trading floor services; real estate consulting services or real estate management for profit purposes.

- Real estate services business is activities that support real estate business and real estate market, including real estate brokerage services, real estate valuation, real estate transaction floors, Real estate consulting, real estate auctions, real estate advertising, real estate management.

Some features of real estate business: Real estate business operates locally and regionally; Real estate business is a big and long-term investment activity; Real estate business is a sensitive activity, strongly influenced by law and policy; Real estate business is both a multi-disciplinary business and a unique business activity. The goal of real estate business administration is to control operations and minimize costs of businesses, improve profits in production and business activities.

3.2. The results of the study and the discussion

3.2.1. Overview of Vietnam's real estate market

The real estate market is one of the markets with an important position and role for the national economy, having direct relationships with the financial and monetary markets, construction markets, building materials markets, labor markets ... The development and effective management of this market will contribute significantly to the process of promoting socio-economic development, creating the ability to attract investment capital for the country's economic development, making a practical contribution to the process of sustainable urban and rural development towards industrialization. , modernizing the country. In the period of the previously centralized planning economy, this market has not had the conditions to develop. But when moving to develop the market economy, the real estate market in Vietnam has gradually formed and developed at a fast pace, which has contributed significantly to economic growth. After a period of formation and development, the real estate market has also revealed shortcomings in market operation mechanisms, legal systems, market participants, in terms of goods structure, transaction, information, management.... The world financial crisis that a resulted from real estate mortgage lending in the United States was a fundamental driver of the recession of most countries around the world demonstrating the enormous impact the real estate market has on the economy. Therefore, the operation of the real estate market to promote the positives and limit the negative effects is a matter of research concern.

3.2.2. Research results

The project "hanging" is one of the biggest and common risks. The hanging project is a hot message causing many frustrations in society. To explain the hanging phenomenon, many people have brought "hundreds of mulberry trees to the head of silkworms", such as:

"hands do not capture the enemy" (do not have capital), tricks of pinning the land for speculation, planning and approving projects.

In Vietnam at present, not only private investor projects are suspended but also a series of projects hanging on the State side. Starting planning is hanging, planning is finished leaving it not implemented. Next was the suspended project, approved the project, built a few stakes and then stopped. Next is the hanging promise, continuously moving the commencement date, the end date of the project; apologize to people many times, promise to return to businesses. Then the profit hangs, there are projects that do not know what to do, the investment purpose is not clear, so when put into use, the more loss. The main risks that a real estate investment project may encounter:

a) Risk on the investor's side:

+ The risk of the investor's financial capacity: The risk occurs when the capital of the enterprise is limited, the solvency of the business is poor, has to borrow with a higher interest rate, so the risk will be higher when the business can be financially active. Currently, most real estate companies in Vietnam operate with low professionalism. The number of enterprises registered for real estate business is very large, but most of them have small capital scale, not suitable for market requirements ... For example, in Ho Chi Minh City, there are currently more than 6,000 real estate businesses but There are only nearly 4,200 enterprises registered for business, of which only nearly 50 enterprises with capital over 100 billion. However, all are still active in a strong way, everyone, whatever they like to do ...

An additional risk and also the current situation of the real estate market is the situation of real estate investment in "fashion". Immediate high profit is the reason why businesses jump into the real estate market. However, not all businesses have a specific market research to come up with an appropriate business strategy. Due to lack of knowledge of the market, many businesses have led to rampant investment, wastefulness, and even speculation, adversely affecting the market. This has been warned to cause turmoil in the real estate market and has a negative impact on businesses themselves.

+ Risk of legal capacity: Real estate is an important asset of each country, real estate transaction relationships often have a strong impact on most socio-economic activities. Therefore, real estate is strongly governed by law and State management. In investment, especially in the real estate sector, even the smallest legal risk can kill the investor ... Risks occur during the appraisal of legal capacity of the investor when there are not enough documents. Proof of legal capacity in accordance with current regulations. Documents proving the legal capacity of the investor include: legal documents, business activity reports, other references.

The unhealthy business environment is the direct cause of many employees - business leaders falling into the labor circle, many times they accidentally violate the law or even not fully aware of the wrong doings. Instead of abiding by the law, market participants casually accept to commit illegal acts if it is already inertia and jointly done by a large number of competitors. Raising interest rates above the ceiling is the inertia of the banking market, which exists long before the banking cases are heard. Some defendants at the time of the breach simply thought that they were doing the same as the market competition.

+ Business capacity risk: Operational capacity risks are corporate governance risks that arise when the leaders do not have the capability and qualifications to lead the business or are unable to lead due to their age, reacting less flexibly to market fluctuations. Another case is that the leader, despite having good qualifications and capabilities, is incapable of internal unity and unity. The lack of consensus of the members will result in inaccurate decision-making. Profitable decisions are sometimes not made. Instead, decisions can undermine the benefits of the business.

Resource-based views suggest that entrepreneurship is seen as a valuable and rare resource that competitors can hardly copy or copy, thus contributing to creating sustainable and valuable competitive advantage. An entrepreneur is a person who directs and acts to lead the business of an enterprise. Their business decisions are influenced by their personal characteristics, knowledge, skills, and abilities. Therefore, entrepreneurs need to have a wide variety of knowledge and skills to fulfill their complex roles in the business, while taking on the three basic roles that are the entrepreneur's role.

b) Project risks:

+ Risks of mechanisms and policies: Changes in policy lines of the State and local authorities may have impacts on the operation of the real estate market in general and the investment into real estate in particular. Specifically:

• Policies that have indirect effects such as: the encouragement of external investment in the locality can increase the demand for real estate, thereby causing real estate prices to rise.

• Direct impact policies such as:

♣ Policies allowing overseas Vietnamese to buy real estate in Vietnam.

♣ Policy allows people who do not have a city registration to buy houses in the city.

♣ Financial policies apply to people who are allocated or leased land by the State ...

♣ Credit policies for investment activities in real estate

♣ State tax policies for real estate

Currently, the Vietnamese legal system is still not uniform; the tax system has not been renewed; The real estate registration system is divided, not enough conditions for a public and transparent management system; it is not easy enough in exercising the right to mortgage, guarantee, contribute capital with real estate to increase investment capital from the hidden capital in real estate; has not been able to mobilize people's savings to invest in real estate; land use planning is still weak; the system of management agencies and managers still has many inadequacies, not yet well served the people; There are still many mistakes in the application of new laws on land ... Administrative procedures are too cumbersome to unnecessary, costing time and money, and missed investment opportunities ...

The lack of professionalism is shown in many aspects, including the legal system: An incomplete and not strong legal corridor has caused the overall inconsistency to adjust. Policies mechanisms with overlaps, shortages and low effectiveness make it difficult to apply in practice. Issues that are considered to be the biggest hindrance are: investment procedures, land allocation procedures are still complicated, not linked to the rights of users and owners; compensation, site clearance and issues related to planning... For example, the state management of housing markets, new urban areas, condominiums and offices for rent lack some adequate regulatory mechanisms in the transaction. It is a fact that many products of new urban housing projects, apartments, offices for rent have been bought from the project's inception. There are many projects that have been renamed, changed owners and the owners selling products are not entirely the investors.

In order to be able to buy land and houses in new urban areas at an acceptable price, most investors have to accept to pay the investor when the investor is not legally eligible to sell a house (not finished the foundation). Therefore, both investors and home buyers have to circumvent the law in the form of business capital contribution contracts or investment contracts. Because it is not protected by the law, there will be a lot of trouble when disputes arise.

+ Macroeconomic risk: The price of real estate depends on macroeconomic factors such as:

- The situation of real estate supply and demand in the region
- Characteristics of the people participating in the real estate market Regional Real Estate
- Regional real estate market conditions
- Current status of the neighborhood (infrastructure such as roads, water supply and drainage systems, electricity supply, communication ...)
- Annual GDP growth rate of the region
- Average annual income of people in region (high, medium or low) compared to other regions
- The ability to meet the credit needs of the credit system in the region;
- Number of plots, vacant land plots in the region
- Average price of land in the region
- Tax rate and tax rate
- General inflation
- Labor market, stock market, market credit in the region.

+ Interest rate risk: Interest rate directly affects the cost of capital and then investment efficiency. Assuming that in the context of rising inflation, the State Bank of Vietnam decides to increase the required reserve ratio, increase the base interest rate in VND and issue compulsory bills of credit to credit institutions to enforce the monetary tightening policy and curbing inflation. These measures have led to a race of deposit rates among credit institutions and as a result increased VND lending rates. The result of this increase in interest rates will directly affect businesses to borrow money from banks to maintain operations and expand production, causing interest expenses to increase, leading to a decline in business results.

On the other hand, real estate investment requires a huge amount of capital, so investors usually have to borrow money from many sources. Re - loans are usually medium and long term loans. But the interest burden is proportional to the length of the project. Therefore, interest rate is a variable that has a great impact on the discounted cash flow of invested capital. Whether the project brings more or less benefits depends greatly on the interest rate.

+ Financial risks: The financial security of the project is the content to be considered in the financial appraisal of an investment project. It is an important basis for evaluating the financial feasibility of a project. Financial risks occur when capital cannot be guaranteed, capital stagnation occurs. The expected capital security is shown in the legality and practical basis of mobilized sources. If it is equity or joint venture, there must be a commitment on the progress and the amount of capital contributed by the shareholders or the joint venture parties. If it is equity capital, there must be an explanation of the business operations of the establishment 3 years ago and now proving that the establishment has been, is and will continue to operate effectively, with accumulation. and thus ensure capital is available for project implementation.

Risks may occur due to the calculation of the proportion of capital mobilized capital accounts for in the total investment. When determining the funding sources of the project, the capital structure of the project was not properly determined. Or the incorrect calculation of the annual fund needed due to price fluctuations or inflation. During the appraisal, it is necessary to check the capital commitment of the capital contributor, lender or sponsor. Checking commitments to ensure credit capital open L / C at funding agencies.

+ Market, income and payment risks: The market greatly affects the success or failure of real estate investment projects because its price depends largely on the supply-demand relationship in the market. When demand is greater than supply, real estate prices are often pushed up; On the contrary, when demand is lower than supply, real estate prices tend to decrease. Real estate prices also depend on factors stemming from market defects such as "monopoly", "speculation", "unfair competition".

The demand for real estate in Vietnam is huge, but this does not mean an abundance of purchasing power. The reason is that people's income is still very low. However, many assessments of the real estate market of many real estate management companies mostly focus on emphasizing, even excessively, the demand for real estate, creating heat in the speculative market. A part of businesses, short-term investors have benefited from the increase in real estate sale / rental prices. However, in the long run, this situation will have serious consequences for the entire economy.

Real estate prices in major cities in Vietnam are currently considered too high compared to the level of income of the people as well as the level of economic development and the real value of real estate. This situation has directly affected the socio-economic development process and makes housing creation of most low-income people difficult. Not only that, high land prices cause great pressure for investors, especially investors in the industrial infrastructure sector. Team project costs increased significantly due to the constantly increasing volatility of compensation costs, site clearance, land access.

+ Construction and construction risks: During the construction and construction process, real estate projects can face many risks such as insufficient capital, materials not meeting the requirements, skills of workers, ... these risks have a great impact. to the completion of the project. Specifically, divide risks into two main groups as follows:

- Construction location: affect investment capital, price, competitiveness, determine the effectiveness of real estate investment projects. Risks occur when the location is inconsistent with the long-term economic development forecast, the local transport network construction plan, the existing facilities of the investment site are inappropriate, the climate of the places with fluctuations ... It is necessary to learn about natural conditions (climate, hydrology, water sources ...), social conditions (population, customs, economic activities ...), conditions of regional development plan, plan, and economic factors of the site.
- Construction scale: Risk occurs when the total cost estimate, cost estimate of each work item is omitted, incorrect, the items needing investment that have not been estimated, or investment in the items is not required. set. When appraising, it is necessary to check the price contracts of the project. For example, the construction does not guarantee proper construction techniques, the labor safety measures are not guaranteed, causing accidents. The Can Tho Bridge collapse on September 26, 2007 caused over 40 billion VND in damage, 54 deaths, and 80 injuries is an example of how great a construction risk occurs.

Therefore, it is necessary to propose suitable bidding, selection of contractors, and contract guarantee. Consider and evaluate whether construction proposals and solutions are appropriate to the norms and construction needs for each work item?

+ Risk of supply: Raw materials, suppliers, tax policy, .. are the things that affect the ability to provide inputs to the project. When the supply of inputs is not guaranteed, it will affect the construction progress of the works. When appraising, it is necessary to check package contracts and contract guarantees, assess the reputation of suppliers of materials.

+ Operational and maintenance risks: Depends on the investor's ability to manage real estate. Especially in Vietnam today, there is a lack of professional managers because this is a relatively new profession. There are always risks in operating a real estate. Although in the process of planning the project, the investor has to research carefully, but because the information is not perfect and everything is always for development, there will always be unexpected events happening. On the other hand, due to the long real estate construction process, when put into operation the technical standards will no longer be guaranteed, the original design will no longer be appropriate.

+ Social environmental risks: Social factors also have a great impact on real estate values. An area where the population density suddenly increases due to the growth of the mechanical population, the value of real estate there will increase as the supply-demand balance is broken. On the other hand, other factors in the region such as quality of health care services, education, people's education, security issues, and local people's habits also affect the value of real estate. Status of people living in real estate, health status, occupation and employment status, family and social relationships of people living together ... The issues related to feng shui must also is scrutinized.

4. Conclusions and Recommendations

4.1. Conclusions

Nowadays, real estate is primarily a commodity. Real estate creation and real estate price formation always include natural, economic and social factors in addition to internal factors such as the law of supply - demand, and the law of value. The real estate market is objective, but risky and includes many opportunities for great returns, especially in a developing economy like Vietnam. Capital for the real estate market must always be a medium to long term source and is often in the same direction as the market price and size. Because the real estate market not only depends on the law of pure value, it is a double-edged sword for investment capital in general and the real estate market in particular, so capital solutions for the real estate market products must be strategic, stable, transparent and professional.

In general, although the market in general and real estate businesses in particular in the coming time will have difficulties, the advantages are still many. The most obvious is the capital story when the market is about to enter a more difficult and quiet period. This is a challenge for the market in general but also an opportunity for large, reputable, potential and long-term businesses.

+ Operational and maintenance risks: Depends on the ability of the investor to manage the property. Especially in Vietnam, there is a shortage of professional managers because this is a relatively new profession. In operation, a real estate is always potentially risky. Although in the process of making the project the investor has to study thoroughly but due to imperfect information and everything is always mobilized to develop, there will always be unexpected events. On the other side, due to the long construction of real estate, when put into operation technical standards will no longer be guaranteed, the original design will no longer be suitable.

+ Social environmental risks: Social factors also have a big impact on real estate values. In an area where population density suddenly increases due to the growth rate of the mechanical population, the value of real estate there will increase due to broken supply and demand balance. On the other behalf of other factors in the region such as: quality of health services, education, people's intellectual level, security issues, customs of people in the region also affect the value of real estate. Status of people living in real estate, health status, occupation and employment status, family and social relationships of people living together ... Matters relating to feng shui theory must also be scrutinized.

4.2. Recommendations

Nowadays real estate is first and fore fore fore fore foreth over the world. The creation of real estate and the formation of real estate prices always include natural, economic and social factors besides internal factors such as the law of supply and demand, the rule of value. Real estate is objective, but full of risks and includes many opportunities for large income, especially in a developing economy like Vietnam. Capital for real estate always has to be a medium and long-term source and often has the same proportions as the price and size of the market. Real estate investment is not only dependent on the law of value, so it is a double-edged knife for investment capital in general and real estate in particular, so the capital solution for real estate investment must be strategic, stable, transparent and professionalized. The key tools to solve the capital problem for real estate investors are: discount works, investors, investors, medium and long-term commitments have enough evidence to be protected by law to reduce risks and even solutions to discount real estate debt when the conditions that form that real estate are qualified.

Overall, although the market in general and real estate businesses in particular in the coming time have difficulties, but the advantages are still many. The most obvious is the capital story as the market prepares to enter a new, more difficult and quiet phase. This is a challenge for the market in general but also an opportunity for large, reputable, potential and long-term businesses.

Recommendation:

Plan ahead: many investors buy a home because they think they have a good deal and then try to figure out what to do with it. This is actually a reverse mindset. Accordingly, first of all, they must find out their plan first, then find a house or real estate suitable for that plan. Remember, you must choose the investment model before looking for the asset to match it.

Having a reliable information network: the key to early investor success is to build a reliable and appropriate team of experts. At the very least, they need to have a good relationship with a real estate agent, an appraiser and a professional lawyer. Because these are the people who will provide all useful information for an investor from accessing the real estate until officially owning it, to avoid investors falling into the case of buying or being deceived.

Always keep stable cash flow: Real estate has quite poor liquidity, so keep the cash flow very stable. If your real estate investment strategy is to buy, then sublease to more than one person, then you need to have enough cash to cover expenses such as maintenance costs, damage repairs ...

Don't get cornered: Many people buy a property and get stuck with it because they have only one way out, a single plan to do. Suppose the investor has only one plan, to sell the property or lease it out. But when the investors can't sell, or they can't rent out, what happens? So always having at least 2, preferably 3 different plans, will be a way to help investors avoid being cornered. For example, if an investor buys a house with plan A to restore the house and then resell it, then plan B could be to keep the house and lease it to cover the costs, plan C, which is to sell to another investor at a price slightly above or below the market price, hoping to still make a profit.

Some effective real estate marketing strategies to help increase revenue:

+ Identify and research target markets

+ Expand budgets for marketing campaigns

+ Develop project websites and use digital marketing channels

+ Promote sales through word of mouth marketing

+ Responding to customer needs quickly

+ Regularly posting about real estate projects

+ Branding

Abstract

With the explosion of The Internet and online media, travel becomes more accessible to everyone, especially the younger generation through online marketing. Rooted in the emergence of travel influencers, one form of online promotion, namely influencer marketing, has become a trending media channel for tour operators. According to the relevant survey of 821 zoomers occupying in Hanoi (of which 800 valid samples are included in the analysis), after the qualitative analysis, regardless of 10 original categories of Travel Social Media Influencer Value (TSMIV) respectively (1) Informative value, (2) Entertainment value, (3) Expertise, (4) Trustworthiness, (5) Attractiveness, (6) Similarity, (7) Familiarity, (8) Likability, (9) Personality and (10) Number of followers, the authors addressed two additional ones, namely (11) Interaction, (12) Occupation. The Exploratory Factor Analysis (EFA) then was concluded with 7 newly adjusted classifications of TSMIV characteristics or aspects including (1) Charisma and trustworthiness, (2) Similarity and familiarity (3) Informative value, (4) Communication and interaction methods, (5) Degree of identification, (6) Level of pervasiveness and (7) Professionalism in tourism.

Key words: *Influencer, travel influencer, Travel Social Media Influencer Value (TSMIV)*

1. Introduction

The growth in tourist arrivals is the key to tourism success. Therefore, marketing strategies are always stimulated and periodically changed by tourism managers in each stage of the society in order to catch the trend, to attract domestic and foreign tourists to their destinations and to help increase tourism demand. To create effective strategies, it is necessary for the managers to understand customers' needs and desires for information and brands related to their destinations as well as the change in customer perception when approaching each type of marketing. One of the decisive factors that affect their decision is the trust and positive brand attitude toward the destination built with data collection from reference sources, to which influential people in the tourism sector significantly contributed.

According to a report by We are Social and Hootsuite which are two organizations that publish annual reports on digital and social media trends around the world, the number of social media users in Asia Pacific (APAC) increased by 9.8%, reaching 2.14 billion people by 2020. The statistics further indicated that in February 2020, there were 67 Vietnamese people using the Internet with 6 hours and 42 minutes spent online on average, of which an average of 2 hours and 32 minutes is for surfing on social networks and 2 hours 31 minutes is for watching live streams or online videos. These above figures already demonstrated the influence of the internet and social networks in daily life of every single Vietnamese, especially Generation Z, who are always the fastest and keenest adapting to technology evolution. The Internet in general and social networks in particular, consequently, is successfully used as invisible referential sources for them to seek the answers to all kinds of questions as well as to satisfy their curiosity. Understanding customers' mindsets, travel influencers have appeared as destination ambassadors to convey messages and raise destination brand awareness among young travelers. It is influencer marketing that takes advantage of their vast popularity to inspire people and spread the word via social networking sites with the content compiled by organizations, businesses or by themselves based on their personal experience and their own feelings. However, their popularity and influence on tourism among young followers is obviously unlike celebrities'.

Involved with Travel Social Media Influencer Value (TSMIV) considering the perception of Gen Z (11–26 years old), this paper can be deployed and regarded as the foundation and premise for further research on other age groups as well as other local and foreign communities to come up with suitable development strategies for different customer markets and a variety of geographic target ones.

2. Method

Data collection methods

The research team accomplished collecting data with two methods:

- Secondary data collection method is adopted in the early stage of the study through reports and statistics from research organizations, relevant research papers on reported topics; involved agencies and departments in general and particularly ones in Hanoi; Vietnam National Administration of Tourism and Hanoi Tourism Department.

Likewise, the group of authors also collected data from a number of reputable journals concerning tourism marketing and influencers. In addition, the group conducted research on some specific local and foreign influencers through online media to add data to the research paper.

- Primary data collection method practiced in the later stages of the study through surveying Generation Z- research subjects- in Hanoi is accompanied by two sub-methods: in-depth interviewing and online survey via questionnaires. In detail, in-depth interviews were conducted prior to the official investigation, to detect and reference arising opinions during the research process in comparison with previous studies. The officially selected method of data collection is an online survey with questionnaires on social networks, Facebook, to be specific- which records the largest number of users nowadays on account of its high authenticity and easy access to a great deal of subjects aged 11 - 26 in Hanoi.

Data analysis methods

For zoning the scope and object of the study as well as to achieve the research targets, the authors decided to apply both qualitative and quantitative research methods in this paper.

Accordingly, qualitative research is adopted to discover new factors or observational variables that contribute to the trust and perspective of the generation Z toward the destination brand through tourism influencers who have not been proven or verified yet in previous relevant papers. In detail, qualitative data collection through in-depth interviews with Hanoi citizens from gen Z, chosen with the target sampling method is to supplement and adjust the research design matching with the set criteria as well as ensuring the research context updates.

Exploratory Factor Analysis (EFA)

Exploratory Factor Analysis (EFA) is designed to explore the nature of response underlying constructs to reduce data (J DeCoster, 1998) or simply to eliminate inappropriate scales and discover new factor groups. While Cronbach's Alpha's test helps the research team check the reliability of the scales, EFA factor analysis in the later step is responsible for evaluating the convergence and divergence of the factors. According to Meyers L.S., Gamst G., Guarino A.J. (2000), regarding factor analysis, Principal Components Analysis merging with Varimax rotation is the most commonly used.

Measurement scale development

After referencing and selecting data from previous studies on related topics and obtaining the result from the qualitative research (using in-depth interviewing method), the research team managed to summarize and arrange those measurement scales for groups of factors in the table proposed below

The degree of influence of the scales on the trust and perception of the destination brand of Generation Z in general and Generation Z in Hanoi in particular through influencers in the tourism sector is quantified according to the Likert 7 scale instead of the usual Likert 5 scale because in the view of The degree of influence of the scales on the trust and perception of the destination brand of Generation Z in general and Generation Z in Hanoi in particular through influencers in the tourism sector is quantified according to the Likert 7 scale instead of the usual Likert 5 scale because in the view of Barnes et al (1994) that the 7-point scale does not affect the analysis of scales and factors while improving reliability. of the answers. In particular, the points of the respective scale are: 1 = Totally disagree; 2 = Strongly disagree; 3 = Disagree; 4 = Confused, neutral; 5 = Agree; 6 = Strongly agree; 7 Totally agree.

Table 1. Constructs and Measurements

Constructs	Measurements	Item	Studies/Source
Informativeness	Advertisements supply relevant information on destinations.	TT1	Robert H. Ducoffe (1995)
	Advertising provides timely information on destinations.	TT2	
	Advertisements tell people about destinations when they need the information.	TT3	
	Advertisements indicate travel influencer's responsibility.	TT4	Qualitative research results
	Advertisements are similar to what we found.	TT5	
Entertainment	Advertisements are entertaining.	GT1	Robert H. Ducoffe (1995)

3. Results

3.1. Literature Review

Influencers and Travel Influencers

In the era of social media appeared a new type of celebrity - micro-celebrity, involving with self-expression on social media and self-branding by creating a distinctive public image to attract a large number of followers' attention (Khamis, Ang, & Welling, 2016; Marwick, 2015; TM Senft, 2008; T Senft, 2013). Micro-celebrities on social media are often referred to as influencers. In fact, "influencers" can be ranged from either "potentially famous" or not widely well-known actresses and models, fitness coaches, friends of celebrities and the wealthy whose love for high-end products to pretty high-school girls (Abidin, 2016; Marwick, 2015; Saul, 2016). (Chae, J. (2017)).

On the other hand, according to Keller and Fay (2016), tastemakers can be depicted as consumers who perform higher-than-average possibilities of information seeking by which they continue to share ideas, information, and suggestions with others. These can be accomplished by actively giving comments on their preferred products and services, gaining relevant knowledge while searching for advice and their brand insights.

While discussed in Freberg et al. (2011), social media influencers (SMI) represent a new independent third party who shapes audience attitudes through blogs, tweets and other mediums. There was a completed document on public relations identifying influential spokespersons' characteristics but the audience perceptions of SMI is, still, a recondite matter.

Social media influencers represent "a new type of independent third party endorser who shape audience attitudes through blogs, tweets, and the use of other social media" (Freberg, Graham, McGaughey and Freberg, 2011, p. 90). Recognized as opinion leaders, they can enhance the influence of information that is passed on to others (Jalilvand, 2017; Uzunoğlu & Kip, 2014). Other studies on different areas rather than tourism, such as culture (Magno, 2017) and fashion (Halvorsen, Hoffmann, Coste-Manière, & Stankeviciute, 2013), have recorded increasing engagement of influencers in the digital environment and the mechanisms by which they control the attitudes and decisions of their followers. These matters can be further approached through current research notes.

According to Ed Keller and Brad Fay (2016), influencers, especially ones in tourism can be considered as upscale inspirational promoters on social networks, who are renowned among the cyber communities. They perform higher-than-average possibility of exploring the information about destinations, sharing informative ideas and recommending travel tips for their followers.

To summarize, travel influencers are those who have a large following on social networking platforms, creating and sharing informative contents regarding tourism. This group may include (1) Professionals in tourism (lecturers, PhDs, experts in tourism); (2) Celebrities (actors, singers ...); (3) Individuals working on social media (travel bloggers, vloggers …) ...

Characteristics of social media travel influencers

- *Advertising Value (Informative and Entertainment Value)*

As stated in Sheth and Uslay (2007), from a marketing perspective, value was recognized to be created and exchanged via marketing practices while marketing services were proposed to possibly satisfy consumers' needs. In particular, advertising value refers to "a subjective evaluation of the relative worth or utility of advertising to consumers" (Ducoffe, 1995, p.1). To further research, Ducoffe (1996) investigated the determinants of online advertising value: informativeness, entertainment and irritation. Additionally, he made a proposal of consumer perceptions of advertising value, positively predicting their attitudes toward online adverbs. The informative value of advertising refers to the ability of an advertisement to inform customers of alternative products in order to promote consumers' satisfaction (Ducoffe 1996). Meanwhile, the entertainment value matches with the assumptions in a valid practical study of McQuail in 1983 where adverbs are considered as media contents and the entertainment impact on consumers was also mentioned (Ducoffe 1996). On the other hand, irritation describes how advertising can annoy, offend and manipulate consumers, or take their attention away from the content of speech (Ducoffe 1996). In short, the information and entertainment value reflect positive perceived and emotional values of advertisement, while irritation represents the negative consumers' response to the ad, rather than its value (Sun et al. 2010). Besides, Dao et al. (2014) examined how the value of advertising on social networks affects consumers' online shopping intention. They then demonstrated that those ads furnishing the audience with informativeness, entertainment, and credibility establish consumers' perceptions of advertising value, which accordingly influences their buying intent.

- *Source credibility (expertise, attractiveness, similarity, trustworthiness)*

The credibility level of a communicator or a transmitted message can be considered as a significant determinant of its persuasiveness (Hovland và Weiss 1951). Hall (2015) used to describe social media influencers as "micro-endorsers" (compared to "bigger" celebrity endorsers) who, in advertising, often play the same role as message sources in the persuasion process, whilst multiple earlier researchers utilized the degree of reliability to evaluate source impact on the persuasive efficacy of messages (e.g., Giffin 1967; Hovland and Weiss 1951; McGuire 1985). At first, Hovland, Janis and Kelley (1953) proposed two factors determining source credibility: expertise and trustworthiness. Expertise is defined as the capacity or qualification of the source, including the specialized knowledge or skills, of making a statement about a certain subject (McCroskey 1966). Trustworthiness is related to an individual's perception of a source as being reliable, sincere, or honest (Giffin 1967). McGuire then in 1985 proposed a third component of source reliability: charisma, which refers to the physical attractiveness or likability of a source. Likewise, Ohanian (1990) defined source reliability as a three-dimensional structure, based on previous research topics including credibility, expertise, and available charisma.

- *Number of followers*

The number of followers plays a critical role in enhancing the approach of influencers' messages (Arora et al., 2019; Belanche et al., 2020: Djafarova and Rushworth, 2017). It also serves as a measure of influencers' popularity. In fact, influencers are categorized based on different levels of popularity (i.e. large, macro, and micro) which are suggested in their follower count (Childers et al., 2019; De Veirman and partner, 2019). However, a larger number of followers does not parallel with better customers' engagement (De Veirman et al., 2017; Djafarova and Rushworth, 2017). As noted in De Verman et al. (2017), popularity on social media is not equivalent to influencers' capacity of guiding their followers' respective. In contrast, follower count may be negatively related to the engagement. The main reason why the followers continued to accompany those influencers is their perceptions of influencers as individuality, authenticity and relevance (Belanche et al., 2020; Jin et al, 2019; Lou and Yuan, 2019; Schouten et al., 2020). However, when a sizable number of followers on social media is accumulated, the sense of connection with those tastemakers might disappear, which then results in diminished interactive behaviors.

- *Familiarity*

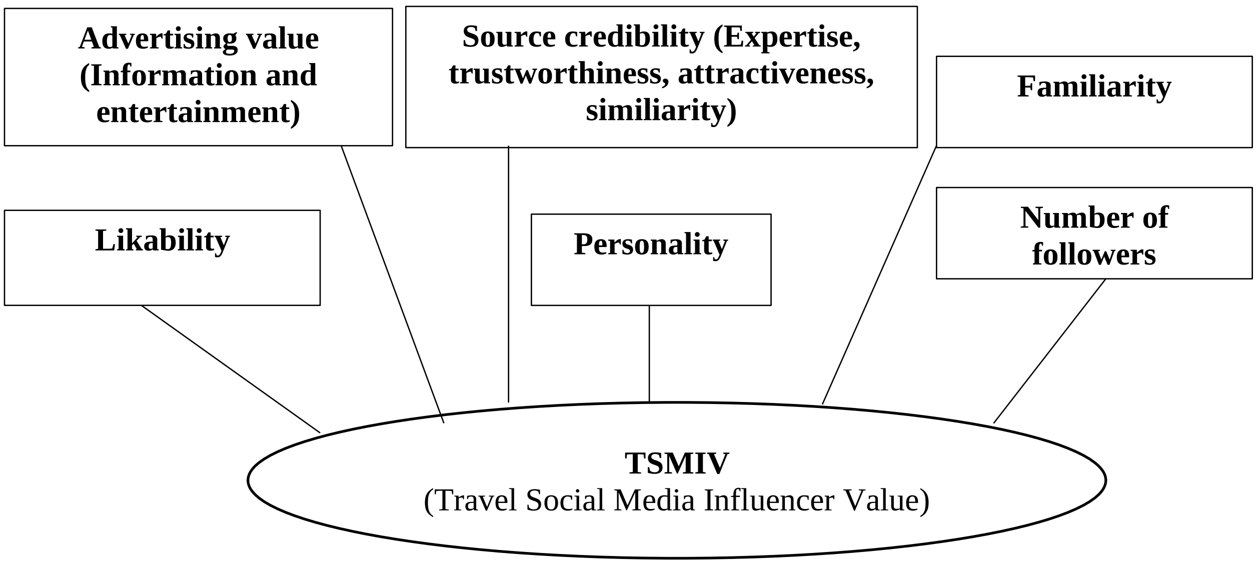
Customer familiarity with a source depends on the amount of information exchanged in the past (Martensen et al. 2018) which means that the intimacy provides the audience with a certain degree of comfort, thus making received messages seem more convincing. Martensen et al. (2018) and Hoffner (2008) further explained that concerning the relationship between social media influencers and their followers, even though the interaction is considered one-sided, they often feel connected and sympathetic to their influencees. In both Deatara et al. (2019) and Martensen et al. (2018), researchers agreed that the intimacy between those bethwether and their followers can foster their trustworthiness. In other words, if consumers perceive their familiarity, they are more likely to trust them which, thereby, positively affects their purchase intent. Researchers, Lee and Watkins, in 2016, demonstrated that influencers positively influence consumer buying intent when promoting brands in their posts while in Chapple and Cownie (2017), an interview study, consumers replied that they regularly follow their followees' recommendations for products by purchasing or further inducing them to people around.

- *Likability*

Unlike several foregoing studies in which likability was used interchangeably with available charisma (Maddux & rogers, 1980), current studies indicated that trend adopters influenced by the charisma / personality of the ambassador, or their intimacy / familiarity with the observers (DeSarbo & Harshman, 1985; Giffin, 1967). Teven (2008) also found that likability is positively correlated with the perceived credibility of political candidates. In another case, Brodsky, Neal, Cramer and Ziemke (2009) discovered witnesses' likability can affect the perceived trustworthiness of their evidence provided in the court. Witnesses with a higher degree of likability were considered to be more reliable than ones with lower levels (Brodsky et al., 2009).

- *Personality*

Personality can be the main determinant of the application of different influence tactics. In detail, Bond (1983) discovered that the personality of travel influencers affected their followers' attitudes and behaviors.



(A summary by the group author, 2021)

3.2. Research result

Demographic characteristics

The overall official research samples on this topic consist of several members in gen Z living, studying and working in Hanoi and the sample data are collected from passed-on online surveys. The total number of responses collected by the research team was 821. After 21 invalid responses were rejected (due to invalid information / identical votes), there were 800 valid responses involved in quantitative data analysis.

Table 2. Demographic characteristics

	Measurement	Frequency	Ratio (%)
Gender	Male	312	39.0
	Female	477	59.6
	Do not want to specify	11	1.4
Age	11-15	140	17.5
	16-18	115	14.4
	19-22	397	49.6
	23-26	148	18.5
Occupation	Student	628	78.5
	Office staff	71	8.9
	Workers, engineers	30	3.8
	Teacher	28	3.5
	Others	43	5.4

Exploratory Factor Analysis (EFA)

After the preliminary assessment on the reliability, The observable variables will be included in the exploratory factor analysis EFA to reduce data, and at the same time the reliability (Sig) will be measured to test the correlation between the observed variables and help the research team discover new groups of factors, re-adjust the research design and hypotheses stated in previous chapters.

Table 3: KMO and Bartlett's Test

Kaiser-Meyer-Olkin Measure of Sampling Adequacy		.972
Bartlett's Test of Sphericity	Approx. Chi-Square	39494.974
	Df	1830
	Sig.	.000

(Source: Analyzed by authors, 2021)

The KMO value = 0.972 satisfying the condition $0.5 \leq KMO < 1$ and the value of Significance level was < 0.05. Thus, on the whole, each observed variable of the factors driving the level of trust and perception among people from Gen Z in Hanoi of destination brands through tourism influencers interrelates with all the others.

After three times of conducting exploratory factor analysis EFA (of which the result each time is removing those scales with < 0.5 factor loading or showing < 0.5 factor loadings in two columns with their difference is > 0.3 (Jabnoun & Al-Tamimi, 2003)), it is included that those factors are divided into 7 groups named according to the significance of the scale. Since the load coefficients are > 0.5, they are considered to be practically significant The total variance extracted is 69.747%, > 50%. The new factor groups were continuously included in Cronbach's Alpha coefficient analysis and all received Cronbach's Alpha values > 0.6.

Table 4: Rotated Component Matrix

	Component							**Rename**	**Cronbach 's Alpha**

(Source: analyzed by authors, 2021)

After data processing, the independent variables are categorized into 7 factor groups (which all perform appropriate Cronbach's Alpha values), namely:

- Group 1: Charisma and trustworthiness: TNDDN8, TC2, TC3, TNDDN2, TC4, TC5, TNDDN4M TNDDN1, SHSC4, SHSC3, UT4, UT2, UT1, UT3, SHSC1, GT2.

- Group 2: Similarity and familiarity: STT1, STT2, STT5, STD4, STD1, STD2, STD3, STT4.

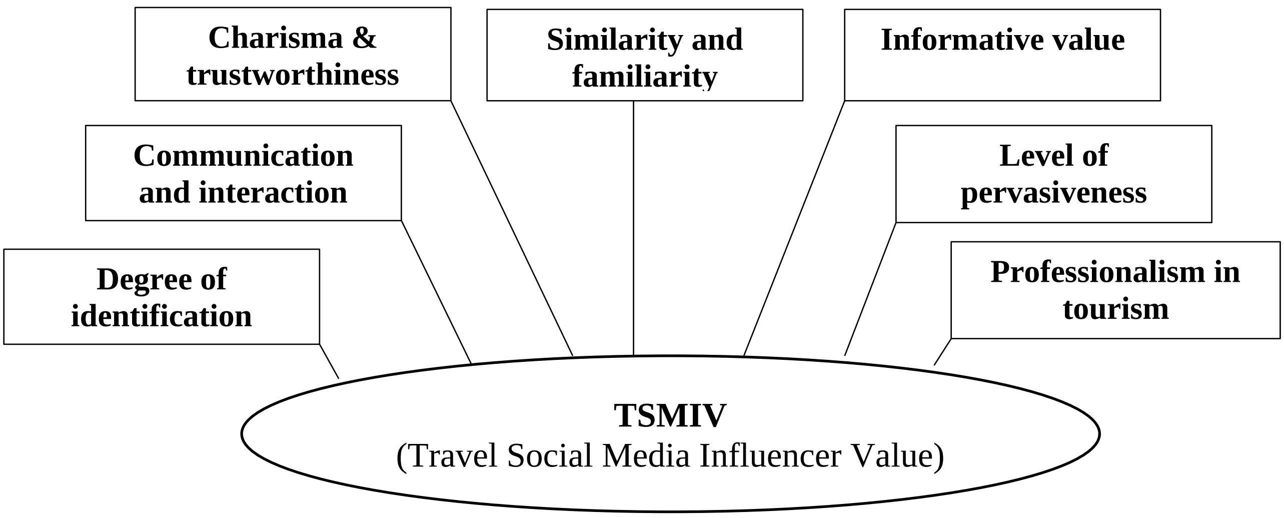
- Group 3: Informative value: TT1, TT2, TT3, TT5.

- Group 4: Communication and interaction methods: STgTac3, GT3, STgTac4, GT1.

- Group 5: Degree of identification: SLNTD5, SLNTD6, SLNTD4.

- Group 6: Level of pervasiveness: SLNTD2, SLNTD1, SLNTD3, NgNg2.

- Group 7: Professionalism in Tourism: KTCM4, KTCM2, NgNg1.



(An summary of EFA results by authors, 2021)

4. Discussion and Conclusion

The research results by the authors issued 7 groups of factors showing the characteristics of tourism influencers that affect the trust and perspective of generation Z in Hanoi toward destination brands. Among them, there are factors being similar to those included in the original SMIV model as well as in other studies, and added with new scales through qualitative research.

The original SMIV model in Lou, C., & Yuan, S. (2018) introduced factors of influencers that impacted on confidence and perception of brand image in business and services, including trustworthiness, charisma, similarity, expertise, informativeness and entertainment value. The research by the author resembles this model as through the data research, processing and analysis with qualitative and quantitative analysis software and tools, it retained the scales of factor measurement of Similarity and familiarity, Informative value, Professionalism, Charisma and Trustworthiness which influence the dependent variable of brand, confidence and perception. Two groups of factors: Degree of Identification and Pervasiveness are synthesized from Colin Campbell's research and Justin Rapp Farrel (2020) in which 2 scales are excluded from the model base, Number of followers, respectively “Over 100,000 - 1,000,000 people"” and “100,000 people”. The factor groups remain, Methods of communication and interaction, including two scales referenced by Robert H. Ducoffe (1995), “the influencers’ speech is highly entertaining and relaxing” and “the influencers’ statements are amusing” and two further scales discovered during the qualitative research by the author, “Those influencers in tourism often interact directly with their fans” and “Those influencers frequently organizes minigames and gives gifts to fans”. Underlying that similarity is that most of previous related papers did not focus on specific groups of subjects marketing-related activities and influencers in general. Therefore, working with a certain target group, Generation Z in Hanoi ,in a particular field of marketing, tourism branding, this study by the group of authors still covers basic characteristics satisfying those factors mentioned in previous ones.

Moreover, due to the up-to-dateness of the research context, along with the diversity of the survey samples, there is a number of new additional scales emerging. In detail, the scale “The information that influencers in tourism provides matches the information I have searched before" is added to the factor group, Informative value, while the scale, “Influencers in tourism have persuasive skills” is included in Charisma and trustworthiness.

In Martensen et al (2018); Agrawal and Kamakura (1995); Misha & Beatty (1990); DeSarbo and Harshman (1985); Stephen Reysen (2005); Digman and Takemoto-Chock (1981); Peabody and Goldberg (1989), groups of factors regarding personality, charisma, likability and trustworthiness are checked and verified to independently impact the subjects' confidence and perceptions of shared areas, non-specific fields. However, according to the research results in Chapter 3, the authors have obtained a group of factors concerning Charisma and trustworthiness with a series of collected scales that generally express personality, available charisma, likability and trustworthiness, showing the distinction in the samples of research subjects compared to the former. Unlike the study based on the number of followers in Colin Campbell, Justin Rapp Farrel (2020), the research by the author group divided Number of followers into 2 subgroups of factors, Degree of identification and Level of pervasiveness, demonstrating the importance of tourism influencers' accessibility to their followers conforming to the perspective of Generation Z in Hanoi. The method of communication and interaction group is composed of scales on approaching methodologies by which influencers can approach their followers and the desire of generation Z in Hanoi to convey creative statements. As regards Professionalism in tourism, Roobina Ohanian (1990) indicated 5 scales measuring the expertise of travel influencers, of which only two remained after the EFA analysis, namely, "The influencer in tourism must be a tourism expert" and "The influencer in tourism must be someone with professional qualifications (diplomas, certificates)", affirming that thanks to the development of online social networks, Generation Z can easily obtain information about the destinations from a variety of sources, and consequently, they desire to access those statements by the more qualified and trustworthy.

In conclusion, according to results of the research by the author group, among 7 groups of factors demonstrating the characteristics of travel influencers, including (1) Charisma and trustworthiness; (2) Similarity and familiarity; (3) Informative value; (4) Communication and interaction methods; (5) Degree of identification; (6) Level of pervasiveness; (7) Professionalism in tourism, there are 4 ones (1) Charisma and trustworthiness; (2) Similarity and familiarity; (3) Informative value; (4) Professionalism in tourism, after the assessment, serving the similar model with the original, of which two scales are newly discovered and included. The other three junior groups, (1) Communication and interaction methods; (2) Degree of identification; (3) Level of pervasiveness are recently added to the model based on previous studies and the results of qualitative research by the authors.

Abstract

In the recent years, various studies on roles of electronic word of mouth in the information researching process of online clients have been a topic of great interest for researchers. However, the majority of the researches center on the impact of online evaluations on customers' buying decisions of common goods. Even fewer studies pay attention to tourism sector, especially to travelers' intents in selecting tourist destinations. This paper, therefore, attempts to evaluate the impact of electronic word of mouth (EWOM) on travelers' intention to choose domestic destination through the combination of the theory of planned behavior (TPB) and the self-congruity theory. This particular approach provides interesting implications in development of destinations, promotion of travelers' interests.

Key words: *Electronic word of mouth (EWOM), Self-congruity theory, Theory of planned behavior (TPB), Travelers' intention.*

1. Introduction

The tourism industry has been playing an increasingly important role in economic development of Viet Nam. Often viewed as an attractive and safe destination for domestic and foreign tourists, Vietnam's tourism industry has experienced a strong and fairly solid growth in recent years. Specifically, Vietnam's tourism has grown continuously over the years with an average growth rate of over 10% per year and Vietnam is among the top 10 fastest growing tourist destinations in the world. In 2019, the number of foreign visitors reached over 18,008 million, the highest ever so far, with an increase of 16.2% compared to 2018 (General Department of Statistics, 2018, 2019). In 2020, the tourism industry is heavily affected by the Covid-19 epidemic, losing US$ 23 billion, reducing 80% of international visitors, 50% of domestic tourists (Minister of Culture, Sports and Tourism Nguyen Ngoc Thien told the National Assembly). Vietnam National Administration foresees the tourism industry will still have to face with further difficulties. Thus, to develop domestic tourism, one of the more viable solutions is to attract more Vietnamese people by helping them form interest on selecting domestic destinations.

One of the method to improve domestic interest as by travel reviews. Travel reviews are useful for travel decision-making as they provide travelers with indirect experiences. Previous studies have shown that a large number of travelers consult different sources of information before making a decision to buy a product or choose a travel destination for their trip (Fodness, 1997, Lim, 2016, Lizbeth Marie J Lim, 2016). Here we can see that information plays an increasingly important role in influencing the behavioral intent of visitors, especially “word of mouth” from people with travel experience through internet communication channels. So we can come to an early conclusion, EWOM has a significant impact on tourism (Jalilvand andSamiei, 2012).

Theory of Planned Behavior (TPB) developed in 1991 focused on customer intent instead of their actual behavior (Ajzen, 1991). According to Hale, intent is the best predictor and central to the behavior, and is an individual's willingness to perform specific behaviors (Hale et al., 2002). TPB has been applied in many studies of social behavior, especially in the field of tourism (Lam andHsu, 2006, Phosikham et al., 2015, B. Sparks andPan, 2009). As such, the adoption of TPB model is suitable in the tourism context to predict visitors' behavior and intentions in selecting destinations. Additionally, Theory of Planned Behavior (TPB) is a theory of expected value which assumes that people are rational and have a plan when they engage in behavior and try to maximize satisfaction through communication. In other words, buying is also a way for consumers to express themselves through the product (Dittmar andDrury, 2000). Yeon Ho Shin also confirmed that the self-congruity theory is related to the intention of behavior in TPB (Shin, 2014). In contrast, Ibrahim stated that self-congruity has a significant effect on attitude, but did not find a direct link between self-congruity and planned behabior (Ibrahim andNajjar, 2008). In this study, self-congruity is considered to be the premise of TPB variables, and has indirect effects on planned behavior.

With regard to studies on destinations in Vietnam, recent studies are more about assessing the satisfaction and loyalty of travelers to a specific destination such as Danang (Ki Minh Ho, 2010, Minh Duc Phan andTan Buu Le, 2016) or assessing the ability of a destination in attracting tourists like Hue (Thi Tam Bui andLe Quyen Mai, 2012); analysis of tourism motives of domestic tourists (Thanh Huong Bui andJolliffe, 2011); factors affecting the typical choice of Hanoi residents: studying Hue and Da Nang (Thi Phuong Thao Hoang andTrong Tam Nguyen, 2017). Based on that, strategies are proposed to attract tourists as well as destination branding.

It is clear that so far no domestic and foreign studies have investigated the impact of electronic worth of mouth (EWOM) on the intention to select destinations in Vietnam, in conjunction with theory of planned behavior and self-congruity theory in order attract tourists. So far no research has been conducted to examine the causality relationship of EWOM and the intention to select destinations, as well as the relationship between EWOM with the variables of the theory of planned behavior and self-congruity theory. To fill in the gaps, based on the theory of planned behavior and self-congruity theory, this research aims to explore the answer for the following questions

- Could EWOM directly influence on travelers' intention to choose domestic destination?

- Could EWOM influence on travelers' intention to choose domestic destination via the mediating role of TPB's variables (attitudes, subjective norm, and perceived behavioral control)?

- Could self-congruity play the mediating role in the relationship between EWOM and travelers' intention to choose domestic destination?

2. Literature Review

2.1. Electronic Word of Mouth (EWOM)

In recent years, consumers prefer to make purchasing decisions that can be independent from information provided by businesses. It is a trend signifying power shifting from company to consumers. Prior to making a decision to buy a product, consumers look at the image of the product or brand through experiences, recommendations, reviews and analysis of other consumers. According to Chevalier, words of mouth was gradually considered as an important source of information affecting consumer behavior (Chevalier andMayzlin, 2006). Opinions, comments from users are refered to as more updated, interesting, and reliable information than marketing information from businesses. A study by Bickart and Schindler, as well as by Kumar et al. showed that the development of the Internet today provides a good approach for people to collect product information and advice from other consumers through electronic word of mouth (Bickart andSchindler, 2001, Kumar andBenbasat, 2006).

According to Hennig-Thurau et al., EWOM is any positive or negative statement made by potential, actual, or former customers about a product or company, which is made available to a multitude of people and institutions via the Internet. EWOM platform is the technological means through which customers communicate with each other and communicate with sellers. EWOM makes data more relevant and reliable by expanding the engagement of past customers. EWOM is also characterized by indirect and public communication that often has little relationship between the message sender and the message recipient. An EWOM proposal is described as a positive, unbiased or negative information about the supplier published on website by a consumer (Hennig-Thurau et al., 2004).

The Internet provides a platform for customers to discuss their views, therefore words of mouth can spread information at an incomparable speed and is much cheaper than regular forms of word of mouth. Stephen W. Litvin argued that online reviews provided a reliable source of information. Litvin defined EWOM as all informal communications directed at consumers through Internet-based technology related to the usage or characteristics of particular goods and services, or their sellers. This includes communication between producers and consumers as well as those between consumers themselves (Litvin et al., 2008). EWOM is not simply a means to facilitate the communication of marketing information, but it is a central position in e-commerce.

According to Park and Allen, online reviews became an important source of information and has impact on consumers' decisions, especially through EWOM. Consumers give and seek opinions online, which greatly affects the choice of goods and services (S.-Y. Park andAllen, 2013). Jalilvand stated that EWOM has a direct impact on purchasing intent (Jalilvand et al., 2013). Customers when choosing goods may be influenced by online reviews, so companies need to be clearly aware of the negative or positive information. A high-end brand can be weakened by a multitude of negative online reviews. Whereas positive reviews can increase customers' buying intent, create a good image of the company and its brand. The research of Hamouda and Tabban also confirmed that EWOM has a significant impact on purchasing intent. This impact is crucial, especially when the attitude towards the proposed product is positive, thus creating a higher consumer buying intent. The role of EWOM has been increasing in all steps of the buying decision process of consumers (Hamouda andTabbane, 2013).

Electronic Word of Mouth in Tourism Industry

Travel products are intangible, and cannot be measured, touched or felt in different ways before tourists experience them. To avoid potential purchasing risks and uncertainty when choosing a destination, tourists depend on EWOM (Mohammed Abubakar, 2016). Google and Ispos MediaCT proved that the internet is the number one source of information in travel planning (Google and Ispos MediaCT andStudy, 2014). Research by Lizbeth Marie Lim (2016) has shown that EWOM has a significant and positive impact on tourism intention (Lim, 2016).

Study by Park et al. indicates that traveler reviews are helpful for making travel decisions and provide indirect experiences for visitors. Online reviews have a dual role: it provides information on products and services, and it also serves as a recommendation. These two roles can completely meet the information needs of visitors (D.-H. Park andKim, 2008). Gretzel and Yoo (2008) note that finding travel-related information is one of the most popular activities conducted online. EWOM plays an important role in the travel planning and decision-making process. Social media helps tourists make informed decisions basing on other people's past travel experiences, be it online reviews or blog posts, additionally EWOM increases travelers' confidence in their decision making, reduces risk, and helps with trip planning. Gretzel and Yoo also suggested that those comments are more updated, more interesting and more reliable than information (Gretzel andYoo, 2008).

The tourism and hospitality industry is increasingly dependent on EWOM via the media. Visitors rely much on online referrals to determine travel plans such as destinations, accommodation and activities as of their budgets and desires (Litvin et al., 2008, Yoo andGretzel, 2011, Zhang et al., 2009). The report shows that hundreds of millions of potential travelers use online reviews as a source of pre-holiday reference. 84% of travelers use online reviews as a source of reference upon booking a trip (travelindustrywire.com, 2007).

2.2. Theory of Planned Behavior (TPB)

The theory of planned behavior (TPB), developed by Ajzen in 1991, aims at describing how behavior is formed. According to TPB, attitudes along with subjective norm and perceived behavioral control influence the intention to perform a certain behavior. As of now TPB has been applied in many researches on social behavior, especially in the field of tourism.

Sparks et al. (2009) tested a TPB model to show that a theoretical approach is useful for investigating visitor behavior. Subjective norm, basing on the social influence, closely relates to the behavioral intention and percieved control also correlates with the behavioral intention. Nonetheless, the attitude towards vacationing at the destination has no meaning in predicting the Chinese intention to vacation in Australia. The conclusion of this study supported that of Lam and Hsu (2006), whereby attitudes seem to have little effect on tourism intent. Therefore, it is possible that for tourism behavior, potential tourists place greater importance on subjective norm and perceived control than attitude. Chinese tourists are more likely to choose a destination when friends, family, colleagues or travel agents make positive comments. The collectivism of Chinese culture can explain the power of social influence in the stated intention of behavior (B. Sparks andPan, 2009). Chinese people's behavioral intention is more influenced by social norms and less influenced by attitudes than Americans. In another research Phosikham et al. (2015) states that visitors' attitudes in choosing destinations is very important because positive attitudes can bring satisfaction to visitors. According to the study by Albarq, tourists' attitudes and perceptions can change behaviors, and behaviors influence decision-making processes because attitudes have a strong impact on tourist intentions in their choice of destinations (Albarq, 2014).

As such, it is highly appropriate to adopt the TPB model in the tourism context to predict visitors' behavior and intentions in selecting destinations.

2.3. Self-congruity Theory

The Self-congruity theory was developed to explain the self-concept in consumer behavior. According to this theory, individuals use brands or products to express themselves or improve awareness of their personal image. As such, people tend to choose products that have similarities with their personality traits. The greater the suitability, the higher the probability of purchase (Sirgy, 1985). This theory has been extensively studied in the literature on consumer behavior in many different fields but there are a few studies on tourism sector (Luna-Cortés et al., 2019, Usakli andBaloglu, 2011). From a marketing perspective, Moore et al. (1995) and Waitt (1996) have similar viewpoints that personal image is considered to be a variable influencing tourist destination selection processes (Moore et al., 1995, Waitt, 1996). Applying the basic concept of self-congruity theory in the tourism context can be propose that when there is a fit between the destination and the concept of the visitor himself, it is likely that visitors will have a positive attitude to destinations (Sirgy andSu, 2000). This attitude can lead to a visit or word of mouth. Therefore, understanding the relevance between the destination personality and the visitor's self-concept is very important to further understand the complex nature of tourism behavior.

Matzler et al. argues that when there is a match between the national identity and visitors' personal identity, there will have a significant impact on the intention to visit a destination (Matzler et al., 2016). This hypothesis is grounded on Sirgy's self-concept in 1982 and suggests that tourists seeing the fit between destination perception and their own image will have more incentive to visit the destination. Matzler's and Stokburger-Sauer conclude that brand identity as a driving force of visit intention (Stokburger-Sauer et al., 2012). Similarly, Research by Usakli and Baloglu (2011) showed that self-congruity has significant imapct on the behavioral intention and therefore supports the the self-congruity theory. In contrast to the above studies, other researchers argue that there is insufficient evidence on the effect of self-congruity theory on tourists' intention in choosing destinations (Boksberger et al., 2011, Litvin andGoh, 2002).

It is apparent that tourist decisions are a complex process. To date, there have been no unified consumer behavior theory or model that has been largely accepted. The effect of self-congruity on the decision-making process of tourists up on visiting a destination is a topic of research which has not been paid sufficient attention to in literature (Chon, 1992, Litvin andGoh, 2002, Sirgy andSu, 2000). It is necessary to develop and test an integrated self-congruity model to measure visitor intentions in destination selection.

3. Propositions

3.1. Electronic word of mouth and theory of planned behavior in the tourist context

Jalilvand et al. (2012) explained the impact of EWOM in the destination selection process. TPB provides an interesting concept of a decision-making process about a tourist destination. The conclusion has shown that EWOM in the tourism sector has a significant, positive and direct impact on attitudes, subjective norm and peceived behavioral control. It also has a huge impact on travel intent. Attitude towards a destination, subjective norm and pervcied behavioral control are all considered important determinants of travel intent to a defined destination. Similarly, Yulin Miao conducted the study on “The influence of Electronic-WOM on Tourists' Behavioral Intention to Choose a Destination: A case of Chineses Tourists Visiting Thailand”. The TPB has been used to examine the the effect of EWOM on tourist behavioral intentions in selecting specific tourism destinations. Results showed that EWOM has a significant effect on the behavioral intention of Chinese tourists visiting Thailand. EWOM, though TPB, has also been proved to have imapct on attitudes, subjective norm and perceived behavioral control (Miao, 2015).

Kwong Goh (2015) indicates that the effect of electronic word of mouth on intention to book accommodation via online peer-to-peer platform through EWOM is significant, positive and direct to the attitude, subjective norm and perceived behavioral control of visitors. In addition, attitudes, subjective norm and perceived behavioral control have significant effect on the intention to use peer-to-peer online applications or websites (Goh, 2015). Study by Ngo Thi Hien Trang looked at whether the EWOM information impact travelers' intention to choose a tourist destination when they come to Danang and its magnitude of impact. The results showed that EWOM has effect not only on the intention to choose tourist destinations, but also on the perception of usefulness, feeling of enjoyment, attitudes, subjective norm and perceived behavioral control (Thi Hien Trang Ngo, 2017).

From the above agruments, the following propositions are presented:

P1: EWOM has positive influence on travelers' intention to choose domestic destination

P2: EWOM has positive influence on attitude toward domestic destination

P3: EWOM has positive influence on subjective norm toward domestic destination

P4: EWOM has positive influence on perviced behavioral control toward domestic destination

P5: Attitude has positive influence on travelers' intention to choose domestic destination

P6: Subjective norm has positive influence on travelers' intention to choose domestic *destination*

P7: Perceived behavioral control has positive influence on travelers' intention to choose domestic destination

3.2. Electronic word of mouth and the self-congruity theory in the tourism context

Tourists are able to develop strong emotional relationships with certain destinations and even assign human personality to these destinations. Destination personality refers to the brand personality in the tourism context. Ekinci and Hosany (2006) define destination personality as 'The set of personality traits associated with a destination' (p. 127), adapted from the brand personality terminology of Aaker (Aaker, 1997). Similar to brand personality, a unique destination personality can make a difference from other destinations, create a competitive advantage, and will therefore influence visitors' decision-making behavior (Murphy et al., 2007).

A study by Feli et al. examines the importance of word of mouth as an important source of information and its influence on the formation of destination personality. The study asserted that word of mouth has a positive impact and a significant effect on destination personality and visitor loyalty. Typically, people who have traveled to a certain place will tell others about their travel experiences. Trip experiences and accounts may be more acceptable than other sources of information (Feli andAzizi, 2016). As such, EWOM is an important tool in creating and developing destination personalities. From there, the proposition is given as follows:

P8: EWOM has positive influence on destination personality.

Currently, where tourism is concerned there are only a few researches on the influence of brand personality on self-congruity. Emperical research by Usakli and Baloglu (2011) is among those few studies. Researchers have demonstrated that destination personality influences the response of individuals through self-congruity, suggesting that the more a destination personality is in line with the self-concept, the more positive attidue tourists have toward that destination, and the higher ratio of choice they make. Research by Chua et al. (2019) shows that brand personality has positive effects on self-conguity. This study takes a closer look at the influence of brand personality and the appropriateness of the self-concept in predicting the behavioral intent of air travelers (Chua et al., 2019). The special and attractive destination personality is able to convey individual images, as a way to shape and reinforce the self-concept of visitors.

From the above studies, it is possible to form this proposition:

P9: Destination personality has positive influence on self-congruity.

3.3. Correlation between the theory of planned behavior and self-congruity theory

Self-congruity has proved to be a theoretical framework for many studies across different areas of behavioral research. Sparks and Shepherd examined the role of Self-identity in relationship with the theory of planned behavior and the intent of green consumerism (P. Sparks andShepherd, 1992). While Sparks and Guthrie (1998) conducted their research in the United Kingdom to prove the predictive effectiveness of self-identity to the consumption intent of a diet low in animal fats. This study has incorporated TPB variables but the self-identity structure has been proven to be independent from the effect of consuming low-fat diets (P. Sparks andGuthrie, 1998).

According to Yeon Ho Shin (2014), the self-congruity theory is associated with the behavioral intent in TPB. The overall signigicance of the TPB model will increase with the participation of the self-conguity theory. Results indicated:

- Self-conguity has positive effect on attitude. This correlation is supported by many empirical studies such as Ibrahim and Najjar, and Kang et al. (Ibrahim andNajjar, 2008, Kang et al., 2012). Individuals who think that their personality is suitable for local food users will have a positive attitude towards buying local food. In the tourism context, when a tourist thinks that her own personality fits the destination personality, they will have a positive attitude towards the destination (Sirgy andSu, 2000). Thus, the next proposition is given:

P10: Self-congruity has positive influence on attitude toward domestic destination

- The correlation between self-congruity and subjective norm is positive. Those who think that their personality is suitable for local food consumers, they will feel more pressure to buy the product and think the reference group will support them in the food purchase process (Shin, 2014). In the tourism context: the visitor's personality in line with the destination personality will affect the reference group such as his parents, colleagues or friends. The author formulates the proposition:

P11: Self-congruity has positive influence on subjective norm toward domestic destination

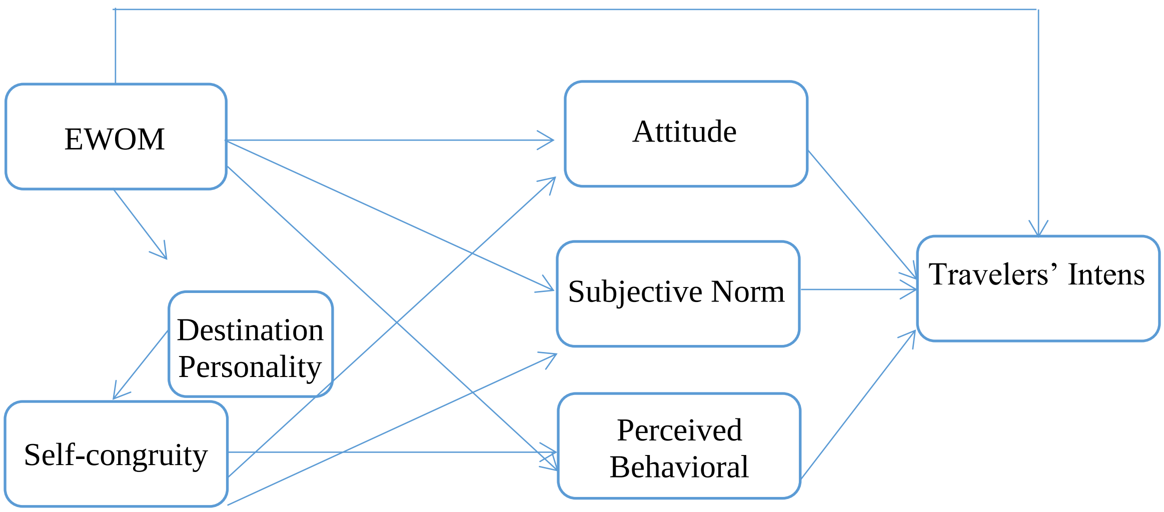
- Self-conguity has also positive effect on perceived behavioral control. People who think their personality are similar to local food consumers will feel more in control of their behaviors (Shin, 2014). The next proposition is that, when visitors' personality matches the destination personality, they will have a better sense of control over their destination selection behavior.

P12: Self-congruity has positive influence on perceived behavioral control toward domestic destination

A number of studies have shown that personal values such as the self-concept are considered as the premise of attitude, subjective norm and perceived behaviorial control (Arvola et al., 2008, Hagger et al., 2007, Kang et al., 2012). Therefore, the self-congruity variables have indirect effect on the intention through the TPB model.

4. Research model

From the given propositions, the author proposes the following research model:



Source: Authors

5. Conclusions

Theoretically, this is the first study to examine the correlation of EWOM with the intent of choosing destinations, and the correlation of the components of the planned behavior theory and the self-congruity theory in the context of tourism. The model was built to show the psychological movement of visitors. From words of mouth, visitors search for information through internet sources, evaluate options. Then attitude, subjective norm and awareness of perceived behavioral control are formed. From words of mouth, they can express themselves, and from which their behavioral intentions are formed.

From the practical perspective, managers will first of all be able to, basing on this research, encourage visitors to engage in discussions in online communities. This can be a useful strategy to increase words of mouth about a certain destination via cyberspace. The higher the number of guest reviews are, the more information about a given destination there will be. This will have impact on potential travelers and as a result, the ability to choose a destination will increase. Secondly, destination managers can build an online travel community and through community tourism websites, tourists will exchange information online, and they are encouraged to share their travel feelingss, previous travel experiences, restaurant services, and hotel, etc. Also managers can monitor EWOM's volume exchange to assess destination images and traveler perceptions through online reviews. Last but not least, tourism planners should attempt to provide tangible products suitable to visitors, and create beautiful memories for them. An interesting experience will create a suitable mental image in the minds of tourists, they can develop strong emotional relationships with certain destinations.

THE EFFECTS OF CORPORATE SOCIAL RESPONSIBILITY ON CUSTOMERS' PURCHASING INTENTION: A STUDY IN HANOI

MBA. Nguyen Anh Viet

vietna@ftu.edu.vn

Foreign Trade University, Hanoi, Vietnam

Abstract

This study investigates customers' perception of four types of responsibilities in Carroll's CSR pyramid (1991), including economic, legal, ethical and philanthropic responsibilities; and the effects of their perception of CSR on purchasing intention. The findings show some interesting points. Firstly, the importance level of four responsibilities from customers' perspective is different from that of Carroll model (1991). Secondly, purchasing power does not affect the relationship between customers' perception of price fairness on purchasing intention. Lastly, customers' perception of CSR has positive effect on purchasing intention. These research findings are a valuable reference for enterprises in implementing CSR to retain customers' loyalty.

Keywords: *Corporate Social Responsibility, Customers' Purchasing Intention, Customers' Perception of CSR.*

1. Introduction

1.1. Rationale of the study

In Vietnam, Corporate Social Responsibility (CSR) has been increasingly playing a paramount important role in promoting a clear, transparent and friendly business environment, contributing to the improvement of people's life quality, ensuring social welfare for sustainable development in the long-term. Vietnamese government has also been developing and completing the legal frameworks in order to create conditions for enterprises to fulfill their CSR as well as to provide a firm basis for strict and comprehensive state management. Especially a series of alarming recent incidents relating to CSR have eroded the belief of local residents, for example, Vedan's destruction of Thi Vai River through releasing unprocessed wastages, chemicals and contaminated water; the marine environment and ecology destruction of Formosa Ha Tinh company; the potato bitterness of PepsiCo Vietnam, Frieslandcampina's allergy-prone milk recall... These cases represent not only the enterprises' lack of awareness and understanding of CSR but also the weaknesses in defining the challenges and issues that protect the interests of the businesses itself in the long-term.

However, there are many MNCs which focus on CSR as key element in their overall business strategy in order to creatively solve problems and actively face up with challenges in the business development process. Successful implementation of CSR will not only helps businesses to ensure high growth rate, generate higher revenues and profits, enhance brand images, maintain well-known reputation, but also helps the companies address strategic issues related to environmental, legal and social issues for sustainable development. More importantly, the implementation of CSR has huge impacts on customers' behaviors, their satisfaction and loyalty to the brand name.

1.2. Definitions of CSR

The World Business Council for Sustainable Development (2006) defined CSR as the continuing commitment by business to behave ethically and to contribute to economic development while improving the quality of life of the workforce and their families, as well as that of the local public and society at large; management studies have defined CSR as a company's obligation to operate in an economically and environmentally sustainable way at the same time recognizing the interest of all stakeholders and maximizing social, economic and environmental values (Waddock and Post, 1990; Wood, 1991; Matten et al., 2003; Waddock, 2004).

As per World Bank (2001), CSR is the commitment of businesses to contribute to sustainable economic development working with employees, their families, the local community and society at large to enhance their quality of life in ways that are both for business and good for international development. World banks definition is almost same as world business council's definition with a broader point about developing at international levels.

1.3. CSR Models

Carroll Model (1991)

According to Carroll (1991), four types of responsibility composing CSR includes: economic responsibilities, legal responsibilities, ethical responsibilities and philanthropic responsibilities.

Economic responsibility

Throughout history, the businesses were set up to become an economic entity with an aim to providing goods and services for the society. The profit goal is built as the most basic motivation of the business. Before achieving any other goals, the enterprises are the basic economic components of society. Therefore, the basic target of the businesses is producing the goods and services that the consumers need and want, and create the acceptable profits through business process. All these other kinds of corporate responsibilities are built based on economic responsibility.

Legal responsibility

The society not only expects the enterprises to operate under profit target but it also expects them to abide the law, operate under the rules and regulations set by the government and the authorities. Companies are expected to pursue its economic mission within the legal frameworks. This responsibility applies not only to the whole enterprises but also each individual of these enterprises.

Ethical responsibility

Ethical responsibility includes activities that are expected or banned by members of society, although these activities are not mentioned in law. Ethical responsibility includes standards, or expectations that reflect the company's concern about what consumers, employees, shareholders, and the whole society regard as fairness or rightness. The company shows respect for the moral norms that the entities mentioned above respect and protect. Moral responsibility can affect legal responsibility. It promotes greater accountability and sets higher expectations for entrepreneurs to do more than the law.

Philanthropic responsibility

Philanthropic responsibility includes the activities of the businesses that respond to the expectations of the society, showing that the businesses are well-performing the obligations of good corporate citizens. It includes a direct commitment of the business in action or the design of programs to promote the prosperity of the whole society, for example, contributing financial, human or other resources to culture, arts, education or community activities.

In short, according to Carroll, CSR consists of four components, namely economic responsibility, legal responsibility, moral responsibility, and philanthropic responsibility. In other words, a CSR company should try to make profit, abide the law, behave in accordance with ethical standards of society and become a good citizen in the community.

Carvalho et al. (2010)

In order to study the impacts of customers' perception of CSR on their purchasing intention, the model proposed by Carvalho et al. (2010) will be applied in this study. The original model includes the key elements: customers’ perception of CSR, price fairness, personal satisfaction, purchasing power, purchasing intention, complaining intention, and switching intention.

Customers’ perception of CSR: This factor shows the level of customers' appreciation for CSR activities which demonstrate whether they perceive the enterprises' concern in the environment, community, law, morality and whether these activities are worth doing or not.

Price fairness: This factor determines whether consumers are willing to pay a higher price for a company's product than their competitors'.

Personal satisfaction: This factor helps assess whether when consumers use products from a company well-performing CSR, they themselves feel pleased and comfortable or not.

Purchasing power: This factor is measured through income, the higher the income, the greater the purchasing power.

Purchasing intention: The likelihood that consumers will choose to purchase a company's products.

Complaining intention: This factor measures the extent to which consumers are inclined to complain and spread negative rumors of a company.

Switching intention: This factor determines the likelihood that the consumers will no longer use a company's products, and switch to another provider.

According to this model, Carvalho et al. proposed the following hypotheses:

H1: Consumers’ perception of CSR has positive effects on their perception of price fairness, personal satisfaction, purchasing intention and negative impacts on complaining intention and switching intention.

H2: Consumers’ perception of price fairness and personal satisfaction mediate the relationship between consumers’ perception of CSR and purchasing intention, as well as complaining intention and switching intention.

H3: The mediating effect of perception of price fairness in the relationship between perception of CSR and the purchasing intention is increased for consumers with lower purchasing power compared with consumers with higher purchasing power.

H4: The mediating effect of personal satisfaction in the relationship between CSR perception and complaining intention, between CSR perception and switching intention is increased for consumers with higher purchasing power compared with consumers with lower purchasing power.

The study was conducted with a sample of 400 consumers in Brazil. According to the findings, the extent to which Brazilian consumers perceive whether a company is socially responsible or not can be predicted as a result of the transaction with that company, as well as switching intention and complaining intention about rising prices caused by CSR. Moreover, these relationships are mediated by the extent to which consumers perceive whether price increases caused by CSR are fair or not and personal satisfaction because of supporting a socially responsible company. Finally, the results showed that these intermediate effects depend on purchasing power. More specifically, the mediating effect of price fairness in the relationship between CSR perception and purchasing intention is stronger with lower income consumers than with higher income ones. Meanwhile, the mediating effect of personal satisfaction in the relationship between CSR perception and switching intention and complaining intention is stronger with higher income consumers than with lower income ones.

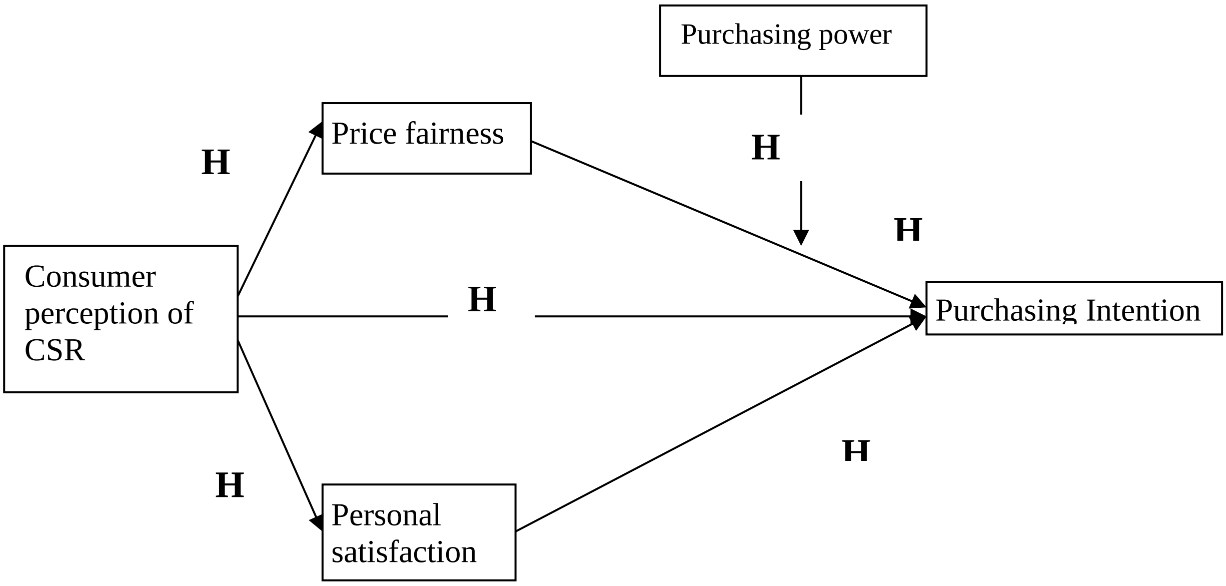
However, the study by Carvalho et al. did not investigate in depth consumers' perception of CSR. Specifically, in their study, there were only questions about philanthropy responsibility without questions to understand consumers' perception of the remaining three types of responsibilities (economic, moral and ethical responsibility). The results did not indicate whether there is a correlation between the age, income, gender, occupation, education level of the respondents and their perception of CSR or not. Their study did not arrange the importance level of four types of CSR from the perspectives of the consumers. Therefore, in order to find out more about the issues that Carvalho and his colleagues have not clarified yet, this study will revise the original model, adding research questions to understand consumers' perception of CSR. The objective of this study is to focus only on the relationship between consumer perception of CSR and their purchasing intention.

2. Method

2.1. Research framework

Starting from research goals, this study is based on model of Carvalho et al. (2010). However, unlike Carvalho et al, this study investigates in depth about the customers' perception of four types of responsibilities in CSR of the Carroll model (1991), while investigating the level of effect of customers’ perception of CSR on their purchasing intention. In this model, the factors that influence the consumer's purchasing intention include: consumers' perception of CSR, perception of price fairness, personal satisfaction, and purchasing power (measured through income). One particular feature is that purchasing power does not directly affect purchasing intention; it will affect the impact of the perception of price fairness on purchasing intention.

Figure 1: Research framework



Source: Author propsoses

2.2. Data collection

The sample subjects

The sample subjects of this research includes people from different age groups (18 – 24; 25 – 35, 35 - 45, over 45); different genders (male, female); different occupations (office workers, students, others); different income (below 5 million, 5 – 10 million, 10 – 15 million, 15 – 20 million, over 20 million); different education level (college/university bachelor, master/doctor, high school student).

The structure of questionnaire

The questionnaire consists of two main sections, which were formulated with questions combined and edited from the questionnaire of two studies by Aril et al. (2009) and Carvalho et al. (2010).

The first part consists of questions to measure the consumers' perception of CSR which rooted from the study by Arli et al. (2009).

The second section includes questions that measure the impact of CSR perception, price fairness, personal satisfaction and purchasing power which rooted from the study by Carvalho et al. (2010).

The method of data collection

After completing the questionaire, the trial survey will be conducted. The purpose of this trial survey is to determine whether the questionnaire is easy to understand or not, as well as whether the language used in the questionnaire should be changed or not. This survey will be conducted by delivering questionnaires to ten subjects, without further explanation of the questionnaire for them to assess and evaluate. After that, the questionnaire will be revised again. Then a second trial survey will be conducted before entering the official one. When conducting the official surveys, the author issued the surveys both online (through facebook, email and messenger) and offline (through supermarkets, convenience stores, shops, commercial centers, universities, hospitals and high schools). All of the respondents are customers of different ages, genders, occupations, income levels and educational backgrounds in Hanoi. Therefore the sample is quite diversified and comprehensive. After 7 days, the author collected 200 completed surveys of 200 respondents, in which there are 189 valid ones.

2.3. Research methodology

In this research question, the methodology the researcher chooses to use is causal research. This is the most appropriate method because the aim of this research question is to analyze and evaluate the effects of CSR on customers' purchasing intention, i.e. the cause - effect relationship. It helps the researcher identify the reasons why the customers make decision to purchase products/services of a CSR company, what factors affect the purchasing intentions of customers and the relationship between these variables: consumers' perception of CSR, perception of price fairness, personal satisfaction, purchasing power, purchasing intention.

189 valid questionnaires were collected from total 200 questionnaires issued in Hanoi. In order to achieve the research objectives, data analysis methods used in this study include: data descriptive statistics, scale reliability analysis, analysis of variances (ANOVA), linear correlation analysis and linear regression analysis.

Scale reliability analysis will be assessed through the Cronbach Alpha coefficient to eliminate unsuitable variables and limit the extraneous variables in the research model.

Accordingly, unsuitable variables will be eliminated if the Corrected Item - Total Correction <0.3 and the scale will be accepted when the Cronbach Alpha coefficient >0.6.

ANOVA method is used to analyze the relationship between qualitative cause variables and quantitative effect variables, based on the calculation of intra-group variation and the variation between group averages, from which concludes whether there is a difference in the evaluation of the significance of a factor between different groups of people or not.

Linear correlation analysis was used to measure the relationship between two quantitative variables, based on the Pearson correlation coefficient (denoted by r). Absolute value of r demonstrates the degree of linearity. The absolute value of r approaches 1 when two variables have a close linear relationship. When all dispersed points are arranged in a straight line, the absolute value of r = 1 (Hoang Trong and Chu Nguyen Mong Ngoc, 2008).

After determining two variables having close linear correlation through the correlation coefficient r, the study quantifies their causal relationship by a linear regression model in which a variable is called is the dependent variable (or variable that is explained - Y) and a variable called the independent variable (or variable explaining -X). In this study, the regression model used would be a multiple linear regression model.

From the research model, the following hypotheses are given:

H1: Consumers' perception of CSR has a linear correlation with their perception of price fairness

H2: Consumers' perception of CSR has a linear correlation with personal satisfaction

H3: Consumers' perception of CSR has a positive effect on their purchasing intention

H4: Consumers' perception of price fairness has a positive impact on their purchasing intention

H5: The consumer's personal satisfaction has a positive impact on their purchasing intention

H6: Consumers' purchasing power has a positive effect on the relationship between consumers' perception of price fairness and purchasing intention.

The linear correlation and linear regression analysis were performed to test the hypotheses.

Linear correlation analysis

Linear correlations were used to test hypotheses H1 and H2, and also to examine the variability between independent variables before conducting regression analysis.

Linear regression analysis

The aim of linear regression analysis is to model the causal relationship between a dependent variable and one or more independent variables. In this study, multi-variable regression analysis will be conducted to determine the importance level of each component: Perception of CSR (CSRb), Perception of Price Fairness (PF), Personal Satisfaction (PS), Purchasing Intention (PI). In addition, the impact of purchasing power (INCOME) on the relationship between perception of price fairness and purchasing intention will also be examined through the PFxINCOME variable in the regression model.

Independent variables: CSRb, PF, PS, PFxINCOME

Dependent variable: PI

The regression model in this study will be in the form:

$Y = \beta 0 + \beta 1 * X1 + \beta 2 * X2 + \beta 3 * X3 + \beta 4 * X4$

In which:

Y: Consumers' Purchasing Intention

X1: Consumers' Perception of CSR

X2: Consumers' Perception of Price Fairness

X3: Personal Satisfaction

X4: Purchasing Power x Perception of Price Fairness

3. Results

3.1. Descriptive statistics

The age proportion in the sample is quite equal. The age group accounting for the highest proportion is 25 - 35 (37.70%), followed by 18 - 24 (31.38%), 35 - 45 (29.26%) and over 45 (2.66%).

Regarding to the gender, there is a considerable difference between the proportion of male and female, with female accounting for 75% and male accounting for 24.47%

In terms of occupation, the highest percentage is office workers (53.19%), the second is students (34.57%), the third is teachers (12.23%) and other occupations account for a small minority.

In terms of income, the highest proportion is the income level of 5 - 10 million (38.83%), followed by below 5 million groups (34.57%). Income level of 10 - 15 million accounts for 15.96%. Income level of 15 - 20 million and over 20 million accounts for quite small proportion (3.72% and 6.91% respectively).

In terms of education level, the highest percentage is college/university bachelor (72.87%), followed that is master/doctor (23.40%), which is suitable with the population features in such a large city as Hanoi where concentrates many universities and colleges. The lowest percentage is high school students (3.72%).

3.2. Testing the scale

Scale reliability analysis

The variables in the study measure the following factors:

- Consumers' perception of CSR includes 11 variables, in which:

• 8 variables measure consumers' perception of CSR derived from the study by Arli et al. (2009): numbered from CSR1 to CSR8. These variables are mainly used to compare the CSR perception of different consumer groups. These variables will not be included in the regression model.

• 3 variables measure consumers' perception of CSR derived from the study by Carvalho et al. (2009): numbered from CSR9 to CSR11. These variables will be included in the regression model.

- Consumers' perceptions of price fairness: 3 variables numbered from PF1 to PF3

- Personal satisfaction: 4 variables numbered from PS1 to PS4

- Purchasing intention: 1 variables PI

After testing, all scales have Cronbach Alpha coefficient > 0.6 (see in Table 1). There is one variable in the consumers' perception of CSR scale that have correlation coefficient < 0.3 that is CSR1, but this variable will not be included in the factor analysis for running regression model since this variable is not included in the Carvalho et al. model. They are primarily used to measure consumers' perception of CSR; therefore, this variable is retained.

Table 1: Result of scale reliability analysis

Test scale	Cronbach Alpha coefficient
Perception of CSR	0.8200
Personal satisfaction	0.9118
Purchasing intention	0.8737

Source: Complied and calculated by the author from Stata14's results

Analysis of variances (ANOVA)

The research compares the perception of four responsibilities in CSR among consumers of different age, gender, occupation, income, educational level through analysis of variance (ANOVA). After the analysis, based on the mean value identified, some results are given in Table 2. ANOVA testing has p-value = 0.0002 < significance level = 1%. Therefore, it can be concluded that there is statistically significant difference in the CSR perception among consumers of different educational level groups: the higher the educational level is, the higher the CSR perception is. Bartlett's test for equal variances has p-value = 0.525 > significance level = 1%. From that, it can be concluded that there is no variance difference in the CSR perception among consumers of different educational level groups.

Table 2: The results of analysis of variances

Criteria	Results	Perception of CSR	Perception of Price Fairness	Personal satisfaction	Purchasing Intention
Education level	Mean	12.675532	11.670213	15.170213	8.6223404
	p-value (ANOVA test)	0.0002	0.0000	0.0001	0.0000
	p-value (Bartlett's test)	0.525	0.611	0.432	0.684
Gender	Mean	12.675532	11.670213	15.170213	8.6223404
	p-value (ANOVA test)	0.7654	0.5315	0.5054	0.6425

Criteria	Results	Perception of CSR	Perception of Price Fairness	Personal satisfaction	Purchasing Intention
	p-value (Bartlett's test)	0.629	0.525	0.108	0.941
Age	Mean	12.675532	11.670213	15.170213	8.6223404
	p-value (ANOVA test)	0.4746	0.0519	0.1296	0.6558
	p-value (Bartlett's test)	0.689	0.600	0.686	0.575
Occupation	Mean	12.675532	11.670213	15.170213	8.6223404

	p-value (Bartlett's test)	0.743	0.015	0.381	0.058

Source: Complied and calculated by the author from Stata14's results

Similarly, from the result tables, it can be concluded that there is no statistically significant difference and no variance difference in the CSR perception among consumers of different age groups, gender groups and income groups. However, there is statistically significant difference but no variance difference in CSR perception among consumers of difference occupation group.

In a similar way, the result tables show that there is no statistically significant difference and no variance difference in price fairness perception and personal satisfaction among consumers of different age groups, gender groups, occupation groups, income groups. However, there is statistically significant difference but no variance difference in price fairness perception and personal satisfaction among consumers of different educational level groups. In terms of purchasing intention, the result tables show that there is no statistically significant difference and no variance difference among consumers of different age groups and gender groups but there is statistically significant difference but no variance difference among consumers of different income groups, educational level groups and occupation groups.

Based on the mean value of the four CSR variables, consumers ranked the importance level of four types of responsibilities in descending order: legal, moral, philanthropic and economic. Thus, in the context of this study, the subjects surveyed assessed legal responsibility as the most important factor and economic responsibility as the least important factor. In other words, for consumers, they think that the business needs to do beyond just looking for profits.

Table 3: The findings from analysis of variance

Hypothesizes	**Results**	**Findings**
There are differences in the CSR perception among consumers of different gender groups	Rejected	
There are differences in the CSR perception among consumers of different age groups	Rejected	
There are differences in the CSR perception among consumers of different occupation groups	Accepted	Teacher groups has the highest CSR perception, followed by student and office worker groups
There are differences in the CSR perception among consumers of different educational level group	Accepted	The higher the educational level, the higher the CSR perception
There are differences in the CSR perception among consumers of different income level group	Rejected	
The consumers evaluate the importance level of four components of CSR in accordance with Carroll model	Rejected	The consumers evaluate the importance level of four components of CSR in descending order: legal, ethical, philanthropic and economic

Source: Author's compilation

3.3. Testing the model

Linear correlation analysis

The analysis result using Pearson coefficients (in Table 4) shows that the variables CSR, PF, PS, IPF have a correlation with PI (sig = 0.0000 <0.05).

Table 4: The results of linear correlation analysis

	CSR	**PS1**	**PS**	**PI**	**IPF**
CSR	1.0000				
PS1	0.4342 0.0000	1.0000			
PS	0.4749 0.0000	0.8777 0.0000	1.000		
PI	0.5420 0.0000	0.5339 0.0000	0.5993 0.0000	1.0000	
IPF	0.2031 0.0052	0.0712 0.3315	0.1754 0.0160	0.2007 0.0058	1.0000

Source: Complied and calculated by the author from Stata14's results

In addition, it can be concluded that there are correlations between the independent variables, therefore, after the regression analysis; it is needed to use the VIF coefficient to test the multicollinearity.

Linear regression analysis

The results of regression analysis are shown in the Table 5.

Table 5: The results of regression analysis

Source	SS	df	MS	
Model	409.731683	4	102.432921	Number of obs = 188 F(4, 183) = 44.16

Using VIF coefficient to test the multicollinearity (see in Table 6)

Table 6: VIF coefficient

Variable	VIF	1/VIF
PF	2.78	0.360290
PS	2.24	0.446749
CSR	1.49	0.670341
IPF	1.16	0.860801
Mean VIF	1.92	

Source: Complied and calculated by the author from Stata14's results

VIF coefficient < 10, therefore, it can be concluded that there is no multicollinearity phenomena.

According to the results from the regression analysis, Prob > F = 0 shows the model has statistical significance (the estimated coefficients are not equal to 0). Estimated coefficients $\beta 1$, $\beta 2$, $\beta 3$ are statistically significant (p-value = 0, 0, 0.003 respectively < 0.01 significance level. The estimated coefficient $\beta 4$ is not statistically significant (p-value = 0.856 > 0.01 significance level). Therefore, it is possible to conclude that consumers 'perception of CSR, consumers' perception of price fairness and personal satisfaction all have influences on consumers' purchasing intention. Meanwhile, the purchasing power of consumers (expressed by income) does not affect the consumers' purchasing intention. R-squared = 0.4912, which means that 49.12% of the difference in consumers’ purchasing intention can be explained by the dependent variables in the model.

Regression equation:

$$Y = - 0.1265352 + 0.2358374 * X1 + 0.2950308 * X2 + 0.1540796 * X3$$

From the correlation and regression analysis, conclusions about the hypotheses of the study could be drawn: Hypotheses H1, H2, H3, H4, H5 are accepted and hypothesis H6 is rejected (see in Table 7).

Table 7: The results and findings from testing hypothesizes

Hypothesizes	Results	Findings
H1: Consumers' perception of CSR have a linear correlation with their perception of price fairness	Accepted	There is a correlation between consumers' perception of CSR and their perception of price fairness
H2: Consumers' perception of CSR has a linear correlation with personal satisfaction	Accepted	There is a correlation between consumers' perception of CSR and their personal satisfaction
H3: Consumers' perception of CSR has a positive effect on their purchasing intention	Accepted	The higher the consumers' perception of CSR, the higher their purchasing intention

H4: Consumers' perception of price fairness has a positive impact on their purchasing intention	Accepted	The higher the consumers' perception of price fairness, the higher their purchasing intention
H5: The consumer's personal satisfaction has a positive impact on their purchasing intention	Accepted	The higher the consumers' personal satisfaction, the higher their purchasing intention
H6: Consumers' purchasing power has a positive effect on the relationship between consumers' perception of price fairness and purchasing intention.	Rejected	The increase in income level does not increase the effect of consumers' perception of price fairness on purchasing intention

Source: Author's compilation

From the results and findings of testing hypothesizes, table 8 demonstrates some differences between previous findings and the findings of this research.

Table 8: The differences between previous findings and the findings of this research

Researches	Previous findings	Findings of this research
Carvalho et al. (2010)	CSR perception of consumers is correlated with the perception of price fairness and personal satisfaction. The purchasing power affects the relationship between the perception of price fairness and the purchasing intention.	There is no correlation between consumers' perceptions of CSR and their perception of price fairness, while there is a correlation between consumers' perception of CSR and personal satisfaction. The purchasing power has no effect on the relationship between the perception of price fairness and the purchasing intention.
Carroll (1991). Arli et al. (2009)	The most important is economic responsibility.	The most important is legal responsibility, followed by philanthropic, ethical and economic responsibility.

Source: Author's compilation

4. Discussions and Conclusions

4.1. Discussions

Based on these findings, it can be concluded that consumers' perception of CSR, perception of price fairness and personal satisfaction have a positive effect on their purchasing intention. In detail, with the H3 hypothesis, that means that when the consumers perceive that a company well-performs CSR, its purchasing intention of this company's product is higher the competitors' one although the price of this product is higher than that of the competitors. This is similar to the H4 hypothesis, when the perception of price fairness increases, i.e. the consumers perceive that the increase in product's price which is caused by the contribution to the CSR policy of the firm is right, and their purchasing intention of the company's products will also increase. Finally, with the H5 hypothesis, when consumers feel self-satisfied because they perceive that purchasing a product of a company which well-perform CSR is a good thing to do for themselves. By making a contribution to society, they feel better and more self-satisfied, they will also accept to buy the products at a higher price than usual.

Besides the accepted hypotheses in the regression model, there is one rejected hypothesis; that is H6. It means that the purchasing power of consumers has no effect on the relationship between the customers' perception of price fairness and their purchasing intention. In the study scale in Hanoi, the income factor does not affect the relationship between customers' perception of price fairness and purchasing intention, in other words, higher income does not increase the effect of the perception of price fairness on the purchasing intention. This is consistent with the ANOVA analysis conducted for the above CSR variables. Income factor does not have the relationship with the consumers' perception of CSR.

4.2. Conclusions

First of all, from the perspective of the consumers, the importance level of four components of CSR in descending order is: legal, ethical, philanthropic, economic. This order differs from Carroll's (1991) when he arranged in descending order of economic, legal, ethical and philanthropic responsibility. The explanation for this may have been due to a series of scandals relating to the business operation of some enterprises, for example, the Vedan incident that dumped toxic wastewater out of the environment in 2008, Coca Cola's "transfer pricing" case in 2013, Formosa Ha Tinh's marine contamination in 2016, therefore, consumers suppose that it is important for businesses to operate within the legal framework. One remarkable thing is that economic responsibility is regarded as the least important. Consumers believe that businesses need to do things beyond the mere profits, and this finding is particularly important for entrepreneurs to control their business activities.

Secondly, the results show that there is no correlation between consumers' perception of CSR and their perception of price fairness; meanwhile, there is correlation between consumers' perception of CSR and their personal satisfaction. Besides, there is no difference in the CSR perception, price fairness perception, personal satisfaction and purchasing intention among consumers of different age groups, gender groups. There are many reasons from the facts in Vietnam to explain this conclusion. In term of gender groups, in "Human Development Report 2016" published by the United Nations Development Program, the United Nations regards Vietnam as a bright spot in the implementation of the Millennium Development Goals, one of the countries having high gender equality achievements. Vietnam is ranked at the top list of gender equality in Southeast Asia. This demonstrates Vietnam's remarkable progress in the implementation of gender equality, in which the chances to access education and information are one of the most important factors. Therefore, in Vietnam, the fact that both genders have quite similar perception of CSR is clearly apparent. In term of age groups, originating from the Vietnamese culture that the elderly often teach or pass down their knowledge and understanding from generations to generations, hence, Vietnamese people at any age groups, more or less, have basic understandings of the importance of CSR in this modern life. Moreover, in spite of age groups, almost Vietnamese people can easily get access to the information of CSR through internet, television or other mass media channels.

However, there is difference in the CSR perception, price fairness perception, personal satisfaction and purchasing intention among consumers of different educational level groups. The reasons to explain for this conclusion could be attributed to the positive CSR education in Vietnam. Nowadays, almost Vietnamese universities, institutions, organizations as well as corporations integrate CSR in many teaching and training programs. CSR becomes an integral part in business administration education. However, for people who have lower education level, the opportunities to access to CSR knowledge is quite limited due to the fact that Vietnamese curriculum from primary to high level tends to concentrate on academic knowledge but practical one. Meanwhile, CSR directly originates from and relates to practical situations.

Finally, the regression analysis revealed that consumers' perception of CSR, consumers' perception of price fairness and personal satisfaction had a positive effect on their purchasing intention. This means that the higher the customers' perception of CSR, the fairer they feel about the price, the more satisfied they feel themselves, the more likely they are to buy the company's products despite the higher price than those of the same category. The study, however, also shows that the purchasing power of consumers (here measured by income) does not have an effect on the relationship between the perception of price fairness and their purchasing intention.

4.3. Implications

From the research results, it can be seen that the perception of CSR has a positive impact on consumers' purchasing intention. Therefore, enterprises should have policies to better fulfill their CSR as this will not only benefit the community, but will also motivate the consumers to purchase the products of that business although the price may be higher than that of the competitors. The companies should conduct responsible business that meets the highest standards of ethics and professionalism. CSR policies fall under two categories: compliance and proactiveness. Compliance refers to the company's commitment to legality and willingness to observe community values. Proactiveness is every initiative to promote human rights, support communities and protect natural environment. In term of compliance, the legaltity plays the most important role. The companies should strictly respect and abide the national as well as local laws and regulations, honor their internal policies, ensure that all their business operations are legitimate and keep every partnership and collaboration open and transparent. The business ethics should also be especially concerned. That is conducting business with integrity and respect to human rights which include ensuring the health and safety of employees and community, respecting the rights of the consumers, appreciating anti-bribery and anti-corruption practices, avoiding the detrimental effects on the lives of local and indigenous people, supporting diversity and inclusion, ensuring equal opportunities, standard working and living condition for employers,… Besides, the enterpries must recognize the need to protect the natural environment, follow best practices when disposing and treating wastages, contaminated water, emissions and chemical substances. In term of proactiveness, the enterprises should preserve a certain budget to make donations to the community, encourage their employees to participate in volunteer and charity activities or sponsor volunteer events of other organizations, proactively protect the environment through recycling wastages, conserving energy, using renewable energy, applying environmental-friendly technologies in manufacturing and delivering, organizing reforestation excursions... Additionally, the companies may initiate and support community investment and educational programs. For example, they may begin partnerships with vendors for constructing public buildings, provide support to nonprofit organizations or movements to promote socio-economic and cultural development of global and local communities. In the long term, CSR policies include active investment in R&D to optimize production and operation procedures which are so called "green". More importantly, these CSR policies should be widely popularized to all employees in the enterprises, so that any individual of the enterprises behaves responsibly towards society in any way. CSR policies also need to be publicized, revised and updated in the annual reports on the website, mass media channels or modern social network platforms in order to improve consumers' insight and awareness of CSR of the companies.

This research also allows the author to conclude that the implementation of CSR policies into companies geared towards meeting the needs of consumers generates competitive advantages. That is to say that investing in CSR not only allows the companies to reduce the impact of business on society, but also leads to the generation of added value for the consumers. This study shows that the consumers are aware and appreciates that firms undertake CSR actions oriented to their needs. This in turn translates into an increase in the trust and commitment of the consumer to the companies that additionally intensifies consumer satisfaction and loyalty.

In addition, the Vietnamese National Assembly and the Government should complete legal systems relating to CSR, regulatory bodies should be firm in enforcing laws in corporations and CSR should be viewed as part of the code of ethics of any corporations. Also there should be a national policy from government to set parameters for CSR in Vietnam including employment policies, working conditions and welfare benefits, product quality, and on protecting the natural environment. The Government should also encourage the dissemination and sharing of examples of responsible businesses should be willing to be studied and the results disseminated widely. If a company operates ethically, the outcome of the study should be favourable, raising its reputation and position in the business community.

Moreover, the researcher also recommends that companies should deepen the performance of their CSR activities to cover more of environmental protection activities, performing in line with the legal requirements, meeting economic objectives and be ethical in their operations. Additionally, the quality of products/services provided by companies must also be critically paid attention to as they are paying critical attention to their CSR activities as well. It would be better to work all things in the right direction. This will make people see the firms as the best not only in the field of CSR performances but also the provision of better products. At the long run the profitability of the company would increase if they pay critical attention to these factors.

Abstract

Social commerce is a new business model marking a breakthrough in the area of online shopping. Its massive expansion has boosted e-commerce and increased the effectiveness of online marketing. In the context of the increasingly developing fashion industry, the study aims to understand factors that affect purchase intention for Vietnamese local brands in social commerce. The study used questionnaire as survey method and collected answers online via Facebook. 555 valid responses were analyzed by using SPSS software version 22.0. The results show that factors including enjoyment, perceived ease of use, online review, brand image, advertising positively influence online purchase intention. Especially, brand image has the strongest impact. Besides, perceived risk has a negative impact on consumers' intention to buy local brands. The findings have important theoretical and managerial implications helping businesses working in domestic fashion sector to come up with efficient strategies to increase customers' intention to purchase.

Keywords: *Purchase intention, social commerce, fashion, local brands.*

1. Introduction

With the advent of digital era, the Internet is becoming a significant means of communication. The increasing popularity of the Internet leads to the rapid growth of e-commerce and digital marketing. In particular, social networks have become a revolution that breaks down traditional barriers to information access, transform methods of conducting business activities as well. Social commerce is a modern business model emerging from the development of social media and e-commerce, aiming to promote product sales and influence customer buying behavior across a network of people on social websites (Sharma & Crossler, 2014; Huang & Benyoucef, 2013). Mark Zuckerberg, the founder of Facebook, states that social commerce will become a new trend in e-commerce because of its much greater growth potential than traditional e-commerce; especially since the government has figured out how to implement taxes on selling via social media; businesses have an extra opportunity to increase market share as tax implementation reduces the number of small retailers in social commerce (Social Times, 2011). As users are becoming more dependent on social media, social commerce will increase in importance and grow even more rapidly.

In Vietnam, with a population of 96 million people, there are 68 million Internet users, 65 million people are social networks' users, accounting for 67% of the total population (Digital, 2020). According to Statista (2020), Vietnamese spend more than 2 hours a day on social platforms using mobile devices. According to the report of Google & Teamaseak (2018), although the overall social commerce market in Vietnam has only reached the size of 3 billion USD, the growth rate amounts to 30% per year. It can be said that social commerce is a much more potential market than traditional e-commerce.

In addition to the strong development of online shopping, the continuous rise of incomes and living standards has caused the trend of shopping in the fashion sector to thrive. While several famous international brands entering the Vietnamese market, local brands are also increasingly asserting their position. Not only being distinguished by the quality in each product, local fashion brands catch up with prevailling trends by making use of benefits that technology bring. Particularly, using social networks as the main marketing channel has enabled Vietnamese fashion local brands to be more successful in attracting customers across the country.

A significant number of research has been conducted to undertand customers' behaviour in the context of online shopping. However, most of the research (Yin et al., 2019; Chen et al., 2018; Shi et al., 2016; Hajli, 2015; Ngo My Tran & Mai Vo Ngoc Thanh, 2017; Nguyen Thi Thanh Thao, 2017) just examine the intention to shop online for products in general. As social commerce is still a relatively new concept in Vietnam, research on the intention to buy products of local fashion brands in social commerce has not existed before. Thus, this study focuses on covering this gap. By examining attributes that affect customers' purchase intention in social commerce, the findings provide helpful insight for managers and brand owners to develop appropriate marketing strategies and manage social commerce business effectively.

The rest of the study is structured as follows. Section 2, the theoretical literature is reviewed to develop hypotheses and research model. Research methods carried out in the analysis are described in Section 3. Next, in Section 4, reliability and validity analysis are performed, the proposed hypotheses are also tested in this section. Finally, in Section 5, the conclusion and suggestion are listed.

2. Literature review

2.1. Social commerce

The term "social commerce" was first mentioned by Yahoo (2005) as a subset of e-commerce combined with social media that supports social interaction and user contributions. Liang et al. (2011) describes that social commerce is the application of Web 2.0 features, such as content creation tools, to enhance user interaction in e-commerce. Kim & Park (2013) consider social commerce as a new business model of e-commerce driven by social media that facilitates buying and selling products and services online. In other words, social commerce is a new model of conducting commerce using social media to reach customers and their online friends. In the study of Turban et al. (2017), social commerce, also known as social business, refers to e-commerce transactions distributed via social media. More specifically, it is a combination of e-commerce, e-marketing, technologies, and social media content. In this study, the authors use the definition of Turban et al. (2017) when referring to social commerce.

2.2. Local fashion brands

According to the American Marketing Association, a local brand is a brand that is marketed (distributed and promoted) and/or developed in a relatively small and limited geographical area. Local fashion brands are only available in a specific region (a country or narrow areas, such as a particular community or even a neighborhood) and customized to the unique needs and features of that local market (Dimofte et al., 2008). Local fashion brands are also known for being self-employed from the stage of ideas creation to production and distribution. Each of these brand is protected by law when registering the trademark at the copyright management agency (Yu Nguyen, 2020). In summary, local fashion brands are brands that do business in a specific area/geographical region and their trademark copyright must be registered and fully met legal sanctions at the same time.

2.3. Purchase intention

For online shopping, Delafrooz et al. (2011) suggest that purchase intention is the possibility that a consumer will make a purchase on the Internet. Pavlou (2003) emphasizes online shopping intention is the situation in which customers are willing to engage in online transactions. Online transactions here can be considered as the process of retrieving, transferring information and performing purchase activities. Therefore, intention to purchase online focuses on the extent to which consumers are willing to buy and pay for a certain product on online platforms; in this context social networking sites. Consumer's online purchase intention, which constantly changes, is an important aspect related to the online marketing and widely studied by market researchers to predict sales and consumer buying behaviours (Cronin, Brady, & Hult, 2000). The study of consumer purchase intention leads to different types of research such as customer loyalty testing, product and new product testing, packaging testing, advertising content testing and brand positioning.

Ghosh (1990) argues that purchase intention is an effective tool for predicting purchasing decision. In the online business environment, customers' behavior is related to how they have intention to buy products or services. Therefore, understanding the online purchase intention will contribute to determining consumers' online purchase behaviours (Salisbury et al., 2001).

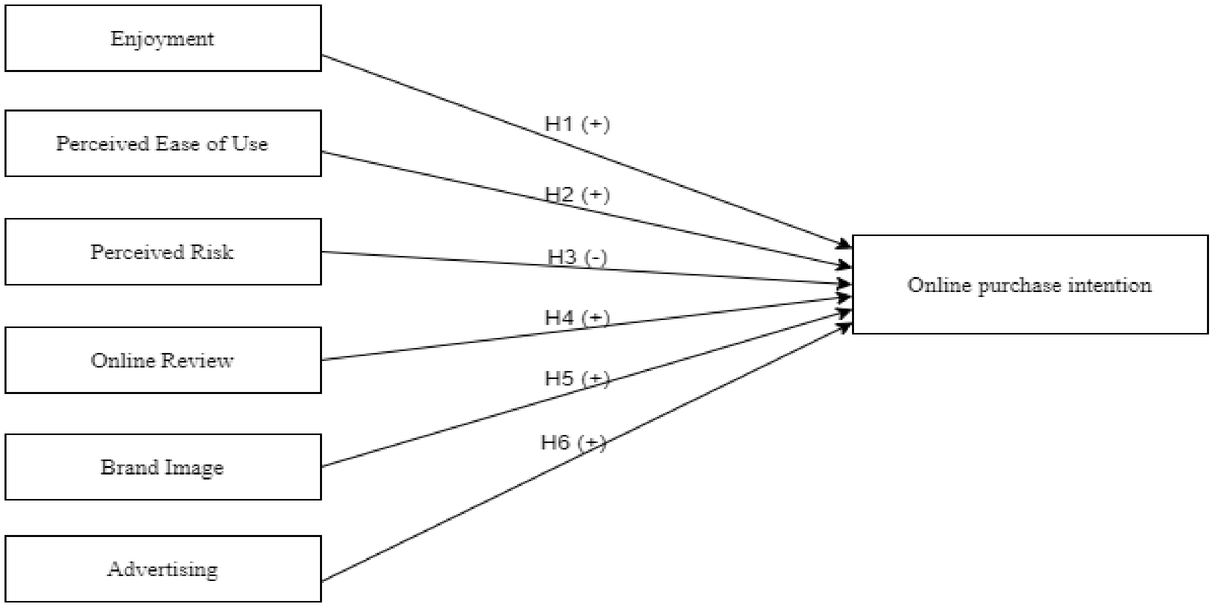
2.4. Research model

TAM (Technology Acceptance Model) model has been used in many previous studies with research field related to information system, focus on explaining how users come to accept and use a new technology. However, with the limitations of the TAM model, the Value-based Adoption Model (VAM) aims to explain the use of technology from the view of consumers. Therefore, this study combined TAM (Davis, 1989) and VAM (Kim et al., 2007) model as a theoretical basis to develop the research model in which factors influencing purchase intention for Vietnamese local fashion brands in social commerce include enjoyment, perceived ease of use, and perceived risk.

In addition to this, based on the study of the impact of advertising on the purchase intention of Ngo My Tran & Mai Vo Ngoc Thanh (2017), the authors propose to add advertising to the model. At the same time, consumers still worry about online shopping as they do not have direct contact with the sellers and products, so the intention to buy is influenced by the online reviews of other consumers. Besides, combined with the study of Park et al. (2007), online review is included in the model. On the other hand, the scope of the research is Vietnam's fashion market, brand image is considered an extremely important factor. Based on research by Zamrudi (2016), the authors add brand image to the model.

In summary, the proposed research model of factors affecting the purchase intention for Vietnamese local fashion brands in social commerce consists of six factors: (1) Enjoyment, (2) Perceived Ease of Use, (3) Perceived Risk, (4) Online Review, (5) Brand Image, (6) Advertising.

Fig 1. Research model



Source: Proposed by authors

According to Khoje et al. (2013), enjoyment is the pleasure gained from the online shopping process. In the context of information systems, this concept is understood as the level of satisfaction that consumers gain when making a purchase on a website, especially in terms of entertainment and stress relief it brings (Davis, 1989; Kim et al., 2007). According to Koufaris (2002), shopping enjoyment has a significant impact on attitude and intention to purchase online. Additionally, Jarvenpaa & Todd (1996) also conclude that the enjoyment of shopping has a great influence on the attitude, behaviour on the website and increases the purchase intention of customers. Hence, it is hypothesized that:

Hypothesis 1 (H1): Enjoyment has a positive impact on the purchase intention for Vietnamese local fashion brands in social commerce.

Perceived ease of use is defined as “the degree to which an individual believes that using a particular system requires no physical or mental effort” (Davis, 1985). In TAM model, perceived ease of use is an important factor assumed to have a positive relationship with using a technology. Based on the theory of task-technology fit, consumers often use social networking sites for their online shopping activities. Davis (1989) also suggests that when an individual perceives the ease of use of a system, they will form a positive feeling that leads to the intention to use that system. Hence, it is hypothesized that:

Hypothesis 2 (H2): Perceived ease of use has a positive impact on the purchase intention for Vietnamese local fashion brands in social commerce.

According to Featherman and Pavlou (2003), the perception of risk is an unwanted loss encountered in the process of completing an action. Hong & Yi (2012) argue that many customers feel brick-and click purchasing is more risky than the conventional one because consumers cannot physically check products when buying online, so they are concerned that the product is not up to their expectations. All the risks consumers perceive during the purchasing process directly influence their purchase intention (Garretson and Clow, 1999). Hence, it is hypothesized that:

Hypothesis 3 (H3): Perceived risk has a negative impact on the purchase intention for Vietnamese local fashion brands in social commerce.

Floh et al. (2013) admit that reading positive product reviews leads to an intention to purchase online. Online product reviews are one of two types of information consumers can access when shopping on social networks, which is what sets them apart from traditional shoppers. Consumer online reviews act not only as information but also as suggestions (Part et al., 2007). Hence, it is hypothesized that:

Hypothesis 4 (H4): Online review has a positive impact on the purchase intention for Vietnamese local fashion brands in social commerce.

Brand image is the perception of the consumer as reflected in the consumer's memory (Keller, 1993). Each consumer usually has a certain impression after seeing, hearing, reading or experiencing a product brand for himself through media such as TV, Internet and other channels (Kotler et al., 2002). According to research by Del Rio et al. (2001), research by Keller (1993), brand image is positively related with consumers' purchase intention. Hence, it is hypothesized that:

Hypothesis 5 (H5): Brand image has a positive impact on the purchase intention for Vietnamese local fashion brands in social commerce.

Attitude formed towards advertising helps to transform consumers' attitude towards products or brands until their purchase intention is shaped (Goldsmith and Lafferty, 2002). Qian He & Hongjian Qu (2018) suggest that the attractiveness of advertising has a significant influence on purchase intention. Social media advertising creates a greatly new dimension to advertising, as it provides interactivity for users, especially on Facebook, users can communicate and perform purchasing activities at the same time (Logan, Bright & Gangadharbatla, 2012). Hence, it is hypothesized that:

Hypothesis 6 (H6): Advertising has a positive impact on the purchase intention for Vietnamese local fashion brands in social commerce.

3. Method

To ensure the accurate and objective results, the authors used both qualitative and quantitative method. For the qualitative analysis, the research team conducted interviews with a group of 10 people living and studying in Hanoi. The interviewees all have knowledge of local fashion brands and have experience buying those products in social commerce. The results of the qualitative study show that there are 6 independent factors accepted by interviewees, including: enjoyment, perceived ease of use, perceived risk, online review, brand image, advertising. Next, the authors quantified analysis by building a scale to measure factors through 35 constructs. The scale is based on previous studies as well as from construction of the authors.

In the formal quantitative study, the authors used a five-level Likert scale to measure impact of factors. According to Hair et al. (2014), the minimum sample size is 175 (5*35), so to ensure the minimum sample size requirement and reliability, the study sample size should be at least 175 responses. Data is collected through a survey which was sent as a questionaire on Google Form to the sampled subjects who are living in Hanoi area. After removing 55 invalid answers from 610 responses, the total number of valid answers put in analysis is 555.

Quantitative analysis was carried out using the following methods: descriptive statistics, reliability testing, exploratory factor analysis (EFA), correlation analysis and regression analysis. The authors conducted data analysis on Statistical Package for the Social Sciences (SPSS) version 22.0.

4. Results

4.1. Descriptive analysis

Data were included in the analysis with sample size N = 555. The results show that female (73.2%) is likely to buy more often than male, especially for fashion products. Young people aging from 18-25 who are interested in shopping activities in social commerce account for the majority of respondents (96.8%). The buying group that account for the highest percentage is students with income below 5 million (95%). This result is expected because they are people who are often exposed to the Internet and online shopping. In terms of social platforms used to perform purchasing activities, it can be seen that Facebook is the most popular (80.5%).

Table 1: Results of descriptive analysis

Category	Information	Frequency	(%)
Gender	Male	148	26.7
	Female	407	73.3
Age	Under 18	10	1.8
	18 – 25	537	96.8
	26 – 35	6	1.1
	Above 35	2	0.4
Job	Students	530	95.5
	Working	6	1.1
	Unemployed	19	3.4
Income	Under 5 million VND	524	94.4

	5 – 10 million VND	22	4.0
	10 – 25 million VND	6	1.1
	Above 25 million VND	2	0.4
Social platforms used for shopping	Facebook	447	80.5
	Instagram	340	61.1
	Zalo	52	9.3
	Tiktok	23	4.1
	Others	17	3

Source: Collected and analyzed by authors

4.2. Reliability analysis

The proposed model includes 6 independent variables, 1 dependent variable with 35 observations. The results of Cronbach's Alpha coefficient analysis show that the total correlation coefficient of the variables is greater than 0.3 and the value of Cronbach's Alpha coefficient is greater than 0.75, so all factors meet this analysis requirements. However, in exploratory factor analysis (EFA), 4 observations are removed from the model because of factor loadings less than 0.5. Thus, authors only list the final results of reliablity test in table 2.

Table 2: Results of reliability analysis

Factor	Observations	Cronbach's Alpha	Total correlation
Enjoyment	6	0.847	0.555
Perceived Ease of Use	4	0.811	0.604
Perceived Risk	5	0.784	0.452
Online Review	5	0.791	0.601
Brand Image	3	0.825	0.577
Advertising	4	0.778	0.565
Purchase Intention	4	0.855	0.652

Source: Collected and analyzed by authors

4.3. Exploratory factor analysis (EFA)

27 constructs of the independent variables are classified into 6 groups of factors in exploratory factor analysis. KMO coefficient is 0.909 (0.5<KMO<1) with a statistical significance level (Sig.) of 0.000 (<0.05), emphasizing that the data used for analysis is appropriate and statistically significant. In addition, according to Egienvalues standard, the total variance extracted is 62.385% (>50%), which means that the results explain 62.385% of the variation of the data.

The results of factor analysis with the dependent variable shows that only one factor is extracted, and all the observations converge at the Egien value of 2,791 and the extracted variance is 69.781%. This reveals the scale of dependent variables are suitable with the load factor greater than 0.8. At the same time, the Bartlett test has the result of 963,912 with sig=0,000 (<0.05), indicating that the observed variables are correlated with each other.

4.4. Correlation Analysis

The results of the correlation matrix analysis with Pearson's coefficient demonstrate that the relationship between purchase intention and six independent variables is statistically significant (Sig<0.05). To be specific, the correlation coefficients of the variables range from 0.255 to 0.618 ($-1 \leq r \leq 1$). Thus, the correlation between factors is closely linear in the model. On the other hand, correlation coefficients scale ensure that there is no multicollinearity. Hence, regression analysis can be used to test the relationship between independent and dependent variables.

4.4. Regession Analysis

From the results of the regression analysis, the adjusted R^2 (Adjusted R-square) shown in the table 3 is 54.5%; it also means that 54.5% of the variation of purchase intention (Y) is explained by six mentioned factors, the remaining of 46.5% is caused by the influence of other attributes and random error. On the other hand, the F test (Sig=0.00 <0.01) in the ANOVA analysis proves that the constructed linear regression model is not only suitable for the research sample but also for the population. Thus, the research model is well-suited.

Based on the analysis results in Table 3, all standardized Beta coefficients are statistically significant (Sig.<0.05). Accordingly, brand image has the most significant impact (Beta = 0.279) and perceived ease of use has the weakest impact (Beta = 0.104) on purchase intention. The remaining factors have the level of impact in respective order: Enjoyment , Online Review, Advertising. Besides, perceived risk has a negative impact on purchase intention (Beta = -0.79 < 0).

Table 3: Results of regession analysis

Model	**Standardized coefficients**	**t**	**Sig.**	**VIF**
	Beta			
Constant		2,293	0,022	
Enjoyment	0,248	7,329	0,000	1,399
Perceived ease of use	0,104	2,691	0,007	1,803
Perceived risk	-0,079	-2,428	0,015	1,289
Advertising	0,157	4,087	0,000	1,786
Online review	0,212	5,439	0,000	1,843
Brand image	0,279	7,173	0,000	1,836

5. Discussion and Conclusions

5.1. Discussion

The study has built a model to understand factors that have impact on the purchase intention for Vietnamese local fashion brands. The authors provide empirical evidence by collecting, processing, and analyzing data of consumers with the ability and have experience with buying products of the local brands on social platforms in Hanoi, Vietnam. The results reveal that six factors affect the intention to purchase local fashion brands in social commerce. To be specific, the factors affecting consumers' purchase have different influence in this descending order: brand image, enjoyment, online review, advertising, perceived ease of use, and perceived risk.

The current study has both theoretical and empirical implications. First, it contributes to the literature by presenting new insights into level of factors' impact on intention to buy Vietnamese local fashion brand products in social commerce. It was concluded that brand image has the strongest positive impact. This finding is expected as most consumers, especially millennials usually pay attention to brand image before making a purchase decision. Particularly, for online shopping, customers cannot directly touch or try on products, brand image acts as a representation of garment attributes of a brand and reflects what the brand stands for in the customers' mind. In addition, perceived risk is shown to have a negative influence on consumer's purchase intention. This result adds to our understanding since we focused on the impact of individual components of perceived risk rather than risk as a whole. Thus, these findings offer informative insights for owners of social commerce websites so that they can build successful strategies to attract more online consumers.

5.2. Suggestions

For Vietnamese local fashion brands that are growing in social commerce, they firstly need to focus on building and consolidating communities of consumers on social platforms to enhance brand image and reduce customers' risk perception when purchasing online. A community available with different reviews from customers who have purchased products and useful information from followers interested in the brand will increase the intention to purchase of other customers. Second, brands should regularly change and add appealing messages into advertising campaigns to increase the effectiveness of marketing and attract more buyers. For example, a local brand with environmentally - friendly products can emphasize its message by participating or sponsoring environmental conservation programs. Third, brands need to diversify and update styles to keep up with new trends and expand the customer base. Many people expect that when using products of Vietnamese local fashion brands, they will have an impressive and unique style. Therefore, the more brands diversify styles and products, the more customers they attract.

For Vietnamese local fashion brands that tend to participate in social commerce, they need to determine the right target consumers and clearly define the brand's image and style at first. Hence, they would be able to create an important premise to make an impression on the customers. Clearly defining fashion styles before entering social commerce allows new brands to attract potential customers on social networking sites. Second, brands need to grasp new trends in the fashion market quickly and wisely. Local fashion brands' identifying trends of the target market is a good way to seize opportunities and create ideas for advertising and marketing strategies on social platforms. Third, local brands should have the consistency for style image on different platforms. To be more specific, posters and advertisements presented on Facebook, Instagram, Twitter should be consistent, aligned with the image and identity of the brands.

For customers, they should consider joining the communities that local brands set up (if any) to get the realistic and comprehensive reviews from customers who have had experience purchasing products of that brand before. At the same time, actively participate in reviewing honestly is a way to build a trustful community of consumers.

For Vietnam Textile and Apparel Association, authors suggest developing a website that provides in-depth articles to orientate and raise customers' awareness of local brands. By doing this, Vietnamese fashion local brands can have the opportunity to introduce their collections and reach buyers more efficiently. Organizing competitions or events so that consumers can vote for their favorite brands (for example, top 10 most popular collections of street style local brands) will also create fair competition environment among brands and act as an official information channel for customers' reference.

5.3. Limitations

Like any other studies, this study has some limitations. As respondents are mainly young consumers from 18-25 years old, the representativeness is not very high; other age groups should be investigated further. Moreover, online purchase intention is affected by many other factors that have not been mentioned in this study. The inclusion of more factors would have produced applicable results of even greater interest for social commerce sites. Besides, the concepts of "social commerce" and "local fashion brands" are still quite new to consumers in Vietnam, so when people have a better understanding of social commerce and accumulating more experience, different results can be found on customer's purchase intention. Therefore, future research is expected to overcome limitations that still exist in this study.

Abstract

The implementation of social responsibility has not only become the basic operating principle of businesses but also their core value in the context of globalization. It highlights the importance of human rights, safety, health, community participation, and environmental protection in addition to the business benefits of the enterprises. In the article, the research team summarizes the views of Friedman, M. (1970), Davis, K. (1973), Carroll, A. (1991) on corporate social responsibility (CSR) and reviews the literature on factors affecting the implementation of corporate social responsibility such as research by Yeh, SL, Chen, YS, Kao, YH, & Wu, SS (2014), Tsuei, LL, & Wen, H, L (2018), Duyen, CTL, & Canh, NM (2013), Hoa, TTM, & Ngoc, NTH (2014), Lanh, NT, & Tram, Lab (2016), etc. Based on the model of Tsuei, LL, & Wen, H, L (2018) and related studies, the research team proposes the model of factors affecting the implementation of corporate social responsibility with 4 factors are: (1) CSR intention of leaders; (2) Business resources; (3) Industrial environment; and (4) Public motivation. These factors are measured by 23 observed variables. The findings show that the "CSR intention of leaders" is the most important factor to promote the CSR implementation of FDI enterprises. The analysis of the factors and their degree of impact will help foreign-invested enterprises better perceive and formulate practical measures in implementing corporate social responsibility.

Keywords: *Affecting factors; Corporate Social Responsibility; Foreign Direct Investment Enterprises*

1. Introduction

Since the establishment of the World Business Council for Sustainable Development (WBCSD) in 1995, many associations in the world have discussed building strategies for improving corporate social responsibility (CSR). CSR, also known as corporate sustainability, sustainable corporations, business conscience, the responsibility of the business or responsible businesses, is a form of self-regulated business activity of corporations [Friedman, M. (1970)]. CSR has not only been the fundamental operation principle but also the core value of businesses, which highlights the importance of human rights, safety, health, community participation, and environmental protection in addition to business benefits of corporations. Corporations have to perceive and strictly implement CSR as well as make CSR a useful tool for creating business competitive advantages in the context of economic integration. Many scholars have studied and stated their viewpoints on corporate social responsibility, including Friedman, M. (1970), Davis, K. (1973), Carroll, A. (1991), etc. Besides, there have been a lot of studies on determinants on corporate social responsibility, namely, Yeh, S. L., Chen, Y. S., Kao, Y. H., and Wu, S. S. (2014*)*, Tsuei, L.L, & Wen, H, L (2018), Duyen, C.T.L, & Canh, N.M (2013), Hoa, T.T.M, & Ngoc, N.T.H (2014), Lanh, N.T., & Tram, P.T.N. (2016), etc.

In fact, CSR was introduced to the developing countries through FDI inflows in the 1990s [Goyal, 2005]. FDI enterprises have contributed investments, enhanced technology transfer, and improved management and production capacity in local countries. Under CSR, FDI enterprises usually build their general codes of business ethics to apply in different regions and markets. However, the existing problems include environmental pollution, business ethic violation, limited awareness of social responsibility, lack of finance and technology to practice social responsibility standards. On the theoretical background and literature review on determinants on CSR implementation, under the model of Tsuei, L.L, & Wen, H, L (2018), the researchers suggested the model of determinants on CSR implementation of FDI enterprises with 4 factors including *(1) CSR intention of leaders; (2) Business resources; (3) Industrial environment;* and *(4) Public motivation.* Due to limitations in time and resources, researchers utilized convenience sampling and surveyed 312 FDI enterprises in Viet Nam.

2. Theoretical background, research model, and hypotheses

2.1. Theoretical background

Corporate social responsibility means that enterprises have to fulfill their economic, legal, ethical, and philanthropic responsibilities with the current and future stakeholders towards sustainable development.

Base on this approach, corporate social responsibility is viewed as the increase in positive impacts and decrease in negative impacts on stakeholders towards sustainable development. Corporate social responsibility is expressed in responsibilities with the markets and consumers; environmental protection; responsibilities with workers, the community, and the society.

In his study on corporate social responsibility, Galaskiewicz, J. (1985) stated that the considerations on CSR short-term strategies can be divided into three forces (1) Public relations: raising the consumers' awareness of an enterprise or products to stimulate sales is the most typical short-term target for an enterprise to participate in socially responsible activities; (2) Competition: in response to pressure from business peers, enterprises can invest passively in socially responsible activities to avoid the negative perception of consumers; and (3) Tax benefits: relevant regulations on tax incentives can reduce the enterprise's spending for socially responsible activities.

Yeh, S. L., Chen, Y. S., Kao, Y. H., and Wu, S. S. (2014) studied corporate social responsibility and its implementation by designing a CSR mind map in listed companies on Taiwan Stock Exchange (TWSE) and Gre Tai Securities Market (GTSM). The results show that "*Negligence of company leaders*" and "*Shortage of human resources*" are major obstacles to CSR implementation. Besides, the research indicates "*Support and assistance of company leaders*" and "*Changes in the mentality of CSR implementation of company leaders*" are important solutions to CSR implementation in Taiwan.

The study of Tsuei, L.L., & Wen, H, L. (2018) discussed factors affecting CSR implementation by exploring the literature and conducting field interviews with enterprises. The study compiles 4 factors and the weights among the factors. The first factor "*Leaders' knowledge on CSR*" indicates that business owners, board of directors, and board of management have comprehensive and diversified impacts on business decision-making; similarly, the decision-makers significantly impact the participation in public welfare activities. The second factor "*business resources*" refers to all elements that the company can use to create value for customers, including material and non-material elements that the company can mobilize. Thirdly, "*Industrial environment*" shows the relationship between the company and its stakeholders to understand the company's practices related to environmental issues and examine whether the company makes a significant contribution to the public. The fourth factor "*Public motivation*" examines a series of company activities following social norms. The results show that "*CSR intention of leaders*" has the highest degree of effects, followed by "*Business resources*", "*Industrial environment*" and "*Public motivation.*"

In Viet Nam, there have been some studies on CSR by Hoa, T.T.M and Ngoc, N.T.H (2014) in tourism; Yen, H.H (2016) in banking, Thao, N.T.P (2019) on customer groups of banks in Da Lat. However, they have all been qualitative research on customers instead of all stakeholders.

The study of Lanh, N.T., & Tram, P.T.N. (2016) used the research model of Yeh, S. L., Chen, Y. S., Kao, Y. H., and Wu, S. S. (2014) and indicated four factors affecting CSR implementation in companies, namely human resources, capital, mandatory institutions of the State and CSR knowledge. Binary Logistic regression shows that among four tested factors, two factors are affecting CSR implementation, namely human resources and capital. The results are also identical to the research findings of Yeh, S. L., Chen, Y. S., Kao, Y. H., and Wu, S. S. (2014) which states that *"human resources"* is the major determinant of CSR implementation of listed companies on Taiwan Stock Exchange.

Duyen, C.T.L, & Canh, N.M (2013), surveyed 88 small and medium enterprises in Can Tho City by a self-administered questionnaire. The research methods include descriptive statistics, frequency, average, Cronbach's Alpha, KMO & Barlett tests, Exploratory Factor Analysis (EFA). The results show that factors promoting the CSR implementation of small and medium enterprises include "*economic benefits", "macro-economic policies", "ethical responsibility",* and "*public orientation",* in which *"ethical responsibility"* is the most significant factor promoting the CSR implementation of small and medium enterprises in Can Tho City.

Despite a large number of studies on CSR, the research samples are mainly domestic companies, companies in general, or companies by size, or sectors instead of FDI enterprises.

In Viet Nam, there have been a few studies on CSR implementation of FDI enterprises. FDI enterprises are classified by investments in distinction with domestic-invested enterprises [IMF (1993), OECD (1996), UNCTAD (2012)]. In Viet Nam, 2014 Law on Investment (with effect on July 1, 2015) states that FDI enterprises are foreign-invested business organizations regardless of the equity ratio. Under the 2014 Investment Law, forms of investments include investment in the establishment of economic organizations (Article 22), investment in the form of contribution of capital to, or purchase of shares or capital contributions at, economic organizations (Article 24, and investment in the form of contracts. Accordingly, FDI enterprises are divided into three following groups:

(i) *100% foreign-invested enterprises:* are owned, established, managed, and controlled by the foreign investors in Viet Nam;

(ii) *Joint-stock enterprises*: are established under the partnership contract between two or more parties to operate in Viet Nam, the parties are only responsible for the committed capital contribution in the enterprise;

(iii) *Cooperation contracts:* are investments under the agreement on liabilities and business result distribution between a foreign investor and a domestic investor to conduct one or more businesses in the local country.

Accordingly, cooperation contracts do not set up a new legal entity (enterprise), thus, FDI enterprises in the study include 100% foreign-invested enterprises and joint-stock enterprises.

With the above-mentioned characteristics, the CSR implementation of FDI enterprises has been the topic of interest of many researchers. Mai, T.N. (2020) in her study built a model for analyzing CSR implementation of FDI enterprises in Viet Nam with a focus on the relation between CSR implementation and the company reputation. The researcher surveyed 208 valid questionnaires from such four stakeholders as government, workers, customers, and community. The study also explores the evaluation of FDI enterprises on their reputation by a self-administered questionnaire. The research methods include Data Envelopment Analysis (DEA), Cronbach's Alpha test, and Exploratory Factor Analysis (EFA). The results show that the corporate reputation is influenced by CSR implementation on all four stakeholders, in which, CSR implementation for the community has the highest degree of influence, followed by customers, government, and workers.

The research of Chau, T.N.H (2018) on CSR in business strategies of FDI enterprises examines the proportional relation between CSR implementation and the reputation, innovation, and capability to create the differentiation of companies by measuring 21 observed variables from the government and enterprise perspectives. However, the study uses a single-variable regression model, in which 21 observed variables have not been explored by components, so the reliability of research findings is still limited.

2.2. Research model and hypotheses

Based on the theoretical background and literature review on determinants of CSR implementation of FDI enterprises, researchers analyze the factors affecting CSR under the model of Tsuei, L.L, & Wen, H, L. (2018). The model of Tsuei, L.L, & Wen, H, L. (2018) covers the analysis of stakeholders of CSR implementation of FDI enterprises with four factors "*CSR intention of leaders", "Business resources", "Industrial environment"* and *"Public motivation."* The researchers build and develop the scale on the pyramid of corporate social responsibility of Carroll, A. (1991) with CSR implementation in 4 responsibilities, namely, *(1) Economic responsibility; (2) Legal responsibility; (3) Ethical responsibility;* and *(4) Philanthropic responsibility.* The researchers suggested another important component, i.e. *(5) Environmental protection responsibility* in combination with characteristics of *FDI enterprise form (*100% foreign-invested and joint-stock enterprises); *Years or time of operation;* and *Business sector* to measure the differences in corporate social responsibility. The research model is expressed as follows:

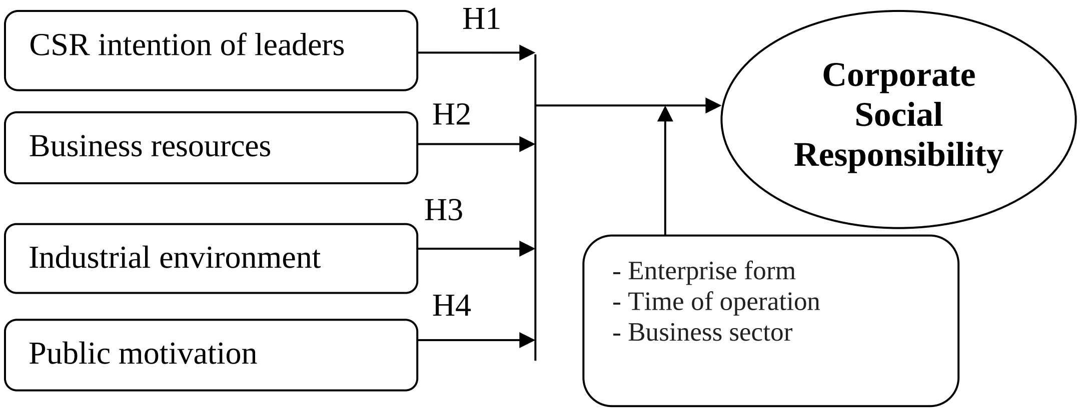

Figure 1. The Proposed Research Model

(Source: the author research)

Hypotheses for the proposed research model include:

H1: CSR intention of leaders has a directly proportional relation with CSR implementation of FDI enterprises.

H2: Business resource has a directly proportional relation with CSR implementation of FDI enterprises.

H3: Industrial environment has a directly proportional relationship with the CSR implementation of FDI enterprises.

H4: Public promotion has a directly proportional relationship with the CSR implementation of FDI enterprises.

3. Method

3.1. Variables and research samples

The study combines qualitative and quantitative research methods. First, the qualitative method is used to conduct preliminary research by discussing with 10 leaders of FDI enterprises in different sectors. The discussion is conducted by the scales with factors affecting the corporate social responsibility of FDI enterprises from previous studies. The participants can give their opinions on aspects of corporate social responsibility. The preliminary sample size is 10 (n=10). The results are used to complete the questionnaire and research model.

The quantitative method is used to collect opinions of enterprises on corporate social responsibility. The questionnaire is formulated based on the preliminary research results with Likert 5-point scale questions. Due to limited time, the authors use convenience sampling. The sample size is determined under the principle of Comrey and Lee (1992), concerning the principle of Hoang Trong & Chu Nguyen Mong Ngoc (2005). With 23 parameters (observed variables) to conduct factor analysis, the minimum sample size should be 23 x 5 = 115 samples; the respondents are company middle and top managers in FDI enterprises at industrial zones in Hanoi, Hai Phong, Bac Ninh, Bac Giang, Ha Nam, Da

Nang, and Binh Duong. Based on the required sample size and data collection capabilities, the researchers decide on the sample size n = 320. Over 320 questionnaires were sent to the survey subject by email, researchers collected 315 questionnaires with 312 valid ones for analysis.

Table 2.1: Factor scales in the research model

Independent variables	Observed variables	Reference
1. CSR intention of leaders		
LD1	Fulfillment of tax liabilities under legal regulations	Compiled and developed from the studies of Tsuei, L.L, & Wen, H, L. (2018; and Useem, M. (1988),
LD2	Equity structure and business performance	
LD3	Operating strategy towards CSR implementation	
LD4	Considerations of interests of stakeholders	
LD5	CSR awareness of corporate members	
2. Business resources		
BR1	Profitability performance	Compiled and developed from the studies of Tsuei, L.L, & Wen; Freeman, R. E. (1984); Shen, C. H., and Chang, Y. (2009)
BR2	Human resources quality	
BR3	Financial capacity	
BR4	Corporate facilities	
BR5	Management information system	
3. Industrial environment		
IE1	Peers' interests in CSR implementation	Compiled and developed from the studies of Tsuei, L.L, & Wen, H, L (2018)
IE2	Increasing popularity by CSR implementation	
IE3	Strengthening competitiveness	
IE4	Peers' benefits from CSR implementation	
4. Public motivation		
PM1	Laws and regulations on CSR	Compiled and developed from the studies of Tsuei, L.L, & Wen, H, L (2018)
PM2	Current socio-economic trends	
PM3	Social norms and value	
PM4	Information disclosure	
5. Corporate social responsibility		
CSR1	Economic responsibility	Built and developed on the pyramid of corporate social responsibility of Carroll, A. (1991)
CSR2	Legal responsibility	
CSR3	Ethical responsibility	
CSR4	Philanthropic responsibility	
CSR5	Environmental responsibility	

Source: Authors research

3.2. Data analysis

The research data after collection will be adjusted and analyzed with the support of SPSS 20.0 software with analytical techniques:

Descriptive statistics: Describe the characteristics of the sample according to the identified signs.

Reliability of the scale (Cronbach's Alpha): This method evaluates the reliability of the scale by Cronbach's Alpha coefficient and removes the unsuitable variables. Variables whose correlation coefficient with the total variable is less than 0.3 will be rejected. The scale with Cronbach's Alpha coefficient over 0.6 is usable.

Exploratory Factor Analysis EFA: Factor analysis EFA allows the compaction of multiple correlated variables into representative factors. Kaiser-Meyer-Olkin (KMO) and Bartlett tests are used to measure the fit of the research samples. Factor analysis is significant if the KMO value > 0.5 and the value of sig <0.05; Factor loading must be > 0.5; In case an observed variable uploads both factors, the loading factors must be over 0.3, and this observed variable is included in the factor that it uploads the highest with the condition must satisfy the factor loading > 0.5.

Correlation and Regression analysis: After extracting the representative factors, the Pearson correlation coefficient is used to evaluate the linear correlation relationship between the factors in the model. If the sig < 0.05, the analytical result is significant; correlation coefficients > 0 represent variables with linear correlation. On that basis, the linear regression model is set up and the R2 coefficient is adjusted to indicate the suitability of the established regression model.

Different impact of personal factor: Independent - Sample T-Test and One-Way Anova test are used to consider the different influence of qualitative variables such as age, gender, seniority.

4. Results

4.1. Statistical results

The degree of corporate social responsibility by factors is expressed in Table 1. Under Likert 5-point scale with 1 (Strongly disagree) to 5 (Strongly agree), the CSR implementation is different under different aspects with the highest degree in legal responsibility of 3.8, followed by philanthropic responsibility (3.71), economic and ethical responsibility at 3.61 and 3.64, respectively. The lowest degree is corporate environmental responsibility at 3.54.

Table 1. Statistical results of CSR

CSR	N	Minimum	Maximum	Mean	Std. Deviation
Economic responsibility	312	1	5	3.61	.806
Legal responsibility	312	2	5	3.88	.766
Ethical responsibility	312	1	5	3.64	.802
Philanthropic responsibility	312	1	5	3.71	.845
Environmental responsibility	312	1	5	3.54	.955
Valid N (listwise)	312				

Source: Synthesis from questionnaires

4.2. Reliability of the scale

Cronbach's Alpha coefficient test shows that all coefficients are over 0.7 (Table 2), Corrected item-total Correlation of observed variables is over 0.3. Accordingly, the research model is relevant and reliable. In five factor groups with the original observed variables Xm = 23 variables, Cronbach's Alpha coefficient test shows that all 23 observed variables are reliable for testing in the model.

Table 2. Cronbach's Alpha test result

Scale	**The number of an observation variable**			**Cronbach's Alpha**
	Before testing	After testing	Removed observed variables	
1. LD	5	5	None	0.917
2. PM	4	4	None	0.907
3.BR	5	5	None	0.923
4. IE	4	4	None	0.904
5. CSR	5	5	None	0.822
Total	**23**	**23**		

Source: Synthesis from test results

4.3. Factor Analysis EFA

EFA analysis with Varimax rotation is used to analyze 23 observed variables after Cronbach's Alpha reliability test.

According to EFA results, at Eigenvalue >1, with Principal Components and Varimax rotation, factor analysis extracted 5 representative factors from 23 observed variables with variance extraction of 73.02% (>50%). KMO = 0.824 (>0.5) means that the analysis is significant. sig = 0.000 < 0.05 shows the correlation between observed variables in the model the relevance of EFA analysis.

Table 3. Factor analysis EFA result

	Component				
	1	2	3	4	5
BR3	.896				
BR2	.877				
BR1	.835				
BR4	.786

PM3				.856	
PM4				.778	
CSR4					.799
CSR2					.747
CSR3					.729
CSR5					.690
CSR1					.663
Eigenvalues			1.756		
Total variance extraction			73.02%		
KMO			0.824		
Sig.			0.000		

Source: Synthesis from test results

With Eigenvalues = 1,756 (>1), 23 original observed variables are grouped into 5 representative factors: CSR intention of leaders (LD); Business resources (BR); Industrial Environment (IE); Public Motivation (PM); Corporate Social Responsibility

(CSR) with total variance extraction = 73.02% (> 50%) which means that 73% of variability of variables are explained by these factors.

4.4. Analysis of linear correlation and regression

4.4.1. Analysis of linear correlation

From Cronbach'Alpha and EFA analysis, there are 5 representative factors with 23 observed variables in the research model. Pearson correlation coefficient is used to test the correlation between factors in the model. Linear correlation results (Table 4) show that with 312 observations, all factors have correlation coefficient (r) >0, sig < 0.05, which means that the factors have linear correlation and significance.

Table 4. Linear Correlation result

		CSR	LD	BR	IE	PM
CSR	Pearson Correlation	1	.639**	.647**	.591**	.673**
	Sig. (2-tailed)		.000	.000	.000	.000
	N	312	312	312	312	312

	Sig. (2-tailed)	.000	.000	.000	.000	
	N	312	312	312	312	312

*. Correlation is significant at the 0.05 level (2-tailed).

Source: Synthesis from test results

4.4.2. Regression analysis

Based on the results of the linear correlation analysis, the authors conducted a regression analysis to examine the impact of factors on the dependent variable.

Table 5. Regression analysis result

Model Summary

Model	R	R Square	Adjusted R Square	Std. error of the Estimate	Durbin-Watson
1	.925[a]	.856	.854	.25500	1.890

ANOVA

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	118.980	4	29.745	457.437	.000[b]
	Residual	19.963	307	.065		
	Total	138.942	311			

Coefficients

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-.219	.083		-2.655	.008
	LD	.281	.016	.401	17.416	.000
	BR	.187	.019	.255	9.861	.000
	IE	.261	.018	.340	14.585	.000
	PM	.245	.018	.347	13.714	.000

a. Dependent Variable: CSR

Source: Synthesis from test results

From the multiple regression results, a linear regression equation to evaluate the impacts of factors on CSR implementation can be built as follows:

CSR = 0.401LD+0.255BR+0.340IE+0.347PM

In the linear regression equation, all coefficients >0, so hypotheses are accepted. All things remain constant, if "*CSR intention of leaders*" (LD) increases by one unit, CSR implementation increases 0.401 unit; if "*Business resources*" (BR) increases by one unit, CSR implementation increases 0.255 unit; if "*Industrial environment*" increases by one unit, CSR implementation increases 0.34 unit; and if "*Public motivation*" increases by one unit, CSR increases 0.347 unit.

The adjusted coefficient R^2 = 0.854 indicates that the independent variables in the model can explain 85.4% of the variation of the dependent variable.

In ANOVA variance analysis, F = 457.437; sig = 0.000 show that the linear regression model is suitable for the data set and can be used.

The statistics of Durbin-Watson = 1,890 show that there is no correlation between the remainder. This means that the regression model does not violate the assumption of the independence of errors. Variance Inflation Factor (VIF) with a value less than 10 indicates that the regression model does not violate multicollinearity (independent variables are strongly correlated).

4.5. Differences in personal factors

Regarding the enterprise forms, the authors divide samples into two groups of 100% foreign-invested enterprises and joint-stock enterprises. In the study, this factor has two values, so Independence-Sample T-test can be applied. The results show that Levene's Test sig = 0.248 > 0.05 representing the equality of variance between two forms of enterprises. It is possible to use sig T-Test in Equal variances assumed.

In Equal variances assumed, with Sig = 0.02< 0,05, it can be concluded that there is a significant difference in CSR implementation between the two forms of enterprises.

Table 6: Result of Independence-Sample T-test

Independent Samples Test

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. 2-tailed	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
CSR	Equal variances assumed	1.338	.248	-2.298	310	.022	-.20706	.09009	-.38433	-.02979
	Equal variances not assumed			-2.637	141.616	.009	-.20706	.07853	-.36231	-.05182

Source: Result from regression analysis of the authors

One-Way ANOVA is used to test the differences between enterprises with different times of operation and CSR implementation. The results show that mean of enterprises with over 10 years of operation = 3.373, the highest in the groups. Therefore, it can be concluded that enterprises with over 10 years of operation implement CSR better than others. In the Test of Homogeneity of Variances, with sig Levene’s test = 0.00< 0.05, there is a significant difference between groups. According to results of Post Hoc Test in Table of Post Hoc Tests Multiple Comparisons with sig = 0,000 < 0,05, it can be concluded that there is a significant difference in CSR implementation between enterprises with different times of operation.

One-Way ANOVA is used to test the differences between enterprises in different business sectors and CSR implementation. The results show that mean of enterprises in industry = 3.467, the highest in the groups. Therefore, it can be concluded that enterprises operating in the industry implement CSR better than others. In the Test of Homogeneity of Variances, with sig Levene's test = 0.016< 0.05, there is a significant difference between groups. According to the results of the Post Hoc Test in Table of Post Hoc Tests Multiple Comparisons with sig = 0.000 < 0.05, it can be concluded that there is a significant difference in CSR implementation between enterprises in different business sectors.

5. Conclusions and recommendations

5.1. Conclusions

From the linear regression equation, it can be seen that in case all things remain constant, if "*CSR intention of leaders*" (LD) increases by one unit, CSR implementation increases 0.401 unit; if "*Business resources*" (BR) increases by one unit, CSR implementation increases 0.255 unit; if "*Industrial environment*" increases by one unit, CSR implementation increases 0.34 unit; and if "*Public motivation*" increases by one unit, CSR increases 0.347 unit.

According to the research findings, at the significance of 95%, corporate social responsibility implementation is at the average of 3.67 on the 5-point scale. Factors affecting the CSR implementation are arranged in the descending order as follows:

(1). "CSR intention of leaders" has a relatively high effect of 40%; CSR implementation is averaged at 3.06, in which 49.4% of surveyed enterprises rated from 1 to under 3; 51.6% rated 3 to 5. It shows that the "CSR intention of leaders" has the largest impact on CSR implementation. Despite the awareness of CSR implementation, many company leaders have not highlighted the CSR implementation.

(2). "Public motivation" has the effect of 34.7%; the average CSR implementation is at 3.28, in which 37.8% of enterprises in the survey rated from 1 to under 3; 62.2% rated 3 to 5. It can be seen that this factor has a relatively strong impact on CSR implementation, but it has not taken the adequate interests of many enterprises.

(3). "Industrial environment" has 34% of effect with the average CSR implementation of 3.96, in which 11.5% of respondents rated from 1 to under 3; 88.5% rated 3 to 5. Accordingly, the industrial environment has a relatively high impact and receives the attention of enterprises in CSR implementation.

(4). "Business resources" has a 25.5% of impact with an average point of 3.54, in which 25% of respondents rated from 1 to under 3; 75% rated from 3 to 5. It shows that despite the limited effect, enterprises are relatively interested in resources as the foundation for CSR implementation. It is difficult for companies to well implement CSR without adequate resources.

In addition, research findings also show the significant differences in CSR implementation between 100% foreign-invested enterprises and foreign-invested enterprises; between enterprises with different time of operation and business sectors.

5.2. Recommendations

- The first, the Government needs to develop and perfect the system of policies and laws on the social responsibility of FDI enterprises.

The improvement of the legal environment for attracting investment capital and managing activities of FDI enterprises in Vietnam is meant as a necessary condition for FDI enterprises to fully and substantively implement CSR. During the review, approval, and management of FDI capital and FDI enterprises, regulations on prevention and reduction of environmental pollution, and responsibility of enterprises to the community need to be concretized into criteria for approval. The government needs to define minimum standards for enterprise operations, including issues related to CSR, such as applying the sustainability accounting standards of the United States sustainable development accounting standards council.

- The second, strengthening coordination between functional agencies in propagating, supporting, and supervising FDI enterprises in implementing social responsibility.

The Government clearly defines the responsibilities of relevant agencies in policymaking, communication, inspection, and handling of violations of FDI enterprises in issues related to CSR. At the same time, the Government reviews and evaluates to improve and amend the coordination mechanism of local departments, agencies, and sectors in licensing and managing FDI projects, and carefully evaluates preferential policies investment according to the scale of investment projects and socio-economic geographical. In order to serve the management, the database system and information on FDI enterprises need to continue to be perfected so that central and local agencies can access and output all relevant information. agencies to serve the general work; thereby helping the evaluation and monitoring work effectively and timely.

- The third, state management agencies implement policies to support and encourage enterprises in implementing CSR.

One of the important factors affecting the implementation of CSR of FDI enterprises in Vietnam is resources. Implementing CSR means that businesses incur more costs, use many resources including financial and human resources, technology, and management. Therefore, the support and encouragement from the local government for businesses that implement or commit to CSR, such as paying taxes in full and on time, creating jobs for local workers, complying with the provisions of the law ... will create motivation for enterprises. Some forms of incentives such as social responsibility awards, "green brand" or "clean technology" certifications

The fourth, raising and changing the CSR awareness of leaders of FDI enterprises

The major motivation of CSR implementation of FDI enterprises is to attract investors and customers rather than the corporate benefits, survival, and sustainable development. In other words, CSR has not been the urgent need for corporate survival and sustainable development. CSR implementation of FDI enterprises partly arises from the pressures of partners, customers, workers, social organizations, State regulations, and the community in general. Besides, small and medium FDI enterprises in Viet Nam (the majority) have limited financial capacity and resources to implement CSR. Therefore, it is difficult for enterprises to implement CSR due to limited finance, substandard technical facilities, reluctance, or inadequate attention to CSR.

Some FDI enterprises have not yet been fully aware of CSR and its roles in improving their corporate competitiveness and sustainable development. Changes should take place in perspectives, perception, issues, plans, and implementation. It is advisable for the government to communicate and improve the awareness of CSR to make corporate leaders understand CSR beyond business ethics and charity activities.

In the current context, enterprises, particularly FDI enterprises should perceive that CSR implementation is an inevitable trend. It provides the opportunity for enterprises to innovate and develop. The perception of business leaders should be communicated to make changes in the awareness of the employees and managers. It is essential for FDI enterprises to provide training courses on CSR for employees and managers and encourage all members of the company to actively participate in environmental protection programs.

The fifth, put CSR into business strategies of FDI enterprises

FDI enterprises usually build their general codes of conduct and business norms to apply in different regions and markets. However, CSR implementation in these companies is still small-scaled and passive despite its strategic importance in the survival and development of the company.

On the basis of CSR perception in FDI enterprises from the perspectives of economic, legal, and ethical responsibilities, CSR plays a significant role in the corporate business strategies towards sustainable development. The diverse CSR-incorporated business strategies include policies related to employees such as recruitment, anti-discrimination, work safety, and product-related policies such as product safety, environmentally friendly materials, etc.

The sixth, focusing on community activities

The research findings show that "Public motivation" has a relatively strong impact on CSR implementation. The community is viewed as the most important stakeholder of CSR implementation of FDI enterprises. CSR activities for the community usually have more influential effects as it is easier to reach and access a lot of people. CSR activities for the community can be conducted under such forms as organizing/ sponsoring sporting, cultural, welfare activities of the local community, arranging volunteering and charity related to the company products and services. FDI enterprises should invest in long-term programs and strategic campaigns, as they are more effective than emergency support and assistance.

Faculty of Marketing, Thuongmai University, Hanoi, Vietnam

Assoc. Prof. Dr. Vu Huy Thong

vuhuythongktqd@gmail.com

Faculty of Marketing, National Economics University, Hanoi, Vietnam

Abstract

In recent years, the luxury fashion market has grown tremendously in the world as well as in Vietnam. However, there has been little research done in Vietnam in this area to gain a deeper understanding of luxury fashion product consumer behavior. This study is based on a literature review, previous studies aimed at overviewing the theoretical issues of customer perceived value. In addition, through a research review, the author evaluates the influence of perceived value on consumers' intention to buy luxury fashion products. From there, a theoretical research model is proposed as a basis for future experimental studies in Vietnam.

Keywords: *Luxury fashion products, purchase intention, perceived value.*

1. Introduction

Luxury fashion is now considered a booming industry and is continuing to expand globally. A large number of companies producing luxury fashion brands already have subsidiaries and stores in many countries around the world. Thanks to the globalization of these companies, consumers around the world have more access to luxury fashion brands. Although luxury industry has only a small number of manufacturing and trading businesses compared to other industries, it is an industry that generates billions of dollars for the world. It plays a special role in the economy and has significant effects on modern society (Chadha & Husband, 2006). According to statistics from Bain & Company, in 2015 the luxury industry contributed one trillion euros in income to the world economy. In particular, the luxury fashion industry - this core product group generated 250 billion euros in revenue in 2015 globally despite the difficulties of many economies during that period. (Bain & Company, 2015). By 2016, 2017, 2018, 2019, the updated figures of revenue of the worldwide luxury industry as reported by Bain & Company: 1.08; 1,2; 1.22; 1.26 trillion euros.

Along with the continuous development of the world economy, the economy of Southeast Asia in general and Vietnam, in particular, is also making important changes. The average income of Vietnamese people has been increasing sharply in recent years.

Specifically, in 2015, the per capita income was 45.7 million VND/person.year, by 2019 this figure increased to 64.4 million VND/person.year (GSO). According to a report by Wealth-X data company, Vietnam is ranked 3rd among the countries with the fastest-growing number of rich people in the world (12.7%). In 2019, Vietnam recorded 12,327 USD millionaires, an increase of 23% compared to 2015. It is forecasted that by 2023, the number of USD millionaires in Vietnam will increase to 15,776 people (The wealth report, 2019, Knight Frank). Besides, Vietnam is also a strong country with a young and highly educated population, with an increasing number of middle-class people. These are considered essential factors to help improve the purchasing power of the Vietnamese market in the coming time in general and for the luxury goods industry in particular.

According to Nguyen & Smith (2013), Asia is considered a remarkable place to research on consumer behavior, which Vietnam is the country chosen by many scholars as a context to study consumer behavior/ purchase intention of consumers (Nguyen Thi Tuyet Mai et al., 2016). Vietnam is a country with a high population growth rate and high income compared to other countries in the region. Besides, people in Vietnam also have different characteristics in terms of cultural factors, typical consumption habits (Nguyen Thi Tuyet Mai et al., 2016) compared to other countries. Therefore, studying the intention to buy luxury fashion products in Vietnam will have important practical significance to help clarify this issue.

Along with the development of the luxury fashion industry, the issues of luxury fashion consumption behavior of consumers have received the attention of scientists. Many studies on behavior and intention to buy luxury fashion products have been carried out and the results published in scientific journals, scientific conference proceedings. During the research process, the author has researched and synthesized many domestic and foreign researches on consumer buying behavior and intentions in general and luxury fashion products in particular. Previous studies by scholars have focused on various aspects of luxury fashion products. Therefore, the author has read, synthesized, compared, analyzed, and grouped research works to find research gaps in the Vietnamese context.

2. Method

To achieve the research objectives, the author uses theoretical research methods (study at desks) to synthesize, analyze, evaluate, compare... theoretical documents and related research works. (secondary data) to consumers' intention to buy luxury fashion products to get a research overview, find research gaps. Based on inheriting the theoretical basis from previous works, the author develops a research model and research direction for the Vietnamese context. The specific steps of the theoretical research method are concretized as follows: Search, classify research works, theoretical documents; Read and analyze documents and research works; Synthesize research results in works related to consumers' intention to buy luxury fashion products, then summarize into issues; Find out research gaps, articles focused on research; Proposed theoretical research model.

3. Research results

3.1. Overview of luxury fashion products

* Luxury products: According to the definition of Vigneron & Johnson (1999), luxury products refer to the highest level of prestigious brands, including different material and spiritual values. From another perspective, luxury products are 95% products of which are only available to 5% of the population and are in limited supply (Savitha & Sathyanarayan, 2014). In this sense, luxury products cause differences in society. Luxury products have some characteristics that distinguish them from other goods. However, it must be affirmed that whether a product can be considered a luxury depends on the perception of people, culture, and society (Vickers & Renand, 2003). Klaus Hein (2012) argues that the luxury product corresponds to the manager's understanding including all products that are beyond the necessary and normal compared to other products of the same type. Bilge (2015) also offers a similar concept when it says that luxury goods are products that have more necessary and conventional characteristics than other products of the same category (Bilge, 2015). And in a conventional approach to product ethos, this is a concept that highlights the difference between luxury goods and conventional goods.

Thus, the definition of a luxury product can be stated: “Luxury products have more necessary and normal features than other products of the same class, including a relatively high price, quality, aesthetics, rarity, specialty and symbolic meaning” (Klaus Hein, 2012). While developing the luxury brand concept, Hein developed and adapted the classification for the luxury product industries (World Directory of Luxury Brands - WLBD; Heine, 2011b).

Table 1: Classification of luxury products (Hein, 2012)

Fashion products: Clothing, shoes, underwear, fashion accessories (belts, gloves, handicrafts, hats, ties, eyeglasses)	**Means of transportation:** bicycle, motorbike, car, boat/yacht, plane/jet	**Interior decoration:** furniture, kitchen, table decoration (silverware, crystal & glassware, porcelain & stoneware), linens (table linens, bed linen, bath linens)), bathroom supplies, carpets, lamps, interior electronics, interior accessories, sports equipment, garden decorations.
Bags and cases: Luggage, handbags, wallets, and cases	**Delicacies:** Beverages (wines, sparkling wines, spirits), Foods	**Body decoration:** Mobile Electronics, Wristwatches, jewelry, pens, Writing paper.
Cosmetics & Perfumes		

* Luxury fashion products: According to reports by Bain & Company (2020), the luxury fashion segment accounted for 34% of total luxury goods revenue in 2019. In 2019, the segment's revenue of luxury fashion reached $106 billion, and is projected to grow to $130 billion by 2025 (Bain & Company, 2020). These figures reflect the importance, role, and development trends of the global luxury fashion segment in the future.

Thus, according to the classification of Hein (2012): Luxury fashion products are part of the luxury product category, including specific products such as clothing, shoes, underwear, accessories fashion (belts, gloves, handicraft items, hats, ties, eyeglasses).

3.2. Perceived value of luxury products

Various studies have tried to understand the key aspects of luxury value from the customer's point of view (Kapferer, 1997). Several scholars have focused on clarifying the concept of consumer perception of luxury value (Vigneron & Johnson, 1999, 2004; Wiedmannet et al., 2007; Berthon et al., 2009). Vigneron & Johnson (1999) proposed five perceptions of luxury value and divided them into two groups: social value (conspicuous, unique, and social value) and personal value (spiritual value) and quality). Vickers & Renand (2003) created a luxury value mode: Functional value, experiential value, and symbolic value. Wiedmann et al. (2007) proposed four value-based dimensions for luxury products: social value, personal value, functional value, and financial value. Various studies have shown that culture plays a significant role in consumer perception, leading to differences in purchasing behavior in different societies (Sharma, 2011). Therefore, researchers have proposed different assessments of luxury value perceptions and their influence on luxury product purchase intentions in Western and Eastern countries (Vigneron & Johnson, 2004)., Wiedmann et al., 2009; Choo et al., 2012).

Choo et al (2012) found luxury values for customers for luxury fashion products. The authors explain luxury value by: utilitarian, hedonic, symbolic, and economic value. Utility value includes the extraordinary value and functionality of luxury goods. Products that are identified by consumers as being excellent and able to fulfill their functional needs can provide utilitarian value. Hedonic value consists of three characteristics: aesthetics, pleasure, and experience. Products that are aesthetically pleasing and create a pleasant and enjoyable experience for customers can provide hedonic value to them. Luxury goods with symbolic value allow consumers to express themselves and associate the symbolic meaning of the product with their image. Economic value, on the other hand, can be determined by sociability. Luxury goods that allow people to socialize, join groups, and social classes can help them get some social benefits. However, a luxury product can have some or all of these values depending on the purpose of purchase and the nature of the product.

3.3. Factors affecting the intention to buy luxury fashion products

For luxury products in general and luxury fashion products in particular, through a research review, the author finds that many researchers use different theoretical frameworks to evaluate, analyze and find understand consumer buying intentions. Popular theoretical frameworks used by scholar: Theory of rational action (TRA) and the theory of planned behavior (TPB). Of course, over time, scholars have adapted, developed, and extended these theoretical frameworks when applied to research on consumer purchase intention in general and luxury fashion purchase intention in general. specifically to build research models that are more appropriate and effective with the research object and context.

According to the theory of rational action (TRA), it is possible to mention the studies of Ricky YK Chan (2001), Bopeng Zhang, Jung Hwan Kim (2013), Emilia Reis (2015), R. Srinivasan, et al (2015)), Sheetal Jain (2021)… According to different approaches, studies have shown the factors affecting the intention/behavior of consumers to buy luxury goods with their characteristics and contexts. particular, specific. There are many overlapping views in the conclusions of the above studies, however, there are also conflicting statements containing certain contradictions.

According to the theory of rational action (TPB), scholars Chao, Y.L (2012); Sohail Younus et al (2015); Ji Yi et al (2013); Ambalak Yadav & Govind Swaroop Pathak (2014) Hasan et al (2019)….have conducted a study on consumer intention/behavior with different methods and contexts. Studies have shown the factors affecting the intention/behavior of consumers to buy luxury goods. Many similar conclusions have been reached, along with controversial statements.

In recent years, many scholars have used perceived value theory to study consumer purchase intentions. So what is value? “Value” is one of the most widely and frequently used concepts in understanding and predicting customer behavior. Smith & Colgate (2007) introduced the concept of customer perceived value: “It is what a customer receives (benefits, quality, value, utility) from purchasing and using a product. It relative to what they pay (price, cost, sacrifice), which in turn affects attitudes towards the product”. Thus, to determine the perceived value of customers for luxury products, it is necessary to determine the customer's preference and belief in the product's attributes (Smith & Colgate, 2007). Also according to Smith & Colgate (2007), perceived luxury value is a strong predictor of consumer behavioral intention. High perceived value will lead to higher purchase intention. Perceived luxury value can be considered as a belief that guides choice or behavioral assessment and can be used to analyze consumer purchase intention (Wiedmann et al., 2007; Hanzaee & Rouhani, 2012). According to the theory of perceived value, the author has synthesized and analyzed several studies related to luxury consumption intention/behavior, specifically in Table 2.

Kuangpeng Hung & Annie Huiling Chen (2011)	Factors affecting Chinese consumers' intention to buy luxury brands	Brand perception, symbolic value does not influence on consumers' intention to buy luxury brands. The experience, function of purchasing luxury brands, physical arrogance, and achievement all have a positive effect on purchase intention. Achievement arrogance has a moderating effect on the relationship	Empirical, quantitative methods	643 Chinese and Taiwanese luxury brand consumers

		between Chinese consumers' brand perception and luxury purchase intentions.		
Ho Jung Choo et al, 2012	Generalize reasoning problems about the perceived luxury value of customers while testing the reliability and validity of the proposed structure.	Utility value includes the superior value and functionality of luxury goods. Spiritual values consist of three characteristics: aesthetics, pleasure, and experience. Luxury goods with symbolic value allow consumers to express themselves and associate the symbolic meaning of the product with their image. Economic value, on the other hand, can be determined by sociability. In addition, the relationship between customers' luxury value and consumers' purchase intention is assessed to be relatively strong.	Theory and empirical, qualitative, and quantitative methods	436 consumers in Korea
Ketsuree Vijanakorn & Randall Shannon (2016)	Develop a theoretical concept by examining the impact of country image on consumers' perception of luxury value	The perceived image of aspects of the country affects perceived value in different respects, and thus affects purchase intention. National images have symbolic and emotional significance for consumers. The research results of the authors have provided a more accurate assessment of the impact of the country's image as well as important information about the country's positioning in the world market.	Empirical, quantitative methods	407 elements (Thai consumers have been using luxury products)
Hiroko Oe & et al (2017)	Exploring the impact of consumer perception on luxury product purchase intention (handbags)	The perceived value of self-expression has a negligible impact on the purchase intention of Thai consumers. While the perception of social value, the perception of personal value has a strong impact on their consumption intention.	Empirical, quantitative methods	650 consumers in Thailand
Sheeltan Jain (2019)	Examine the influence of luxury value perception and luxury purchase intention among millennial consumers in India.	Conspicuous value is the most important determinant of luxury purchase intention of young Indian consumers. Experiential values, sensitivity to normative influences, and pragmatic values play an important role in determining the luxury purchase intentions of young Indians. In contrast, the unique value was found to have a negligible impact on consumer’s intention to purchase luxury goods.	Empirical, quantitative methods	728 young consumers in India

Source: Author's synthesis and analysis

For luxury fashion products, the perceived luxury value of consumers can directly explain why they choose to buy a particular luxury fashion product (Wiedmann et al., 2009; Choo et al., 2012; Ketsuree Vijaranakorn et al., 2016; Hiroko Oe et al., 2017; Sheeltan Jain, 2019). The above research results have confirmed the role of perceived value on consumers' intention to buy luxury products.

In the context of research in Vietnam, besides theories used by many scholars to study consumer intentions/behavior such as TRA, TPB, the consideration of applying a theory is contemporary. as perceived value theory is needed to clarify consumers' intention to purchase luxury fashion products. Therefore, the author proposes the following research hypotheses:

H1: The luxury perceived value of customers has a positive impact on the intention to buy luxury fashion products of Vietnamese consumers.

H1a: Utility value has a positive effect on the intention to buy luxury fashion products of Vietnamese consumers.

H1b: Hedonic value has a positive impact on the intention to buy luxury fashion products of Vietnamese consumers.

H1c: Symbolic value has a positive impact on the intention to buy luxury fashion products of Vietnamese consumers.

H1d: Economic value has a positive impact on the intention to buy luxury fashion products of Vietnamese consumers.

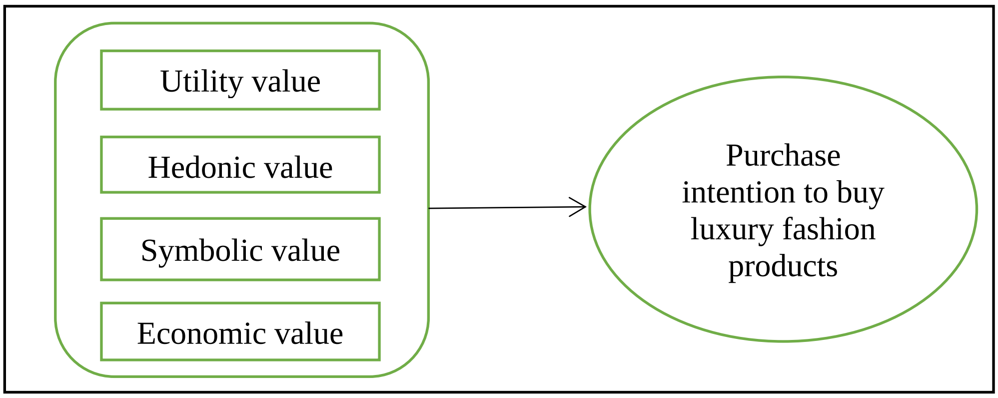

Figure 1: Research model of consumers' intention to buy luxury fashion products

4. Discussion and Conclusion

4.1. Meaning of research

There are different implications of this research: First, this research provides relatively valuable insight into factors of consumer perceived value. The concepts, characteristics, and classifications of luxury products are presented as a premise for assessing the purchasing intention of consumers for a specific luxury segment - luxury fashion products. Secondly, based on the synthesis, classification, and analysis of documents, the article has presented a theoretical framework that provides an overview of the customer's perceived value: concept, constituent elements (utility value, hedonic value, symbolic value, and economic value). Utility values include excellence and functionality; hedonic values including aesthetics and pleasure; symbolic values determined by experience, self-expression and social positioning; and finally economic value. Thirdly, the article attempts to review the researches that address the influence of perceived value on the intention/behavior to purchase luxury fashion products of consumers. From there, a theoretical research model and hypotheses are proposed to evaluate the impact of perceived value on the intention to buy luxury fashion products in the research context in Vietnam. Specifically, the luxury value of customers (including component factors: utility value, hedonic value, symbolic value, economic value) has a positive impact on the intention to buy luxury fashion products of Vietnamese consumers. The article attempts to present a theoretical framework that can help to better understand, analyze and explain consumer purchasing behavior towards luxury fashion products.

4.2. Limits and scope of future research

The scope of this study is limited to luxury fashion products and therefore, future studies can be carried out regarding other luxury products such as luxury travel, luxury furniture, etc. luxury furniture, etc., to get more comprehensive insights into consumer behavior towards different luxury segments. In addition, the paper makes theoretical conclusions based mainly on the review and analysis of previous studies. Therefore, it is necessary to have a quantitative study based on the proposed theoretical model in the future. The theoretical model developed in this study needs further confirmation by experimentally verified hypotheses. Besides, within the scope of the article, the author only mentions the influence of perceived value on consumers' intention to buy luxury fashion products. However, to explain more deeply the intention to buy, it is necessary to add other factors to the research model. This also opens up new research directions in the future for myself and other researchers.

National Economics University, Hanoi, Vietnam

Abstract

The main purpose of this study was to integrate trust and perceived risk into the theory of planned behavior (TPB) and the technology acceptance model (TAM) to explore factors influencing youth's intention to order online food delivery services (OFDS) in Hanoi, then to provide some practical implications to develop OFDS. The research adopted the structural equation modeling (SEM) to examine the data. The final sample consisted of 435 young people between the age of 15 and 25 in Hanoi. The study used the primary data collected from November 2020 to the end of January 2021 and the second data collected in the last 5 years. As a result, the findings showed that the attitude was the strongest predictor of the intention, followed by the trust. Low-magnitude predictors included subjective norms and perceived behavioral control, while perceived risk had no impact on the attitude and intention, even it positively affected trust. Besides, perceived usefulness had direct influence on the attitude, while perceived ease of use indirectly affected the attitude through perceived usefulness. Furthermore, there were differences in the impact of factors between males and females, between people having less than 5-million income and people having 5-million-or-more income. Hence, this study offered the substantial practical recommendations for OFDS developers and restaurants, and provided a mapping of the factors influencing consumers' intention to use OFDS.

Keywords: *behavioral intention, online food delivery services, technology acceptance model, theory of planned behavior.*

1. Introduction

The rationale of the study

In the last few years, several new technologies have affected the food and beverage sector and players' strategies. In particular, advancements in food delivery services are changing consumers' food buying habits. Online food delivery services (OFDS) is an innovative way to purchase food. With the increasing use of Internet and smartphones, the food delivery market is being reshaped. Through online websites and applications, OFDS provide consumers convenience and numerous food options from many different food retailers. Besides, these services may become an opportunity for restaurants to increase their revenues with the simplified process of service, payment, … Hence, the global OFDS market is in the robust growth. According to the report by IMARC Group (2018), the global OFDS market grew at 84.6 billion USD. In additon, according to Statista (2019), its revenue amounted to approximately 94.38 billion USD, resulting in a market volume of 200 billion USD by 2025.

An increase in smartphone users and Internet penetration has give a boost to OFDS in the world and there is no exception in Vietnam with 64 million people (about 66% of the population) accessing and using the Internet (Digital Marketing, 2019). According to the data of Statista (2020), Vietnam's revenue in the OFDS market amouted to about 274 million USD. The market is expected to reach 377 million USD in 2021 and 557 million USD in 2024. Not to mention, according to the research by Kantar TNS (2020), this thriving market is set to supersize to a hefty 449 million USD in 2023. According to Q&Me's survey (2021), 51% of consumers in Hanoi and TP. HCM has used OFDS. Especially, this number has increased up to 75% when the COVID-19 pandemic has broken out, because most Vietnamese people are practicing social distancing.

Thus, OFDS is playing a pivotal role. However, if businesses want to have great advantages to maintain and develop their business, it is necessary to grasp customer psychology. Factors that influence the intention to use OFDS often vary with different customers of each geographic area, gender, age, occupation and income, ... With the desire to find out the factors affecting the intention to use OFDS, we select the topic ***"Factors influencing youth's intention to order online food delivery services in Hanoi***" to identify and examine the important factors affecting the youth's intention to use OFDS. This study not only contributes scientific implications to OFD market, but also brings practical recommendations to enterprises in building business strategies.

Related Literature Reviews

There have been many studies investigating the main driver of online shopping. Rong Li et al. (2007) demonstrated that trust is an important factor affecting the intention in online shopping of consumers in China. Some studies focused on the characteristics of technology (Ma Mengli, 2011; Nguyen Thi Kim Van & Nguyen Khanh Ngoc, 2013), while others used the generic behavioral models (Sita Mihra, 2014; Shyh-Hwang Lee & Hoang Thi Bich Ngoc, 2010). However, studies on the intention to order online food delivery services are limited (Hansen et al.,2004; Alagoz & Hekimoglu, 2012; Quevedo-Silva et al., 2016; Lee et al., 2017). In Vietnam, there are not many research on this field.

Moreover, the lack of explanation about the positive effect of perceived risk has left a research gap. In addition, most of the above studies are conducted in foreign countries with the different characteristics of political, economics, social and culture from Vietnam in general and Hanoi in particular, leading to the intention to use OFDS is different. In Vietnam, although online shopping has developed and attracted the attention of the public, there are general studies on online shopping. For each product and each age range, factors' influence on consumers' buying intentions will vary in degree.

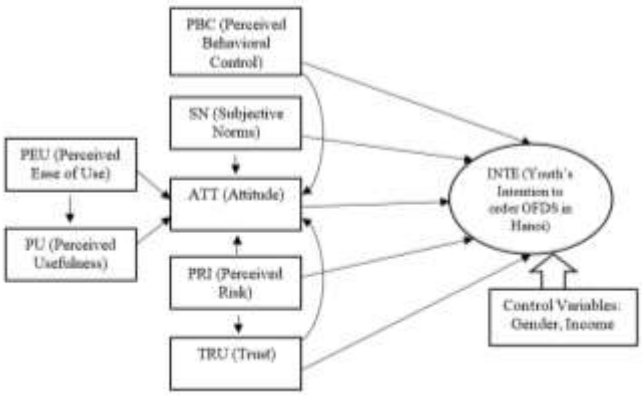
The aim of this research is to fill the gap on the drivers behind the consumer's intention to adopt OFDS, and to analyse the effects of factors. In this stusy, we integrate trust and perceived risk into the theory of planned behavior (TPB) and the technology acceptance model (TAM) to explore factors influencing youth's intention to order online food delivery services (OFDS) in Hanoi, then to provide some practical implications to develop OFDS.

Theoretical Framework

Currently, there is still no specific concept of online food delivery service, the research only stops at investigating: "What is online shopping?". However, according to the way of business and consumption, we can understand this as a service that provides a variety of different dishes to diners through applications, websites on smartphones and mobile devices.

Meanwhile, the concepts of purchase intention are somewhat more diverse. According to Ajzen (1991), "intention is motivating and represents the level of effort an individual is willing to put into performing a particular behavior". By 2012, Park had simplified it by defining "intent to buy as what we think we will buy". There are also a few other studies but in general we can understand "Purchase intention is the probability that a customer will buy a product or service".

In this research, we propose the following model:



In both the TPB (Ajzen, 1991) and the TAM (Davis, 1989), the attitude (ATT) towards a given behaviour has a relevant effect on the behavioral intention (BI). According to Ajzen (1991), attitude refers to "the degree to which a person has a favourable or unfavourable evaluation or appraisal of the behaviour in question". Hansen et al. (2004) confirmed that consumers' ATT towards online grocery shopping was the most important predictor of BI in online grocery shopping. Other studies focussed on using apps to purchase food also highlighted the importance of ATT BI (Lee et al., 2017; Yeo et al., 2017; Cho et al., 2019). Accordingly, we propose the following hypothesis:

[H1]: "Attitude positively influences the behavioural intention to use OFDS".

At the same time, according to the TPB model, perceived behavioral control (PBC) and subjective norms (SN) influenced BI. Ajzen (2002) defined PBC as the "subjective degree of control over performance of the behaviour itself". Various studies confirmed that PBC is a relevant factor in the BI to use OFD. For example, Hansen et al. (2004) showed the mportance of considering PBC in analysing the BI to purchase food online. Moreover, Barkhi et al. (2008) revealed PBC affected consumers' ATT towards online shopping. Thus, we propose the following hypotheses:

[H2a]: "Perceived behavioral control positively influences the behavioural intention to use OFDS".

[H2b]: "Perceived behavioral control positively influences the attitude towards OFDS".

Subjective norms – "the perceived social pressure to perform or not to perform the behavior" (Ajzen, 1991). Several scholars have found a significant positive link between SN and BI in online grocery shopping (Hansen et al., 2004; Piroth et al., 2020). In addition, when customers perceive that their friends, family and other relevant people are positively oriented towards using OFDS, they will be more sympathetic towards adopting it. Thus, we propose the following hypotheses:

[H3a]: "Subjective norms positively influences the intention to use OFDS".

[H3b]: "Subjective norms positively influences the attitude towards OFDS".

In the TAM, Davis (1989) identified two main cognitive responses predicting ATT: perceived ease of use (PEU) and PU. Davis (1989) defined PEU as "the degree to which a person believes that using a particular system would be free of effort". In OFDS, PEU refers to ease of making orders, choosing food or restaurants and tracking orders (Ray et al., 2019), while PU refers to the perceived utility and advantages of purchasing food on apps (Piroth et al., 2020). Several studies highlighted the positive influences of PEU and PU on ATT towards OFDS (Alagoz and Hekimoglu, 2012; Cho et al., 2019). Moreover, Lee et al. (2017) confirmed Davis's idea (1989) that PEU influenced PU. Based on this, the following hypotheses are proposed:

[H4]: "Perceived ease of use positively influences the attitude towards OFDS".

[H5]: “Perceived usefulness positively influences the attitude towards OFDS”.

[H6]: “Perceived ease of use positively influences the perceived usefulness of OFDS”.

Several scholars have studied how trust (TRU) influences BI (Alagoz & Hekimoglu, 2012; Ashraf et al., 2019). In food delivery, Alagoz & Hekimoglu (2012) showed that TRU improved the ATT towards OFDS. Cho et al. (2019) confirmed these results, finding that in OFDS, TRU significantly influenced both ATT and BI. Therefore, we propose the following two hypotheses:

[H7a]: “Trust in OFDS positively influences the behavioural intention to use OFDS”.

[H7b]: “Trust in OFDS positively influences the attitude towards OFDS”.

The role of perceived risk in the intention to adopt internet services is increased because customers perform their transactions with no face to face contact with the supplier’s personnel and no cash on hand. By using internet services, customers are concerned about potential financial risks such as the loss of their money during the transaction process and perceived threats for privacy and personal information leakage. Based on the above, it is expected that perceived risk negatively affects customers’ trust, attitute and intentions to adopt OFDS. Thus, the following hypotheses will be tested:

[H8a]: “Perceived risk negatively influences the behavioural intention to use OFDS”.

[H8b]: “Perceived risk negatively influences the attitude towards OFDS”.

[H8c]: “Perceived risk negatively influences the trust in OFDS”.

2. Method

Sample and Data Collection:

For the main survey, we collected the data from young people between the age of 15 and 25 in Hanoi from November 2020 to the end of January 2021, giving out the survey and sharing it on Facebook. We collected 450 questionnaires, but only 435 were complete. The sample represented males (26.67%), females (71.95%) and LGBT (1.38%). For the income, we divided users in two classes according to their income in a one-month period: less than 5 million VND (89%) and 5 million or more (11%).

Measures and Questionaire Development:

Measurement items used to evaluate all variables were cited from existing research and modified to be suitable in the context of OFDS. We have developed a research questionnaire adapting TAM and TPB constructs to fit our research context. All 34 items were measured on a 5-point Likert-type scale, which ranged from strongly disagree (1) to strongly agree (5). PBC (4 items), ATT (5 items) and SN (6 items) were adapted from Ajzen

(1991), Lin (2007), Bhattacherjee (2000). The three items for PEU and the five items for PU were adapted from Davish (1989), Lin (2007), Ha Ngoc Thang & Nguyen Thanh Do (2016) and us. TRU (4 items) were adapted from Gefen et al. (2003), Jarvenpaa et al. (2000); McKnight et al. (2002). PRI (7 items) were adapted from Pavlou (2003), Forsythe et al. (2006), Corbitt et al. (2003). Finally, those for BI (three items) were adapted from Ajzen (1991), Davish (1989).

Afterwards we tested our model by using Cronbach's Alpha Reliability Analysis, Exploratory Factor Analysis (EFA), Confirmatory Factor Analysis (CFA), Structural Equation Modeling (SEM) and Multigroup Analysis.

3. Results

3.1. Cronbach's Alpha and Exploratory Factor Analysis (EFA)

Cronbach's Alpha results gave us some numbers from 0.832 to 0.893, which indicated a high level of internal consistency for each scale with this specific sample.

Table 1. Results of Cronbach's Alpha and Exploratory Factor Analysis

Cron-bachs Alpha		**Questions**	**Component**						
			1	**2**	**3**	**4**	**5**	**6**	**7**
0.893	**PRI6**	Food is not what I expected	.799						
	PRI4	OFDS is not safe because I can not sample the food before buying	.795						
	PRI1	Credit card number theft	.793						
	PRI5	OFDS is not safe because I can not see the real food before buying	.792						
	PRI2	Personal information theft	.790						
	PRI7	I can lose much money when using OFDS	.715						
	PRI3	Food is not delivered to me	.703						
0.885	**SN2**	My family think that OFDS is a good idea		.803					
	SN4	My important people and idols encourage me to use OFDS		.771					

Cron-bachs Alpha		Questions	Component						
			1	2	3	4	5	6	7
	SN5	The information about OFDS is great		.767					
	SN3	I use OFDS because many people use them		.744					
	SN6	The media affects my intention to order OFDS		.741					
	SN1	My friends think that OFDS is a good idea		.712					
0.883	**PBC3**	I have time to order OFDS			.807				
	PBC4	I have money to order OFDS			.796				
	PBC2	I have smartphone, Internet to order OFDS			.771				
	PBC1	I am confident in my ability to use OFDS			.749				
0.852	**ATT1**	I like OFDS				.719			
	ATT2	Using OFDS is a good idea				.697			
	ATT3	Using OFDS is the best way in the Industry 4.0 era				.667			
	ATT4	OFDS is attractive to me				.643			
	ATT5	OFDS is well suited to my habit				.581			
0.852	**PU2**	I can buy cheaper food					.836		
	PU3	OFDS gives me some food which there is not in my place					.810		
	PU1	OFDS is useful for comparing a variety of food					.764		
	PU4	Using OFDS saves me time					.550		

Cron-bachs Alpha		Questions	Component						
			1	2	3	4	5	6	7
0.832	**TRU1**	I believe OFDS's websites and applications are reliable						.763	
	TRU3	I trust OFDS provides safe deal						.749	
	TRU2	I trust OFDS's websites and applications to do the job right						.742	
	TRU4	I trust OFDS brings the best benefits to me						.632	
0.893	**PEU2**	Using a website or a food delivery application is easy for me							.736
	PEU3	I easily search food and track the order							.698
	PEU1	I find it easy to order food through the Internet							.697

After the first test, PU5 was eliminated because it contributed to two factors. For the final stage, the factorability of the remaining 33 items was examined. The KMO (0.919) value was large and Bartlett's test of sphericity (Chi-square = 8978.334, df = 528, p = 0.000) was significant, implying that the present research had an adequate sample size and correlations among at least some of the items. The rotated component matrix was used from these 33 items; 7 components were extracted and they were able to capture 69.629% of the variability in the data.

3.2. Confirmatory Factor Analysis (CFA)

The results of CFA indicated that the measurement model had a proper fit to the data (Chi-square/df = 2.090, CFI = 0.942, GFI = 0.872, TLI = 0.934, RMSEA = 0.050). In the past, Hair et al. (2010) found that it was necessary to estimate the factor loadings for each construct to establish the reliability and validity. The reliability was evaluated on the basis that composite reliability (CR) should be greater than 0.7. Moreover, the average variance extracted (AVE) was used to test for the convergent validity. It is recommended that the AVE should be greater than 0.5. Finally, the discriminant validity was assessed by comparing AVE values and MSV (maximum squared variance) values. All constructs' AVE values should exceed MSV values. Hence, the discriminant validity was also established.

Table 2 showed that the reliability, the convergent validity and the discriminant validity were supported in this study.

Table 2. CR, AVE, MSV values

	CR	**AVE**	**MSV**
TRU	0.820	0.533	0.504
PRI	0.859	0.504	0.116
SN	0.887	0.568	0.372
PBC	0.872	0.634	0.503
ATT	0.843	0.519	0.504
PU	0.868	0.623	0.428
PEU	0.894	0.738	0.503

3.3. Structural equation modeling (SEM)

SEM was conducted to assess the hypotheses. The SEM results revealed an appreciable model fit with the data (Chi-square/df = 2.499, CFI = 0.912, GFI = 0.835, TLI = 0.902, RMSEA = 0.059). Table 3 showed the detailed results from testing the hypotheses. The results supported and confirmed all hypotheses except for 4 ones including H4, H8a, H8b (p-value > 0.05) and H8c (β=0.073 > 0).

Table 3. Hypothesis Decision

Hypothesis				**Standardized factor loadings**	**P-value**	**Decision**
H1	**INTE**	<---	**ATT**	.333	***	Accepted
H2a	**INTE**	<---	**PBC**	.131	.026	Accepted
H2b	**ATT**	<---	**PBC**	.282	***	Accepted
H3a	**INTE**	<---	**SN**	.181	.002	Accepted
H3b	**ATT**	<---	**SN**	.310	*******	Accepted
H4	**ATT**	<---	**PEU**	.077	**.373**	Rejected
H5	**ATT**	<---	**PU**	.258	***	Accepted
H6	**PU**	<---	**PEU**	.557	***	Accepted
H7a	**INTE**	<---	**TRU**	.226	***	Accepted
H7b	**ATT**	<---	**TRU**	.292	***	Accepted

Hypothesis				**Standardized factor loadings**	**P-value**	**Decision**
H8a	**INTE**	<---	**PRI**	.064	**.226**	Rejected
H8b	**ATT**	<---	**PRI**	.024	**.636**	Rejected
H8c	**TRU**	<---	**PRI**	**.373**	***	Rejected

3.4. Multigroup Analysis

The results of multigroup analysis revealed p-value = 0.04 < 0.05, implying that the relationships between factors and the intention to order OFDS were found to be significantly different between males and females, and between people having less-than-5-million VND income and people having 5-million-or-more income.

Table 4. Results of Multigroup Analysis

			Males	**Females**	**People having less-than-5-million VND income**	**People having 5-million VND-or-more income**
PU	<---	PEU	.514	.551	.584	.364
TRU	<---	PRI	.424	.294	.414	.047
ATT	<---	PU	.363	.233	.266	.229
ATT	<---	TRU	.176	.294	.267	.616
ATT	<---	SN	.486	.232	.319	.233

INTE	<---	TRU	.357	.180	.187	.478
INTE	<---	ATT	.384	.277	.328	.199

4. Discussion and Conclusion

This paper amongst the first attempts to explore factors influencing youth's behavioral intention to order OFDS by integrating the TPB (Ajzen, 1991), the TAM (Davish et al., 1989) and extending them to consider both the role of trust and perceived risk. This integrated model showed several interesting results both supporting and negating the previous studies.

Firstly, attitude was determined to be the strongest predictor of intention. The attitude towards using OFDS had a positive relationship with the intention to use the services. It was in line with the studies conducted by Ajzen (1991), Yeo et al. (2017), Lee et al. (2017) and Wang & Somogyi (2018).

Secondly, PBC had a positive influence on the intention. This confirmed the previous research such as Ajzen (1991), Hasen et al. (2004), Quevedo-Silva et al. (2016). Furthermore, PBC also affected ATT. But PBC was found to slightly influence BIs and ATT. Perhaps because members of Gen Z are true digital natives. From earliest youth, they have been exposed to the Internet, to social networks and to mobile systems.

Thirdly, the results of the data analysis showed that SN had a positive impact on INTE and ATT. This supported previous findings that the adoption of OFDS was more linked to the relevant other's opinions than to the individual's own attitude (Ajzen, 1991; Roh & Park, 2019; Alalwan, 2020).

Besides, our study confirmed the important role of trust in the formation of the intention to use. It could be interpreted that when consumers were able to trust the OFD platforms, they would have a better attitude towards using these services and were prone to use them. The significant impact of trust on the attitude and the intention to order OFDS supported the previous studies which demonstrated that trust was the significant predictor of the intention to use OFDS (Alagoz & Hekimoglu, 2012; Ashraf et al.,2019).

At the same time, the study's findings also indicated that PU directly affected ATT. It showed that consumers' attitude towards OFDS was influenced by how useful they find it. However, TAM's other factor, PEU only had an indirect effect on ATT through PU.

Finally, even if the previous research such as Hsin Chang & Wen Chen (2008), Nittala (2015) supported the negative influence of PRI, our study found that there was no significant relationship between PRI and ATT, also INTE. In addition, there was a positive relationship linking PRI and TRU. Perhaps because the sudden, unexpected, and virulent spread of the COVID-19 brought about a change in consumers' perception and behavioral intention, and many businesses made a strong shift towards online delivery services. People kept using OFDS as often after there were some social distancing measures due to the COVID-19 outbreak.

Recommendations

Our study provided some practical recommendations for these platform managers. Our data confirmed the importance of the perceived usefulness. One of the OFD's usefulness is cost and time saving. People enjoy having the ability to order food at any time and in any place without wasting precious time buying food and/or cooking it at home, and they like to have the opportunity to choose food from different vendors to suit their fleeting desires. Thus, these results recommend that managers should define policies to help users to order and receive all their food together. Moreover, managers could also define promotional strategies to encourage their users' intention to order OFDS through voucher programmers. Besides, OFDS developers should emphasize the key attributes of the ordering task and design OFDS that capitalize on those attributes. For example, the order interfaces should be designed with concise information.

Furthermore, the results revealed that consumers' intentions to use OFDS are tied with their trust in the services. OFDS developers and restaurants should capitalize on this relationship by providing the relevant information such as pictures, ingredients, price, … so that the amount of information presented on the website does not constitute the bottleneck, thereby maintaining consumers' focus on the task. Besides, OFDS developers and restaurants must ensure that the nature of services provides meets and corresponds to the anticipation of the services customers expected. OFDS, which integrates service quality dimensions of assurance, efficiency, reliability, responsiveness, tangibles, and convenience, has the potential to influence the intention of the customers. In addition, OFDS managers need to focus on customer service, both before and after they buy and use the services since it is a key driver of business success. They should encourage service agents to ask questions when interacting with customers to know about customers and their needs.

Although the findings did not support all hypotheses about perceived risk, it would be necessary to make these perceived risks less relevant to develop OFDS effectively in the long-term future. Managers should define policies on high security on customer's information and account to reduce their negative opinions.

Meanwhile, managers should also develop new social media to advertise OFDS. For example, they can link between TikTok and OFDS because TikTok has become Gen Z's one of the most favorite social network channels. TikTok statistics (2020) showed there were 13 million Vietnamese people including the huge number of youths using TikTok. Thus, OFDS managers should pay more attention to trends on TikTok to create relevant content of OFDS to attract more potential customers.

These findings will probably have some intriguing implications for food businesses (e.g., restaurants) and policymakers or authorities as well. Food venues should focus their efforts on getting the most out of OFDS, creating dedicated customer service channels to enhance OFD-related operations. Policymakers and authorities should pay attention to OFDS and introduce and implement specific regulations to guarantee a high level of service quality.

Conclusions

OFDS is becoming more popular day by day with the increase in the usage of the Internet, so understanding customers' needs has become a challenge for marketers. Our study findings indicated that there were four factors such as attitude, trust, subjective norms, and perceived behavioral control which affected customers' intentions to use OFDS. The study also concluded the customer's attitude supported trust, subjective norms and perceived behavioral control and perceived usefulness. The results on perceived risk reveal that it had no significant effect on customers' attitude and intention. As a result, our study provided some practical recommendations for food businesses, policymakers, and authorities to develop OFDS.

Abstract

Creativity is admitted to be the lifeblood of the majority of the most successful organizations and highlighted as the key ingredient for long-term organizational sustainable development. The latest research in the field reveals that creativity includes two stages: idea generation and idea implementation, in which the latter stage could be significantly limited because of the effect of face culture. This is because members in face culture avoid creativity-related activities, such as "rocking the boat" and risking failure in the public. This paper focuses on a new perspective regarding the moderator role of perceived supervisor support (PSS) in mitigating the effect of face on creativity. It concludes that PSS mitigates the negative effect of face culture on creativity. In addition to the theoretical contribution, the paper also suggests implications to create an environment for creativity by emphasizing the perception of supervisor's support on both task and relationship-oriented aspects, creating a cooperative atmosphere among coworkers and considering workers' positions while promoting creativity.

Keywords: *Creativity, Face culture, Organizational behavior, Perceived supervisor support*

1. Introduction

Nowadays, fast-paced changing environments lead to increasing complexity and make creativity and innovation become important sources of competitiveness (Nouri et al., 2014). In 2000, Ng Aik-Kwang published a book named *"Why Asians are Less Creative than Westerners"*. Since then, there have been fruitful scientific gains in the relationship between culture and creativity, and innovation (Erez et al, 2015). However, there are inconsistent findings on the effect of culture on creativity (Nouri et al, 2014). A huge range of research supports the argument that cultural values influence creative performance (Jaquish & Ripple, 1984; Harzing & Hofstede, 1996; Goncalo & Staw, 2006; Niu, Zhang, &

Yang, 2007). On the contrary, Chen et al (2002), Niu & Sternberg, 2002; Nouri et al (2013), and Riquelme (2002) find that there are no significant effects of culture on creativity. These inconsistencies motivate researchers to submit a call to search for the missing piece of the puzzle, the moderators of the culture-creativity relationship in order to overcome stereotypes about culture and creativity and enable identifying working conditions that enhance or attenuate the effect of culture on creativity (Nouri et al, 2014; Erez et al, 2015).

The research on the social context at work as a moderating factor on creativity has emerged for the recent period of time since the call from the Journal of Organizational Behavior (2015), there are several findings representing different levels of analysis from the most micro-level of the individual to the most macro-level of the country, to answer the question: to what extent social context can variate the effect of culture on creativity (Erez et al., 2015). They indicate that such relationships can be manipulated by the working context of power distance and the presence of a supervisor (Nouri et al, 2015). These include face logic endorsement (Spektor et al, 2015), foreign experiences (Morris, 2015), different models of negotiation (Gelfand, 2015), and other important elements of the working context. The majority of the researchers admit the importance of social context at work because it is likely to activate the shared cultural values and norms that guide appropriate behaviours (Nouri et al, 2015). Particularly in this research authors focus on investigating the moderating role of perceived supervisor support, which is an important aspect of social context at work, in the relationship between culture and creativity. This element has been concluded to affect an individual's creativity (Amabile et al., 1996; Andrews, 1967; and Oldham & Cummings, 1996). In addition, perceived supervisor support create a general organizational climate that enhances positive perspectives and mitigate the destructive side of culture (Fass & Tubman, 2002; Feldman, 2007; Mattanah, Lopez, & Govern, 2011; Robbins et al., 2009; Oldham and Cummings, 1996)

Besides, regarding a particular perspective of culture, it is not as diverse research examining the relationship of creativity and culture, particularly, on the perspectives of face culture. The differentiation of face logic is regarded as a critical feature of West and East culture (Kim & Nam, 1998 cited in Miron-Spektor, 2015). Research shows that people in all cultures want to be respected by others (Earley, 1997; Ting-Toomey, 1994). However, individuals across cultures vary in their endorsement of face logic; also, motivation to preserve their own face and others' differentiates among cultures. According to Kim and Nam (1998), the logic of face is predominately endorsed in East Asia but less so in Western cultures.

In this paper, we will examine if face culture can influence creativity and whether or not perceived supervisor support would play as a moderator of that relationship.

1.1. The relationship between Face Culture and Creativity

Creativity has been defined in various ways throughout history (*Boorstin, 1992; Dudek, 2003*). Amabile (1983, 1996) is among the most popular scholars to recognize the process of creativity. This scholar described employee creativity as the creation of new and useful combinations regarding products, services, processes, and procedures. Since then, creativity has been re-examined many times. Michael Mumford suggested: "*Over the course of the last decade, however, we seem to have reached a general agreement that creativity involves the production of a novel, useful products*" (Mumford, 2003). Sternberg (2011) defined creativity as the production of "*something original and worthwhile*". Another definition given by Torrance (1974) describes creativity as a process of becoming sensitive to problems, deficiencies, gaps in knowledge, missing elements, disharmonies, and so on; identifying the difficulty; searching for solutions, making guesses, or formulating hypotheses about the deficiencies: testing and retesting these hypotheses and possibly modifying and retesting them; and finally communicating the results. In a nutshell, the authors agree that creativity involves the process of the early-cycle including creative-oriented behaviors of ideas generation regarding either product, services, processes, procedure, and late-cycle related to implementation-oriented behaviors of ideas implementation.

"Face" is acknowledged as a human universal; however, the salient level of concern for face varies across cultures. The role of the face or its equivalent can be used to explain the East West cultural differences (Kim & Nam, 1998). While face-saving culture is well known in Asian social norms as Face (*Mianzi, 面子)* in China, *Maruah* in Malaysia and *Thể diện* in Vietnam; it seems to have less effect in Western culture (Kim & Nam, 1998). However, according to Miron-Spektor et al. (2015), recent findings suggest that face also exists in Western cultures (Liu et al., 2012; Mak et al., 2009). The extent to which people endorse face logic affects the way they respond to insults and aggressive behaviors (Severance et al., 2013), friendly gestures (Leung & Cohen, 2011), and other judgments about themselves (Kim & Cohen, 2010; Kim et al., 2010).

Despite important contributions to the understanding of face as presented, little is known about the effect of face culture on creativity. Available literature and critical thinking suggest that face culture will have a negative effect on creativity.

Goncalo and Staw (2006) state that creative ideas are often deviant (Moscovici, 1976) when first raised, and thus can be ridiculed and rejected (Baer, 2012; Mainemelis, 2010; Torrance, 1995). For this reason, most people are reluctant to express themselves because of the fear of receiving negative evaluations from other group members (Diehl & Stroebe, 1987). In other words, people who are concerned with their face may feel reluctant to engage in creativity (Miron-Spektor et al., 2015). Miron-Spektor et al., (2015) argue that

Face culture is established upon "the 3 H's", three related cultural components: hierarchy, humility, and harmony respectively. Different levels in the hierarchical system require people from these levels to maintain each other's face, especially the face of a higher level. Any attempt to over-claim face, which means to claim a higher status than one is perceived to deserve poses a threat to the hierarchical social structure and may result in punishment and social sanctions (Kim et al., 2010). Individuals should, thus, comply with the criteria of humility by not over-claiming face. In addition, face culture asks members within it to maintain a harmonious atmosphere by avoiding causing other people to lose face, from direct conflicts and carefully adhering to formalities (Leung & Cohen, 2011). In order to maintain the 3 H's foundation, members in face culture avoid creative-related activities, like "rocking the boat" and risking failure in public. They tend to follow socially common norms and always behave in ways compatible with their social roles (Choi & Lee, 2002; Hwang et al., 2003), They are more likely to preserve their own and others' face by engaging in solidarity, approbation, and tact; and going against conflicts (Cocroft & Ting-Tooney, 1994). Research has shown that highly face-concerned individuals are more likely to stand on the other side and more willing to conform and adopt the views of the other party. Also, they have a strong desire to be socially accepted, and a greater sensitivity to others' perceptions of them (Liu et al., 2012).

However, this tendency to follow the face culture by conforming to social expectation has long been regarded as contradictory to original thinking and creativity. Research has revealed that individuals, who are more afraid of risking their social image were less willing to raise and promote a different point of view and engage in innovation (Yuan & Woodman, 2010). They generate fewer and less creative ideas when interacting with others (Camacho & Paulus, 1995). In order to generate new ideas, individuals need to challenge existing paradigms, norms, stereotypes, and others' assumptions, as well as think differently and uniquely (Kim et al., 2012). Creative individuals are willing to face the pressure from the majority (Oldham & Cummings, 1997), to handle conflicts and disagreements (Janssen, 2003), and to discover the answer to the suspicion towards their ideas. On the contrary, people who endorse face logic are less willing to share their ideas because of fear of being wrong and being seen by others as ignorant (Huang et al., 2008). They are less likely to ask questions and search for feedback, which exposes the individual to different perspectives, fuels original thinking, improves creative ideas, and promotes innovation, due to the fear of embarrassment (Hwang et al., 2003).

Thus, it is proved that Face culture and creativity have a negative relationship. The more face people hold, the less creative they are. In this paper, the authors are going to re-examine whether there is such a relationship between Creativity and Face culture.

Hypothesis 1: Employees that possess a higher level of face culture demonstrate lower levels of creativity.

1.2. The moderating role of Perceived Supervisor Support in the Environment of Face Culture and Creativity

According to Eisenberger et al. (2002), Perceived Supervisor Support (PSS) is originated at organizational support theory and is defined as the degree to which employees form impressions that their supervisors care about their well-being, value their contributions, and are generally supportive. It is noted that in the leader behavior literature the term "support" is considered relationship-oriented behaviors only. Meanwhile, regarding creativity literature, several authors including Oldham & Cummings (1996), Scoot & Bruce (1994), and Fleishman (1953) in his two-factor theory of leadership, supervisor support is perceived to consist of both task and relationship-oriented behaviors. The former present actions relating to merely jobs: clarifying job descriptions, planning projects, instructing the work, and managing time and resources. The latter connect to leader-subordinate relationships: showing concern for subordinates' feelings, acting friendly, and personally supportive to subordinates, and being considerate to their welfare. In our paper contributing to the creativity literature, we mention "support" with the second boarder usage.

A slowly expanding body of literature over the past thirty years has documented the importance of perceived leader support for subordinate creativity. At the level of teams, some studies have demonstrated that team members' collective view of support from a leader is associated with the team's success in creative endeavors. Amabile et al. (1996) on the intra-organizational foundations of innovation – creative project work by teams of individuals. The study concludes that supervisory encouragement, which is one of the stimulants to creativity, is related to team creativity, in which higher levels of creativity correspond with higher levels of supervisor support and lower levels of creativity correspond with lower levels of supervisor support. Consistent with the above result, the study of Amabile & Conti (1999) suggests that during downsizing supervisory encouragement perceived by workers plays a particularly important role in project team creativity. The interviewee's comments largely reinforced the view that the supervisor support deteriorates during the downsizing *"Supervisory support? None, zero – has gone from bad to worse… They're in limbo too."* Declined perceived supervisor's support is accompanied by uncertain and chaotic changes, bad consequences on every aspect, and negative trends of creative team performance.

At the level of individuals, there is evidence of a connection between subordinates' general perceptions of their leaders and the individual creativity of those subordinates. Classic studies on this topic are of Amabile et al. (1996), Andrews (1967), and Oldham & Cummings (1996) showing that overall perceived leader support is a significant aspect of the work environment for creativity. A few studies of individual creativity have investigated particular areas of leader support, such as the team leader's tendency to provide both clear strategic direction and procedural autonomy in carrying out the work (Pelz & Andrews,

1976) as well as supportive, non-controlling supervision (Oldham & Cummings, 1996). Amabile (2004), then, supports such results and extends those findings with evidence on day-by-day leader support. Tierney, Farmer & Graen (1999) suggest a potential impact of leader-member exchange, which permits risk-taking, operational autonomy, and the freedom to deviate from the status quo, on creativity that is measured by supervisor ratings, invention disclosure forms, and research reports.

Taken together, these studies present the important impact of perceived supervisor support on creative performance. Subordinates are discovered to be more creative when they perceive their immediate supervisors as being supportive to them and their work. Whereas, Face culture is shown to be a negative environment for creativity. Oldham and Cummings (1996) demonstrate that supportive supervision makes a significant contribution to decreasing Face logic's effects on the workers. Other scholars claim the encouraging acts from social partners, such as advisors, mentors, and colleagues as the key factors to enhance knowledge learning, self-development by creating a comfortable, autonomic sharing environment (Fass & Tubman, 2002; Feldman, 2007; Mattanah, Lopez, & Govern, 2011; Robbins et al., 2009). Thus, we predict that Perceived supervisor support strengthens individuals' Creativity in the Face culture.

Hypothesis 2: Perceived supervisor support moderates the relationship between face culture and creativity by mitigating the impact of face culture on individual creativity.

2. Method

2.1. Sample and Procedure

The author conducted the survey during the peirods of time from the first week of February and to the first week of March 2018. The authors send both online questionnaires presented by Google Form via email and hard copies in person in two start-up companies. The first one is an insurance joint venture in Vietnam, in which the primary ownership belongs to the governmental Military Bank. The other one is a technology start-up in Norway which is based in Oslo and founded by a Norwegian team. The purposes of the research are discussed with CEO from these two star-ups. After agreeing to participate in the survey, two top managers introduce us to heads of departments, who in turn distribute questionnaires to their employees. To choose the sample size, the authors used convenient sampling and snowball sampling methods. We collected data from 260 out of 350 sent out questionnaires, which suggest the response rate of approximately 74%. Among the returned questionnaires, N = 245 (Vietnam, N = 121; Norway, N = 124) were valid for further statistical analysis. Out of the workers, the respondents' ages ranged from 25 to 45 years old. Of which, 11% of them are middle managers and top managers, 89% are normal employees. 48% of them have over 5 years of working experience. 99% obtained graduate and postgraduate degrees. Gender distribution simultaneously was 47% male and 53% female. The participants are oblivious of the research hypotheses, but aware of the general purpose of the study – to discover the relationship between creativity and face culture and how perceived supervisor support can moderate such relationship.

2.2. Measurement

The authors conducted the survey to quantitatively measure three variables: Creativity, Perceived Supervisor Support, and Face Culture. Unless otherwise indicated, all items were measured by a Likert-type scale anchored at 1, indicating “strongly disagree” and 7, indicating “strongly agree”.

Creativity

The participants self-report their creativity level based on creativity scales developed by Zhou and George (2001). The scale consists of 13 items, of which three items were adopted from Scott and Bruce (1994, cited in Zhou and George, 2001). According to Zhou and George (2001), all items are averaged out ($\alpha = 0.96$). The questionnaire includes items like *“You often suggest new ways to achieve goals or objectives.”, “You often search out new technology, processes, techniques, and/ or product ideas.”,* and *“You often have a fresh approach to problem.”*

Perceived Supervisor’s Support (PSS)

The participants then give the ratings for Perceived Supervisor Support Scale, which consists of four items ($\alpha = 0.88$) from the original one developed by Eisenberger, Hungtington, Hutchison, and Sowa (1986, cited in Skerlavaj et al., 2013). This shortened scale was validated in studies by Pazy and Ganzach (2009), and Kuvaas and Dysvik (2010). The four items that we used focus more on personal relationships than specific resources, which is supported by the Job Demands-Resources model (Demerouti et al., 2001) regarding PSS as a resource at the interpersonal level. Also, Ng, Lam, & Feldman (2013) state that assistance and resource allocation frequently originates at the embeddedness of employees with their colleagues and their supervisor (Ng, Lam, & Feldman, 2013), which suggests that such a relationship-based point of view may be appropriate (Skerlavaj, Cerne, and Dysvik; 2013).

2.3. Control variables

Contextual and individual factors that could be expected to influence both motivation and creativity will be controlled. These factors include age, gender, education, working experience, working position, creativity requirement, and task independence. Studies have indicated age affects creativity, but differently across various domains (cf. Jones & Weinberg, 2011). Also, researchers have pointed toward large differences in the creative achievement of men and women in many fields (cf. Baer & Kaufman, 2008), as well as for employee education (cf. Fasko, 2001) and work experience. Work experience is a valuable control variable because employees who have performed a particular task for a longer period of time may perceive its difficulty or reactiveness differently (Amabile, 1998), and direct task experience leads to higher levels of creativity (Gino et al., 2010).

3. Results

3.1. Descriptive statistics and Confirmatory Factor Analysis

Descriptive statistics (means, standard deviation, and correlations) for the key study variables appear in Table 1. Also, we notice that while running an additional t-test for two sample groups of Vietnamese employees and Norwegian employees, the discovered significant level is 0.292, which is greater than the 0.05 level. Thus, we can conclude that cultural differences might be not due to geographic differences between Vietnam and Norway.

We begin by examining the factor structures of the three focal variables: Creativity, Perceived supervisor support (PSS), and Face culture. We carry out a confirmatory factor analysis using STATA software version 15 with maximum-likelihood estimation procedures (e.g., Kline, 1998). The three-factor solution displays an adequate fit with the data (χ^2[489] = 1226.05, CFI = 0.89. SRMR = 0.073). All factor loadings are statistically significant and ranged from 0.77 to 0.83 for the Creativity items, from 0.66 to 0.80 for PSS items, and from 0.45 to 0.70 for Face culture items. We test all alternative nested models to examine whether a more parsimonious model achieved equivalent fit. Chi-square difference tests, which are presented in Table 2, show that our model achieved a significantly better fit.

3.2. Testing H1: Employees that pose a higher level of face culture demonstrate lower levels of creativity

We conduct linear regression and square regression to examine the relationship between Face culture and Creativity. In the former, obtained adjusted R Square is 0.405, which indicates that Face culture variable can explain 40.5% of Creativity variable. The causal relationship is statistically significant p = 0.000 in both ANOVA and coefficient variable. In the latter, obtained adjusted R Square equals 0.115, thus the squared Face culture variable explains Creativity less than the Face culture variable. The linear relationship, hence, is more relevant and is demonstrated in Table 3. To facilitate the interpretation of the interaction between face culture and creativity, we plot the linear regression of such relationship. The result, which is plotted in Figure 1, suggests that consistent with hypothesis 1, face culture negatively impacts individual creativity, which means hypothesis 1 is approved. To test this interpretation, we statistically compare the slopes to zero, obtained a standardized coefficient (β = -0.240) smaller than zero. Thus, higher level of face culture significantly predicts a lower level of creativity. This result initially supports our first hypothesis that Face culture has negative effect on Creativity variable. Workers working in an environment possessing a higher level of face culture or they possess higher level of face are predicted to have lower capability to be creative. Although this finding is encouraging in forecasting level of workers' creativity, the explaining power of face culture toward creativity is not remarkably high. Thus, it is important to test our mediating hypotheses about Perceived supervisor support variable as an explanatory mechanism for the relationship between face culture and creativity.

3.3. Testing H2, involving the moderating role of PSS in Face Culture and Creativity Relationship

To examine hypotheses in the working environment with the appearance of supervisors, we conducted hierarchical ordinary least square (OLS) regression analyses. We follow the moderated regression procedures recommended by Aiken and West (1991), entering the control variables in step 1, adding Face culture variable in step 2, PSS variables in step 3, and interaction between PSS and Face culture in step 4. As a results, the adjusted R square remarkably increases to 0.958 in the final model (adjusted R square is 0.403 in the first model, 0.405 in the second one). Literally, the full model is able to explain 96% of the dependent variable – Creativity.

Table 4 depicts the results of our moderated regression analyses. Model 4, which includes all the variables (Face culture, Creativity, PSS) and PSS's interactions with face culture, enhances the result in the previous part. Standardized coefficient of face culture ($\beta = -0.464$) is smaller than 0. Thus, the negative effect of face culture on creativity is emphasized.

Model 4's results support hypothesis H2 "Perceived supervisor support moderates the relationship between face culture and creativity by facilitating the impact of face culture on individual creativity." To test this interpretation, we compare the standardized coefficient of the interaction between PSS and face culture variable to zero. Calculated $\beta = 0.501$ is greater than 0. Thus, the PSS possesses the moderating role toward the relationship between face culture to creativity by weakening the effect of face culture. Hypothesis H2 is approved. Literally, workers, who are well supported by supervisors and better perceive this, can reduce the effect of face culture to have higher levels of creativity. On the contrary, worker, who cannot fully perceive supervisor's support, reduce the effect of face culture to a smaller degree. Plus, workers, who are not supported by supervisors or cannot perceive this (PSS = 0), lie under the same effect of face culture and do not obtain the improvement in their creativity.

Besides, the relationship between control variables and creativity in researched context also revealed in Step 1 with adjusted R square 0.403, indicating that with the only appearance of control variables, 40.3% of creativity variables is explained. Among eight examined control variables four variables, including country, working experience, working position, task independence, are is significant in impacting creative performance at p-value smaller than 0.05. Especially, the requirement for creativity in work variable is remarkbly significant at p-value equal to 0. These results are consistent with the conclusion of Jaquish & Ripple (1984), Harzing & Hofstede (1996), Goncalo & Staw (2006), Niu, Zhang, & Yang (2007) about culture and creativity; findings of Amabile (1998), Gino et al. (2010) regarding working experience and creativity. Meanwhile, gender, age, education level show no impact on individual's creativity level.

To sum up, on the quantitative approach of conducting the survey by using linear regression, we employ linear regression analyses and conclude that face culture has a bad effect on individual creativity. Working environments with a higher level of face culture decreases workers' capability of being creative, while at workplace with a lower level of face workers are more motivated to be creative. Hierarchical ordinary least square (OLS) regression analyses have shown that face culture's effect can be moderated by individual perceived supervisor support. Our statistic results support hypothesis H2. Literally, perceived supervisor can mitigate face culture effect on creativity.

4. Discussion and conclusion

4.1. Theoretical contributions

Although face culture is pervasive in East Asia and in multicultural work context, the influence of face has gained little attention of researchers in managerial field (Kim & Nam, 1998; Miron-Spektor, 2014). Our research contributes to the emerging body of work on cultural logics (Kim & Cohen, 2010; Kim et al., 2010; Leung & Cohen, 2011) that have explained inter-and intra-cultural differences in creativity and innovation (Leung et al., 2014). Our first result testing hypothesis 1 is consistent with earlier research on the negative effect of face culture on creativity (Oldham & Cummings, 1997; Yuan & Woodman, 2010; Kim et al., 2012; Miron-Spektor et al., 2015). Employees with a higher level of face are discovered to be less creative than the ones with the lower level. An interesting novel point discovered in our research is that there is no significant difference in face culture level between Norwegian and Vietnamese companies. Suggested causes might be stronger organizational culture and personal characteristics.

Furthermore, the authors answer the call to find reasons for inconsistent results researching cultural differences in previous creativity studies (Erez & Nouri, 2010). Besides already explored manipulation, such as power distance and the presence of a supervisor (Nouri et al, 2015), face logic endorsement (Spektor et al, 2015), foreign experiences (Morris, 2015), different models of negotiation (Gelfand, 2015), subtle differences in creativity might be manipulated by situational context of the extent to which how workers perceived supervisors support. Our findings suggest that the moderating role of perceptions about support from others at work, supervisor particularly, should be considered when exploring the possible effect of face culture on creativity. Consisting with previous research of Oldham & Cummings (1996) and componential theory of Amabile et al. (1988, 1996) that prove the critical positive impact of PSS on creativity, the effect of face culture on creativity is weaker or negligible when employees feel better support from supervisor. The finding suggests that PSS can curb the appropriate reflexive response to enhance one's image following a threat caused by face culture (Schmeichel & Vohs, 2009); thus, workers could be more creative even under the impact of face.

4.2. Practical contributions

The effect of face culture on creativity might be shifted due to the work environment (Nouri et al., 2014; Zhou & Su, 2010), which could be attributed by PSS. The practical implications of our study, therefore, will focus on suggesting novel ways to improve the work environment through PSS to promote creativity and, simultaneously, mitigate the influence of face culture. Innovative ideas need more resources (time, energy, attention, support, etc.) for their implementation (Škerlavaj et al., 2014). If the managers want to enhance the creativity in both quantity and quality of the ideas, they need to create a suitable environment for it (Zhou & George, 2001). Thus, both instrumental and socio-emotional support from supervisors needs to be highlighted and widely recognized throughout the company.

4.3. Limitations and Direction for Future Research

First, prior works including ours have largely neglected the ability to observe the qualitative mechanism behind moderating roles of perceived support from supervisors in the environment, possessing different levels of face culture, for creativity. These works mainly rely on the precision of quantitative research that likely does not reflect the realities of subjective feelings of worker's perception and qualitative characteristic of creativity. Also, the use of the survey captures only variance about if PSS can moderate other processes rather than exploring how these elements can interfere with the others. Thus, we submit a call to investigate this mechanism quantitatively under diverse points of view from different levels of managers and followers.

Second, our sample might not fully demonstrate face culture differentiation on the scope of country. In these two chosen companies, employees have some commons that decrease the representativeness of the sample. For example, the majority of workers are at the age in between 25 and 45 years old; plus, most of them have at least bachelor degree. As proved in prior research, age (Jones & Weinberg, 2011) and education (Fasko, 2001) can influence the level of face culture. Moreover, these two companies include also international workers. Therefore, workers in these two countries hardly present face culture in Eastern and Western countries. Also, both sample companies are start-up with open and flat initial organizational culture. Study's statistics notice that there is no significant difference between creativity levels between Western and Eastern countries. Thus, the samples might have stronger effect of organizational culture than geographic culture. This raises the opportunities for further research to look at a more concrete sample serving the purpose of investigating culture on the scope of countries.

Finally, because of the proven effect of face culture, workers might not honestly rate their creativity level in the questionnaire and in the interviews. They did not want to underestimate their abilities or lost their image under the interviewers' eyes or at least in their mind. Future research should employ a more objective method to estimate the creativity level, for instance: supervisors' or colleagues' ratings.

Table 1. Means, Standard Deviations, and Correlations among the research variables

	Variable	Mean	s.d.	1	2	3
1	Creativity	4.90	1.02			
2	PSS	4.65	1.03	0.434**		
3	Face culture	4.0	0.97	-0.240**	-0.230**	-0.41

Abstract

This article is an overview of affecting factors to turnover intention of the hotel industry staff. There are many factors that summed up different articles, which only guarantee to discover a particular content. In order to have more comprehensive view of affecting causes to the turnover intention of hotel staff, we recommend a research model with the synthesis from different factors basis on Job Descriptive Index and organizational commitment theories, other studies. New contribution of article is recommending the research model of turnover intention of hotel staff with impacting seven independent variables, two mediating variables that are job satisfaction and commitment to organization. Relationship between perceived risk factor in the correlative impact factors is a new discovery of the research. Affirming that, application of this model in the hospitality research from three stars hotel to five stars hotel in Vietnam is completely new, applying new discovery factors to the new research fields for further studies.

Keywords: *Turnover intention model, hotel staff, independent and mediating variables*

1. Introduction

Hospitality industry staff have different requirements, difficult to replace by machines, hotel business jobs require directive communication and flexibility with guests. In the three stars hotel to five stars hotel the professionalism of staff is higher; staff is not only healthy, good looking, charming, friendly, considerate and hygienic, but also requires nice uniform, foreign languages, knowledge, professional skills, handling situations and communication with customers are expected specific and standards. Labor in hospitality services have changed a lot by seasonality, the competition for human resources in the booming trend of the hotel business in Vietnam currently. This is a big challenge for human resource management administration in hospitality industry. The decision to terminate working at the hotel is the final result from the influence of factors affecting to the satisfaction and commitment of employees, arising the turnover intention and find a new opportunities, alternative jobs in other businesses. To clarify this content, we would like to summarize some of literature review, research sequences and approach as following:

First, aggregate factors affecting turnover intention of hospitality industry staff. Identify factors affecting turnover intention of hospitality industry staff through consultation with experts in hotel management then recommend the most comprehensive research model.

Second, the research question is what factors affect to the turnover intention of hospitality industry staff? Define independent variables, intermediate variables and relationship between factors.

Third, the object and scope of the study are the factors affecting the turnover intention of hotel industry staff through job satisfaction and organizational commitment mediating variable. Original theoretical review, articles written about turnover intention are published with domestic and international scientific indexes.

The original theory is determined to be the Job Descriptive Index (Smith et al, 1969) with the research content measuring attitudes employees about "job satisfaction and retirement" has shown Job satisfaction is the foundational study for future studies. Job satisfaction is assessed by five groups of factors that are the job itself, supervision, co-workers, salary and promotion opportunities. Research confirms and inherits groups of factors in job satisfaction, according to (Imparato, 1972) compares job description index with the relationship of satisfaction (Porter, 1961), the research content has reflected similar views and concepts about the factors constituting job satisfaction, although there are differences in methodological techniques, the difference score of the questionnaire on the level of satisfaction of needs (Porter, 1961) related to the level of satisfaction measured by the Job Descriptive Index. The research (Imparato, 1972) once again confirms that the five factors affecting job satisfaction have high applicability for future studies. (Smith, and Rollo, 1974) continues to assert that the Job Descriptive Index measures job satisfaction according to the five factors of the job itself, pay, promotion, supervision and coworker used frequently (Blood, 1969), (Evans, 1969), (Hulin, 1969), (Hulin & Waters, 1971), (Soliman, 1970), (Waters & Waters, 1969).

The theory of Commitment to Organization (OC). Derived from study "Unity performance, situational factors and employees' attitudes in different working companies" (Mowday, Porter, and Dubin 1974) initiated research attitudes employee to the organization in different work environments with three groups of tools; commitment to organization; resources attached to the organization; job satisfaction. The group of organizational commitment is used with 15 questions to measure employee commitment to the organization such as the desire to continue working with the organization; willingness to exert a high degree of effort on behalf of the organization; believe in and accept the values and goals of the organization. Especially, this tool is used to research in different organizations, the results obtained are different between groups of employees with different positions such as high commitment to organization (management group), low commitment to organization (group of employees doing tedious jobs). Organizational Engagement Resource used 12 questionnaires in order to measure the perceived influence of specific aspects of the job such as the working environment in the organization on desiring to stay or leave. The results obtained are different in the content of the question, there is a group that wants to leave organization, but there is also a group that wants to stay and work for the organization. It can be said that the group of authors (Mowday, Porter, and Dubin 1974) with different research contents, in which based on the employee's attitude to the organization to assess the commitment toorganization is pre-research for future research. According to the research content of the author (Meyer and Allen 1984), (Mowday, Porter, & Steers, 1982) the relationship between employee commitment to organization and some characteristics of the organization and employees. Commitment is understood in many different meanings; commitment is generally considered to be a decision to bet on the intended activity, all bet value will be forfeited upon discontinuing participation in the organization (Becker, 1960); Commitment may be labeled “Continued Commitment”, developed by (Stevens et al, 1978), however, this is not the only way to talk about commitmentn Affective commitment (Buchanan, 1974), (Steers, 1977). The significance of this difference will become apparent in the reinterpretation of the proposed findings. It should be noted that these two forms of commitment are understood to be independent, that is, the degree to which a person is emotionally committed does not affect the level of ongoing commitment and vice versa.

According to the authors (Porter, Steers, Mowday, & Boulian, 1974), (Porter, Crampon, & Smith, 1976), (Mowday, Steers, & Porter, 1979) measures of organizational commitment are based on three content; “strong belief in the values and goals of the organization”, “willingness to make significant efforts for the organization” and “desire to continue working for the organization”. These are closely related to what is mentioned in the emotional commitment above. Base on background and reference studies, the author (Meyer and Allen 1984) decided to use a 5-factor scale to measure commitment to organization as follows; Affective Commitment Scale – ACS, Continuance Commitment Scale – CCS, Organizational Commitment Questionnaire – OCQ, Responses to the Ritzer-Trice Scale / R-TS, Hrebmiak-Alutto Scale / HR-S. According to the author (Reichers 1985) commitment to the organization is synthesized from many studies as an independent variable, the research results correlate such as work performance, job satisfaction, absenteeism (Angle & Perry, 1981). From the above research results, it has been proved that job satisfaction and organizational commitment is the foundational research theory that has been used in many different research fields.

Turnover intention is a behavioral factor that has been studied by many scholars, especially in the field of human resource management, it has a role to reflect the actual situation in the workplace, the relationship between colleagues, between staff with investors, with customers. This information helps human resource managers have a comprehensive perspective and make timely plans to adjust to limit the behavior of leaving employees in order to stabilize personnel and sustainably develop their businesses. According to the author (Cho and Lewis 2012), (Emberland and Rundmo 2010), (Dipietro and Condly 2007), (Karatepe, Rezapouraghdam, and Hassannia 2020), (Tuan, Loc, and De 2016), (Chung

2018), (Wang et al. 2020), (Limyothin and Trichun 2012),(Chung 2018) research on turnover intention shows that the most obvious manifestation of employees' job dissatisfaction is due to a number of reasons. The end result leads to the act of leaving, causing serious damage to the organization in terms of people, brainpower and technology. Some views on turnover intention in the organization "the job turnover intention of staff is the thought of wanting to leave the organization and move to another workplace". Or the partner factors affecting employees make them feel unsatisfied, affecting their commitment leading to turnover intention (Amin and Akbar 2013), (Aykan 2014), (Jung) et al, 2012), (Albattat and Som, 2013), (Kulachai and Amaraphibal 2017), (Sánchez-Medina et al. 2019), (Rasheed et al. 2020). According to the author “Turnover intention is understood as the thoughts, considerations and calculations of employees for the behavior of leaving the current organization in the context of the influence of subjective or objective factors inside and outside the hotel business”.

2. Metthod

To achieve the research objective, this paper approaches the literature research review. Information from specialized scientific journals related to human resources in enterprises and hotel businesses. The search for the scale of factors is based on literature research review. Qualitative study of interviews with experts to select suitable factors for the model.

There are many factors that affect to the turnover intention of hospitanity staff. During the research process, the author has compiled 360 related articles, then applied the literature review method, following the instructions of the authors (Moher et al. 2009), (Kitchenham et al. 2009), (Brereton et al. 2007), (Murata, Wakabayashi, and Watanabe 2014). In order to use the document system conveniently after searching, the author has numbered and divided the documents into the group of job description index theory, commitment to organization, group of models and group of studies. Empirical research, the group of factors affecting the turnover intention in general, the group of factors affecting the turnover intention in the hotel industry. Most of the articles focus on studying only a few factors affecting the turnover intention. Therefore, there many factors affecting to the turnover intention the hotel staff, including the use of two mediating variables, is a new research direction that helps author to contribute a more holistic and multidimensional view of influence and the relationship of factors related to the turnover intention the hotel industry staff. Author has coded selected articles according to the article number, the content of the articles is mainly related to the turnover intention or leaving hotel industry.

3. Results

For the Job Descriptive Index, author has listed 18 studies, which refer to the relationship between factors and satisfaction moderative variables: (Imparato 1972), (Smith, Smith, and Rollo 1974), (Schneider and Dachler 1978), (Johnson, Smith, and Tucker 1982), (Heneman and Schwab 1985), (Jung, Dalessio, and Johnson 1986), (Marin 1987), (Gregson 1987), (Ironson et al. 1989), (Hanisch 1992), (Stanton et al. 2002), (Lake et al. 2010), (Lan et al. 2013), (Nahar et al. 2013), (Yeager et al. 2015), (Theodosis and Giannouli 2017), (Davies, Van der Heijden, and Flynn 2017), (Inoyatova 2021). In the above studies, authors refer to about 521 published in the world whose foundation theory is Job Descriptive Index. According to the author (Inoyatova 2021) the use of measures of overall or general job satisfaction, also referred to as global scales, the author has statistics in table 1:

Table 1: List of Widely Known Measures of Job Satisfaction

N	Title	Abbreviation	Author name	Year
	Facet-specific Satisfaction Measure			
1	Minnesota Satisfaction Questionnaire	MSQ	Weiss et al.,	1967
2	Job Descriptive Index	JDI	Smith et al.,	1969
3	Job Satisfaction Survey	JSS	Spector	1985
4	Job Diagnostic Survey	JDS	Hackman & Oldham	1975
	Global Job Satisfaction Measure			
1	Faces Scale	FS	Kunin	1955
2	Michigan Organizational Assessment Questionnaire	MOAQ	Camman et al.,	1979; 1983
3	Job in General Scale	JIG	Ironson et al.,	1989
4	Overall Job Satisfaction Scale	OJS	Brayfield & Rothe	1951
5	Global Job Satisfaction Questionnaire	GJSQ	Warr et al.,	1979
6	Overall Job Satisfaction Scale	OJS	Judge	1994

Source: (Inoyatova 2021)

For the theory of Commitment to Organizational (OC), author has listed 20 studies related to research overview, the relationship between factors and commitment to organization in the role of moderative variables, commitment to organization change, Commitment as an Independent Variable, Commitment as a Dependent Variable: (Mowday, Porter, and Dubin 1974), (Morris and Sherman 1981), (Meyer and Allen 1984), (Reichers 1985), (Mathieu and Zajac 1990), (Eby et al. 1999), (Cohen and Gattiker 2005), (Cohen 2007), (Joo and Park 2009), (Lapointe, Vandenberghe, and Panaccio 2011), (Bhatnagar 2013) (Rehman et al. 2013), (Mercurio 2015), (Zhao 2017) . According to statistics from the above publication, there are 143 topics related to commitment to organization.With the above research results, it is clear that the Job Descriptive Index and Commitment to

Organizational are the foundation for building a research model, the relationship between the factors affecting satisfaction moderative variables and commitment to organization with turnover intention. and the role of moderative variables of satisfaction, commitment.

Statistically a number of studies on the influence of factors on turnover intention such as: Employee burnout (Back et al. 2020), position, skill level, behavior and job satisfaction (Xu et al. 2020), working environment conditions, safe leadership (Amponsah-Tawiah, Ntow, and Mensah 2016), (Bradley and Cartwright 2002) the relationship between social support and recognition awareness, job stress, (Luo et al. 2020), information skills model, extended motivation, (Aykan 2014) relationship and transactional contract with mediating role is the emotion of loneliness. of employees in the workplace, benefits, affordability, advancement opportunities, self-employment (Zahra Malik and Khalid 2016), demographic factors, job satisfaction, organizational commitment , perceived perceived alternative job opportunities (Ojiaku, Nkamnebe, and Nwaizugbo 2018), job engagement, commitment to organizational, job commitment, job satisfaction (Zhang et al. 2019) , the relationship between factors of career development, teamwork, relationships at work (Khuong et al. 2016), (Quoc Hung & Hao Thi 2010) factors of satisfaction, stress, salary and benefits , organizational commitment, work environment, training and development, job challenges, leadership behavior, workplace relations, conformity, organizational policies, traditions, morale In the work. In the field of education, there are a number of studies on the factors affecting the intention to quit, such as according to the author (Feng and Angeline 2010) this study examines the perceived of organizational support, employee burnout, job satisfaction and emotional commitment, job pressure factors, job satisfaction and team commitment (Chung 2018). The influence of social media in human resource management strength (Ruparel et al. 2020), (Ulufer and Soran 2019) demographic and emotional factors of employees in the correlation between variables such as: nervous breakdown; openness; outward; compliance; self-discipline; play superman; deeply immersive; natural emotions, (Long, Ajagbe, and Kowang 2014) the factors of tight management of performance, compensation, training, and employee relations are effectively implemented, (Jones et al. 2007) on studying the role of overload in work attitudes, (Arshadi and Shahbazi 2013).

Statistics on researches on turnover intention of hotel staff: (Park and Gursoy 2012) factors such as vitality, dedication, absorption, job satisfaction, practice factors human resource management and employee development including performance appraisal, training and development, career advancement, organizational trust (Hemdi and Nasurdin 2006), (Yang, Wan, and Fu 2012), describe multi-level model of management support at management level, department level, supervisor level, individual level, departmental support, departmental supervision, sincere team, transformational leadership membership, civil rights organizational behavior, the effect of organizational commitment on employee attitudes and loyalty – hotel employee retention (Li, Kim, and Zhao 2017), (Yao, Qiu, and Wei) 2019), (Sun et al. 2020), the content of the structural equation research (Limyothin and Trichun 2012) the factors studied by the author are work and life quality, acceptance of organizational culture, job satisfaction and team commitment organization, demographic factors in hospitality businesses, (Li, Bonn, and Ye 2019), the relationship between job change in hotels and intention to quit; The regulatory role of organizational support is perceived and the psychologically competitive environment - artificial intelligence and robot awareness of hotel staff. (Wang et al. 2020) studied the influence of professionalism on the intention to change the job of hotel employees, the mediating role of employee engagement and job satisfaction, factors that are Paired topic in the research content of professionalism, satisfaction, cohesion, (Zhuang et al. 2020) the effect of friendship deviant behavior in the workplace of hotel employees - the regulatory role of hotel staff. organization, (Peng, Lee, and Lu 2020) employee green behavior from a positive perspective and positive spillover because such voluntary behaviors benefit actors other than employees, specifically can be hotels that use them and their natural surroundings, (Urmanov Bahromjon, Shin Hoyoung, and Kim, Ki-Su 2013) working environment, co-worker relations, job satisfaction, salary, organizational commitment, engagement, work motivation, job satisfaction, work environment (Dipietro and Condly 2007), (Park and Min 2020) work attitude, work stress Work and role stressors, conflict between parties (Akova, Cetin, and Cifci 2015), (Emiroğlu, Akova, and Tanrıverdi 2015).

Statistical a number of turnover intention research models: research (Feng and Angeline 2010) on the relationship between organizational support, emotional exhaustion, job satisfaction and engagement feelings and intentions to quit and jump jobs. According to the author (Kim, Im, and Hwang 2015) three counseling functions have been selected, which use the factors of career development, psychosocial support, role model, role conflict, role ambiguity, job satisfaction, and organizational commitment. This research model has generalized consulting activities at luxury hotels to include three factors of career development, psychosocial support, and role modeling. The analysis content from the structural equation model has shown the statistical significance between the relationships of the factors, most notably the psychosocial support factor that has a strong relationship with the variables in the model. Positive impact on organizational commitment and job satisfaction factor, but negative impact on role ambiguity, role conflict leads to employee's intention to quit. Research results also show a significant relationship between career development function and role ambiguity, between role and role ambiguity, or between role ambiguity and intention to retire. job. Job intentions are related to personal characteristics such as physical condition, interest in other areas of work, unfavorable relationships with current co-workers, distance between residence and employment. company, the ability to combine work and study. Positive impact of three mentoring functions on job satisfaction and organizational commitment and negative impact of role stress on these two factors. The results of the study provide evidence of the merits of mentoring programs in hotels, restrictions in the hotel staff. Therefore, it is necessary to extend the sample to other parts of the hotel. Therefore, future studies need to clearly define the role of these variables as regulators. In this research model, we see that the author has not clarified the relationship between job satisfaction and organizational and individual commitment, which is studied by functional groups; The role of stress at work, attitude at work to turnover intention.

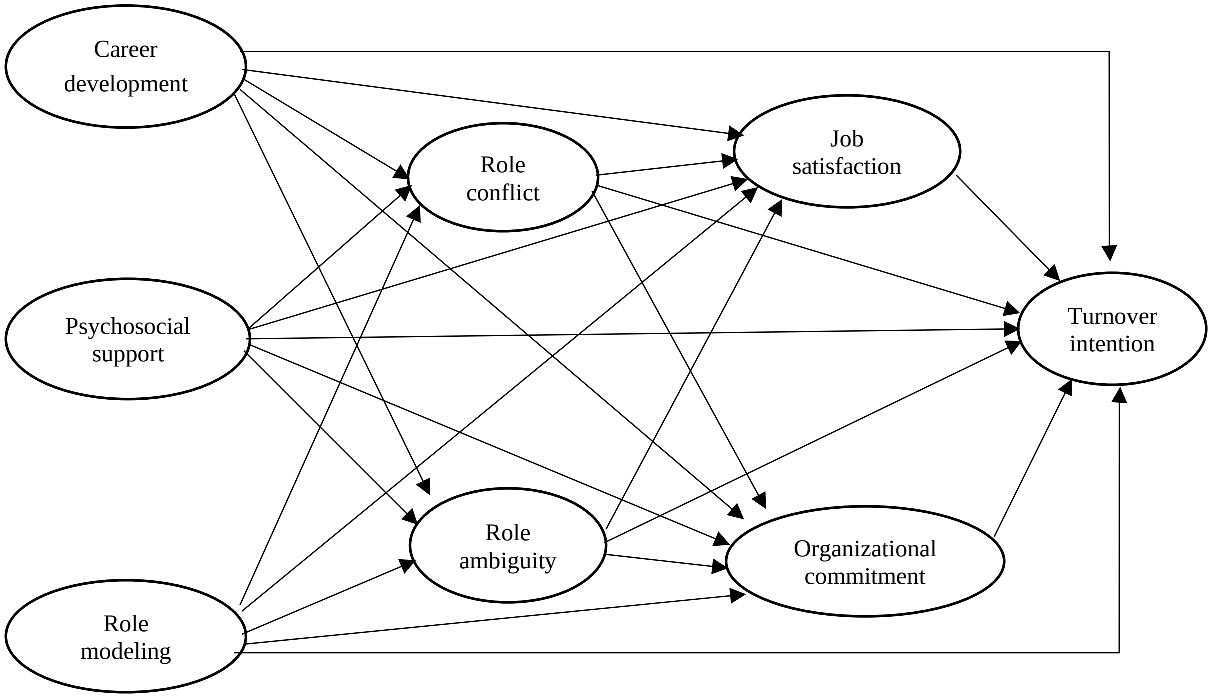

Figure 1: The turnover intention model

Source: (Kim, Im, and Hwang 2015)

According to the author (Urmanov Bahromjon, Shin Hoyoung, and Kim, Ki-Su 2013) used a structural model to explore the factors affecting the turnover intention hotel staff in Taiwan. Research results show that; higher levels of satisfaction about their work environment have a positive impact on job satisfaction; higher commitment to organization among hotel staff

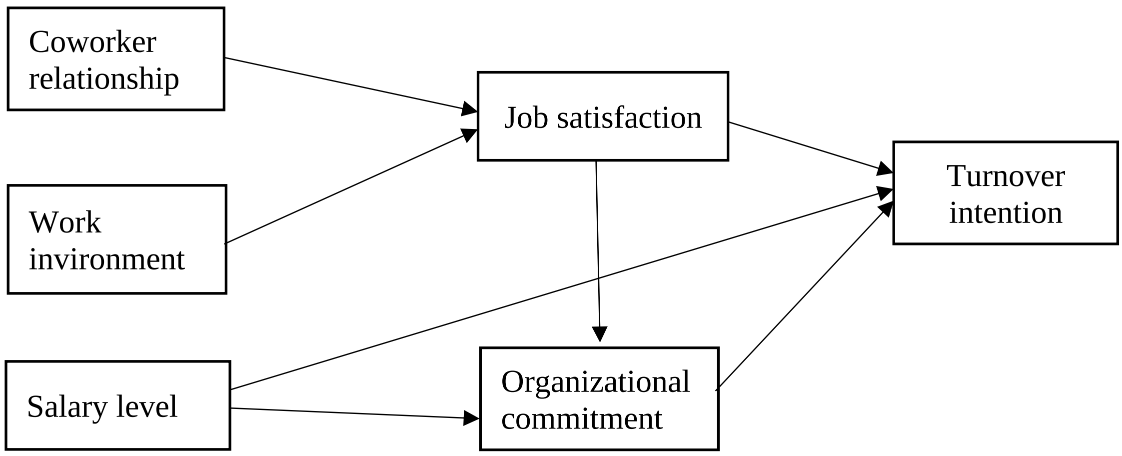

Figure 2: The turnover intention model

Source: (Urmanov Bahromjon, Shin Hoyoung, and Kim, Ki-Su 2013)

Based on the above studies, author finds that the research on turnover intention in the world focuses on analyzing the demographic characteristics, gender, age affecting to turnover intention in the hotel industry. In the above studies, few authors have studied the effects of factors on the turnover intention of hotel industry staff. In Vietnam, there have also been some studies on turnover intention, but only focusing on education, industrial parks and textiles, no author has comprehensively studied the influence of factors on thr turnover intention of hotel industry staff. Therefore, author finds that research gaps still exist, specifically as follows:

Firstly, the studies confirmed that there are many factors affecting to the turnover intention of hotel industry staff, however, in Vietnam, no author has studied the overall impact of these factors on the employee's turnover intention of hotel industry through the relationship between factors and two moderative satisfaction and organizational commitment.

Secondly, the sample studies only focused on a few factors in the individual hotel, pre-opening hotel, 4-5 star hotel Therefore, extensive research is needed to ensure the full representativeness of the research sample from 3 stars hotel to 5 stars hotel.

Thirdly, through the research results, it will be the basis for recommending perfecting the research model on the factors affecting the turnover intention of the hotel industry staff in Vietnam.

Fourthly, the perceived risks of occupation in the context of the pandemic in general, Sars, H5N1 and Covid_19 in particular, especially in the hotel business is more heavily affected. Therefore, the addition of the perceived risk factor in the relationship between factors in order to discover the extent to which the factors affect to the turnover intention of the hotel industry staff is a new contribution in this study.

With the combination of a review of research documents and a survey of 20 hotel human resource management experts, author proposes to recomend a research model with 9 factors affecting to the turnover intention hotel staff currently. The elements are coded under table 2 as follows:

Table 2: Coding factors in research model

No	***Code***	***Type of** variables*	***Factors***
1	**WI**	Independent	Work Itself
2	**SU**	Independent	Supervision
3	**COR**	Independent	Coworkers Relationship
4	**SBE**	Independent	Salary and Benefit
5	**COP**	Independent	Career Opportunities
6	**JST**	Independent	Job Stress
7	**PR**	Independent	Perceived Risk
8	**JSA**	*Mediating*	Job Satisfaction
9	**OCO**	*Mediating*	Organizational Commitment
10	**TI**	Dependent	Turnover Intention

Source: Authors synthesized

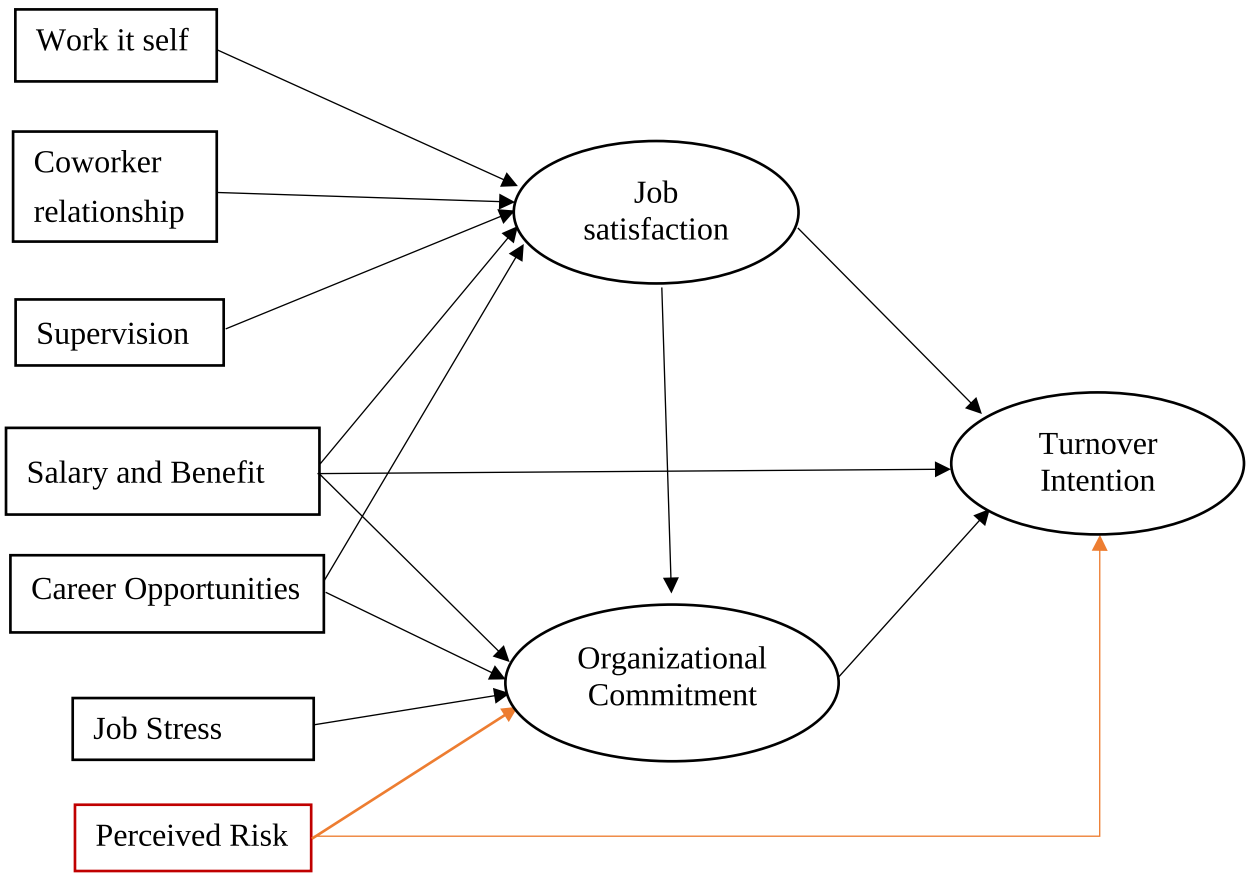

Figure 3: The turnover intention model of hotel industry staff in Viet Nam

Source: Authors recommendation

From the research model (Figure 3), the author proposes the following research hypothesis:

H1: The job itself has a positive impact on job satisfaction

H2: Job supervision has a positive effect on job satisfaction

H3: Coworker Relationship has a positive effect on job satisfaction

H4a: Salary and benefit has a positive effect on job satisfaction

H4b: Salary and benefit has a positive effect on work commitment

H4c: Salary and benefit has a negative effect on turnover intention

H5a: Career opportunities have a positive impact on job satisfaction

H5b: Career opportunities have a positive impact on organizational commitment

H6: Job stress has a negative impact on organizational commitment

H7a: Perceived risk has a negative impact on organizational commitment

H7b: Perceived risk has a positive impact on turnover intention

H8: Job satisfaction has a negative effect on turnover intention

H9: Organizational commitment has a a negative effect on turnover intention

H10: Job satisfaction has a positive effect on Organizational commitment

4. Discussion and Conclusion

This is an overview, meta-analysis, and statistical analysis of researches related to factors and turnover intention. Determining the relationship between factors as (Figure 3) is a new research direction in the hotel industry in Vietnam, especially from 3 stars hotel to 5 stars hotel. From research model 3, we have 10 hypotheses and 13 negative and positive impact relationships between factors. Research model and research hypothesis are very important content for the author's future research directions. However, in reality, the research results are not always consistent with the model and hypothesis, so the research model and hypothesis of this review are only foundation, creating a premise for the research further direction.

The synthesis of the above factors only response the requirements of the research content, but it is necessary to have research practice to confirm the exact relationship of the factors in the research. To apply the observed variables in the factor to the research, it takes a lot of time to consult experts to choose the most suitable survey content. The relationship between synthesis, inheritance of factors, scales, observed variables and actual research results is also very important, it is necessary to carefully handle the survey content to suit the context. the content of the research will be successful.

From an overview of research theories to applied studies in various fields and research in the hospitality sector. Author finds that this is a new comprehensive research proposal. In particular, the perceived risk factor in the context of factors is completely new to study about turnover intention of the hotel industry staff. With not so much time and experience, author needs to be learned more and would like to receive suggestions to improve the writing rather than a basis for the author to continue research.

From the above research model, author will continue to improve the thesis to analyze the impact of turnover intention on working performance, engagement and responsibility, co-worker relationships, job satisfaction, commitment to organization and proposed solutions to develop sustainable hospitality staff.

FACTORS INFLUENCE CONSUMER SATISFACTION IN SAFE FOOD STORES: THE CASE OF THANH HOA CITY, VIETNAM

Dr. Ngo Chi Thanh

ngochithanh@hdu.edu.vn

Lecturer, Faculty of Economics and Business Admiration

Head, Department of Technology and Science Management

Hong Duc University, Thanh Hoa, Vietnam

Abstract

In recent years, a system of safe food stores has been formed and developed to meet the increasing demands of consumers. We observe that, safe food stores develop in competition for customers with other food retail systems such as traditional markets, supermarkets and trade centers. Based on such observation, the article studies the factors affecting customer satisfaction towards safe food stores. In more precisely, we propose the research model with five influencing factors, including: Food quality; Price; Promotion; Product display; and Staff. The study was conducted based on a survey of 265 consumers at safe food stores in Thanh Hoa city. The result shows that, Food quality; Price has the most influence on customer satisfaction. Besides, Promotion; Product display; and Staff also influence customers' choice to go to a safe food store. Based on those results, the article proposes recommendations for safe food stores to improve customer satisfaction.

Keywords: *Safe food stores, retail system, consumer satisfaction, Thanh Hoa city*

1. Introduction

The food system has been transformation in Vietnam toward modern distribution channels and high quality (Thanh, 2020). Besides the development of supermarkets and trading centres, the appearance of safe food store system also offer to the consumers more choice to buy food with high quality products. In recent years, Safe food distribution system in general and safe food stores in particular has been strongly developed. The number and quality of safe food stores in the country has increased significantly, meeting the increasing demand for safe food of consumers. Food safety criteria have been included in the socio-economic development plans of the localities. Safe food stores have provided consumers with new options for safe food. In other words, customers are free to choose to consume products between safe food stores, traditional market systems, as well as supermarkets and trade centres. From that observation, there is strong competition for customers between safe food stores and other distribution systems.

Thanh Hoa is a province with a developed retail distribution system, according to the Thanh Hoa Provincial Statistical Yearbook (2019), as of 2019, Thanh Hoa province has 391 markets, 20 supermarkets and 02 commercial centres) and chain of convenience stores, safe food stores. The safe food distribution system of Thanh Hoa province in general and of Thanh Hoa city in particular is developing very diversely and abundantly. Statistics show that, currently, in Thanh Hoa province, there are 558 safe food stores built, of which 86 stores have been granted food safety certificates, 377 stores were inspected to meet food safety requirements.

Thanh Hoa province has issued many mechanisms, policies and guiding documents related to food safety. A number of guidelines, mechanisms and policies have been promulgated such as: Resolution No. 04-NQ/TU dated August 18, 2016 of the Provincial Party Committee on strengthening the Party's leadership in the work of ensuring security and food safety in the province until 2020; Directive: No. 25/CT-UBND dated September 6, 2016 of the Chairman of the Provincial People's Committee on strengthening the responsibility of state management of food safety in the province; Directive No. 19/CT-UBND dated October 5, 2018 on strengthening leadership and direction in building food safety communes, wards and townships, No. 09/CT-UBND dated June 17, 2019 on strengthening transportation management. Transporting, slaughtering, processing and consuming meat and poultry, No. 18/CT-UBND dated June 11, 2020 on strengthening the state management of food safety in the province in the new situation.

Although there have been significant developments, the safe food distribution system in the province still has limitations in terms of the size of the distribution system, the quantity and type of safe food, the chain supply chain, link chain. Based on such observation, the article studies the factors affecting customer satisfaction with the safe food store system in Thanh Hoa city, thereby proposing solutions to promote the development of food safety. system of safe food stores in the direction of meeting the increasing demands of consumers.

The issue of the food distribution system in Vietnam in general and the safe food distribution system in particular has been approached by researchers in many different aspects. Thanh et al. (2019) analyzes the factors affecting the formation of modern food distribution channels while Thanh (2021a) studies the Nash equilibrium of the food market in Vietnam. Related to research on customer satisfaction and loyalty to the retail system, Vo Minh Sang (2015) address the factor influencing on customer’s satisfaction with supermarket services; Dang Thi Kim Hoa, Bui Hong Quy (2017) has analysed factors affecting customers’ loyalty to Vinamilk’s Fresh Milk; and Thanh (2021b) has studied the factors influence customer loyalty towards typical-local agricultural products of mountainous regions for the case of Thanh Hoa province, Vietnam.

The strategy of this paper is to borrow several arguments from series of well-known literatures of Cronin and Taylor (1992), Zeithaml, Berry & Parasuraman (1988), and Zeithaml & Bitner (2000) for factors influencing the satisfaction of consumers. The paper presents the model with five factors included: Food quality, Product displace, price, Promotion, and Staff. Based on the results of the model, the paper proposes policy implication for the development of safe food stores in Thanh Hoa city, Vietnam.

2. Method

2.1. Research model

The research model based on the theory of from series of well-known literatures of Cronin and Taylor (1992), Zeithaml, Berry & Parasuraman (1988), and Zeithaml & Bitner (2000), which indicate factors influencing the satisfaction of consumers. Concerning to measurement scales, this paper also borrow from the model of Vo Minh Sang (2015) for factor influencing on customer's satisfaction with supermarket services for the case of Bic Can Tho; Dang Thi Kim Hoa, Bui Hong Quy (2017) which analysing factors affecting customers' loyalty to Vinamilk's Fresh Milk in Gia Lam, Ha Noi; and Ngo Chi Thanh (2021), which analyse the factors influence customer loyalty towards typical-local agricultural products of mountainous regions for the case of Thanh Hoa province, Vietnam. Our proposed model also closely linked to the context of Thanh Hoa province since the system of safe food stores have develop quickly in recent years. The research model is presented in the figure 1.

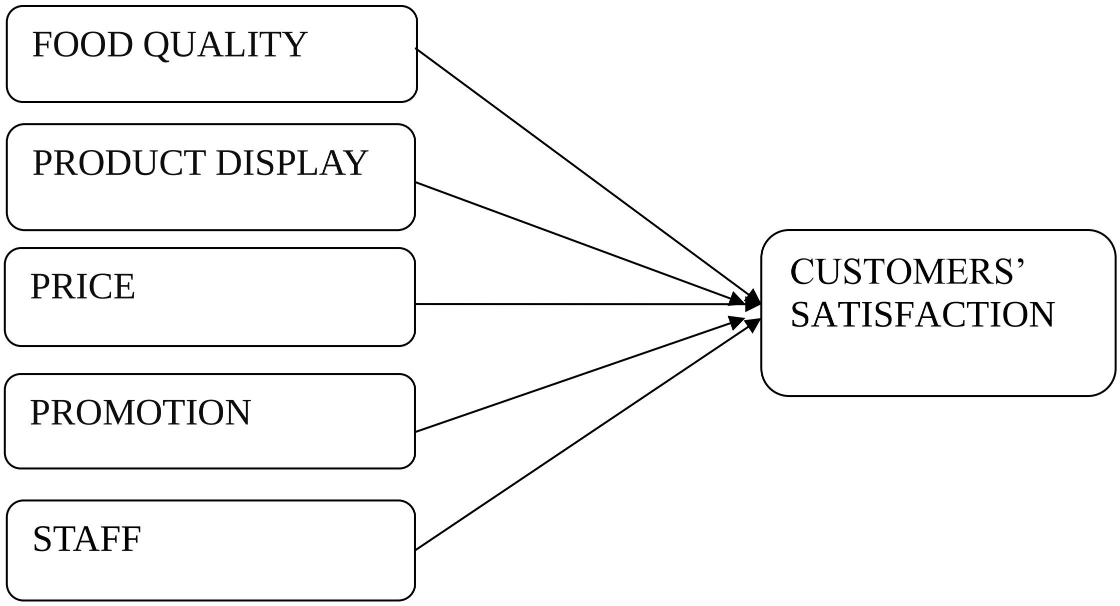

Figure 1: Research model

Hypothesis:

H1: Food quality positively affects customers 'satisfaction towards safe food stores;

H2: Product display positively affects customers 'satisfaction towards safe food stores;

H3: Price positively affects customers 'satisfaction towards safe food stores;

H4: Promotion positively affects customers ‘satisfaction towards safe food stores;

H5: Staffs positively affects customers ‘satisfaction towards safe food stores;

Table 1: Measurement scale

STT	Factors	Denote
FOOD QUALITY		
1	Safe food stores have variety kinds of foods for consumers to choose	FQ1
2	Safe food stores sell foods with stable quality	FQ2
3	Safe food stores sell foods with a high nutritional content	FQ3
4	Safe food stores sell foods with a clear origin	FQ4
PRODUCT DISPLAY		
5	Foods in safe food stores is conveniently displayed for the purchaser	PRD1
6	Food displayed is easy to find in safe food stores	PRD2
7	Safe food store have modern payment equipment	PRD3
PRICE		
8	Safe food stores sell foods with reasonable price	PRI1
9	Safe food stores sell foods with more affordable prices in comparison with other retail stores	PRI2
10	Payment methods are simple and convenient when buying foods at safe food stores	PRI3
PROMOTION		
11	Safe food stores have always offered promotions	PRO1
12	Safe food stores have provided completely and clearly information on foods	PRO2
13	Safe food stores have regularly advertised for for foods	PRO3
STAFF		
14	Staffs at safe food stores are friendly	ST1
15	Staffs at safe food stores have answered every question concerning to foods of consumer	ST2
16	Staffs at safe food stores are professional in selling foods	ST3
CUSTOMERS’ SATISFACTION		
17	I always choose to buy foods at safe food stores	SA1
16	I will recommend to others to buy foods at safe food stores	SA2
19	I will buy foods safe food at stores without buying at other places	SA3
20	I will continue to buy foods at safe food stores	SA4
21	I am satisfy to buy foods at safe food stores	SA5

2.2. Data and method

The research use the sample size followed by the framework of Hair, Black, Babin, Anerson & Tatham (1998), that emphasize for Exploratory Factor Analysis (EFA), the minimum sample size is N ≥ 5 * x (x: total number of observed variables). Under such consideration, the authors chose a sample size large enough to satisfy both conditions as suggested by the EFA method and the multiple regression method. In more precisely, N ≥ max (sample size as required by EFA; sample size as required by multiple regression), applying to the theoretical scale of 21 observed variables, the author applies the formula of Hair et al. (1998): the minimum required number of subjects is N> max (5*32) = 160 subjects to be surveyed. From that point of view, the research has been conducted by questionnaires with 265 consumers who buying typical-special local foods different distribution channels in Thanh Hoa province, included: traditional market, convenient stores and supermarkets. The research has used the tool of software SPSS 22.0 and AMOS 22.0 to analyse the data.

The descriptive statistics of sample is analysed in three aspects: gender, ages, education, income and jobs of consumers. The data shows that, most of consumers buying at safe food stores are: female (74,1%), from 26-40 year olds (38,8%), the income from 5-10 million per month (49,8%). This data reflects the behaviour of consumers buying at safe food stores since most of these products normally get high quality of the foods.

Table 2: Sample descriptive statistics

Contends		**Frequency (person)**	**Percent (%)**	**Cumulative (%)**
Gender	Male	74	25,9	25,9

3. Results

3.1. Chronbach's Alpha Reliability Analysis

The results of Chronbach's Alpha Reliability Analysis show that, the total number of valid survey questionnaires collected for processing is 265 votes. The tool of SPSS.20 software is used to process 21 observed variables (including 16 independent observed variables and 05 dependent observed variables); based on this result, one variable (SA3) is eliminated since there is a total variable correlation coefficient < 0.3. The results of processing the remaining variables (16 independent observed variables and 4 dependently observed variables) are shown in Table 3.

Table 3: The result of Chronbach's Alpha Reliability Analysis

Variables	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted
FOOD QUALITY	**Alpha = 0.910**

PRO3	7.58	2.571	.728	.785
STAFF	**Alpha = 0.907**			
ST1	6.82	4.010	.827	.856
ST2	6.63	3.960	.796	.881
ST3	6.82	3.912	.819	.862
CUSTOMERS' SATISFACTION	**Alpha = 0.940**			
SA1	11.27	7.297	.823	.932
SA2	11.23	6.354	.893	.909
SA4	11.20	6.719	.874	.915
SA5	11.23	7.034	.841	.926

Sourse: Data collected by author

We observe that, the remaining observed variables all have Cronbach's Alpha coefficients greater than 0.7. The test results show that the scale used is suitable, the correlation coefficients of the total variables are all from 0.3 or more (Nunnally and Bernstein, 1994). Therefore, these measurement variables have reliability and are used in EFA analysis

3.2. The result of exploratory factor analysis (EFA)

3.2.1. Exploratory factor analysis (EFA) for independent variables

Through the analysis results of Table 2, KMO reached 0.788. Therefore, the KMO index of the research model is greater than 0.5, showing that the application of exploratory factor analysis here is completely appropriate. The total variance extracted was 79.286%, showing that these factors explain 79.286% of the data variation. Under such consideration, the exploratory factor analysis method in this case is completely statistically significant.

Table 4. Rotated Component Matrixa

	Component

% of Variance	29.648	16.851	13.504	11.666	7.617
Cumulative %	29.648	46.499	60.003	71.669	79.286
KMO	**.788**				
Bartlett's Test of Sphericity	Approx. Chi-Square 2525.350 df 120 Sig. .000				

Sourse: Data collected by author

The results of the analysis of the rotation matrix of 16 independent variables are divided into 5 groups of factors; all variables have Factor loading coefficient > 0.5, ensuring the difference between the loading coefficients greater than 0.3 and the variables. is kept exactly as the original model, no new factor groups are created.

3.2.2. Exploratory factor analysis (EFA) for dependent variables

The result of exploratory factor analysis (EFA) for dependent variables is presented as in table 5.

Table 5. The result of exploratory factor analysis (EFA) for dependent variables

Variables	**Loading factor**	**Results**	**value**
SA1	.900	KMO	.650
SA2	.941	Sig.	.000
SA4	.929	Cumulative of Variance	84.753%
SA5	.911		

Sourse: Data collected by author

The KMO coefficient in the analysis is 0.650 > 0.5, showing that the factor analysis results are reliable. Bartlett's Test has the coefficient Sig. =0.00<0.05, showing that the results of factor analysis ensure statistical significance. The extracted variance is 84.753%, showing that the variation of the analysed factors can explain 84.753%, the variation of the original survey data; this is a fairly high level of significance. The factor loading coefficient of each observed variable showing all the factors is greater than 0.5, showing that the observed variables all show the influence with the factors that these variables represent.

3.3. Regression

3.3.1. Pearson Correlation coefficient

The analysis results of Pearson correlation coefficient on SPSS.20 software are presented as follows.

Table 6. Pearson Correlation coefficient analysis

Correlations							
		SA	FQ	PRD	PRI	PRO	ST
SA	Pearson Correlation	1	.577**	.575**	.581**	.464**	.431**
	Sig. (2-tailed)		.000	.000	.000	.000	.000
	N	265	265	265	265	265	265
FQ	Pearson Correlation	.577**	1	.408**	.332**	.223**	.105
	Sig. (2-tailed)	.000		.300	.080	.000	.089
	N	265	265	265	265	265	265
PRD	Pearson Correlation	.575**	.408**	1	.472**	.320**	.329**
	Sig. (2-tailed)	.000	.000		.210	.070	.100
	N	265	265	265	265	265	265
PRI	Pearson Correlation	.581**	.332**	.472**	1	.353**	.279**
	Sig. (2-tailed)	.000	.080	.210		.130	.000
	N	265	265	265	265	265	265
PRO	Pearson Correlation	.464**	.223**	.320**	.353**	1	.182**
	Sig. (2-tailed)	.000	.000	.070	.130		.003
	N	265	265	265	265	265	265
ST	Pearson Correlation	.431**	.105	.329**	.279**	.182**	1
	Sig. (2-tailed)	.000	.089	.100	.000	.003	
	N	265	265	265	265	265	265

Sourse: Data collected by author

The result show that, Sig values between dependent variable and independent variables are = 0.000< 0.05. Therefore, the variables are all correlated with the dependent variable and are statistically significant. The strongest correlation with the dependent variable is PRI (correlation is: 0.581, with $p<0.05$) and the weakest correlation is the factor ST (correlation is 0.431, with $p<0.05$).

3.3.2. Regression analysis

To evaluate the influence of each factor on customer satisfaction, the author uses a multivariate regression model. We obtain the results as follows:

Table 8. Model Summary[b]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.801[a]	.641	.634	.52250	1.186

The results show that, the model has R2 = 0.641 and adjusted R2 = 0.634. This result shows that the model's relevance is 63.4%, or in other words 63.4% variation of factor Customer satisfaction is explained by 5 independent factors, on the other hand, Durbin coefficient. -Watson = 1,186 (>1) indicates that there is no linear autocorrelation between variables.

Table 9. ANOVA[a]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	126.284	5	25.257	92.515	.000[b]
	Residual	70.707	259	.273		
	Total	196.992	264			

Using the F test to test the fit of the regression model, the results of Table 6 show that: F value = 92,515 with significance level sig = 0.000 < 0.05, which shows multiple linear regression model is fit the data set and are usable.

The graph of the normal distribution of the residuals shows the residuals of the model has an almost bell-shaped shape, which is consistent with the graph form of the normal distribution. The mean Mean = -4.21E-16 is close to 0, the standard deviation of 0.99 is close to 1, so the residual distribution is approximately standard (Figure 2). It can be concluded that: the assumption of the normal distribution of the residuals is not violated. So the model that the study estimates can be used and does not violate the assumptions initially set.

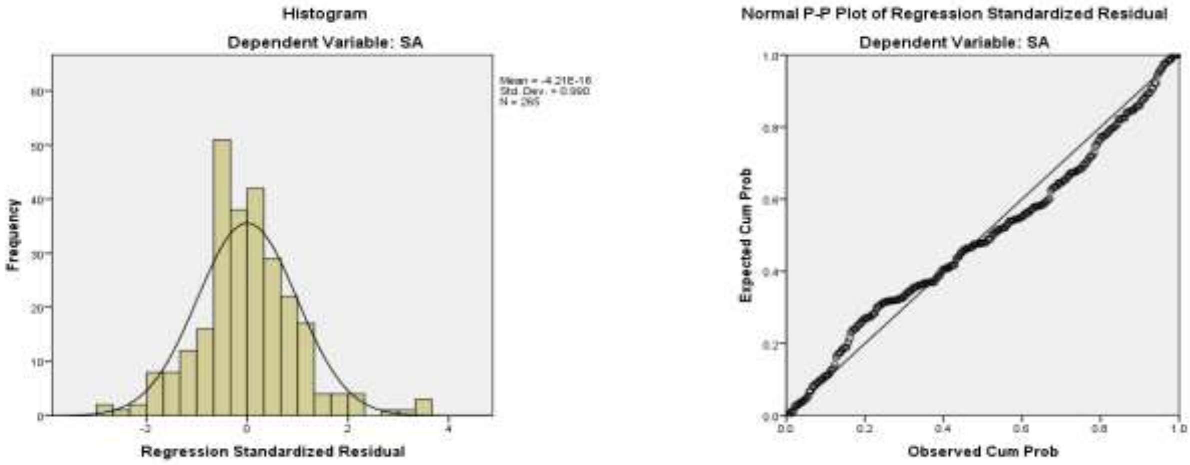

Figure 2. Distribution of the residuals

On the other hand, the Normal P-P Plot plot shows the percentiles in the distribution of residuals centered on a diagonal, thus, the assumption of the normal distribution of the residuals is not violated.

The results of multiple regression analysis are as follows:

Table 10. The results of multiple regression analysis

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	-.964	.226		-4.268	.000		
	FQ	.387	.045	**.356**	8.553	.000	.801	1.248
	PRD	.186	.049	**.174**	3.780	.000	.652	1.533
	PRI	.267	.049	**.245**	5.507	.000	.700	1.428
	PRO	.212	.037	**.232**	5.797	.000	.866	1.155
	ST	.232	.047	**.201**	4.939	.000	.839	1.192

We obtain that, all independent variables have Sig. is less than 0.05, which imply that all independent factors have an effect on the dependent variable. The degree of influence of each factor depends on the standardized Beta coefficient, or which factor has a large standardized Beta coefficient, which has a strong impact on the highly dependent variable. Based on the results of Table 7, we obtain the following regression equation:

$$SA = -0.964 + 0.356FQ + 0.174PRD + 0.245PRI + 0.232PRO + 0.201ST + ui$$

In which: FQ: Food quality; PRD: Product display; PRI: Price; PRO: Promotion; ST: Staff; SA: Customer’s Satisfaction.

The model shows that, the variable Food quality has the strongest influence on Customer's Satisfaction (standardized β coefficient = 0.356). Similarly, the second strongest factor affecting Customer's Satisfaction is Price (normalized β coefficient = 0.245), followed by the following factors: Promotion (standardized β coefficient = 0.232); Staff (normalized β coefficient = 0.201); and finally Product display (normalized β coefficient = 0.174), these factors all have a positive impact on the dependent variable. Therefore, the research hypotheses H1, H2, H3, H4, and H5 are accepted.

4. Discussion and Conclusion

The study has proposed a model of factors affecting customer satisfaction for safe food stores. The results show that, there are 5 influencing factors, including: Food quality; Price; Promotion; Product display; and Staff. The model results reflect the reality in Thanh Hoa, which shows the trend of consumers consuming products at safe food stores. The results of the model emphasize that when consuming at safe food stores, customers are most concerned with quality. More specifically, when consuming at safe food stores, customers expect to consume products of original origin, preserved in accordance with the process, and tested for safe quality. Besides, the research results also show that price is an important factor affecting customer satisfaction. Despite consuming quality products and ensuring food safety, customers still want more reasonable prices in the context of safe food stores that compete with other food distribution channels. Research results are related to Thanh's study (2021a) on the influence of quality on customers' choice; As well as logic with research results Vo Minh Sang (2015); Dang Thi Kim Hoa, Bui Hong Quy (2017), on factors affecting customer satisfaction in the retail system.

Based on the result of the model, some recommendations are presented as followed:

Diversify products with reasonable prices to meet the needs of consumers: According to the result, Food quality and Price are two important factors affect to customer satisfaction on safe food stores. From that point of view, improving the quality of the supplied foods is the key solution in order to satisfy the consumers. Safe food stores should expend the category of the safe foods for the choice of the consumers in the relationship with the price. For instance, for each item, it is necessary to have many different product codes with low to high price brackets to serve the needs of a large number of consumers with average incomes and above. Safe food stores need to develop and implement the most reasonable price policy in relation to the quality of goods, ensuring good competition with other business types.

Having more promotion programs for consumers: Currently, supermarkets and trade centres have regular promotions, while safe food stores, with a smaller scale, do not have many promotional programs for customers. This directly affects customer satisfaction and loyalty towards safe food stores. The result of the model also indicates that, promotion programs influence to customer satisfaction. Safe food stores need to strengthen links with localities, businesses and farms that provide safe food to build promotions. Regularly participate in food market connection programs to introduce products to customers.

Policy for staffs and product display: Research results show that employees are also an important factor affecting customer satisfaction. Safe food stores need to develop team development policies. In which, it is necessary to focus on the following directions: strengthening training for employees, training in management knowledge and sales skills; Have a policy to attract qualified employees; formulating salary and bonus policies for staffs. Besides, safe food stores also need to improve infrastructure related to stores, paying attention to product display in which, food stores need to pay attention to expanding their area, ensuring to serve customers' needs well. Display products in a professional and nice way for convenience and to attract customers.

INVESTIGATIVE STUDY ON FACTORS AFFECTING THE DEBT MATURITY STRUCTURE OF REAL ESTATE COMPANIES LISTED ON HO CHI MINH STOCK EXCHANGE

Dr. Nguyen Thanh Nha

nhatdg@ufm.edu.vn

Faculty of Valuation and Real Estate Business

University of Finance and Marketing, Ho Chi Minh City, Vietnam

Abstract

In this study, the system generalised method of moment (Sys-GMM) was used to investigate the debt maturity structure of real-estate companies listed on Ho Chi Minh Stock Exchange (HOSE) in the period from 2008 to 20019. The decision on debt maturity structure was found to be influenced by firm size, liquidity and tangible asset. In addition, tangible asset had the largest impact on the possibility for companies to access long-term loans. This observation indicates that the companies mostly borrowed money from banks and collateral is very important to make decision on loans. This was supported by another finding that financial institutions had an impact on the debt maturity structure, while effects of financial market were insignificant. Besides, the companies seemed not to pay attention to changes in inflation, economic growth, and institutional quality, when making decision on the debt maturity structure.

Keywords: *Debt maturity structure, financial development, financial institutions, institutional quality.*

1. Introduction

1.1. Research question

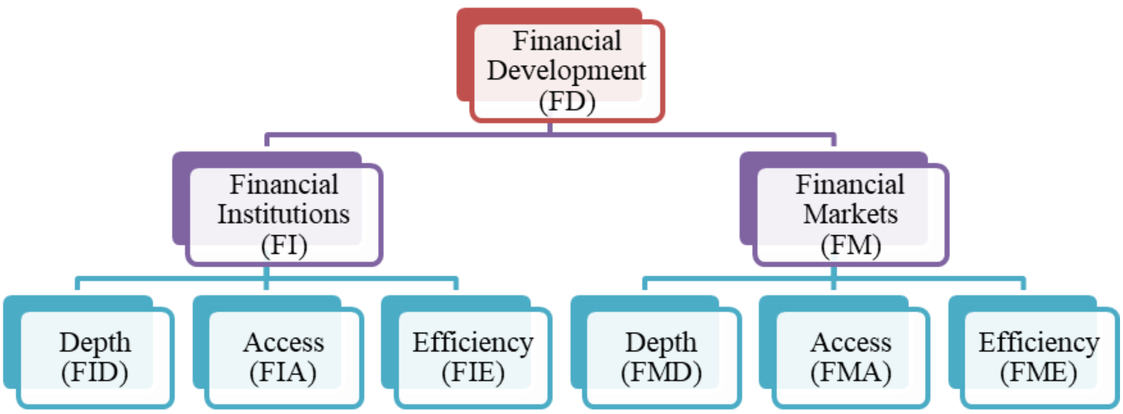
The debt maturity structure is regarded as one of the most important financial decisions affecting the development of companies. The decision influences investment due to changes to the capital cost, as well as dividend due to effects on the cash flow. The debt maturity structure of companies is studied in both developed and developing countries. These studies not only used static models to investigate effects of firm and macroeconomic factors, but also utilised dynamic model to evaluate the rate of adjustment to the debt maturity structure (Barclay and Smith, 1995; Demirguc-Kunt and Maksimovic, 1999; Ozkan, 2000; Antoniou et al., 2006; Teruel and Solano, 2007; Cai et al., 2008; Deesomsak et al,. 2009; Wang et al,. 2010; Terra, 2011; Lemma and Negash, 2012; Krich and Terra, 2012; Matues and Terra, 2013; Bilgin, 2020). According to these studies, the debt maturity of structure of companies is determined by the ratio of long-term debt to total debt which comprises long- and short-term debts. The focus of these studies is to investigate effects of firm and macroeconomic factors, thereby enabling financial administrators to make sound decisions on the debt maturity structure of companies.

The global financial crisis in 2008 has brought economic hardship to companies in Vietnam, including those in the real-estate sector. Nevertheless, real-estate companies are making significant contributions to the economy and require business loans to maintain and expand their operation. They however face difficulties in making decision on how, where and when to borrow money as well as the duration of loans. This study aims to give insights into how internal factors, representing the characteristic of firms, and external factors, reflecting the economy, especially the financial development and institutional quality, affect the debt maturity structure of real-estate companies listed on Ho Chi Minh Stock Exchange (HOSE).

According to IMF (International Monetary Fund, 2015) (Čihák, 2012), the financial development is the combination of *(1) the depth of the market*, including size and liquidity; *(2) the access to the market*, including the ability of individuals and organisations to access financial services; and *(3) the efficiency*, which is examined based on the performance of capital markets and the ability of credit institutions to provide low-cost financial services. In order to accurately assess the financial development of a country, IMF (2015) developed a set of financial development indices (FD indices), which comprise indices of depth, accessibility and efficiency of financial institutions (FI) and financial markets (FM) (Figure 1). Financial institutions and financial markets pose different impacts on financing decisions of companies, in particular the debt maturity structure. This study, therefore, also aims to examine the role of financial institution and financial market to uncover impacts of the financial development on the debt maturity structure of the real-estate companies in Vietnam.

In addition, the study aims to verify whether the real-estate companies adjust their debt maturity structure, thereby providing financial administrators with evidence to support their decision making in matters related to the debt maturity structure of companies.

Figure 1: ***Financial Development Index (Source: IMF, 2015).***



1.2. Theoretical Framework and Empirical Research Results

The debt maturity structure of companies is determined by the ratio of the long-term debt to the total debt and is governed by Signalling theory (Diamond, 1991; Flannery, 1986), Agency-cost theory (Barnea et al., 1980; Jensen and Meckling, 1976; Myers, 1977), Tax-based theory (Brick and Ravid, 1985, 1991) and Matching theory (Morris, 1976). According to these theories, the debt maturity structure is resulted from when a company tries to balance costs and benefits by approaching debts having different maturities.

Empirical studies based on the aforementioned theoretical frameworks demonstrate that ***firm factors*** have major impacts on the debt maturity structure of companies. The study of Myers (1977), which was later supported by Barclay and Smith (1995), agreed with Agency-cost theory where, by reducing the debt maturity, companies will be able to control underinvestment problems. Large companies will issue many long-term debts and companies with asymmetric information will use short-term debts. It was found taxed-based theory does not influence the debt maturity structure of companies. Terra (2011) showed similar factors affecting the debt maturity structure of companies in the US and Latin American countries, despite differences in the financial and business environment between countries in the sample survey. Specifically, the factors of firm size, profitability, tangible assets do not affect debt maturity; debt ratio, asset maturity and liquidity have positive effects on debt maturity; taxes and growth opportunity have negative effects on debt maturity. The study of Costa et al. (2014) on SMEs (small and medium enterprises) in Portugal showed that small companies that have low liquidity tend to use many short-term debts. The tax rate has very small positive effect on asset maturity. The capital cost has a strong positive effect on long-term debt. The capital cost is opposite to the growth opportunity; companies that have more physical assets will less likely to grow and more likely to use such assets as collateral to borrow from banks. This observation agrees with Myers (1997) who found that companies that have many growth opportunities should use short-term debts. Chung and Phan (2020) showed that leverage, firm size and lagged debt maturities are the important factors for listed non-financial companies in Vietnam to decide the debt maturity structure.

External factor that reflects the characteristics of market and economy also affects the debt maturity structure of companies. The study of Krich and Terra (2012) showed that the debt maturity structure of companies in five South American countries including Argentina, Brazil, Chile, Peru and Venezuela are significantly influenced by the national institutional quality, whereas the financial development only has a minor impact. Lemma and Negash (2012) concluded that companies in low-income countries tend to use less long-term debts. Also, taxes, economic growth and development in the banking sector have negative effects on the debt maturity structure of companies in Africa. Deesomsak et al. (2009) found that the debt maturity structure of companies in Thailand, Malaysia, Singapore and Australia is strongly related to the characteristics of the economy. Accordingly, economic growth, inflation, the level of the market capitalisation, the size of banks and the maturity structure of interests have an impact on the debt maturity structure. In China, Cai et al. (2008) showed that the debt maturity structure depends on the factors representing the characteristics of the economy, including the maturity structure of interest, the volatility of stock markets and interests. Similarly, according to Wang et al. (2010), taxes and growth opportunities have positive effects on debt maturity, whereas inflation and money supply have negative effects on debt maturity of companies. Bilgin (2020) concluded that, in addition to firm factors such as debt ratio, firm size, and growth opportunities, the debt maturity structure of companies in 30 selected developing countries is also influenced stock market development and bank concentration.

Besides, the studies of Antoniou et al. (2006), Deesomsak et al. (2009), Krich and Terra (2012), Ozkan (2000), Terra (2011) and Matues and Terra (2013) showed that companies in the United Kingdom, America, Eastern Europe and South America adjust the debt maturity structure towards their targets in order to reduce incurred cost of borrowing. However, the rate of adjusting the debt maturity is different between countries, depending on its economic context.

2. Method

2.1. Data collection and processing

The sample includes 48 real-estate companies categorised based on GICS and listed on HOSE in the period from 2008 to 2019. The data was collected from the companies' audited financial statement archived in the electronic database of www.vietstock.vn and www.bvsc.com.vn. Since the archived data was structured as panel data, the regression modelling was conducted using specialised methods.

2.2. Variables

The regression model of the company's debt maturity structure is based on Agency-cost, Signalling, Matching and Tax-based theories. The company's debt maturity structure is represented by the debt maturity variables, which is the dependent variable of the model and is defined as the ratio of the long-term debt to the total debt (Barclay and Smith, 1995; Cai et al., 2008; Deesomsak et al., 2009; Wang et al., 2010; Krich and Terra, 2012; Lemma and Negash, 2012; Costa et al., 2014; Bilgin, 2020). Factors affecting the debt maturity structure are represented by the variables listed in Table 1. In addition, the model includes the first-order lagged debt maturity to study the dynamic debt maturity structure (Ozkan, 2000; Antoniou et al,. 2006; Deesomsak et al., 2009; Terra, 2011; Krich and Terra, 2012; Mateurs and Terra, 2013).

Table 1: Variables in the regression model.

Variable	Symbol	Definition	Expected correlation	Theories and empirical studies
Debt maturity	MR	$\frac{\text{Long term debt}}{\text{Total debt}}$		Barclay and Smith (1995), Demirguc-Kunt and Maksimovic (1999), Ozkan (2000), Antoniou et al. (2006), Teruel and Solano (2007), Cai et al,. (2008), Deesomsak et al,. (2009), Terra (2011), Krich and Terra (2012), Lemma and Negash (2012), Matues and Terra (2013), Costa et al,. (2014), Chung and Phan (2020), Bilgin (2020).
Leverage	*LEV*	$\frac{\text{Total debt}}{\text{Book Assets}}$	Positive	Signaling theory; Costa et al,. (2014), Krich and Terra (2012), Cai et al,. (2008), Teruel and Solano (2007), Antoniou et al,. (2006), Barclay and Smith (1995), Deesomsak et al,. (2009), Lemma and Negash (2012).
Profitability	*PROF*	$\frac{\text{EBIT}}{\text{Book assets}}$	Negative	Signaling theory; Lemma and Negash (2012); Antoniou et al,. (2006); Deesomsak et al,. (2009); Cai et al,. (2008).

(Source: the author)

2.3. Regression model

In this study, a dynamic model was adopted (Ozkan, 2000; Antoniou et al, 2006; Deesomsak et al., 2009; Terra, 2011; Krich and Terra, 2012; Matuers and Terra, 2013), in order to examine effects of internal and external factors on the debt maturity structure of the real-estate companies listed on HOSE, and thereby to provide evidence that the companies adjusted their debt maturity structure.

Assumed that the target debt maturity structure can be represented by an linear equation of *k* variables as follows:

$$MR^{*}_{i,t} = \sum_{k=1} \omega_k X_{k,i,t} + \epsilon_{i,t} \quad (1a)$$

where:

$MR^{*}_{i,t}$	the target debt maturity of the company *i* in the year *t*;
$X_{k,i,t}$	*k* factor affecting the target debt maturity structure;
$\epsilon_{i,t}$	error of the regression model.

Assumed the company adjusts the actual debt maturity structure with an adjustment coefficient ρ toward the target:

$$MR_{i,t} - MR_{i,t-1} = \rho \left(MR^*_{i,t} - MR_{i,t-1}\right) \quad (1b)$$

where:

$MR_{i,}$ the actual debt maturity of the company *i* in the year *t*;

$MR_{i,t-1}$ the actual debt maturity of the company *i* in the year *t*–1;

$MR^*_{i,t}$ the target debt maturity of the company *i* in the year *t*;

$MR_{i,t} - MR_{i,t-1}$ change in the actual debt maturity

$MR^*_{i,t} - MR_{i,t-1}$ change in the target debt maturity

ρ adjustment coefficient.

From Equations 1a and 1b, the partial adjustment to the actual debt maturity is written as follows:

$$MR_{i,t} = (1 - \rho)MR_{i,t-1} + \sum_{k=1} \rho\omega_k X_{k,i,t} + \rho\epsilon_{i,t} \quad (1c)$$

Equation 1c indicates $0 \leq \rho \leq 1$

If $\rho = 1$: Change in the actual debt maturity structure equals to change in the target debt maturity structure

If $\rho = 0$: There is no adjustment to the debt maturity structure. It could probably be because the debt maturity in the year *t* equals that in the previous year, or the cost associated with adjusting the debt maturity structure is higher than the incurred cost due to deviation from the target.

If $0 < \rho < 1$: There is partial adjustment to the debt maturity structure, or the debt maturity structure is dynamic.

If the incurred cost due to deviation from the target debt maturity structure is higher than the cost associated with adjustment, then the adjustment coefficient ρ is expected to be higher. In fact, ρ is determined as the difference between 1 and the regression coefficient of the first-order lagged variable of the dependent variable.

Equation 1c can be re-written in more detail by incorporating all variables, to study effects of firm and macroeconomic factors on the debt maturity structure of the real-estate companies listed on HOSE:

$$MR_{i,t} = \alpha_0 + \alpha_1 MR_{i,t-1} + \alpha_2 LEV_{i,t} + \alpha_3 PROF_{i,t} + \alpha_4 VOL_{i,t} + \alpha_5 LIQ_{i,t} + \alpha_6 TAN_{i,t} + \alpha_7 AM_{i,t} + \alpha_8 SIZE_{i,t} + \alpha_9 GROW_{i,t} + \alpha_{10} TAX_{i,t} + \alpha_{11} INF_{i,t} + \alpha_{12} GDP + \alpha_{13} FI_{i,t} + \alpha_{14} FM_{i,t} + \alpha_{15} IQ_{i,t} + \epsilon_{i,t} \quad (2)$$

2.4. Regression method

In a dynamic model such as one used in this study, the lagged variable of the dependent variable is indeed an independent variable and can have correlation with other independent variables. Also, there is a concurrent relationship between the debt maturity variable MR and the leverage variable LEV (Krich and Terra, 2012), which can cause endogeneity and affect the accuracy of regression results. This is the disadvantage to some regression methods that are appropriate for panel data, such as Pooled OLS, FEM, REM and GLS. On the other hand, Antoniou et al. (2006) showed that the system generalised method of moment (Sys-GMM) method can resolve this issue and therefore, this method was applied in this study to estimate the regression model, together with Sargan and Arellano-Bond tests.

(Source: Stata data processing by the author)

*(The Sys-GMM method was applied to conduct the regression analysis for Equation 2 using five different groups of variables: (1) firm factors; (2) firm and macroeconomic factors; (3) firms and macroeconomic factors, and those representing the financial development (including financial institutions and financial markets); (4) firms and macroeconomic factors, and those representing the institutional quality; (5) all factors. *, ** and *** represent the statistical significance of 10%, 5% and 1%, respectively.)*

The correlation in Table 2 suggests that effects of all factors on the debt maturity structure are in line predictions based on theories and previous empirical studies. The results of the regression analysis are in a good agreement with Cai et al. (2008), Deesomsak et al. (2009), Costa et al. (2014), Tayem (2018), and Bilgin (2020), as well as Agency cost, Signalling and Matching theories. The results suggest that the real-estate companies approached loans with longer maturities when the companies grew, improved their liquidity and possessed more tangible assets. While tangible asset is the firm factor that has the strongest effect on the debt maturity structure at 10% statistical significance, asset maturity is not significant. This shows the real-estate companies in Vietnam listed on HOSE pay less attention to debt maturity and asset maturity when making borrowing decision. In addition, the study found no evidence to support the tax-based theory.

Among other external factors, only financial institutions have significant influence on borrowing decision of the real-estate companies. This observation helps clarify the research aim stated in the previous section. Borrowing decisions are greatly affected by the financial development, in particular the development of financial institutions. The results of this study are consistent with financing and debt activities in the real-estate sector. The development of financial institutions helps reduce agency cost since they are better to monitor borrowers than other creditors. In such a financial environment, short-term debts are preferred by real-estate companies.

A dynamic debt maturity structure enables the companies to actively adjust the ratio between long-term debt and short-term debt. The regression analysis of Equation 2 shows that the first-order lagged variable of the debt maturity (MR_1) has the statistical significant of 1% to 5%, regardless of different groups of factors or dependent variables. This indicates the model is dynamic or, in other word, the debt maturity structure of the real-estate companies is dynamic. The regression coefficient of MR_1 varies from 34.35% to 46.59%, depending on the group of factors. In general, taking into account effects of firm factors and external factors including financial institutions, financial markets and institutional quality, the regression coefficient of MR_1 is 38.97%. Therefore, the adjustment coefficient ρ is 1 – 0.3897 = 0.6103, i.e. 61.03%. This indicates the real-estate companies significantly adjusted their debt maturity structure because the cost associated with adjustment was lower the incurred cost due to deviation from the target maturity. Therefore, the real-estate companies listed on HOSE in the period from 2008 to 2019 adjusted their debt maturity structure and their financial administrators made decision based on specific firm characteristics such as liquidity, tangible assets and company size.

4. Conclusion

The real-estate companies listed on HOSE was found to have dynamic debt maturity structure and make relatively large adjustments to their debt maturity. This indicated high incurred cost due to deviation from the target debt maturity. The study showed that the financial development, in particular the development of financial institutions, posed large impacts on decisions of long-term borrowing. In addition, the study identified factors that had significant influence on the debt maturity structure of the real-estate companies. In particular, the study provided evidence to support agency-cost, signalling and matching theories. Unlike other counties, tangible asset is the firm factor that affected borrowing decision the most. This proves that the real-estate companies listed on HOSE tended to borrow through banks and collateral enabled them to access long-term debt. The results of this study strongly suggest the development of financial institutions had large influence on the debt maturity of the real-estate companies, whereas inflation, economic growth, financial market and institutional quality had insignificant impact.

The study presented on this paper only focused on investigating influence of firm and external factors, especially the financial development, financial market, and institutional quality, on the debt maturity of structure of the real-estate companies in Vietnam listed on HOSE. This research will pave the way for future studies, using large samples to provide more insights into this topic in a Vietnamese context.

Abstract

The brand of a tourism destination can be deemed as a success factor that attracts tourists to a potential tourism destination, and drive tourists' internal travel motives through conveying values, inducing expectations about the satisfaction of possible needs and wants. The study's objective is to determine and identify the influence of brand image, brand value, and brand perception on tourist satisfaction for Pu Luong, Thanh Hoa province. Qualitative and quantitative research methods are used through the collecting and processing of data form 500 tourists of Pu Luong, Thanh Hoa province. Data were collected, processed and analyzed using SPSS 20 and AMOS 20 software. The SEM (Structural Equation Modeling) model developed from the study's findings is consistent with reality, indicating that all factors influence tourist satisfaction with the destination's brand, with a brand image having the most positive and significant effect on tourist satisfaction. Based on the study's findings, the authors made some suggestions to improve tourist satisfaction for Pu Luong, Thanh Hoa province.

Keywords: *Brand image, brand value, brand perception, brand satisfaction.*

1. Introduction

Pu Luong Nature Reserve is located in Thanh Hoa province, just about 130 kilometers far from Thanh Hoa City to the north-west and 210 km from Hanoi, belongs to both Ba Thuoc and Quan Hoa district. Pu Luong is a backpacking, self-sufficient backpacking, and inexpensive mountain resort tourism destination that is starting to make a name for itself. The scenery and wild beauty of Pu Luong, especially the terraced rice fields and primeval forests, awes most tourists. Pu Luong, in particular, is close to well-known tourist attractions such as Lac Village (Mai Chau), Ca Than stream (Cam Luong, Cam Thuy, Thanh Hoa), Cuc Phuong forest (Ninh Binh), Citadel of Ho Dynasty cultural heritage (Thanh Hoa), and others. As a consequence, it has "inadvertently" established a tourist-friendly closed tour of fun and experience. The destination has beauty and wild landscapes concealed in the mist like a hanging garden in different locations, such as: Son Ba Muoi (Lung Cao Commune), Pu Luong peak, Kho Muong, Ban Don with Pu Luong Retreat resort, Uoi Village, Tien Moi Village, Hieu waterfall area in Co Lung Commune, and so on have attracted hundreds of thousands of tourists. Many domestic and international tourists who enjoy trekking and backpacking come to visit, experience and relax at this tourism destination.

The acceptance of a tourist's brand is often a priority for tourism managers and businesses. Establishing a partnership between tourists and destination brands is critical for enhancing long-term relationships with tourists by ensuring their satisfaction, which results in their loyalty to the tourism destination. Currently, the evaluation and level of satisfaction for Pu Luong, Thanh Hoa province has significantly changed. More and more information about destinations is provided for tourists such as: topography, climate, nature, scenery, a specialty of the destination, types of accommodation, food services, etc. Furthermore, demand for travel has increased dramatically in recent years, especially for ecotourism destinations.

As a result, the current challenge for managers, local authorities, tourism companies, and others is to determine what needs to be done to improve tourist satisfaction and loyalty to the image of a local tourism destination or area. The objective of the study is to determine the relationship and evaluate the impact of four factors: brand image, brand perception, brand value, and brand satisfaction of tourists for Pu Luong, Thanh Hoa Province. Following that, recommendations are proposed to increase tourist satisfaction with this tourism destination.

2. Method

2.1. Theoretical basis and research model

2.1.1. Brand image

Keller (1998) believed that brand image can be defined as a subjective perception phenomenon, that is reflected through the emotions of buyers towards products, based on their memories. The brand image helps businesses improve their brand competitiveness in the market. According to Bian and Moutinho (2011), the brand image refers to the association and perception of a brand through tourists' memories. Sharing the same point of view, Aghekyan et al. (2012) said that brand image plays a critical role in purchase intention. Products with a strong brand image and attributes will increase tourist satisfaction and contribute to the formation of more favorable and positive attitudes.

2.1.2. Brand value

While there are numerous opinions and assessments of brand value worldwide, brand value is generally analyzed and evaluated through the perspective of consumers. Among them, Aaker's (1991) definition is widely used and widely accepted by scholars and administrators when conducting research and analyzing brand value. Whereby,“The brand value is derived from high levels of customer loyalty, brand awareness, perceived quality, and strong associations with the brand and other assets such as patents, certified trademarks, and channel relationships”.

According to the research of Hoang Thi Phuong Thao and Thai Tu Uyen (2016), there are five components that affect overall brand equity: brand awareness, brand image, perceived quality, brand loyalty and brand association. The research of Nguyen Van Thuy and Ngo Thi Xuan Binh's (2018) shows that brand value is influenced by brand awareness, brand loyalty, perceived quality, and brand association. Cronin et al. (2000) demonstrated there is a strong link between brand equity and brand satisfaction.

2.1.3. Brand Perception

Matzler et al. (2008) said that brand perception is considered a certain category of the association between tourists and the brand. Brand perception refers to a psychological response that elicits specific emotions in the tourist. Brand perception is a consumer's persistent preference for or dislike of a brand (Fishbein and Ajzen, 1980) as well as the consumer's overall assessment of the brand. The outstanding benefit or brand image serves as the basis for evaluating brand perceived attitudes. Consumers will determine the utility of the outstanding benefit or brand image and then constitute a general attitude toward the brand as a result of the comprehensive assessment which reflects consumer attitudes toward brand attributes (MacKenzie and Spreng, 1992). A customer's positive attitude towards a brand can increase their likelihood of using that brand (Kotler and Keller, 2011).

2.1.4. Brand satisfaction

Moliner et al. (2015) claim that making customer brand satisfaction has become one of the most important priorities in marketing management. Puška et al. (2015) said that satisfaction is evaluated through the prior customer experience of a product or service. Brand satisfaction plays a vital role in maintaining brand value and retaining customers. Buyers will be satisfied if the product meets their expectations. If the product meets the customer's expectations, they will be satisfied with the brand and thus the brand itself is being strengthened. Satisfaction with a brand influences a customer's decision to purchase from that brand.

2.1.5. The correlation between brand image and brand satisfaction

Customer satisfaction is contingent upon a product or service experience and service's quality and perceived value (Anderson et al., 1994). Numerous authors assert that brand image is a function of the cumulative effects of satisfied or dissatisfied customers based on specific transactions. (Bolton and Drew et al., 1991; Johnson and Fronell, 1991).

The brand image also contributes to the formation of attitudes, beliefs, satisfaction, and behavior of consumers. Brand images are regarded as useful recommendations for both existing and potential customers. It is also believed to influence how consumers evaluate customer satisfaction because it is formed and developed in their minds through communication and experience. When customers are satisfied with the services they receive, their attitude toward the brand will be improved, which affects customer satisfaction (Andreassen and Lindestad, 1998).

In the study of Aydin and Ozer (2005), customer loyalty is stated to be determined by brand image, service quality, reputation, and switching costs. Additionally, Chao et al. (2015) considered the brand image to be a significant factor affecting customer satisfaction.

2.1.6. The correlation between brand image and brand perception

Brand image plays an important role in the formation of senses of quality (Cretu and Brodie, 2007; Veloutsou and Daskou, 2004). Images reflect personal feelings about the brand. Therefore, the quality of feelings about the brand has related to brand reputation (Selnes, 1993). In some cases, many customers only choose a product or service because of the brand, so brand reputation only measures the product level, and in some other cases many customers only identify the products and services through brand image (Veloutsou and Daskou, 2004). Brand image also creates solid expectations in evaluation criterias of product and service (Selnes, 1993). According to Mishra et al. (2016), positive brand perceptions have an effect on tourist satisfaction. On the other hand, its adverse consequences result in tourist dissatisfaction. According to the opinions of Sweeney and Swait (2008), brand image act as the first tool to implement marketing activities and form brand perceptions.

2.1.7. The relationship between brand image and brand value

Research of Cretu and Brodie (2005) shows that brand image has a strong influence on service perception quality, and more broadly on brand value and loyalty. Gounaris and Stathakopoulos (2004) also specified that, if the perception of the brand value is high, the customer satisfaction also will become high.

In the field of tourism, Lertputtarak (2012) emphasized that destination's image plays two important roles in behavior: (1) influence the process of selecting destination and (2) influence the conditions behind the decision-making behavior. Som and Badarneh (2011) also found that perceived value positively affects tourist satisfaction and visistor's intention to revisit. Moreover, both perceived value and satisfaction have a significantly direct and positive impact on purchase intention (Waheed & Hassan, 2016). Therefore, it can be found that tourist satisfaction has a significant influence on visistor's intention to revisit (Puspitasari et al., 2018).

According to the previous studies, it has been proved that a positive brand image will have a strong influence on customer satisfaction; additionally, brand image has an effect on brand value and customer perception. On the basis of consultation with experts and some previous studies, the author proposes a research model of the influence of destination brand image, value, and perception on tourist satisfaction for Pu Luong, Thanh Hoa Province as shown in Figure 1.

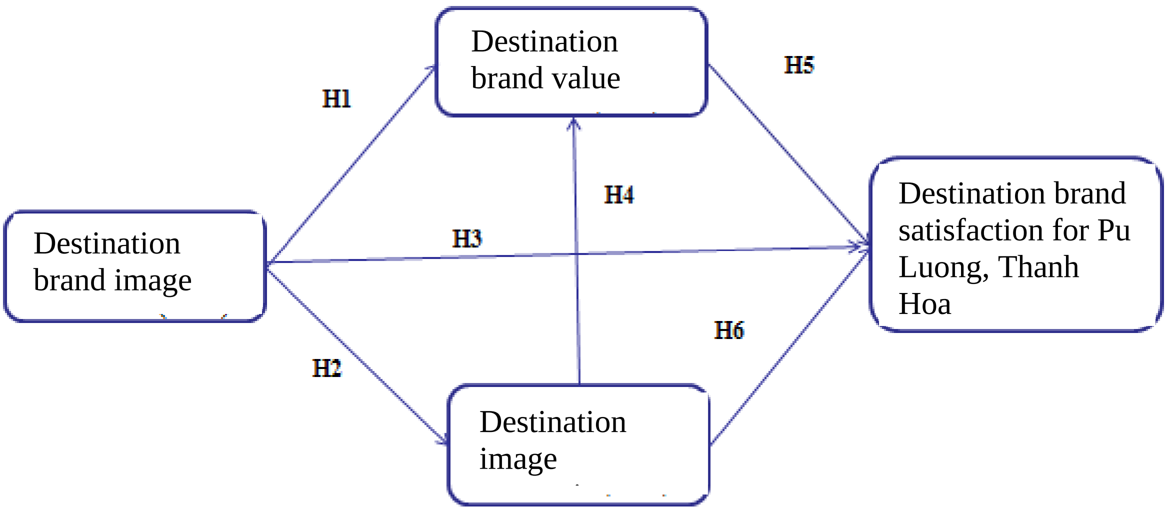

Figure 1. Proposed research model

(Source: proposed by the author)

Corresponding research hypotheses:

H1: Brand image has a positive influence on the brand satisfaction for Pu Luong, Thanh Hoa province.

H2: Brand image has a positive influence on the brand value of Pu Luong, Thanh Hoa province.

H3: Brand image has a positive influence on brand perception of Pu Luong, Thanh Hoa province.

H4: Brand perception has a positive influence on the brand value of Pu Luong, Thanh Hoa province.

H5: Brand value has a positive influence on brand satisfaction for Pu Luong tourism destination, Thanh Hoa province.

H6: Brand perception has a positive influence on brand satisfaction for Pu Luong, Thanh Hoa province.

2.2. Method

Research design

The study was conducted through questionnaire with tourists at Pu Luong, Thanh Hoa province using the non-probability sampling methods and evaluation of scholars (Black, 2010) The survey was from October to the end of December 2020. We used a 5-point likert scale with 1 being strongly disagree and 5 being strongly agree. All scale factors are unidirectional. All scale factors are unidirectional.

Sample size

Hari et al. (1998) suggested that if the sample size is around 100, then the standard factor loading must be greater than 0.5 (Bollen, 1989) recommended a ratio of 5:1 for selecting the sample size over the number of parameters in the multivariate analysis Besides, the author's research model identified 19 observed variables by using the 5-point likert scale. The number of samples initially calculated was 19*5 = 95 samples. The research's sample size is 500 tourists, which ensures the requirement and achieve generalization, represents for the survey; this results in a total of 385 valid survey questionnaires collected and processed

Analytical methods

The author performed EFA (Exploratory Factor Analysis, CFA (Confirmatory Factor Analysis), SEM (Structural equation modeling) by using software SPSS.20 combined with AMOS.20. Testing is done through the following steps:

- Preliminary estimate of the scale and reliability of the measured variable by Cronbach's alpha coefficients and factor loading coefficients by Exploratory Factor Analysis (EFA)

- The CFA method is used to confirm the univariate, multivariate, convergent and discriminant value of the concepts.

- Drawn from the CFA results, building and testing the suitability of the research model through the SEM structural model, evaluate the impact of the independent variables on the dependent variables. The source of the component variable scale is shown in Table 2:

Table 2. The source of the component variables scale in the research model

Elements	Symbols	Number of observed variables	Reference source
Brand Image	IMA	5 variables (IMA1 to IMA5)	Based on the research of Matzler et al. (2008), Cho and Fiore (2015) and qualitative research
Brand Value	VAL	5 variables (VAL1 to VAL5)	Giovanis and Athanasopoulou (2017); Waheed and Hassan, 2016
Brand Perception	PER	5 variables (PER1 to PER5)	Cretu and Brodie, 2007; Veloutsou and Daskou, 2004
Satisfied destination's brand	SAT	4 variables (SAT1 to SAT4)	Based on the research of Som and Badarneh (2011); Puspitasari et al., 2018 and qualitative research

3. Results

3.1. Descriptive statistics of the study sample

The study's sample is 500 tourists, resulting in the collection and processing of 385 valid survey questionnaires Demographic information of the observed sample is shown in Table 3.

Table 3: Description of the characteristics of the study sample

Content		Frequency	Percent
Gender			
	Male	198	51.4
	Female	187	48.6
	Total	385	100.0
Age			
	Under 18	84	21.8
	19-30 years	148	38.4
	31-50 years	107	27.8
	Above 50 years	46	11.9
	Total	385	100.0
Income			
	Under 5 million	113	29.4
	5-10 million	180	46.8
	11-15 million	57	14.8
	over 15 million	35	9.1
	Total	385	100.0
Education			
	College, high school, or lower	95	24.7
	Bachelor degree	242	62.9
	Post graduate degree	48	12.5
	Total	385	100.0

3.2. Cronbach's Alpha reliability analysis

Variables with correlation of less than 0.5 with the total variable (Item Total Corelation) are considered garbage variables and are excluded from the model, the scale is accepted when Cronbach's Alpha coefficient is greater than 0/7 (Hair et al., 2014). The results of the first Cronbach's Alpha analysis remove the PER3 variable because the total correlation coefficient is less than 0.5. The results of the second Cronbach's Alpha data processing show that all observed variables have a total correlation greater than 0,5 and Cronbach's Alpha coefficient is greater than 0,7. Cronbach's Alpha coefficient of the factors Destination brand image (0.902), Destination brand perception (0.877); Destination Brand Value (0.847) and Destination Brand Satisfaction (0.824).

Principal Axis Factoring was used with Promax rotation (Anderson & Gerbing, 1988) and factor loading coefficients ≥ 0.5 (Hair et al., 1998) to incorporate remaining variables into Exploratory Factor Analysis (EFA) model for the purposes of scale validation. The results show that (Table 4): KMO and Bartlett's test in factor analysis we get: KMO coefficient = 0.845 > 0.5 shows that the data is suitable for Exploratory Factor Analysi. The statistically significant difference of Bartlett's Test (Sig. = 0.000 < 0.05), as a result, the observed variables in the population are correlated. The extracted variance is 68.839, indicating that the analyzed factors' variation can account for 68.839 percent of the variation in the original survey results. The 4th factor's Eigenvalues coefficient is 1.994 > 1, indicating that the study has reached its conclusion. Each observed variable representing all factors has a factor loading coefficient greater than 0.5, indicating that the observed variables have a major impact on the factors that these variables represent.

Table 3. The findings of EFA (exploratory factor analysis).

Pattern Matrixa

KMO	.845			
Bartlett's Test of Sphericity	Approx. Chi-Square 3730,435 df 135 Sig. .000			

3.3. Critical Frame Analysis (CFA) results for analyzing the saturated model

The saturated model for research concepts is shown in Figure 2. The saturated model is a model of established factors that are freely interrelated. CFA's analysis results demonstrate that: Chisquare/df = 2.519 < 3 (Carmines & McIver, 1981), CFI = 0.946 > 0.9; TLI = 0.936> 0.9 (Bentler & Bonelt, 1980); GFI = 0.916 > 0.8 và RMSEA= 0.063 < 0.8 (Steiger, 1990). All factor weights of each observed variable are greater than 0.5, so it can be viewed that the model achieves convergence value (Figure 2).

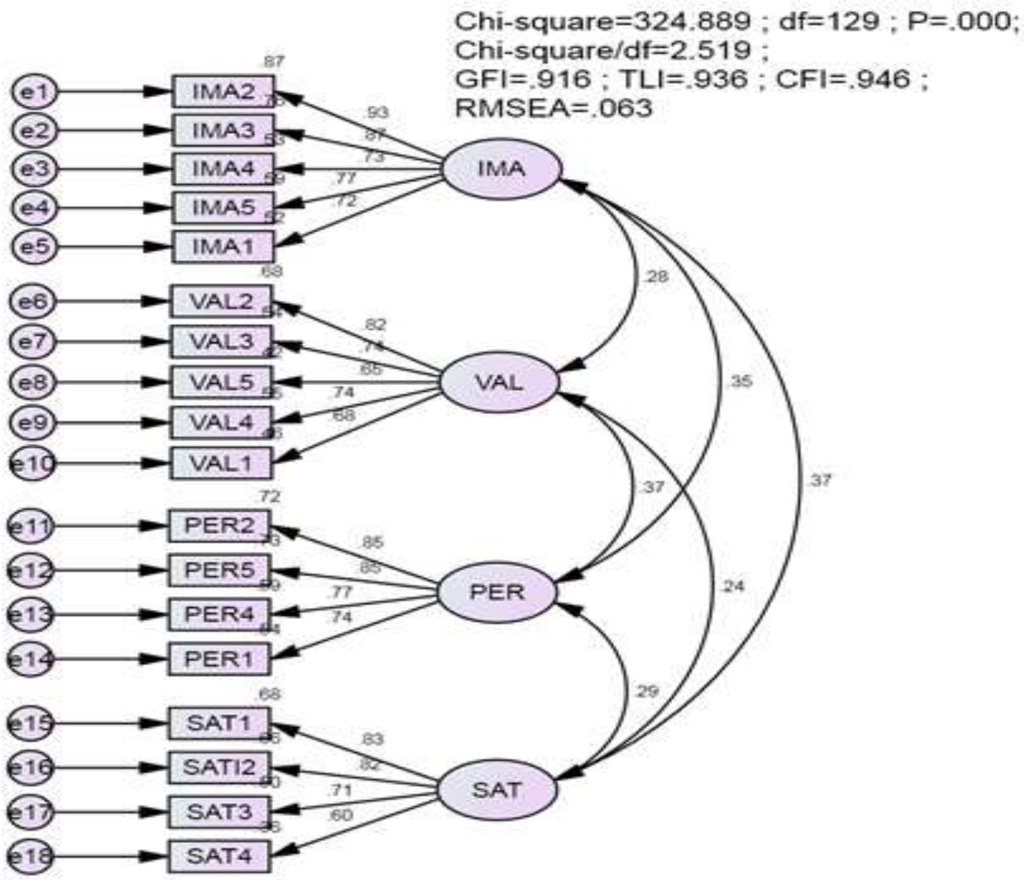

Figure 2: CFA's analysis results for the saturated model

Analysis results indicate that: Correlation coefficients are less than 1, covariance validation and correlation between pairs of variables are statistically significant ($p < 0.05$, table 5). The outcome of the CFA review for the saturated model

Table 5: Coefficient of correlation, covariance between variables

Relationship			Estimate	S.E.	C.R.	P
IMA	<-->	VAL	.182	.039	4,688	***
IMA	<-->	PER	.251	.043	5.784	***

VAL	<-->	SAT	.144	.037	3.890	***
PER	<-->	SAT	.193	.041	4.693	***

3.4. Research hypothesis's testing

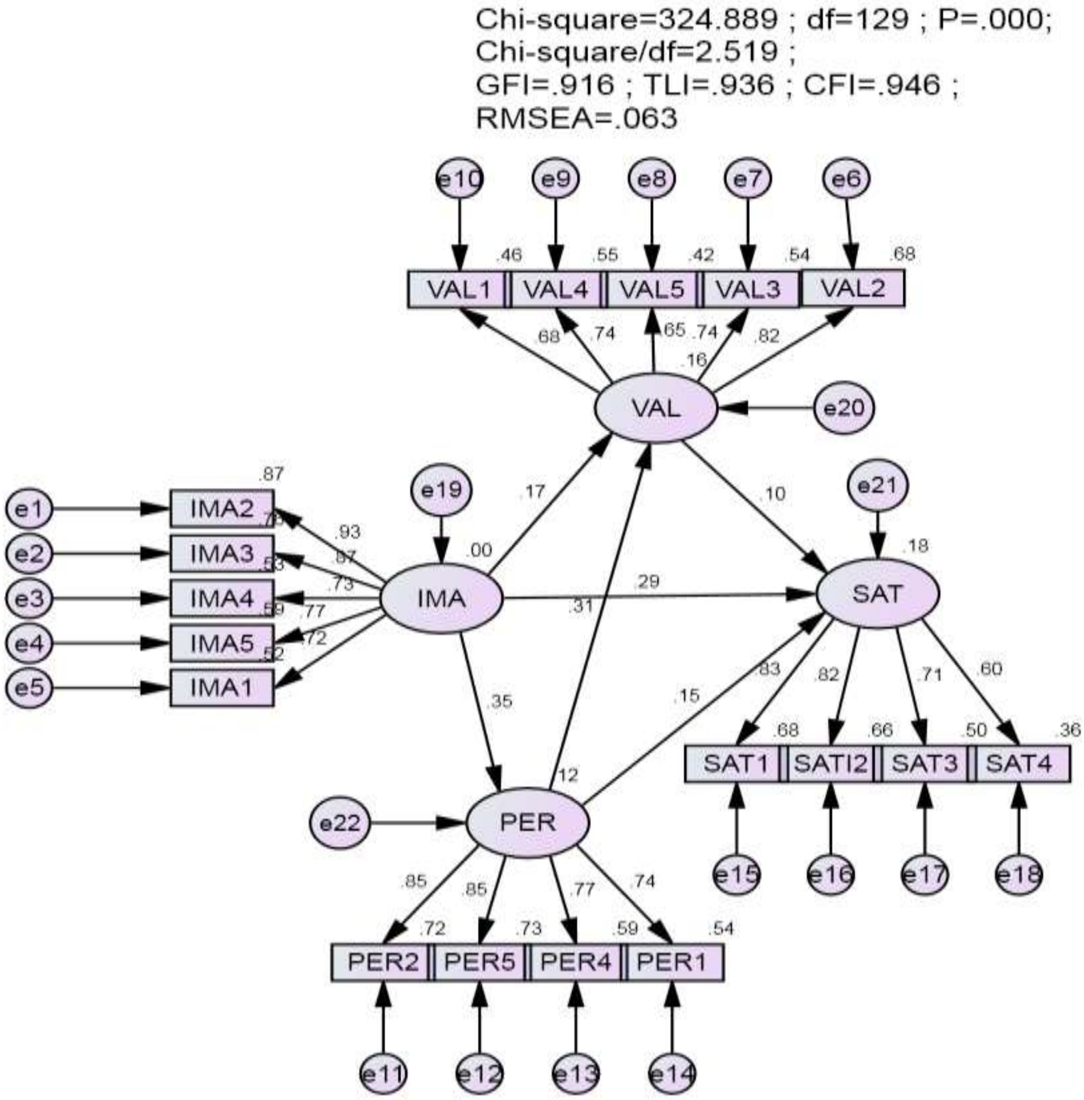

Figure 3. SEM validation results for the final structural model (normalized)

The study used SEM linear structure model to evaluate the suitability of the research model and to validate the correlations in the model. The results show (Table 5): the model has a Chi-square value = 324,889; df = 129; CMIN/df = 2,519 with p = 0.000, GFI = 0.916; TLI = 0.936; CFI = 0.946; RMSEA = 0.063. Furthermore, the model's normalized beta regression coefficients are all positive, with a p-value < 0.05 indicating statistical significance. This demonstrates that the findings of the research hypotheses testing are accepted, as evidenced by the corresponding normalized beta correlation coefficients for hypothesis H1: 0.290; Hypothesis H2: 0.174; Hypothesis H3: 0.347; Hypothesis H4: 0.306; Hypothesis H5: 0.105; Hypothesis H6: 0.152.

Table 6: Result of hypothesis test

4. Discussion and Conclusion

The study's objective is to determine and measure the influence of brand image, brand perception, and brand value on tourist's brand satisfaction for Pu Luong, Thanh Hoa province. The findings indicate that the destination brand image has a greater influence on tourist brand satisfaction than the other two factors, brand value, and brand perception. However, the two factors of brand value and brand perception have a relatively large influence on tourist satisfaction for Phu Luong, Thanh Hoa. Based on the findings, the author makes a number of recommendations to raise tourist brand satisfaction for Pu Luong, Thanh Hoa province, thereby contributing to the development of the Pu Luong, Thanh Hoa province at the following time:

4.1. Choosing and developing the image of Pu Luong as a tourism destination

It is possible to consider positioning Pu Luong as a tourism destination with the type of community-based tourism that preserves the most primitive nature of the culture of Thanh Hoa's mountainous ethnic groups. To create an image of the Pu Luong in the eyes of tourists, first and foremost, an outstanding destination image associated with the core values of the destination's natural and human resources must be created in order to convey to customers a how to persuade through effective communication channels. The image of a destination that tourists recognize is one that is unique in terms of natural and human resources, safe and pleasant environment, and the friendliness of the people. As such, it is suggested that the local government conduct research and select some images to serve as a tourism symbol for Pu Luong. It could be images of Pu Luong's stunning natural beauty (terraced fields, local villages, waterfalls, etc.) or humanistic tourism resources such as festivals, fairs, scenes of cultural and artistic activities in the Thai, Muong communities, etc.

With differences The differences of Pu Luong tourism as above can help orient Pu Luong tourism toward a market share of middle-income tourists and the development of a "affordable" tourism brand. On that basis, the government orients businesses and property owners in the localityto develop strategies for the price and cost of tourism activities in the area aimed at middle-income residents.

4.2. Building image of local people and cultural identity of Pu Luong

The images of local people and cultural identity are critical components of a destination's tourism brand. Pu Luong is a destination that excels in this area, so the local government needs to continue to implement strategies to promote propaganda and raise awareness about the importance of developing positive images of people and regional cultural identity of Pu Luong. It is recommended to elicit local people's pride in traditional cultural values, sense of responsibility to preserve and introduce those cultural beauties to tourists through combined eco-tourism and community tourism in the form of sightseeing, relaxation, cultural tourism – historical sites, etc.

To accomplish the aforementioned goal, it is necessary to propagate and introduce so that when tourists visit Pu Luong, they want to immerse themselves in community life and sample regional specialties such as Cổ lũng Duck, Green catfish of Mã river, Cần wine, etc. Additionally, the restoration of traditional brocade weaving villages (for example, brocade weaving in Lan Ngoai village, Lung Niem commune) should be prioritized to provide souvenirs for tourists and to meet tourist needs to raise the income of local residents.

4.3. Maintaining an emphasis on developing diverse tourism products with distinct characteristics based on Pu Luong tourism's strengths and potentials

Tourism products are unique and distinctive, reflecting the personality of each destination. Building tourism products is a strategy that requires emphasis and attention to help tourism achieve comprehensive development. For Pu Luong, the current tourism product must forge its own path in order to reaffirm the local tourism industry's position in the current trend of integration.

To compete with other tourism destinations and entice tourists to visit and stay longer, local authorities must implement a strategy of product diversification. In the coming time, the destination's products must be distinct from those of other localities in the region; cooperation programs must be based on the mutual agreement along a chain of links that takes into account the resource characteristics and advantages of each locality.

The study's limitation is that it was conducted exclusively in Pu Luong, Thanh Hoa province, a tourism destination with numerous distinctions from other destinations (climate, nature, ...). As a result, the research findings differ slightly from those of other tourism destinations in the country in general and Thanh Hoa province in particular, and thus generalizability is limited. As a result, extensive research into other provinces and cities is necessary. The research, on the other hand, only looks at the effect of brand image, value, and perception on tourist satisfaction for Pu Luong, Thanh Hoa province, but not tourist loyalty. Therefore, more research is required into the impact of brand image, value and perception on tourists' satisfaction and brand loyalty to tourism destinations.

ANALYZING THE COVERED INTEREST PARITY DEVIATIONS IN VIETNAM BY USING THE POOLED MEAN GROUP METHOD

Dr. Nguyen Thi Hong Nham

nhamnth@ueh.edu.vn

Tran Minh Hieu

tmhieu2294@gmail.com

School of Finance, University of Economics Ho Chi Minh City, Vietnam

Abstract

Vietnam's foreign exchange market is developing and perfecting over time, it is more and more closely linked with world economies, create various types of trading in the foreign exchange market, including covered interest arbitrage (CIA). Along with fluctuations in domestic and foreign exchange rates and interest rates, policy makers will set up appropriate strategies, policies and solutions to increase the level of covered interest arbitrage to correct for covered interest rate parity (CIP). However, in order to better understand Interest Rate Parity (IRP), not only is there a relationship between exchange rate and interest rates, but according to previous studies, there are macroeconomic factors that also affect the covered interest parity. By using the Pooled Mean Group (PMG) method to estimate the weekly data sample of 5 currencies of the US, China, Korea, Japan and European countries (USD, CNY, KRW, JPY, EUR) in 2019, I conclude that the foreign exchange market in Vietnam exists interest rate parity deviations.

Keywords: *Foreign exchange market, CIA, interest rate parity, PMG method.*

1. Introduction

The foreign exchange market is a highly traded market, globally connected via the Internet, and is also the largest speculative market. Therefore, it is very sensitive to infomation as well as economic and political events taking place in the world such as: political situation, inflation rate, unemployment rate, production index,… This will create many opportunities for different types of businesses, such as covered interest arbitrage. Interest rate arbitrage is investing abroad to enjoy higher interest rates but with hedging against exchange rate risk through forward contracts. For the market to reach equilibrium, there must be a large enough amount of covered interest arbitrage (CIA) that such solutions involve the theory of interest rate parity (IRP), in this state. The difference between the forward rate and the spot rate is properly offset by the interest rate differential between the two countries and it does not create any opportunity for covered interest arbitrageurs. The market reaching a state of interest rate parity will bring benefits to businesses and investors, although it is not possible to implement CIA to make a profit, at this time, the interest rate will accurately reflect the market's price, so businesses will not be able to make profits. Businesses will not have to fear that they have to raise capital at a higher interest rate than its true value. The Vietnam interbank market was established in 1994 and the rapid development of the foreign exchange market due to the use of the Internet for transactions means that the foreign exchange market in Vietnam is increasingly connected. closely with foreign markets, especially developed countries. Due to the connection, the exchange rate and interest rate movements of currency pairs for the Vietnamese dong are more and more volatile and more sensitive than before, which means that the CIP deviation is more volatile more . With the research objective is to test the existence of covered interest rate parity (CIP) and the relationship of hedging interest rate parity with macroeconomic factors, the author uses the Pooled Mean Group method for regression for weekly datasets of 5 countries and regions that are the main trading partners with Vietnam (US, China, Japan, Korea and EU) in 2019.

2. Method

2.1. Literature review

Theory of Interest rate parity

When market forces render interest and exchange rates no opportunity for covered interest arbitrage, we are in a state known as Interest Rate Parity (IRP). In this equilibrium, the difference between the forward and spot rates between the two currencies is offset by the difference in the interest rates of the two countries. If investors want a higher rate of return from investing abroad, there is a rebalancing effect as investors pay more per unit of foreign currency (the spot rate) and receive less per unit of the pre-sold foreign currency (the forward rate). Note that a forward rate greater than the spot rate will receive a premium and smaller will represent a discount.

The relationship between the premium (or discount) of a foreign currency and the interest rate based on this currency under the IRP can be determined as follows: Let us consider an investor who conducts a covered interest arbitrage, this investor's rate of return from covered interest rate arbitrage is determined as follows: $r_t = (1+i_f)(1+p)-1$

With: $p = \frac{F}{S} - 1$

S : spot rate of foreign currency

F : forward rate when converting foreign currency to local currency

i_f: Foreign deposit interest rate

If interest rate parity exists, then the rate of return from covered interest arbitrage will be equal to the domestic interest rate: $r_f = i_h$

With r_f is yielding business received from interest rate differences have preventive and i_h is the domestic interest rate.

Review of the literature

The origin of Covered Rate Parity (CIP), first articulated by Keynes (1923) during the period of floating exchange rates after World War I, was the fundamental building block of International Finance Economic. Most of the research papers by authors around the world study the CIP deviation in 3 periods: before, during and after the 2008 global financial crisis (GFC). Before the Global Financial Crisis (GFC), for several decades, the Interest Rate Parity deviation was quite small, even close to zero, but as the number of research papers increased, and As we discover more, that relationship seems to be broken when GFC occurs. The CIP deviation due to the volatility of the Global Financial Crisis is not surprising. What has been more puzzling is CIP continues going wrong after the GFC. This phenomenon becomes important at least for these 3 reasons. First, this could be the evidence of financial market conflicts or unintended policy consequences that could potentially lead to inefficient resource allocation. Second, it could lead to a change in the way that macroeconomic policies (especially monetary policies) propagate across borders. Third, CIP bias can be explained by asset valuations in the world, where financial intermediation constraints are random and potentailly binding (Du et al., 2019).

The research paper of Eugenio et el. (2019) analyzes the impact of interest rate differential and forward-spot rate differential along with macro-financial factors determinants to CIP deviation in the US. By using some techniques such as split-sample analysis, OLS regression, and instrumental variable regression (IV regression), the authors have draw the conclusion that the CIP deviation in the US occurs not only during the GFC crisis but also in the post-crisis period and on macroeconomic factors such as US dollar strength and foreign exchange market liquidity had a very strong explanatory role for the CIP deviation.

After reviewing previous research papers, the author found that very few studies on interest rate parity deviation in Vietnam market; In addition, with the research method of the previous authors, the research results do not show that the short-term and long-term relationships are expressed through the long-term relationships cointegration system. In this research, I am not only interested in the existence of CIP deviation, activities affecting exchange rate fluctuations and the relationship between macroeconomic factors and CIP deviation in the future. In the case of the Vietnamese economy, the author also considers the short-term and long-term relationships of macroeconomic factors and exchange rate differences. Therefore, the author wants to consider and test the effects of exchange rate and interest rate fluctuations along with the influence of macro-financial determinants.

2.2. Data and Research methods

Data

In this research, I use the data of 5 coins, respectively CNY, USD, KRW, JPY and EUR in 2019 , of which Japan is one of the countries where the currency safe havens. The paper uses the daily spot and forward rates of Euro currencies, US dollars, Japanese yen, Korean won and Chinese yuan for the Vietnamese dong from Investing.com website. The reason why the authors chose these currencies is because the above countries and regions are major trading partners for Vietnam. In addition, the author does not use 2020 data because of the strong impact of the COVID-19 pandemic.

Research methods

Eugenio et al. (2019) have used regression methods instrumental variables (IV regression) for panel data and OLS regression for time series data. Instrumental variable regression (IV regression) is not an effective endogeneity remedy like Generalized Method of Moments and Pooled Mean Group, however both GMM and IV regression have common limitations that are estimation results requires uniform parameters between panel units; in addition, neither IV regression nor GMM can show short-term and long-term dynamics for the model through co-constraints. end. In addition, one of the reasons to choose Pooled Mean Group is that the data type has a big difference between N and T. In the case of N>T, GMM is an effective method for estimation; however, with the weekly data set where there are only 5 currency pairs (T>N) in this study, the efficiency of the estimation results will be weaker. To overcome the above limitations, in this study, I propose to use PMG. Pooled Mean Group regression model was developed by Pesaran and Smith (1995), Pesaran (1997); Pesaran et al.(1999).

By using the PMG method and based on the research of Avdjiev et al. (2017), the proposed research model is as follows:

$$(f_{t,t+n}-s_t) = \alpha_s + \beta_s\,(r_{t,t+n}-r^*_{t,t+n}) + \delta_s\,VNDINDEX_t + \gamma_s \ln(VIX_t) + \eta_s(LIQ_t) + \varepsilon_{st} \qquad (1)$$

With:

- $f_{t,t+n} - s_t$ is the difference between the forward and spot rates;

- $r_{t,t+n} - r^*_{t,t+n}$ is the difference between Vietnam interbank interest rates (VNIBOR) compared to foreign interbank rates;

- VNDINDEX is a trade-weighted VND index;

- ln(VIX) is VIX index (an index measuring general volatility in the stock market);

- LIQ is the liquidity of the foreign exchange market calculated by the difference between the bid and ask prices.

3. Results

Table 1: Descriptive statistics of variables in the model

Variable	Observations	Mean	Standard deviation	Min	Max
FS	180	-35.0083	52.0972	-193.5098	4.1780
rr*	180	1.6041	0.9563	-0.8204	3.9859
VNDINDEX	180	2.3205	0.0085	2.3121	2.3409
lnVIX	180	2.7686	0.2452	2.0037	3.3112
LIQ	180	53.0629	71.0017	0.0024	246.0143

Source: Calculation from research data

Research data consists of 180 observations, representing 36 trading weeks of 5 currency pairs. A larger mean of r-r* is greater than 0 that throughout 2019 Vietnam's interbank rates were generally higher than the interbank rates of the currencies under study. Due to the difference between the exchange rates of currency pairs against Vietnam, F-S and LIQ have high volatility, meanwhile, VNDINDEX and lnVIX have low volatility.

Table 2: Correlation coefficient matrix

	F-S	r-r*	VNDINDEX	lnVIX	LIQ
F-S	1.0000				
r-r*	0.1818	1.0000			
VNDINDEX	-0.0312	-0.1604	1.0000		
lnVIX	-0.0180	-0.0943	0.1891	1.0000	
LIQ	-0.5728	0.0586	-0.0242	-0.0315	1.0000

Source: Calculation from research data

The correlation coefficient matrix table show a preliminary view of the correlation between the variables in the model; between the dependent variable and the independent variable. The correlations of the variables are consistent with the research hypothesis, so the author can conduct the study with the selected data sample size. However, the results from the above correlation coefficient matrix table cannot help me evaluate and draw final conclusions.

To perform the stationarity test for panel data, I use the Levin-Lin-Chu (2002) unit root test for the dependent variable and the variables in the model. In addition, the author uses the cointegration test of Pedroni (1999, 2004).

Table 3: ***Summary table of unit root tests***

Out	p-value
FS	0.0000
rr*	0.8340
VNDINDEX	0.0883
lnVIX	0.0514
BID-ASK	0.0278

Source: Calculation from research data

Table 4: ***Table of results of testing the cointegration***

Pedroni test	Statistics	p-value
Modified Phillips-Perron t	-2.3967	0.0083
Phillips-Perron t	-10.6686	0.0000
Augmented Dickey-Fuller t	-10.1760	0.0000

Source: Calculation from research data

Therefore, using the PMG estimation models will be suitable for this research data that is not homogenous in terms of stop order of panel units as well as cointegration phenomenon.

Source: Calculation from research data

The table of results estimated by PMG method is divided into two main parts: short-run dynamics (short-run) and long-term dynamics (long-run). Specifically, in the short term, the variable ec is statistically significant at 1% and has a negative estimation coefficient, which proves the existence of cointegration. In addition, with an estimate of ec of -0.97 - which has an absolute value close to 1 and the study uses weekly data, this means that the rate of adjustment to long-run equilibrium is fast, specifically, It is possible that if the independent variables in the model change by 1 percent, the forward and spot exchange rate differential will self-adjust to 97 percent equilibrium in one week. In the long run, most of the variables are statistically significant except for the LIQ variable, the impact of these variables is also consistent with my expectation; specifically, if r-r* increases by 1 percent, FS will be adjusted up by 5.3% at 1% significance level, VNDINDEX will increase by 1 unit, then FS will adjust down by 79.44% at 1% significance level, variable lnVIX increases by 1 percent. 1 unit, the FS will be adjusted up by 1.38% with a significance level of 10%. By comparing the regression results of 4 models, I can check the robustness of the estimator sign. Specifically, in the long term, the estimated coefficient of interest rate difference is positive and less than 1 in statistically significant cases, VNDINDEX has negative estimation coefficient in all cases with statistical significance, the estimated coefficient of lnVIX is positive in both cases. In addition, the equilibrium adjustment speed of all cases is close to the absolute value of 1, so all cases in the pre-crisis period have a fast rate of adjustment to equilibrium.

4. Discussion and Conclusion

Thanks to the strong progress in the integration process, the foreign exchange market in Vietnam is also developing rapidly, and covered interest rate parity is an issue that investors are increasingly concerned about. However, to be able to consider the size of the covered interest rate parity, I use the PMG method to estimate the results along with the use of different types of tests to check the reliability of the results. Pooled Mean Group estimation method. Based on the research results presented above, it can be seen that interest rate differentials have a positive impact on forward and spot exchange rate differentials, most of the macroeconomic factors are significant. Statistical significance and impact on the forward and spot exchange rate difference in the long term and not in the short term, the emergence of the COVID-19 epidemic has changed the macro-financial factors and changed the change their impact on the interest rate parity. In general, during the year, the Vietnamese foreign exchange market did not reach covered interest rate parity. Causes the continuation of interest parity rate deviation began from the policies of the government for the foreign exchange market.

Abstract

The study examines the factors affecting health demand in Vietnam, specifically the northern part of Vietnam, based on the 2016 VHLSS dataset. The first results show that individual and household characteristics are impact on the individual's demand for medical services. Second, the study found that purchasing health insurance increased the frequency of medical visits by policyholders and contributed to a reduction in their medical spending. Third, air pollution is considered as one of the important factors that increase current health spending. From there, the study gives some policy recommendations for state agencies.

Keywords: *environment pollution, health insurance, VHLSS, inpatient, outpatient*

1. Introduction

In Vietnam, in recent years, with many reforms on health policies, the ability of access to health services has been significant increased, and people are getting better and better health care. However, health expenditure is still rising, creating a financial burden for many families. This is also the reason why many households with members being ill, falling into poverty after paying medical expenses (Hoang Van Minh, Phuong, Saksena, James, & Xu, 2012).

The impact of determinants on healthcare utilization is studied in many countries and in Vietnam. All of them showed that health expenditure of individuals affected a wide range of factors, including: personal characteristics, household characteristics, health insurance (Ahmed, Tomson, Petzold, & Kabir, 2005; Mocan, Tekin, & Zax, 2004; Onwujekwe et al., 2010). However, most of these studies mainly study separately the factors influencing decisions on using health services and health expenditure. This paper consider healthcare demand that is a process from deciding using healthcare services to deciding how to payment for medical services.

Many previous studies shows that personal characteristics, household characteristics, and health insurance policies affect behavior of using health care services. In addition, the state of the environment in Vietnam from water, air, food, noise or land is polluted at an alarming rate, directly threatening health and affecting many life activities. Scientists pointed out that one of the causes of the increasing incidence of cancer is the increasingly degraded living environment. The number of people suffering from cancer, occupational diseases, affecting nerves and endocrine gland function, children having birth defects is increasing day by day. This increases the pressure on health expenditure. The humid tropical monsoon climate is also favorable for the development of many diseases, along with the problem of population aging, which also significantly increases the demand for health services in our country. Therefore, the study of determinants of healthcare demand is still very important and meaningful in the current context. This study aims to investigate factors affecting healthcare demand, including two steps: factors influencing on annual frequency of outpatient and inpatient visits at health facilities and factors influencing on spending on healthcare at health facilities. Besides the introduction and references, the paper is organized into 4 parts. Part 2 is literature reviews, part 3 is data and research method, part 4 presents analysis results and discussion. The final part is the conclusion and some policy implications.

2. Literature reviews

There have been a number of empirical studies that estimated the impact of factors on the health services utilization. Ahmed et al. (2005) studied health-seeking behavior of elderly people in Bangladesh. This study found that education and poverty are two important factors impacting on health care seeking behavior. Kevany et al. (2012) studied impact of socio-economic status and employment status on health care utilization in rural Zimbabwe by using data collected from random household surveys in Mutoko district of a province of Zimbabwe with logistic regression. The research has shown that health care utilization is highly related to the socio-economic factors and employment status.

Wagstaff, Lindelow, Jun, Ling, and Juncheng (2008) evaluated the benefit of voluntary health insurance programs of people in rural of China. This study combine differences-in-differences with matching methods to estimate and showed that health insurance increased outpatient and inpatient utilization, but it did not reduce outpatient and inpatient expense per visit.

Supply-side factors from the health facility are also found to have an impact on health expenditure. Lépine and Le Nestour (2011) showed that the quality of medical care and travel costs are the important factors affecting the probability of seeking treatment from health facilities. An increase in average travel costs reduces your ability to seek medical care by 25%. Laokri, Soelaeman, and Hotchkiss (2018) used the variable satisfaction on health facilities to represent the quality of health care services and showed that the better service quality, the more people are willing to pay more on health spending, and distance to health facilities also have a negative impact on individuals' health spending.

Jowett, Contoyannis, and Vinh (2003) used a two-step Heckman estimate to deal with the endogenous problem of insurance, thus ignoring the selection of health seeking. Waters (1999) studied the effects of health insurance in Ecuador also examined the presence of selection bias in healthcare search through two separate steps, the author first used the Probit model to predict the probability of using health services and then put the forecast value in the OLS model to estimate health expenditure. The results also showed the presence of selection bias.

Hoang Van Minh et al. (2012) used logistic regression method to study the factors that influence catastrophic health expenditure. The results also showed that the economic characteristics of households impact on household health expenditure. Higher-income households will increase health spending and pay more for expensive medical services. Households living in rural have a significantly higher proportion of catastrophic health spending than those living in urban.

Nguyễn Thị Thùy Trinh, Nguyễn Thị Kim Xuyến, and An (2018) investigated determinants affecting the decision of health care seeking and the amount spent on health care of the farmers in Tra Vinh province, using data collected from 200 farmer households in one district of Tra Vinh province. The results also show that the factors affecting the amount of health spending by households, such us occupation of household heads, capita income, subsidy policy and household economic status.

Previous studies have shown the factors affecting the use of health services. In Vietnam, however, there are some fators which are not fully considered. This study estimates the factors influencing the use health services including personal characteristics, family characteristics, health insurance, characteristics of health facilities and environmental pollution. Characteristics of medical facility such as distance to nearest medical facility. In addition, this paper considers separately for inpatient and outpatient health spending because these two types of health services have many different characteristics.

3. Method

3.1 . Research data

To analyze the factors affecting health demand, this study uses data extracted from from the Household Living Standards Survey (VHLSS) Dataset which is conducted every 2 years by the General Statistics Office, the VHLSS 2016 is use in this study. The data set used for the study is cross-sectional data with 10580 observations with characteristics including health expenditure, health insurance, individual characteristics, and household characteristics. The data only includes individuals in households in the North of Vietnam, including the Red River Delta and the Northern Midlands and Mountains.

3.2. Definition of variables

From a review of previous studies,the author considers four groups of variables that are likely to affect demand for health services. The first group is the characteristics of the individual such as age, gender, ethnicity, health insurance. The second group is the characteristics of the household; the third group is the health facility characteristics such as the distance to the nearest medical facility (representing the availability of the medical). The fourth group is the living environment characteristics such as environmental status, living area, which is typical for climate, geography, socio-economic characteristics where the individual lives. These are important factors affecting access to health services and health spending personal.

Personal health expenditure here means health out-of-pocket spending including expenditures on medical care during personal visits to medical facilities or visits through medical facilities. private physician. Specifically, in this study health expenditure of a personal include fee and treatment, medical bills, physician training, travel, buy instruments, ... concerning examinations/treatment that does not take into account the individual buying medicine for self-treatment. With this concept, health expenditure is only observed for individuals who choose to use health services, and not for individuals who do not choose to use health services, that is, do not go to the doctor. The squared age variable is included because it can have a non-linear relationship with health. In this study, the economic status of the household is measured by the per capita income of the household.

Definitions of variables are detailed in Table 1.

Table 1. Definition of variables

Variables	Define
Dependent variable	
Number of outpatient visits	Calculated by the number of outpatient visits at medical facilities
Number of inpatient visits	Calculated by the number of inpatient visits at medical facilities
Outpatient care expenditure	Natural logarithm of outpatient expenditure
Inpatient care expenditure	Natural logarithm of inpatient expenditure
Independent variables	
Health Insurance	1= Have health insurance

Variables	Define
	0= No health insurance
Ethnic	1= Kinh people
	2= Ethnic Minority
Residence	1= Urban area
	2= Rural area
Education of the household head	
	1= No degree
	2= Elementary school
	3= Have a secondary school/high school diploma
	4= Have a high school diploma
Household size	
Gender of household head	1= Male
	2= Female
Education	
	1= No degree
	2= Elementary school
	3= Have a secondary school/high school diploma
	4= Have a high school diploma
Income	Logarithm of average household income
Age	Calculate by years
Age squared	Square of age
Gender	1= Male
	2= Female
Number of times sick	Number of times sick and unable to work or study,
Distance to nearest medical facility	Distance from commune to nearest medical facility
Environmental pollution	Measured by the concentration of PM2.5 in the air

3.3. Estimated model

Healthcare demand in this study included the number of individual outpatient visits and the amount of money the individual spent on healthcare during the visits in 12 months. With the model to estimate the factors affecting the number of individual visits, because the dependent variable is the number of inpatient and outpatient visits, which is numerical data, the study uses the Poisson regression model is suitable. For individuals who have no doctor visits or being payment by 100% covered health insurance, these individuals' health expenditures are zero, so there is a large number of observations for health expenditure equals 0 so it is appropriate to use a two-part model to estimate inpatient and outpatient health expenditure. The first part of the model estimates the likelihood of positive out-of-pocket payments at a health facility, whereas the second part of the model estimates the positive level of out-of-pocket expenditure per patient.

The study used Stata 14 software for cleaning data and quantitative analysis.

4. Results

4.1. The use of healthcare and environmental problems in Northern Vietnam

Table 2 presents the number of visits and average outpatient and inpatient medical expenditures of individuals in the past 12 months up to the time of the survey .

Table 2. Use of health services in Northern Vietnam

	Number of outpatient visits	**Number of inpatient visits**	**Average outpatient expenditure (thousand dong)**	**Average inpatient expenditure (thousand dong)**

Source: Calculation from 2016 VHLSS data

The results are in Table 2 shows that people living in urban areas is the frequency of use of health services outpatient and health expenditure is higher than the people living in rural areas. Specifically people in urban areas have average outpatient visits of 12 months was 1.06 times, while the people living in the rural area is 0,83 times. The average health expenditure of people in urban areas was higher in rural areas shows that people in urban have the more ability to pay for medical services than people village area.

Similarly, the Kinh people also have the higher average visits and the health expenditure than the ethnic minorities. The health expenditure of the Kinh people for outpatient and inpatient medical services is 410,9 thousand VND and 609,98 thousand VND per year respectively, more than double that of ethnic minorities .

The table above also shows that people with health insurance have more inpatient and outpatient visits than people without health insurance. This shows that the majority of people participating in health insurance often have serious illnesses and often require inpatient rather than outpatient treatment. As a result, the average inpatient expenditure of those with health insurance is still higher than that of the outpatient, and the average inpatient medical expenditure of those with health insurance is still higher than those without health insurance. This was explained above, the participants of health insurance are often those with serious illnesses requiring inpatient treatment, health insurance contributes to reducing medical costs, but currently health insurance only pay for some medical items, in addition, the patient still has to pay some expenses such as travel expenses, accommodation costs, expenses for family caregivers. The frequency of inpatient care is higher, so patients with health insurance have a higher average inpatient expenditure.

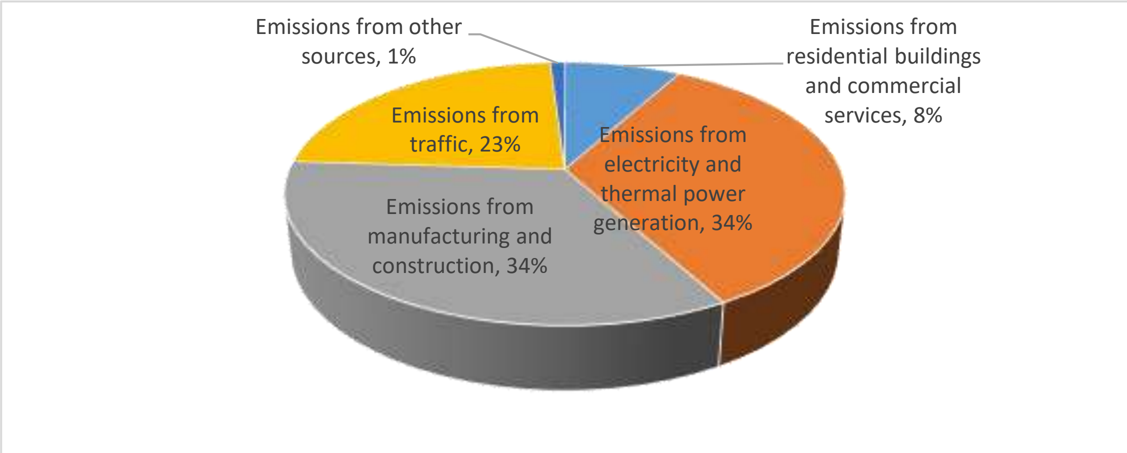
About age, the data in Table 2 also show that when age increases, frequency of medical examination and treatment and health expenditure also increase . This is because as their age increase, their health becomes worse, and they are more likely to have health problems. Statistical results also show that when income increases, the frequency of medical examination and treatment and health expenditure on health also increase. This shows that people with better economic conditions are more concerned about their health and more willing to pay for medical expenses. The rich are better able to pay for health services than the poor.

Regarding gender, women have a higher rate of inpatient and outpatient medical care than men, but women's inpatient health expenditure is less than that of men. This can be understood because during pregnancy, women often go to antenatal care at least once, in addition, women often pay more attention to health check-ups, so they often go to outpatient care than men. However, women have a lower average inpatient health expenditure than men, possibly because women have better health, fewer illnesses, and less disease severity. Men should have lower average health expenditures of women .

According to education, Table 2 also shows that the higher the education level, the more people pay attention to health care and are more willing to spend on health. The members of the household having fewer than 5 members are also frequency healthcare and have higher health expenditures for inpatient services and outpatient than households with five or more members. This shows that the household size is small, the members have more frequent medical check-ups and the household is also willing to spend on health services.

Statistics also show that when the level of air pollution increases, the number of outpatient visits also increases and health spending also increases. In recent years, with the trend of innovation and integration, Vietnam has been a bright spot in terms of economic development in Southeast Asia. However, Vietnam is still facing many challenges, including environmental pollution. Environmental pollution is considered one of the leading agents with negative impacts on public health, especially concentrated in developed urban areas, industrial zones and clusters. Due to the influence of climate and weather factors (including radiation regime, temperature, and precipitation), environmental pollution, especially air pollution in our country, is seriously affecting the health of the environment. people's health and significantly increase the pressure on current household health costs. Construction, renovation and new construction of apartment buildings, urban areas, repair of bridges and roads, housing, transportation of construction materials and wastes take place everywhere, causing smoke and dust to be released into the surrounding air environment. Due to the availability of data, this study uses air pollution to represent the impact of environmental pollution on healthcare demand of Vietnamese.

Figure 1: Air pollution in Vietnam



Source: World Bank (2010-2016)

Figure 1 shows that the main sources of air pollution include: emissions from traffic (23%); from processing, manufacturing and construction (34%); from electricity and heat production (34%); from residential buildings and commercial services (8%) and other sources (1%). In which, the largest amount of emissions comes from the manufacturing and construction industry and emissions from electricity and thermal energy production. The processing and manufacturing industry is considered the main pillar of the economy with a huge consumption of fuels as well as a large amount of emissions to the environment. Recycling activities also put considerable pressure on the environment and are common in the Northern region. The construction industry puts pressure on the air environment mainly because the construction units have not fully and strictly implemented environmental protection measures at the construction site. Livelihood activities are concentrated in rural areas, where raw materials for cooking and production are still mainly based on fossil fuels, firewood and uncontrolled waste as well as energy use by businesses, is the cause of high emissions from power generation and thermal energy. Emissions from traffic (CO, VOC, TSP from motorcycles and SO2, NO2 from cars) account for a significant proportion at 23% due to the strong increase in the number of vehicles over the years, contributing to significant deterioration in air quality. Due to pressure from urbanization, emissions from residential buildings and commercial services also cause air pollution, accounting for 8%. The farming sector also causes environmental problems due to an uncontrolled increase in the amount of chemical fertilizers, pesticides and post-harvest waste (including straw and dried plants) 1% of emissions come from the source of this. Air pollution is clearly at an alarming rate in urban areas, industrial zones and big cities.

PM2.5 dust is considered as the air pollutant that has the most negative impact on human health. Because of its very small size, PM2.5 dust is very dangerous, capable of depositing, penetrating and penetrating deep into the alveoli in the lungs and into the blood . N If the concentration of PM2.5 in the air cleaner, the daily exposure is greater and increases the risk of acute health problems and chronic. Air pollution increases the risk of respiratory infections, heart disease, stroke and lung cancer. Both short-term and long-term exposure to air pollutants cause health effects. Children, women, pregnant women, the elderly, people with weak health, people who are sick are those who suffer the most from air pollution.

*Note: The symbols***/** /* represent significance at 1%, 5% and 10%, respectively.*

Source: Estimates from 2016 VHLSS data.

The coefficient of Health Insurance is positive in column (2) and column (3), both statistically significant at the 1% level. This result shows that when people have insurance, people go to the doctor more often. This result is similar to the study of Nguyen Huu Dung (2016). Currently, the health insurance policy stipulates to pay 100% of medical expenses for medical examination at the commune level for the items covered by the insurance, and 100% of the cost of health insurance for when going to the right doctor for a one-time payment less than 15% of base salary. As a result, the number of outpatient and inpatient visits has increased. Thus, the 2014 revised health insurance policy has a positive effect in encouraging people to visit doctors more.

The results also show that Kinh people have better access to outpatient health care services. Because ethnic minority people often live in mountainous and highland provinces, their understanding of health care is still limited. When they get sick, they usually self-treatment, so medical expenses are lower.

Regarding the place of residence, people in urban areas have fewer outpatient visits than in other regions. This is because in urban areas, living conditions are better, with better nutrition, so urban people have less outpatient medical care than in rural areas.

Regarding the education of the household head, the research results are quite similar to the results of Awiti (2014). The education of the household head positively affects the medical examination of the members of the household. Household heads with higher education have a better awareness of health care, so they are more concerned about the health of individuals in the household. In contrast, the coefficient estimates of the member's education variable are all negative, and this negative level increases with education level. The results show that members with higher education have a lower frequency of medical visits, indicating that with higher education, individuals are more conscious in health care.

The coefficients of the variable household size are negative and highly statistically significant in both models, showing that when the household size increases, individuals receive less health care, so the number of medical visits of the households increases. individuals in the household will decrease.

Regarding the gender of the household head, the estimated results show that the number of inpatient and outpatient visits of members of male-headed households is less than that of members of a male-headed household. household is female. This means that the female head of the household is more concerned with the health of the members than the male.

The coefficients of the income variable have a positive effect on the number of outpatient visits at the 1% significance level. This result suggests that individuals with a higher average income, which is interpreted as having better economic conditions, will take care of their health more often.

The results show that the frequency of outpatient visits increases with age. This is because as age increases, health declines, individuals experience more health problems and therefore the need for medical examination and treatment increases.

Men are shown to have a lower frequency of outpatient care than women, because women care more about their health, in addition, women are the object of childbirth, so they have to spend more during childbirth and pregnancy.

The level of illness of individuals also has a negative impact on the number of visits to the individual. Specifically, the number of times of being sick and unable to work increases,the number of outpatient and inpatient visits also increases.

Regarding environmental factors,the coefficient of air pollution in column 3 is negative and statistically significant. This is due to short-term research data, so in the short-term air pollution have not caused serious diseases that require inpatient treatment. However, in the long term, air pollution can cause serious illnesses and increase inpatient visits.

Source: Authors' estimates from VHLSS 201 6

The estimated results in Table 4 show that the coefficient of health insurance is negative and statistically significant at 1% in both columns (2) and (3), showing that health insurance contributes to reducing costs of inpatient and outpatient medical care compared to people without health insurance.

The coefficient of the positive ethnicity variable shows that Kinh people have higher health expenditure than ethnic minorities. This shows that ethnic minorities still have difficulty in spending on health. In addition, now that ethnic minorities have free health insurance,when they go to medical facilities, their medical costs are also reduced.

Higher education of the household head reduces the likelihood of individuals having to go to an inpatient clinic, indicating that with a high level of education, the household head has better knowledge of individuals' health care. As a result, they are less likely to have serious illnesses that require hospitalization. However, when a member is sick, the heads of these households are willing to spend more on health, so the average health expenditure of members of these households is also higher. This is also similar for the estimated results of the individual's education variable in outpatient spending.

The estimated results of the income variable show that with higher income, individuals have better access to health services and they are more willing to spend on health. Many households with good economic conditions are willing to use health services to expect the best medical treatment.

Outpatient expenditure of men is higher than that of women. For men, the more they age, the health of men less than women, men with average life expectancy is lower than women and often suffer from chronic diseases than women so health expenditure on average of men is more than that of women.

The coefficients of the variables age and age squared show that the likelihood of inpatient care and outpatient treatment increases with age, but the increase decreases with age. As age increases, health declines, therefore, health expenditure also increases .

The number times of being seriously ill increases, increases inpatient and outpatient expenditure of individuals. There is no evidence that distance to a health facility does not affect outpatient health spending, but increases inpatient health spending .

About environmental problems, pollution of air increases both inpatient and outpatient expenditure. Due to the development of industries and construction, air pollution is increasing day by day. When air pollution increases, people are prone to respiratory and cardiovascular diseases, so health spending also increases.

5. Conclusion

From the above analysis, the study draws some important conclusions as follows.

Firstly, health insurance increases the ability to use health services of individuals and reduces their health spending, thereby helping people get better health care. According VHLSS 2016, the rates of people having health insurance in Vietnam is 84%, the State needs to continue implementing policies health insurance the whole people to increase. Therefore, the State should continue to implement the policy of health insurance the whole people to increase audience participation health insurance,which will contribute to increase people's ability to access to medical care.

Second, economic conditions also have a positive impact on the use of healthcare. Members of households with high per capita incomeare willing to spend more on health care. Therefore, the State should have policies to promote economic development for the people and at the same time need to have policies to support members of low-income households to help them get better medical care.

Third, the research results also show that as the age increases, the demand for health also increases. Therefore, the State should continue to have health care policies for the elderly. Especially Vietnam is in a state of population aging, the proportion of people aged 60 years and above is high, accounting for 9.34% of the total population (VHLSS 2016), so the State should to focus on this group of people to give appropriate policies to enhance medical care for this group of people.

Fourth, environmental issues locally also affect health and increase health spending by individuals. In the coming time, the State needs to have good environmental management policies such as waste treatment, arrange production areas away from residential areas to reduce air pollution to protect people's health.

LISTED COMPANY AND DISCLOSURE OF CORPORATE SOCIAL RESPONSIBILITY (CSR): EMPIRICAL EVIDENCE FROM VIET NAM

M. Fin. Mrs Luong Thi Thao

thaoluong@ueh.edu.vn

Mr. Nguyen Thanh Chuong

chuongnguyen49.k43@st.ueh.edu.vn

Faculty of Finance, University of Economics Ho Chi Minh City, Vietnam

Abstract

Social responsibility disclosure (CSR) has become one of the strategic action programs in many countries. However, in Vietnam, this issue is not focused on the operation process of enterprises. On the other hand, differences in the business environment such as culture, geographic regions, politics, governance characteristics,... make policies on CSR information disclosure indicators in other countries are not appropriate when applying to Vietnam, so creating and building a set of indicators, assessment framework for the extent of social responsibility disclosure is becoming an important issue. Starting from that basis, the study examines the current situation of how corporate social responsibility disclosure in listed companies in Vietnam is taking place, along with that the study also examines corporate governance, ownership, characteristics, and financial factors that influence CSR disclosure through the development of indicators based on four dimensions of environment, human resources, products and customers, and community.

After performing regression analysis and resolving defects from the models OLS, FEM, REM and GLS with 240 listed company from 2013-2019, the results were for the proportion of female board members, foreign ownership, company size, enterprise age, auditing firm, and growth potential are positively correlated, with variables in state ownership and financial leverage having a statistically significant correlation with CSR. In addition, the research results also show that the situation of CSR information disclosure of Vietnamese listed companies is getting more and more attention, in which two indicators on human resource and product/customers information disclosure are the two most published indicators. Furthermore, the research results also show that enterprises whose activities directly affect the CSR indicator components a higher level of CSR information disclosure at that indicator.

Keywords: *CSR, listed company, Vietnam.*

1. Introduction:

1.1. Overview

The whole world is entering an explosive era of globalization and international integration, which presents the economies of nations with great opportunities and potentials for development. However, besides that integration process, sustainable development to ensure the maintenance of future resources for the whole society poses many challenges for businesses along with generating profits. In the past few years, with a series of social problems such as the case of Vedan company silently killing Thi Vai river (Dong Nai), a series of product quality scandals from the case of Tan Hiep Phat with "500 million flies" or most recently, the Formosa environmental disaster that killed a series of marine species along the central coast has raised concerns about the problem corporate social responsibility of Vietnamese enterprises.

The term corporate social responsibility in the world has been around for a long time and has been successfully implemented by developed countries in parallel with maximizing corporate profits. According to statistical data from Pricewaterhouse in 2012, more than 70% of the managers of enterprises consider the implementation of social responsibility disclosure as a matter of survival for the whole business. Especially, with the problems occurring in the country in recent times, the publication of information on social responsibility is even more important to help people understand and trust more in environmental and social values, etc. These businesses have been doing, and also help companies improve the quality and value of their brand in relation concerning other business entities.

In Vietnam, although the state has focused on issues of social responsibility since early with the policy "CSR towards sustainable development" (2005), in general, activities on CSR information disclosure of enterprises have not been really focused, perfected and complete. Besides, there are still not many empirical studies on the level of CSR information disclosure in Vietnam, if any, only at the level of basic research for specific industry groups or companies but not considering the overall market, with the level of information declaration is incomplete, not up to date such as: My, Nguyen Ha (2017) research-based on factors affecting CSR in Ho Chi Minh City Stock Exchange. Ho Chi Minh City; Thanh, Nguyen Le Van (2019) research on CSR in Vietnam's consumer goods industry;); eitc. From the reality of the current state of CSR disclosure in Vietnam, the author researches with the desire to contribute to the practice to help businesses recognize the factors and the extent of their impact on the environment. The publication of information on social responsibility will have a basis to build a suitable set of mechanisms for sustainable development commensurate with the issue of generating profits as well as helping investors and consumers use an effective source of information to make investment decisions and purchase choices more effectively.

1.2. Objective

Measuring the level of disclosure of social responsibility of enterprises listed on HOSE and HNX, thereby assessing the situation disclosure of social responsibility of the companies listed in Vietnam.

Identify factors related affecting the level of corporate social responsibility information disclosure on annual reports and corporate sustainability reports

1.3. Literature Review

1.3.1. Carroll theory

Archie Carrol's theory about corporate social responsibility was developed through various stages. At the first stage, this theory is understood as the connection of basic factors including Economy, environment and social responsibility in business. After this time, Archie Carrol developed CSR into a pyramid model that includes economic, legal, ethical and philanthropic responsibility. Accordingly, economic responsibility is located at the bottom of the pyramid, showing that the goal of creating profit value is the core and most basic motivation for all business activities and policies. Located on the bottom part, liability represents the act of complying with the provisions of the law in the process of manufacturing, designing, manufacturing finished products, and in the obligation to pay state taxes, etc. Ethical responsibility embodies standard rules that reflect the company's concern for what shareholders, consumers, employees and society consider right, not violating the ethical rules that these stakeholders respect and uphold. And finally, located at the top of the pyramid is charity responsibility, this responsibility shows the commitment of businesses in promoting the progress and development of the whole society through activities, campaigns to improve social welfare (Trevino and Nelson, 1999).

1.3.2. Agency theory

This theory was developed by Jensen and Meckling (1976), whereby the author deals with the relationship between shareholders and corporate managers and the conflicts of interest between them. While shareholders always want the business to carry out activities aimed at minimizing costs and maximizing profits for the business, in the opposite direction, managers also want to implement policies, projects, activities that bring fame and benefit to themselves. Therefore, to limit this behavior of managers, shareholders have increased the implementation of control measures as well as introduced agreements to punish and control managers, and this has appeared agency costs.

Therefore, in order to minimize this type of cost, one of the ways to show that managers are acting in the interests of shareholders is through the publication of management reports, financial statements, annual reports, sustainability reports, etc are published most transparent and clear way about the activities of the business in the period (Watts, 1977). In addition, according to Urquiza et al. (2010), it is also suggested that to strengthen the trust of shareholders, managers must increase disclosure of information on corporate social responsibility (Jo and Harjoto - 2011). However, this disclosure needs to be discussed and agreed to be consistent with the CSR goals of the shareholders or it will give rise to hidden problems in corporate governance (Eisenhardt, 1989).

1.3.3. Stakeholder theory

Stakeholder theory deals with the relationship between activities, policies of company and stakeholders directly and indirectly affected by those (Friedman, 1970) such as government, shareholders, creditors, employees, customers and the community, etc. Therefore, to maintain stable growth, it is extremely important to take care of the interests of stakeholders (Van der La, 2009).

Discussing the relationship between corporate social responsibility disclosure (CSR) and corporate stakeholders, Roberts (1992) show that the level of social responsibility disclosure (CSR) has a significant correlation with the interests of stakeholders, and with the economic performance of enterprises. In addition, Snider et al. (2003) also acknowledge that stakeholder theory provides a valuable framework for assessing corporate social responsibility disclosure (CSR) through social activities reported (Snider et al., 2003).

1.3.4. Legitimacy theory

According to Deegan (2002) defines that the legitimacy theory expressing the rights and responsibilities in business activities of the organization must derive from social benefits, not do any actions that negatively affect the value of the society. Parker (1989), O'Donovan (2002) also said that the theory of legitimacy is the point of view of the implementation of corporate policies based on society, minimizing the risks that may arise in the business process, and in which the transparent disclosure of social responsibility information is an effective method to demonstrate "corporate civic responsibility".

Applying the theory of legitimacy to the relationship between CSR and corporate social reporting, Cormier et al. (2011) when investigating the effects of social responsibility disclosure on the issue of inequality information between managers and investors in the market has shown that CSR disclosure is correlated with firm size, leverage, exposure to news related to the environment, and efficient environment. In which, the environmental performance has a direct correlation with CSR disclosure. Not only that, the higher the level of CSR disclosure also helps companies achieve a higher level of legitimacy.

1.3.5. Political costs theory

Political costs are considered as costs that external parties such as the state impose on businesses as compensation for political actions. On the other hand, the political theory holds that state managers decide to implement policies and measures affecting the interests of each enterprise based on information published by enterprises such as the application of taxes, taxation on goods, technology transfer, property, restriction of monopoly, etc.

From this point of view, Watts and Zimmerman (1978) have reported that depending on the size of the firm the political costs for firms can vary. In particular, large enterprises often have to bear higher political costs than small enterprises, as well as the more transparent disclosure of information will help reduce this cost for businesses and limit government intervention. Furthermore, the research results also show that businesses that currently have good business results will also tend to disclose more information to limit explanations or legal procedures due to less transparent information communication.

2. Methods

2.1. Data

Regarding qualitative data, the author builds a research scale based on content analysis that combines the international standard set of GRI Standards for sustainable development reporting - with the latest version upgraded from GRI4 and the highest international standards in sustainability reporting published by the Global Sustainable Development Standards Board (GSSB); Guidelines on environmental and social information disclosure issued by the State Securities Commission in collaboration with IFC; Circular No. 155/2015/TT-BTC issued on October 6, 2015 of the Ministry of Finance requiring the disclosure of sustainable development information of listed companies; the actual survey used to interview businesses was developed by MayBank Kim Eng Vietnam Limited Company on ESG issues and research by Branco and Rodrigues (2008) to establish a set of criteria to evaluate the information disclosure of social responsibility of Vietnamese enterprises with four groups including responsibility to the environment, responsibility to employees, responsibility to products/customers and responsibility to the community. After that, the author scores these criteria in turn on annual reports and reports on sustainable development of enterprises by industry group.

Regarding the source of quantitative data on the records of the Board of Directors and the market data compiled from the reports of 240 companies listed on HOSE and HNX from 2013 to 2019 through the websites of each enterprise, information from Stock Exchange or websites www.finance.vietstock.vn, www.fiinpro.com, www.scafef,vn,...

Table 1: Indicators measuring the level of information disclosure on social responsibility of listed companies in Vietnam

Serial	**Scale of indicators on the disclosure of corporate social responsibility information**
	Social responsibility towards the environment
1	There are policies to protect the environment

Serial	Scale of indicators on the disclosure of corporate social responsibility information
2	Efficient use of energy resources in business activities.
3	Compliance with the provisions of law on environmental protection
4	Compliance with the recycling, disposal and waste water in the enterprise
5	Pursue environmental goals.
6	No scandals or problems affecting the environment
7	Received certificates and awards for environmental protection activities
	Social responsibility for the company's human resources
1	Have policies that care about workers' health and safety
2	Policy to care about worker's health and safety
3	Training plan and roadmap for advancement for employees was clearly announced
4	There are policies on employee welfare and treatment.
5	There are policies to support and care for employees' families.
6	Announcement of average training hours per employee
7	Equality between male and female workers, among ethnic groups.
8	Do not use child labor
9	There are employee engagement activities throughout the company
10	There is information on the classification of personnel structure by qualifications
11	There were no scandals or issues related to employees' interests during the year
	Social responsibility for products and customers.
1	Disclosure of information on ingredients and quality of products and services of enterprises
2	Information about the management of input materials of the enterprise
3	Products and services of enterprises are certified safe
4	The enterprise has a product research and development department
5	No scandals or problems affecting product quality
6	Achieve customer satisfaction with products and services of the business.
7	There are awards for activities for the benefit of consumers
	Social responsibility towards the community
1	There are educational support activities
2	There are cultural and artistic support activities
3	Sponsor fitness events, sports and recreational activities of the community .
4	Contributing to charity funds for the poor, storms, floods, Agent Orange.
5	Support for local development projects and activities

Serial	Scale of indicators on the disclosure of corporate social responsibility information
6	Support social policy activities: Vietnamese heroic mother, wounded soldiers, sea and islands of the Fatherland, ...
7	Enterprises fully announce the fulfillment of tax obligations or achieve the State's certificate of merit on tax obligations, ensuring the fulfillment of tax obligations .
8	The business has an environmental and social impact report; Sustainability report in the company's annual report
9	Enterprises have reports related to green capital market activities under the guidance of the State Securities Commission
10	There are certificates and awards for social activities
11	In the year, enterprises won awards for the best annual report organized by HOSE and HNX or for transparent information disclosure in the market.
12	In the year, enterprises have won the award for the best sustainability report organized by HOSE, HNX and Investment newspaper.

2.2. Models

Based on the the original research paper by Branco and Rodrigues (2008). The first model is the model related to the level of information disclosure on corporate social responsibility in the annual report and sustainable development report of enterprises and models (2) (3) (4) (5) respectively, the component measuring groups of indicators related to the level of social responsibility information disclosure, including ENV (environment), HUM (employees), PRO (products and corporate customers) and COM (community).

(1) $CSRit = \alpha0 + \alpha1BSIZEit + \alpha2BINDEPEit + \alpha3POLit + \alpha4FDSHIPit + \alpha6BEDUit$ $\alpha7OWNSTAit + \alpha8OWNFORit + \alpha9FSIZEit + \alpha10BOLDit + \alpha11AUDit + \alpha12ROAit + \alpha13Qit + \alpha14DEBTit + έit$

(2) $ENVit = \alpha0 + \alpha1BSIZEit + \alpha2BINDEPEit + \alpha3POLit + \alpha4FDSHIPit + \alpha6BEDUit$ $\alpha7OWNSTAit + \alpha8OWNFORit + \alpha9FSIZEit + \alpha10BOLDit + \alpha11AUDit + \alpha12ROAit + \alpha13Qit + \alpha14DEBTit + έit$

(3) $HUMit = \alpha0 + \alpha1BSIZEit + \alpha2BINDEPEit + \alpha3POLit + \alpha4FDSHIPit + \alpha6BEDUit$ $\alpha7OWNSTAit + \alpha8OWNFORit + \alpha9FSIZEit + \alpha10BOLDit + \alpha11AUDit + \alpha12ROAit + \alpha13Qit + \alpha14DEBTit + έit$

(4) $PROit = \alpha0 + \alpha1BSIZEit + \alpha2BINDEPEit + \alpha3POLit + \alpha4FDSHIPit + \alpha6BEDUit$ $\alpha7OWNSTAit + \alpha8OWNFORit + \alpha9FSIZEit + \alpha10BOLDit + \alpha11AUDit + \alpha12ROAit + \alpha13Qit + \alpha14DEBTit + έit$

(5) $COMit = \alpha0 + \alpha1BSIZEit + \alpha2BINDEPEit + \alpha3POLit + \alpha4FDSHIPit + \alpha6BEDUit$ $\alpha7OWNSTAit + \alpha8OWNFORit + \alpha9FSIZEit + \alpha10BOLDit + \alpha11AUDit + \alpha12ROAit + \alpha13Qit + \alpha14DEBTit + έit$

Empirical studies around the world have shown that there are many problems with variable variance or autocorrelation when studying CSR. These defects may come from the reciprocal interaction between factors related to CSR and the Board of Directors, affecting the sustainability and research results. Therefore, the author uses FEM, REM and finally FGLS estimation models for panel data to be able to overcome these defects. The author will present these tests in turn in the regression results section.

3. Results

3.1. Descriptive Statistics

In this section, the author presents descriptive statistics related to the observed sample. Table 3 presents the statistical criteria for the variables in the model .

Table 3: Descriptive statistics table of variables

Variables	Number of observations	The average value	Standard deviation	Minimum value	Maximum value

AUD	1680	0,3970	0,4894	0	1
ROA	1680	0,0710	0,1295	-0,4716	2,4116
Q	1680	1,1832	0,6292	0,1764	9,0440
DEBT	1680	0,4961	0,2392	0,0110	1,2945

Source: Statistical results from Stata 14

Overall, the statistical results described in Table 3 shows the significant difference between the minimum value and a maximum value of the variable group, in which the variables belonging to the group of corporate financial variables show a large difference. for example, ROA ranges from -0,4716 to 2,4116; Q ranges from 0,1764 to 9,0440 or Debt from 0.0146 to 0.9642, which indicates that there is a relatively large difference between market value and corporate CSR disclosure.

3.2. Results

In this section, the author will present the results related to the status level of corporate social responsibility information disclosure over the years, the relationship between CSR factors and corporate governance, ownership, characteristics and finance (Table 4). Besides, the author also show four regression equations with the dependent variable measuring the level of CSR disclosure, including indicators CSR total and indicators CSR components: environment (ENV), human resources (HUM), consumers and products (PRO) and communities (COM) and the independent variables divided into groups of variables related to the business (Table 5).

Table 4: The level of disclosure of CSR in each sector

Serial	**Sector**	**CSR**						
		2013	**2014**	**2015**	**2016**	**2017**	**2018**	**2019**
1	Information Technology	51.29%	50.90%	53.61%	59.41%	60.18%	57.46%	59.00%
2	Energy	58.02%	58.57%	62.08%	69.00%	69.31%	70.95%	73.14%
3	Utilities	49.25%	51.56%	53.74%	60.83%	61.27%	60.73%	61.38%
4	Health Care	57.92%	57.61%	61.72%	64.17%	65.87%	64.96%	65.57%

5	Consumer Discretionary	51.47%	53.19%	56.97%	60.25%	61.97%	61.80%	62.31%
6	Materials	43.84%	44.92%	48.42%	53.75%	55.91%	57.35%	57.04%
7	Consumer Staples	42.30%	44.68%	52.24%	57.48%	57.86%	59.78%	59.86%
8	Financial	55.19%	56.92%	59.79%	65.18%	65.62%	67.01%	67.52%
9	Industrial	47.60%	48.74%	54.01%	59.26%	59.74%	60.19%	60.70%

Source: Analysis from Stata 14.0

In Table 4.2, we see that the level of information disclosure of social responsibility of industry groups has increased gradually over the years, which shows that later listed companies pay more attention to the issue of information disclosure about corporate social responsibility. In which, the energy sector has the highest growth (from 58.02% to 73.14%).

Source: Analysis from Stata 14.0

Note: The symbols (*) (**) (***) represent the significance levels of 10%, 5%, 1%.

Table 5 shows that when considering the aspects of CSR indicators including environmental, human resources, product/customer and community indicators and the variables represent the results heterogeneous correlation for each indicator, so when considering the overall correlation of CSR, the author draws the following results:

For the group of corporate governance variables, the variables on the number of board members, independent members of the Board of Directors, and the chairman of the Board of Directors having political relationships show a negative correlation with the issue of CSR disclosure, in then, the percentage of female members, the educational level of the members of the Board of Directors has a positive correlation, in which the percentage of female members in the Board of Directors shows a statistical significance of 1%, similar to the research results of Frias-Aceituno et al (2012), Isidro and Sobral (2014). This shows that the existence of female members on the Board of Directors will help the implementation of social responsibility information disclosure take place better due to gender-related characteristics such as caution, aversion to risks. , sympathy and compassion (Eagly and Johasen Schmidit, 2003) thereby helping the Board of Directors discuss and come up with the most appropriate policies for the goal of maximizing corporate value without harming the environment. , to workers and social life.

For the group of variables on corporate ownership structure, there is a statistically significant negative correlation at 5% for state ownership and a statistically significant positive correlation of 5% for foreign ownership. This shows that the existence of state ownership will affect the separation of management rights and control rights of enterprises. On the other hand, taking advantage of state ownership, enterprises can also take various measures to avoid the issue of information disclosure, especially information about the social environment that affects the environment. bad for the company's position in the industry. Meanwhile, the existence of foreign ownership will help businesses make better use of foreign experience and resources from countries that have developed regulations and institutions on information disclosure standards. corporate social responsibility. This result is consistent with the original expectation of the author and is similar to the results of Naser (2002), Chapple and Moon (2005), Luo et al (2006), Jiang and Habib, (2009), Solima et al. colleagues (2013), while contrasted with Ghazali (2007), Wuttichindanon (2017).

For the group of variables on corporate characteristics, the three variables of firm size, operating time and audit unit of the business all show a positive effect on CSR at the 1% statistical significance level. , in line with the author's expectations. This shows that the larger the enterprise and the longer it has been operating in the market, the better it will be to disclose information about social responsibility because the better understanding of market psychology, behavior consumers as well as the creation and maintenance of brand reputation. Along with that, businesses with annual reports or sustainability reports audited by Big4 audit firms also show that their CSR implementation is clearer and more transparent. This result is consistent with the studies of Trotman and Bradley (1981), Roberts (1992), Ghazali (2007), Rettab et al. (2009), Santos (2011), Andrilopoulous and Bekiaris (2014) and contrary to the study of Freedman and Jaggi (1988), Yao et al (2011).

For the group of variables on corporate finance, the return variable and Tobin's Q show a positive impact on CSR, in which Tobin's Q shows the 1% statistical significance. In contrast, the financial leverage variable shows a negative impact on CSR at the 1% statistical significance level. This result shows that enterprises with good growth potential will perform better on corporate social responsibility disclosure than those with low growth potential, on the other hand, enterprises with high debt level. Higher borrowing will indicate poorer CSR disclosure because concerns about debt reduce the value of the company to the market, so businesses may hide their shortcomings. This result is similar to the results from Raza et al

(2012), Harjoto and Jo (2011), Cahan et al (2016), Chung et al., 2008, different from the results by Yang et al (2008), Maskun (2013).

4. Conclusions and Policy Implications

4.1. Conclusions

From the research results, the author draws the following main conclusions: Firstly, the existence of female members in the Board of Directors will help increase the level of CSR disclosure because with the female character, she will effectively harmonize the dictatorship of an all-male leadership team, they will contribute more valuable ideas in terms of risk management, minimizing the impact on natural resources from human activities, as well as strengthen the implementation of sustainable development policy

Second, enterprises need to reduce state ownership and increase foreign ownership to increase CSR disclosure. Because when foreign ownership accounts for a high percentage of the enterprise, it will be the motivation for managers to adjust their behavior. They will be responsible for more information disclosure, focusing on reasonableness, completeness and transparency to meet the requirements as well as attract more and more investment from foreign shareholders, especially foreign investors who plan to expand the business market.

Third, the entity whose report is audited by Big4 including Delloite, E&Y, KPMG and PwC will make the CSR disclosure level better by satisfying the objectivity and trust value for the end users. results of the audit. Not only that, for listed companies, this factor is also an effective way to signal to investors to understand the business's real concern for social responsibility and the source of information content which enterprises provided to meet fully the transparent and objective spending.

4.2. Policy Implications

4.2.1. For the state

Firstly, the state needs to standardize the requirements for the disclosure of corporate social responsibility information, and it is necessary to develop a common set of evaluation criteria such as a set of indicators or a common scale for all enterprises and each industry group to be able to compare and evaluate the level of information disclosure between enterprises and between industry groups.

Second, the state needs to develop a system of regulations on CSR disclosure, and should include specific regulations on environmental management, pollution control, and food safety in the Enterprise Law, providing service quality, employee employment practices, etc. as a mandatory regulation and with sanctions to deal with specific and clear violations.

4.2.2. For Enterprises

Firstly, business managers need to raise awareness about the impacts and benefits of social responsibility information disclosure, properly aware of the nature of CSR, as well as each specific aspect of CSR. Moreover, the state needs to develop a system of regulations on CSR disclosure, which should be included in the Law.

Second, enterprises should build effective ownership structures for businesses, which reduces the percentage of ownership of the state and increase the percentage of ownership from foreign shareholders to increase the level of CSR.

Third, businesses need to pay more attention to gender diversity as well as within enterprises need to build a strong union union, representing employees to give opinions and discuss with Senior management of the enterprise regarding the conditions, working time, training, salary, bonus, welfare and many other benefits of employees.

THE USING OF LOGO AND BRAND NAME IN ADVERTISING TO CONSUMERS' BRAND AWARENESS: CASE STUDY OF COMMERCIAL BANKS

Dr. Nguyen Quang Dung

qcdung68@gmail.com

National Economics University, Hanoi, Vietnam

Abstract

The process of consumer brand awareness has long been a special interest to businesses, scholars, and researchers. For consumers, brand awareness is an important stage of the cognitive process, and is the basis for the brand to be present in the minds of consumers (Howard & Sheth, 1969; Campbell, 1969; Narayana & Markin, 1975). From a business perspective, brand awareness in particular and consumer brand awareness in general are considered the results and efforts of businesses in building their own mark of the brand in the minds of consumers. In which, advertising is an activity of an enterprise that is a tool with the task of creating a change in consumers' perception of the brand. However, in Vietnam, this activity still faces many big challenges: How to effectively use and exploit brand elements in advertising? How should brand elements be combined in different types of advertising messages? Those are questions that are posed to business managers. In theory, in the world, there have been many authors studying the influence of advertising on the cognitive process of consumers such as Engel- Blackwell-Miniard (1968), McGuire (1969), Dember (1980), G. Belch (2009). Several authors have opened the beginning stage for studies on the influence of factors in information advertising messages to consumers' perceptions such as Claude Hopkins (1923), Rossiter and Percy (1978, 1987), Lutz and Lutz (1978). These studies have provided meaningful contributions. However, there are few studies on how to effectively use brand elements in advertising messages such as repetition, resizing, and color and its effect on consumers' brand awareness, especially in the context of research in Vietnam.

Keywords: *Advertising message, logo, brand name, repetition, size, color, brand awareness.*

1. Introduction

1.1. Consumer's brand awareness

The cognitive process is defined by Dussart Christian (1989) as an important stage of the cognitive process in which the consumer receives and refines complex information about factors from the environment. Engel-Kollat-Blackell (1968) pointed out that the stages include awareness, attention, understanding, acceptance, memory, comprehension, and attitude formation (positive or negative). Duval, Shelley, Wicklund and Robert (1972) identify the value dependence of the stimulus and the consumer's access conditions; Howard-Sheth (1973) the process of receiving stimuli is the process by which consumers perceive the brand; Lane, Richard, Schwartz & Gary (1987) The consumer's cognitive process undergoes the following levels of transition: (1) Physiological collision; (2) Psychological collision; (3) Personal feelings, (4) Acceptance; (5) Memorization; Assael Henry (1995) made the point of view that there are two stages occurring in the consumer's cognitive process, which are: (1) the Recognition process; (2) Memorization process (information is stored in memory for use according to need). McGuire W.J (1969) when studying the cognitive process of consumers clarified that this process is formed through five stages: Awareness - Attention - Understanding - Acceptance - Memory.

Awareness is understood as an individual's recognition that there is an impact from the environment. Attention refers to the ability to process information after the individual recognizes stimuli. Know (Knowledge). Accept an individual who can understand the stimulus. Remember (Recall), understood as the act of storing stimulus information into the consumer's memory. Earlier, Engel, Kollat, Backwell (1968) also proposed a model of consumer buying behavior combined with cognitive processes. Studies show that the consumer's cognitive process is a complex process with levels from low to high, and depending on the level of impact of stimuli, consumers will have different trips. cognitive process changes.

Figure 1.1 Studies on consumer awareness and cognitive processes.

Source: Author

In summary, the studies of the above authors and especially Guire WJ (1969) have made important conclusions: (1) consumer perception is a process consisting of many stages (2) The first stage of the cognitive process is awareness, this is a stage of special importance, because it is the basis to help consumers operate the following stages.

1.2. The effect of advertising on consumer brand awareness

Stokes (1985) mentioned that the awareness stage is very important, because it will be the driving factor for the next stages in the consumer's brand awareness process. Philip Hans Frances and Marco Vriens (2004) have shown that the impact of advertising on consumers' brand awareness is influenced by: exposure level, consumer motivation and especially is the involvement of brand elements in advertising. Rossiter and Percy (1987) demonstrated that advertising influences consumer brand awareness, and argued that awareness precedes all other steps in the consumer perception process. According to the author, consumers' brand awareness has three levels: (1) First awareness in the mind (top of mind); (2) Spontaneous awareness; (3) Assisted awareness and advertising can influence these three levels.

Advertising message

The advertising message is the core element of advertising that is reflected through words, images, sounds, etc., and is defined in a space and time to convey to the target audience in order to create affect their cognition, emotions and behavior. According to George Belch (2010) advertising message is a system of stimuli used in advertising, through which information flows one way from the sender. Akhila Thazhakkal (2016) advertising message is the point of advertising that customers will receive through words or images. According to Akhilap (2016), the structure of an advertising message includes groups of elements: Title (language or image); Content; Slogans and brand identity elements. According to Rossiter and Larry Percy (1990), the structure of an advertising message includes: The text/text; The art part is images, colors, sounds; The brand elements involved in the advertising message include: logo, brand image, color, brand name (text), sound (brand music). Rossiter and Percy (1978) proposed a model of the structure of advertising messages, and divided the stimuli into two groups including visual images (visual) and words or words (Verbal).

In summary, the common advertising message structure includes: (1) Language (word or voice), brand name, message content; (2) Image: image of character and background, brand logo; (3) Color: standard color for brand identity; (4) Sound: brand music. Besides, the structure of the message depends on the arrangement of the message components in space, time and medium.

Logo and brand name

According to Zajonc et al. (1972), logo is a simple visual element, capable of visual stimulation, a tool used in communication, and an element to achieve specific communication goals. Wheeler (2009) states that a logo is a visual sign of a brand. According to Richard Moore (2011), a logo is a visual graphic template designed in combination with character patterns, symbols or brand names to show images showing the brand personality. Neumeier (2010) argues that brand names are meaningful terms, capable of creating subtle awareness. Bornstein (1989)gave the definition of a brand name as a part of a brand consisting of readable and spelled words for the name of a product, service or company. Kotler and Armstrong (1998) propose a broader concept when conceptualizing that a brand name is a term, or a combination of a term with a sign or symbol. As for David Aaker (1991), a brand name is a fundamental element of a brand, the basis for raising brand awareness and communication efforts. More important than a brand name is a fact that can describe a brand's value set.

1.3. Some methods and techniques in building advertising messages to affect consumers' brand awareness

Imagery usage

According to Toglia and Battig (1978) images are visual elements, in advertising the visual element is expressed through visual stimuli. Pezdek and Evans (1979) argue that images are elements that describe reality reflected through human vision. People often associate words with visual images. David Ogilvy (1963) pointed out the influence of images in advertising on brand awareness through its reflective form, in addition to the combination of images and words for influence. to consumer brand awareness. Besides, there are also studies of the authors Paivio (1971), Shepeard (1967), Wright (1979), Bruce & Young (1986), Rik Pieters, Michel Wedel (2004), especially Larry Percy's. and John R. Rossiter (1983) investigate the impact of two variables related to the way images are represented in advertising, namely image size and color, which have a significant influence on consumer perception.

Color usage

Larry Percy & John R. Rossiter, (1983) suggested that brand responses, specifically consumer awareness and subsequently attitudes, are closely related to their perception of color. Satyendra Singh (2006) suggested that color can be used as an information encoding, attracting attention and increasing the ability of consumers to recognize and remember the brand. Gerald J. Gorn et al. (1997) showed that the majority of color ads are often more recognizable and responsive, leading to better ad preference than black and white ads. Javed Hussain and Rizwan Khan Nizamani (2011) show that in outdoor advertising, color is the factor that has the greatest influence on consumers' brand awareness.

Text usage

Elizabeth C. Hirschman (1985) has shown that, along with images, language in advertising is an important factor in creating awareness. Piller (2003) focuses on clarifying the discourse in advertising, and argues that language is an important element in the message that affects consumers' perception. P Bruthiaux (2005) argues that language is an important factor affecting the audience in advertising. Jaime Noriega, Edward Blair (2008) Words as a strategic tool to influence consumer awareness and behaviour. Teresa J. Domzal, James M. Hunt & Jerome B. Kernan (2015) use special words that can enhance the effectiveness of advertising, especially increasing awareness and memory of the public.

Logo and brand name usage

According to Herr et al. (1996), brand logo is a factor that has a strong influence on consumer perception, is the basis for recognizing and distinguishing brands and products. Aaker and Equity (1991) agreed that brand logos can influence the perception and perception of brand attributes and benefits. In advertising messages, logos are considered to be the simplest visual elements with strong visual stimulation, shown to create contacts Zajonc (1968, 1972). Carpenter and Nakamoto (1989) thought logo is an element that helps to establish a brand's position and maintain brand equity. According to Henderson and Cote (1998) noted that logo influences consumer response through brand awareness. Kevin Lane Keller, Susan E. Heckler and Michael J. Houston, (1998) believe brand names generate higher brand awareness and memory than brand names that are ambiguous and do not refer to or are unrelated to the meaning. product.

Adjustments of elements in advertising message design

Christie L. Nordhielm (2002) said that when the stimulus elements are not repeated in the advertising message (the stimulus appears once in a message), the awareness level of consumers is low; when repeating stimuli (stimuli appear 02 times in a message), consumers' awareness level is higher; but when the number of repetitions of the stimulus is increased (03 times) or more, it may create a negative response (against cramming) of the consumer. Chris Janiszewski, Tom Meyvis (2001) have clarified that stimuli will increase with the number of repetitions of the logo with initial exposure, familiar stimuli are perceived by consumers more quickly. ZajoncJohn, W. Pracejus (1972) demonstrated that repeated randomization with an unfamiliar brand with an initial exposure time of 1-6 seconds or more had a positive effect. consumers' perceptions and attitudes towards brands. In summary, repetition is a method of using brand elements to create effects that affect the audience's perception, emotions and behavior, especially awareness, and repetition is most effective at times. Monday.

1.4. Research model & hypothesis

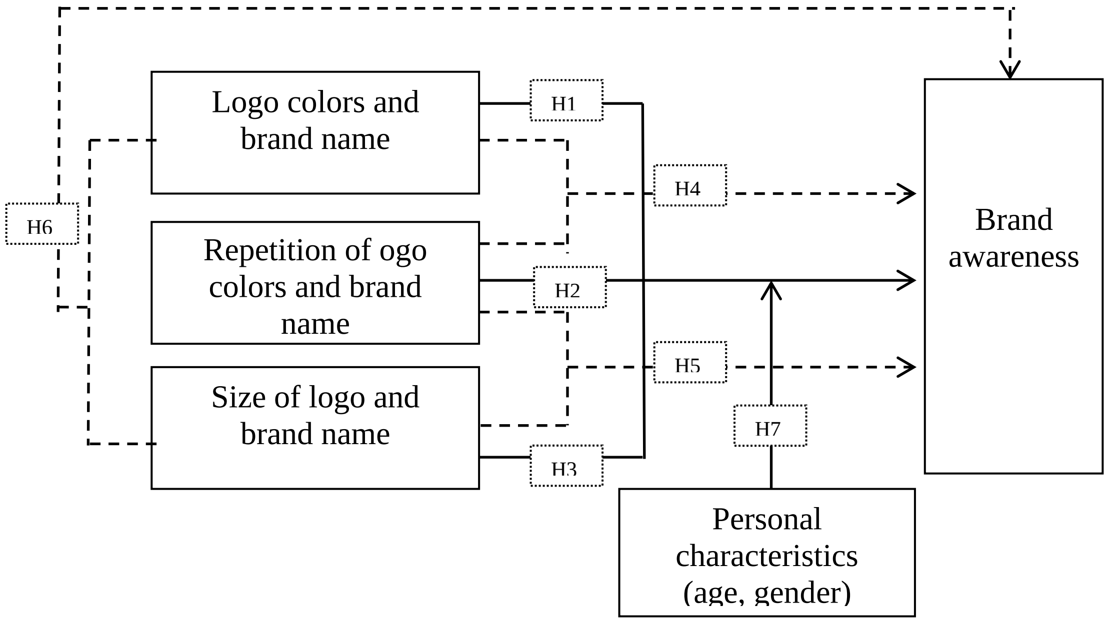

Figure 1.2 Research model

Source: Author

The author conducts an overview test according to the following topics: (1) User's brand awareness; (2) Influence of advertising on user's brand awareness; (3) Message, logo and brand name; (4) Methods and techniques in formulating advertising messages affect users' brand awareness.

Hypothesis:

H1: The color of the logo & brand name in the advertising message affects the brand awareness of consumers.

H2: Repetition of logo & brand name in advertising message affects consumer brand awareness.

H3: The size of the logo & brand name in the advertising message affects the brand awareness of consumers.

H4: Color combinations and repetition of logos & brand names in advertising messages affect consumer brand awareness.

H5: Combining size and repetition of logo & brand name in advertising message affects consumer brand awareness.

H6: The combination of color and size of logo & brand name in advertising message affects consumers' brand awareness.

H7: Personal characteristics regulate the influence of logos & brand names in advertising messages to consumers' brand awareness.

2. Methods

2.1. Selection of research context

In Vietnam, the banking sector has been established since 1951. In recent years, the tendency of international economic integration, system of commercial bank has developed rapidly, and has become an important financial institutions importance of the national economy. Advertising activities and the application of logos and brand names in advertising by commercial banks in Vietnam in recent years have had certain effects, however, due to lack of scientific basis, there are only few commercial banks in Vietnam that do this effectively. In fact, logos and brand names play a very important role in the advertising activities of commercial banks in Vietnam, expressed in these aspects: Representability; Applicability; Repeatability; Brand identity maintenance and reflection; Intangibility; Competition; Brand protection. Therefore, the author has selected commercial banks as a suitable context to conduct research.

2.2. Research design

To test the research hypotheses, the author chooses to collect observational data by experimental method. Specifically, the author changes the logo and brand name in advertising message with different variations in repetition, color and size.

Independent variable design: bank service flyer with adjusted logo and brand name

To ensure objectivity in the research, the author chooses to create a hypothetical bank, with the logo and brand name never appearing, and design flyers for a similar banking service from other commercial banks in Vietnam. Adjust logo and brand name in flyer templates: Color: two flyer variations with color logo and brand name and black and white logo and brand name. Occurrences: two flyer variations with the logo and brand name appearing once and the logo and brand name appearing twice. Size: Logo and brand name are presented in regular size: (100% = 210mm x 297mm) and small size (50% = 105mm x 148.5mm)

LEAFLETS Logos and name brand appear	COLOR		BLACK AND WHITE	
	100% regular size	SMALL size (50%)	100% regular size	SMALL size (50%)
01 TIME	A	B	A1	B1
02 TIMES	C	D	C1	D1

Table 2.1 Coding table of advertising flyer templates

Source: Author design

Dependent variable (brand awareness):

To measure consumers' brand awareness after being exposed to advertising messages (brochures for commercial banking services), the author has consulted the empirical survey method of Rossiter and Percy (1978). Respondents were exposed to a flyer template and asked to consider all the information on both the front and back of the flyer as if it were an actual advertisement. After (3-5 minutes), samples of flyers will be revoked and the object will answer some questions in the survey to assess the role of the logo and the brand name in the ad to receive know the brand. The author chooses a direct measurement method to assess the level of brand awareness of consumers. A table identifying logos and brand names including 05 logo samples and 05 different brand names is given, and the survey participant chooses only one correct option by indicating his logo and brand name for was seen in the leaflet.

The questionnaire includes: (i) Explain the meaning of terms logo, brand name; The table identifies the logo and brand name with two questions: (ii) Identify (recognize) the logo; (iii) Identify (recognize) the brand name; (iiii) General personal information (demographic) of the survey subjects.

Plan for the public to be exposed to leaflets

Based on the survey method of Larry Percy & Rossiter (1983) and Chris Janiszewski & Tom Meyvis (2001), the author analyzes the plan for the public to be exposed to advertising messages, specifically as follows: Survey subjects exposed a single flyer template. The entire survey sample will be divided into 08 groups, each group will be exposed to 1 leaflet. The survey subject viewed and read the leaflet sample as with a regular advertisement, then the leaflet sample was recovered and the subject was asked to indicate the logo and brand name among the 05 options given on the questionnaire. *Advantages:* The survey subject is not affected by the previewed samples and the researcher can obtain the natural (initial) responses of the surveyed subjects. *Limitations:* The differences in the level of brand awareness of customers may stem from subjective causes (psychological characteristics of the subject), besides the impact of the leaflet template.

Sample selection and data collection implementation

The author selected survey with the amount of 686 subjects, who are students studying in universities in Hanoi, have characteristics similar demographic, who also belongs to consumer groups targeted by banks. In order for the collected data to ensure objective reliability, the survey sample needs to be representative and accurately reflect the parameters of the population. The demographic characteristics of the sample object: gender, age: Percentage of men and women (men 41%), women (59%); Aged mainly: from 18 - 23 years.

2.3. Data analytics methods

Chi-Square test: used in testing the relationship between nominal variables or hierarchical identifiers. The test helps the study to know if there is a relationship between two variables in the population. In SPSS, P-Value is the Sig value. In the table of test results, α is the possibility of error allowed in the test, i.e. the ability to reject the null hypothesis (H0) despite the fact that H0 is true. If α = 5%, the test accepts the maximum possibility of error of 5%, from which the test reliability (1- α) = 95%.H0: 02 independent factors, Hi: 02 factors not independent (dependency). In the author's research, the author will test the hypothesis by the method: direct measurement, through the public identifying the logo model and the brand name that they have seen (measure the logo awareness and awareness respectively. brand name) answer the questions in the brand identification sheet. *Impact analysis using Binary Logistics regression model: Logistic* regression analysis is a technique to analyze the relationship between an independent variable (either a quantitative or a qualitative variable) and a dependent variable which is a binary variable: $Y=\alpha + \beta x+\varepsilon$.

3. Results

Testing hypotheses about the effects of logo and brand name modification

Hypothesis H1 about the effect of color

Table 3.1 Chi-Square analysis comparing two cases of black and white and color leaflets

Recognition		**Correct**	**Wrong**	**Total**	**Correct rate**	**Wrong rate**	**Pearson-Chi-square**	**Asymp.Sig.(2-Sided)**
Brand name recognition	Black and white	138	204	342	40%	60%	8,960a	0.003
	Colored	178	166	344	53%	47%		
Logo recognition	Black and white	83	259	342	24%	76%	20,405a	0.000
	Colored	139	205	344	40%	60%		

Source: survey results

For the variable “brand awareness”, the value Chi-Square = 8,960a (sig=0.003), for the variable “logo awareness” the value Chi-Square = 20,405a (sig=0.000). Therefore, it can be concluded that color has an effect on consumers' brand awareness. Hypothesis H1 is supported, and at the same time, the influence of color on brand awareness through logos is more pronounced than in brand names.

Hypothesis H2 about the effect of repetition

Table 3.2 Chi-Square analysis comparing two cases of repeating/non-repeating leaflet

Recognition		**Correct**	**Wrong**	**Total**	**Correct rate**	**Wrong rate**	**Pearson-Chi-square**	**Asymp.Sig.(2-Sided)**
Brand name recognition	Do not repeat	144	204	348	41%	39%	6,239a	0.001
	Repeat 02 times	172	166	338	51%	49%		
Logo recognition	Do not repeat	92	256	348	26%	74%	11,327a	0.001
	Repeat 02 times	130	208	338	38%	62%		

Source: survey results

For the variable "brand awareness", the Chi-Square value = 6.239a (sig = 0.001), for the variable "logo awareness" the Chi-Square value = 11.327a (sig = 0.001). Therefore, it can be concluded that repetition has an effect on consumers' brand awareness. Hypothesis H2 is supported, and at the same time, the influence of repetition on brand awareness through logos is more pronounced.

Hypothesis H3 about the effect of size

Table 3.3 Chi-Square analysis comparing the two cases of full and small leaflets

Recognition		**Correct**	**Wrong**	**Total**	**Correct rate**	**Wrong rate**	**Pearson-Chi-square**	**Asymp. Sig.(2-Sided)**
Brand name recognition	Full (100%)	177	157	334	53%	47%	12,582a	0.000
	Small (50%)	139	213	352	39%	61%		
Logo recognition	Full (100%)	140	194	334	42%	58%	27,148a	0.000
	Small (50%)	82	270	352	23%	77%		

Source: survey results

For the variable "brand awareness", the value Chi-Square = 12,582a (sig=0.000), for the variable "logo awareness" the value Chi-Square = 27,148a (sig=0.000). Therefore, it can be concluded that size has a significant effect on consumers' brand awareness. Hypothesis H3 is supported again, it can be seen that the effect of size adjustment on brand awareness through logo is higher than that on brand awareness. The results of testing hypotheses H1, H2 and H3 show that the influence of color, repetition and size on brand awareness in all situations has a stronger influence on logos than brand names.

Hypothesis H4 the effect of the combination of repetition and color adjustment

Table 3.4 Chi-Square analysis comparing leaflet case (repeated color matching)

Recognition		**Correct**	**Wrong**	**Total**	**Correct rate**	**Wrong rate**	**Pearson-Chi-square**	**Asymp.Sig.(2-Sided)**
Brand name recognition	Other cases	224	296	520	43%	57%	7,718a	0.003
	Repetition & color	92	74	166	55%	45%		
Logo recognition	Other cases	138	391	520	27%	73%	31,126a	0.000
	Repetition & color	83	83	166	50%	50%		

Source: survey results

For the variable "brand awareness", the Chi-Square value = 7.718a (sig= 0.003), for the variable "logo awareness" the Chi-Square value = 31.126a (sig= 0.000). Therefore, it can be concluded that repeated color combinations have a significant effect on consumer brand awareness. Hypothesis H4 is supported, which shows that the effect of repeated adjustment in combination with color on brand awareness through logo is higher than that on brand awareness.

Hypothesis H5 on the effect of combined adjustment of repetition and size

Table 3.5 P comparative leaflet Chi-Square analysis (repeated size combination)

Recognition		**Correct**	**Wrong**	**Total**	**Correct rate**	**Wrong rate**	**Pearson-Chi-square**	**Asymp.Sig.(2-Sided)**
Brand name recognition	Repeat full size (100%)	103	67	170	61%	39%	19.189a	0.000
	Other cases	213	303	516	41%	59%		
Logo recognition	Repeat full size (100%)	76	94	170	45%	55%	15,734a	0.000
	Other cases	146	370	516	39%	61%		

Source: survey results

For the variable "brand awareness", the value Chi-Square = 19,189a (sig= 0.000), for the variable "logo awareness" the value Chi-Square = 15,734a (sig= 0.000). Therefore, it can be concluded that repeated size combinations have a significant effect on consumer brand awareness. Hypothesis H5 is supported, which shows that the effect of repeated adjustment combined with size on correct brand name recognition through brand name is higher than logo recognition.

Hypothesis H6 effects of color and size adjustment combinations

Table 3.6 Chi-Square analysis comparing leaflet case (colour combined with size)

Recognition		**Correct**	**Wrong**	**Total**	**Correct rate**	**Wrong rate**	**Pearson-Chi-square**	**Asymp.Sig.(2-Sided)**
Brand name recognition	Colored + full size (100%)	97	65	162	60%	40%	16,286a	0.000
	Other cases	219	305	524	42%	58%		
Logo recognition	Colored + full size (100%)	87	75	162	54%	46%	44.133a	0.000
	Other cases	135	389	524	26%	74%		

Source: survey results

For the variable “brand awareness”, the Chi-Square value = 16,286a (sig= 0.000), for the variable “logo awareness” the Chi-Square value = 44,133a (sig= 0.000). Therefore, it can be concluded that color combined with size has a significant effect on consumer brand awareness. Hypothesis H6 is supported, which shows that the influence of color matching and size adjustment on correct brand name recognition through brand name is higher than logo recognition. As with H5, the effect of color matching size adjustment on logos is higher than that of brand names.

Hypothesis H7 on the regulatory role of age and gender on the influence of logo and brand name adjustment on brand awareness

Adjustment of age on the effect of logo and brand name adjustment on brand awareness

The results of Binary logistics analysis show that age-adjusted characteristics for the effect of color and size-specific adjustment B=1,713 (sig=0.000) for age and color, and B=2,166 (sig=000) for age and size. While B=0.266 (sig=0.682) for age and repeat did not moderate the effect. The results of the Binary logistics analysis show that B = -0.508 (sig = 0.310) for age and color, and B = 0.280 (sig = 0.631) for age and size and B = -0.238 (sig = 0.693). The above results show that age does not moderate the effects of color, repetition and size adjustment on brand awareness through logos.

4. Discussion and Conclusion

Research has confirmed that logos and brand names have an influence on consumers' brand awareness depending on different variations: color; repetition and size, especially the adjustment of the color, repetition and size of logos and brand names have an influence on consumer brand awareness. The research results help administrators of commercial banks in particular and expert advertising design in Vietnam in general see more clearly the role and importance of the method of using the logo and the brand name in advertising message. Research results have shown the role of logos and brand names in advertising activities in general, and in advertising to build brand awareness in particular in the field of commercial banking in Vietnam, besides their influence of the elements of advertising message, such as message words, language (words), images... that previous studies have done, there are 3 groups of factors that positively affect the brand awareness of consumers. Those are: Logo colors and brand names in advertising message; Repetition of logo and brand name in advertising message; Size of logo and brand name in advertising message, and especially the effect of logo and brand name when adjusting for color, repetition and size. Thus, commercial banks in Vietnam who want to use logos and brand names in effective advertising messages need to focus on the following specific issues: Firstly, it is necessary to emphasize the role of color when use logos and brand names in advertising messages; Second, when using logos and brand names in advertising messages, it is necessary to pay attention to the degree of repetition (the number of times the logo and brand name appear in an advertising message); Third, when using the logo and brand name in the advertising message, it is necessary to pay attention to the size of the logo and the brand name in the advertising message; Fourth, when using logos and brand names in advertising messages, it is necessary to focus on methods of adjustment, combining elements of color, repetition and size.

Abstract

Women entrepreneurship has recently been a fashionable trend in research. The mixed methodology of this study has shed light on the barriers in women entrepreneurship by examining the factors affecting the entrepreneurial performance of female entrepreneurs' work. A quantitative analysis of 87 female entrepreneurs combined with qualitative analysis via in-depth interview with 10 entrepreneurs show that work-life balance, financial support and gender bias are challenges facing women entrepreneurship. Further, this study also reports that emotional support, in particular from family members will improve the performance of female entrepreneurs' work. Some policy implications are offered by this study. Policy makers should focus on financial support for women entrepreneurship because of the flaw of the current supporting policy. Further, gender equality movement still has a long way to go in order to support women entrepreneurship in Vietnam.

Keywords: *Entrepreneurship, challenges, women entrepreneurship, Vietnam*

1. Introduction

At global scale with continuous change, women entrepreneurs confront surmounting challenges that create a need for effective support mechanisms leading to strengthening businesses in order to satisfy the demands of customers, market conditions, supply chains, competitors, and can adapt to changes in technology.

Women entrepreneurs have to confront many challenges: the majority of those who run a business do not have previous experience as a business person but have only been employees in state enterprises; their main concerns are to provide the everyday living, and not necessarily to develop themselves in the perspective of the business; they do not have extensive technical and material endowments; and they have limited financial resources. Lack of public policies to sustain entrepreneurship, lack of businesswomen association networks, professional stereotyping, the stereotype of the mentality of society, maternity and childcare; difficulty in finding the equilibrium between work, family, and private life, the stereotype of the promotion of women in mass media, identification of contracts, and access to new technologies can all be considered as barriers.

Although the global list of most famous entrepreneurs is long, few women are included. This historic trend of low representation of women entrepreneurs confirms a persistent inequality in the workforce and highlights unsolved problems that women confront to start a business or deters their efforts to pursue entrepreneurial activities. A particular problem for women is the harmonization between work and family life, rather than the lack of family support and proactive actions of the state in encouraging entry into entrepreneur stream. The obligations to perform several roles at the same time can negatively influence the professional success and satisfaction of women (Zapalska et al., 2005). These mixed feelings of guilt and fear of neglecting their family and/or their business force women to learn ways to manage these competing demands on time (Abrar et al., 2011). Besides, the absence of childcare facilities in some transition countries is a limitation to one's entrepreneurial career. Hence, it can be concluded that women were not able to combine work and family due to the lack of affordable social services and childcare facilities (ILO, 2002; Ramadani et al., 2013). The development of mechanisms to advance cultural change through national policies are needed. These are aiming to secure shared family responsibilities between men and women, because the stereotype that woman need help at work and at home is misleading and obsolete. What women need today is men's collaboration, at work and at home.

For women entrepreneurs, quality education is irreplaceable to consolidate start-ups and take advantage of opportunities. Quality education is important in developing countries where women in general and women entrepreneurs particularly confront obstacles in terms of limited access or, most commonly, attend obsolete programs that curtail women's potential to become successful entrepreneurs (Lepeley and Albornoz, 2013). Klaus Schwab, founder and executive chairman of the World Economic Forum, highlights the importance of education to develop the skills entrepreneurs need to prepare for the future and solve increasingly complex business problems in the global economy. He assesses that quality education needs to be a top priority for governments and entities in the private sector to attain growth rooted in human and social progress. Educating women in developing countries and providing them with training in future-looking business management for sustainability is a pending challenge that governments and society need to address to foster social and economic development.

Even though women have access to the same education and jobs as men, they have more difficulty accessing external financial assistance (GERA, 2013). Obtaining financial support to start or continue a business is another obstacle faced by female entrepreneurs. It can be difficult to obtain finance because of social positioning or, as in some countries, because women are not allowed to seek finance as an individual and must have a male family member such as a father, brother or husband obtain it for them (OECD, 2004). An alternative for many potential entrepreneurs is microfinancing, which is the practice of providing financial services to low-income households (OECD, 2002).

Policies are needed to improve the business environment and encourage entrepreneurship, especially women entrepreneurship. Measures to change the mentality are needed. Thus, suitable local, regional, and national strategies are needed in correlation with the local particularities, considering that “the most difficult challenge to transition in the former communist countries is to change the mentality of individuals” (Kenny and Trick, 1995; Suutari and Riusala, 2001).

Vietnam’s economic reform has gained substantial achievements and interested researchers. The reform is known as “Doi Moi” has been emerged a rich theoretical context. Painful reforms have been undertaken to transform the stiff central planning system into a market economy, breaking the long-standing hurdles to the private sector and provoking entrepreneurship development. Entrepreneurship has become an essential driving force for the development. The Vietnamese Government (in short Government) applied a learning-by-doing approach with reformative ideas initiated, implemented, then ratified and officially encouraged. Policies shifted from a de-entrepreneurship to pro-entrepreneurship stance. Multi-face economic sectors, supportive policies have been cultivated in quest for prosperity among businesses, grounding on a more levelled playing field for all. Overcoming decades of the clash of ideologies and socio-economic upheavals, what we have today is a country well on its way to transitioning into a fully-functioning market economy.

With women accounting for about 26% in the national assembly, Vietnam is among the world’s leading countries and the second in the Asia-Pacific region, after New Zealand, in terms of female representation in parliament. Women also account for about 20% of managerial positions in state agencies at all levels (Debroux, 2010). A law passed in 1987 paved the way for the de facto de-collectivization of agriculture. Peasants were given long-term land-use rights. Individual farmers became the major players in the rural economy. The following year the legitimacy of the non-agricultural private sector was recognized. In 1990 encouragement for the private sector was raised to the level of official government policy with the enactment of a law on private enterprise. Since then many enterprises have been established by former employees of state companies and civil servants, including a considerable number of women.

Vietnam was one of the first countries to ratify the Convention on the Elimination of all Forms of Discrimination Against Women (CEDAW) convention in 1982. But even before the ratification, gender equality was enshrined in the 1946 constitution. The Gender Equality Law was enacted in 2006, already men and women are subject to the same criteria in terms of qualifications and age in matters of employment, job assignment, promotion and access to training. Even though, restrictions still exist that contain elements of gender discrimination. Vietnamese women retire at 55 years old, against 60 for men, in the public sector. Public companies will continue to be a major employer of women for some time, and because they provide better training than most private concerns they are likely to be an important source of female opportunity entrepreneurship. The different retirement ages are a factor in reducing the career and promotion prospects for women. It is observed that they are passed over for promotions or career development opportunities at a younger age than men, usually by the same five-year gap. This is a double challenge for women, who may also have missed earlier promotion opportunities while they had young children. Gender distribution by sector and type of occupation creates clusters of male or female jobs for which there are differences in wages and career opportunities. Even in the sectors where there are many women, such as education, health and culture, they are mostly concentrated in occupations that offer little chance of careers or acquisition of marketable skills. There are, for instance, very few women in top positions in the academic world despite the large number of women in university jobs. The gap in training opportunities seems to remain large, as male access to on-the-job training is eight times higher than that of female employees. As result, a gender-neutral policy language may not result in gender-egalitarian outcomes when implemented in a gendered environment that is influenced by gender imbalances and biases. The development of female entrepreneurship is indeed linked with equality, but the linkage is not straightforward. It can develop in an environment characterized by gender inequality and occupy a specific place in society and economy, as access to formal equality does not guarantee that it will flourish. The neutral language of many laws can work alongside mores, traditional customs and cultural expectations in ways that can hinder the economic advancement of women. Formal political and economic equality in the labor market was bestowed on women decades ago. It opened new horizons and paved the way to the slow development of entrepreneurship. But it remained stuck (and still is to some extent), with the gender-biased reality of regulatory, cognitive and normative institutional obstacles.

Property rights still remain as gender issues for women entrepreneurs in Vietnam when land generally has been registered in the name of the husband. Although traditional inheritance practice in Vietnam gives men and women equal rights to inherit land, in practice women are less likely to be registered as land users. Most of the land-use rights certificates issued were in the name of the husband only. A 2003 revision of the Land Law dictates that land-use rights certificate must include the names of both husband and wife. It ensures that many women gain access to land and, subsequently, get better access to finance thanks to the property titles. However, the previous documents have not been rescinded. The titles issued before the revision are still under the name of the husband. About 75 per cent of Vietnamese women are self-employed, mostly in agriculture or the informal sector (Debroux, 2010). Improved access to capital resources would have a significant impact on their ability to upgrade their productivity and expand their businesses.

Gender disparity is influenced by economic development, but also by institutional obstacles and the resistance of traditional society to change. A distinction has to be made between segregation and equality. Equality can be measured by criteria such as rights, independence, access to education and healthcare, etc. Segregation is the allocation of life patterns or specific life spaces to one sex or the other. Broadly speaking, the transitions in socio-economic and business models seem to lead towards gender equality.

The start-up context in Vietnam presents opportunities as well as challenges for women entrepreneurship. This study aims to shed light on the status of women's entrepreneurship in terms of resources and barriers that women face when starting a business.

2. Method

This study uses a mixed research approach (qualitative and quantitative), in which qualitative research will shed light on women's resources and perspectives on entrepreneurship, quantitative research will help uncover challenges facing women's entrepreneurship.

In-brief descriptions of qualitative approach and quantitative approach are respectively presented as follows:

The research uses a multidisciplinary approach based on the intersection of the gender field and the start-up (business) field, set in the new context of the transitional economy in Vietnam. Accordingly, this study will use a gender lens to analyze issues surrounding women's entrepreneurship, focusing on the barriers that women in Vietnam encounter in starting a business in Vietnam. rapidly changing socio-economic landscape in a transitional economy.

The study also used in-depth interviews in qualitative analysis to explore more about the resources mobilized in women entrepreneurship and women’s perception of entrepreneurship. The authors conducted in-depth interviews (online) with 10 women entrepreneurs of SMEs. The in-depth interview method currently collects 5 out of 10 expected subjects. Women participating in this study are business owners in Hanoi city. The time since the establishment of the enterprise is not more than 7 years. These female business owners meet the sampling criteria for this study: married women with their children. The selection based on these criteria stems from integrating the findings from the research review with the actual context in Vietnam – its culture is influenced by Confucian ideology. Cultural characteristics set up relatively specific barriers for female entrepreneurs in Vietnam.

The qualitative data analysis goes through a process of 3 stages: first, after transcribing the audio recordings, the researcher proceeds to reduce the text; second, using codes for groups of repeating ideas; third, grouping codes into themes. Coding and qualitative data analysis were performed with the help of NVIVO software version 12.

This study collected primary quantitative data on entrepreneurship with 87 respondents being female entrepreneurs of small, micro and medium-sized startups. Quantitative analysis will show the barriers as well as their impact on women's entrepreneurship. Quantitative data analysis was performed with the data obtained from the survey on 87 female entrepreneurs. After the data-inserting process, the analysis is supported by SPSS software. The basic analysis steps include: data coding, testing the reliability and suitability of the measure, regression analysis to test the research hypotheses and evaluate the impact of factors on the women entrepreneurship.

3. Results

Table 1: Demographic characteristics of the sample

		Frequency	Percent
Age	< 30 years old	25	28.7
	31 – 40 years old	41	47.1
	Over 40 years old	21	24.2
Business industry	Food	26	29.8
	Construction	17	19.5
	Handicraft	6	6.9
	Catering services	28	32.1
	Technology	10	11.7
Number of children	1 child	26	29.9
	2 children	61	70.1

Table 1 shows that business industry is diverse among female entrepreneurs including construction, handicraft, catering service and technology. Noticeably, 10 start-up entrepreneurs got involved in this survey showing the new trend in the business field of Vietnamese women.

Table 2: Reliability and Validity tests

Variables and items		Mean	Std. Deviation	Factor Loadings
Work-life balance	Cronbach's Alpha = 0.762			
	WLB1	3.38	0.721	0.656
	WLB2	3.02	0.643	0.748
	WLB3	3.58	1.012	0.776
	WLB4	3.29	0.930	0.829
	WLB5	3.22	0.952	0.812
Emotional support	Cronbach's Alpha = 0.845			
	ES1	3.51	0.992	0.801
	ES2	3.49	0.829	0.621
	ES3	3.43	0.833	0.687
	ES4	3.28	0.977	0.739
	ES5	3.52	0.923	0.701
Financial support	Cronbach's Alpha = 0.731			
	FS1	3.38	1.051	0.701
	FS2	3.63	1.112	0.610
	FS3	3.67	0.846	0.712
	FS4	3.49	1.023	0.893
	FS5	3.53	1.019	0.833
Gender bias	Cronbach's Alpha = 0.821			
	GB1	3.45	0.791	0.601
	GB2	3.51	0.829	0.521
	GB3	3.61	0.601	0.728
	GB4	3.16	0.812	0.774
	GB5	3.39	1.212	0.821
Entrepreneurial Performance	Cronbach's Alpha = 0.832			
	EP1	3.43	0.812	0.695
	EP2	3.71	0.865	0.729
	EP3	3.33	0.864	0.912
KMO	0.692			
Total Variance	61.579			
(*): Statistics for Independent Variables				

Source: from survey results

As reported in the table 2 and other results from the current survey, all of observed variables are reliable and the values of Cronbach's Alpha of all variable are higher than 0.7. It means that the measure is reliable for further analysis.

Table 3: Rotated Component Matrix[a]

	Component			
	1	2	3	4
WLB1	.656			
WLB2	.748			
WLB3	.776			
WLB4	.829			
WLB5	.812			
ES1	.672	.801		
ES2		.621		
ES3		.687		
ES4		.739		
ES5		.701		
FS1			.701	
FS2			.610	
FS3			.712	
FS4	.502		.893	
FS5	.521		.833	
GB1				.601
GB2				.521
GB3				.728
GB4				.774

To make sure that the observed variables of each factor will only reflect the factor that they are grouped in, the authors continue to use EFA. The table 3 shows that the item ES1 should be removed because it appears in two factor and the gap between the 2 factor loadings is less than 0.3. FS4 and FS5 are kept because the gap between the 2 factor loadings is more than 0.3. In other words, the variable FS will include 5 observed variables while ES will now have ES2, ES3, ES4, ES5.

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.612[a]	.573	.503	.4934	1.531
a. Predictors: (Constant), WLB, ES, FS, GB					
b. Dependent Variable: Entrepreneurial Performance (EP)					

Regression results

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	-.219	.122		-.543	.329		
	WLB	-1.264	.036	-1.061	2.594	.013	.731	1.321
	ES	.713	.120	.628	3.216	.091	.403	1.621
	FS	-.514	.048	-.509	2.617	.002	.882	1.553
	GB	-1.025	.529	-1.291	4.203	.000	.629	1.712

a. Dependent Variable: EPMEAN

The regression results confirm that WLB, FS and GB have negative impacts on performance of female entrepreneurs while ES imposes a positive impact on it with confidence interval at 90%. Adjusted R square at .503 means that WLB, FS, ES and GB explain 50.3% of the average variation of EP.

EP = -1.061*WLB + 0.628*ES – 0.509*FS – 1.291*GB

4. Discussion and Conclusion

The mixed methodology of this study has shed light on the barriers in women entrepreneurship by examining the factors affecting the entrepreneurial performance of female entrepreneurs' work. A quantitative analysis of 87 female entrepreneurs combined with qualitative analysis via in-depth interview with 10 entrepreneurs show that work-life balance, financial support and gender bias are challenges facing women entrepreneurship.

Further, this study also reports that emotional support, in particular from family members will improve the performance of female entrepreneurs' work.

However, the study has some limitations. First, it cannot use the control group of non-entrepreneurial females to compare the differences between two groups. Second, a relatively small-size sample of 87 observations will limit the representativeness of the research results.

Some policy implications are offered by this study. Policy makers should focus on financial support for women entrepreneurship because of the flaw of the current supporting policy. Further, gender equality movement still has a long way to go in order to support women entrepreneurship in Vietnam.

Abstract

Market development of agricultural products has been a fashionable trend in research, in particular the transition economy like Vietnam. The purpose of the current study is to analyze the impact of determinants of market accessibility of green tea. This paper applies a mixed approach including both quantitative methodology based on 110 observations collected through survey questionnaire and qualitative methodology with 06 in-depth interviews that are conducted in Ven village, Yen The District. The research results show that road status, market information access, agricultural extension services, the linkage and age significantly positively affect the market accessibility of Ven village's green tea. Conversely, educational level and distance to output market impose weak impacts while gender and ownership of communication electronic devices have no significant impacts on market accessibility of this product.

Keywords: *Ven village's green tea, market accessibility, information, access*

1. Introduction

Agriculture plays an extremely important role in social - economic development, especially for developing countries. It not only helps ensure national food security but also provides inputs for processing industries. In addition, agricultural development is associated with rural development and poverty reduction because most of the poor's livelihoods depend on agriculture (Ahmed et al., 2016; Markelova et al., 2009). As an inevitable consequence in the context of industrialization and modernization in many countries, industry is having a significantly reduced share in the economic structure. According to World Bank statistics, the share of agriculture in Vietnam is only approximately 14% (World Bank, 2019). Contrary to this trend, some localities in Vietnam still take agricultural development as the focus for local social - economic development. Yen The district, Bac Giang province is one of the typical examples of this approach.

Taking advantage of the conditions of soil, climate and terrain conditions, Yen The district has successfully built and developed many agricultural models, creating recognizable brands in the market such as Yen The chicken, Hong Ky mountain goat, Hong Ky wild honey... Besides, the locality is also promoting the development of the green tea brand in Ven village. In recent years, green tea in Ven village has been one of the main crops of the locality, becoming the main source of livelihood for farmers, helping to improve living standards and reduce poverty. Contrary to the existing results of quality-based certification (Ven village green tea was recognized as a 4 - star product in 2019), this product is still mainly consumed in Yen The district and surrounding areas. From the above analysis, the main research question that the research team propounded is: what factors have affected the market access of Ven village green tea products?

This study has the following main contributions: (1) In terms of academic contributions, this study approaches the research problem based on mixed research methods. This allows to provide more in - depth results about the research problem. Besides, this study approaches the problem of a brand with low brand awareness - as opposed to the technical standard endorsement achieved by the product. Finally, this study takes into account the linking factors in market development, age in the research model; (2) On practical contributions, first of all, the result of this study answers the question of policy makers and managers about the phenomenon of low market access of agricultural products under supported conditions by local and international stakeholders. On the other hand, policy suggestions from this study may be of specific policy application to promote market expansion and development of Ven village green tea in particular, and agricultural products in general.

This study focuses on analyzing the following three main contents: firstly, assessing the status of market access of green tea in Ven village; secondly, identifying influencing factors and analyzing their impact on market access; thirdly, it provides policy implications to enhance market access of green tea in Ven village.

2. Literature Review

Some scholars such as Machete (2004), Mwangi et al. (2015), and Ahmed et al (2016) believe that poor market access of households is the main cause of the phenomenon of a product that meets the standards. quality but sold at low prices and small market size. Previous research by Sendal et al (2007) also showed that low access to output markets will have a negative impact on increasing profits and improving the quality of life of farmers, because thereby, reducing the motivation of farmers to participate in the market (A. De Janvry et al., 1991). Market access plays an extremely important role in promoting rural development, poverty reduction and income enhancement (Jayne et al., 2010; Cai et al., 2012; Ahmed et al., 2016).

According to Nutilus Consultants (quoted in Nguyen Tien Hung, 2009, p.5), market access is defined as a series of commercial activities by which producers bring goods to consumers. Another definition is that market access is the researching of the product output market, in order to grasp the needs and tastes of consumers in order to build an appropriate production organization plan to meet the requirements and wishes of customers in the best way

(Luu Thanh Duc Hai, 2007). Thus, it can be generalized that: Market access is a multi-step process of a supplier from determining the output market to bringing its products to the market.

Indeed, access to output markets is influenced by many factors. For example, Kyaw et al (2018) and Kuma (2012) conclude that distance has a strong and negative impact on market access. On the other hand, there are studies that show that access to the output market is strongly influenced by the gender variable, in which, men have better market access than women (Asfaw et al., 2012; Sigei et al., 2012). 2014; Kihiu & Amuakwa-Mensah, 2020). In contrast, research by La Nguyen Thuy Dung & Mai Van Nam (2015) found that gender is not correlated with market access. Not only that, age is also one of the factors that strongly affect market access (Asfaw et al., 2012; Kassa et al., 2017; La Nguyen Thuy Dung & Mai Van Nam, 2015; Nguyen Quoc Nghi & Mai Van Nam, 2014). In addition, factors such as education level, road conditions, access to market information, linkages, ownership and access to extension services have also been shown to have a positive and very strong impact. to market access (Ahmed et al., 2016; Apind et al., 2015; Kuma, 2012; Kassa et al., 2017; Kyaw et al., 2018; La Nguyen Thuy Dung & Mai Van Nam, 2015 ; Mwangi et al., 2015; Nguyen Quoc Nghi & Mai Van Nam, 2014; Onoja et al., 2014; Siziba et al., 2011).

The common thread in previous studies is that they look at developing countries and often assess market access for agricultural products as a whole, rather than a particular local product. In addition, these studies have not considered the linkages between stakeholders including farmers, cooperatives and localities. Besides, past studies have not built a measurement framework to measure market access, but mainly use dummy variables with two values of 0 and 1 (Ahmed et al., 2016; Asfaw). & associates, 2012; La Nguyen Thuy Dung & Mai Van Nam, 2015; Nguyen Quoc Nghi & Mai Van Nam, 2014). Therefore, this study used observed variables to measure the dependent variable (market access) and used a 5-level Likert measure to be able to clearly and more closely reflect on the level of market access. market access of green tea in Ven village. Specifically, the study examines the influence of 9 factors on the dependent variable, including: distance, gender, age, education level, access to market information, road conditions, association connect, own and access agricultural extension services.

3. Methods

3.1. Researching methods and materials collecting

With the quantitative research method, the study uses primary data, collected from the survey for Yen The district officials, cooperative officials and tea farmers. These are the people who are directly involved in the production and consumption of local Ven village green tea. The questionnaire was designed in two parts. The first part is the personal information of the survey respondents, including gender, age, education and occupation. The rest builds on the development of a measure to understand the factors that influence the marketability of tea products. In the second part, in addition to the questions designed in an integrated form (distance and access to extension services), the remaining questions about road conditions, access to market information, linkages, Ownership and market access are used 5-level Likert measure to show the level of agreement of the surveyed subjects, in which 1 is completely disagree and 5 is completely agree.

After designing the survey questionnaire, the author used a combination of Anket method by sending online questionnaires and direct distribution of questionnaires to collect data. Specifically, the online survey was sent to district and cooperative officials. As for farmers, the method of submitting online survey forms is not suitable because many tea farmers do not have smart electronic devices and have difficulty using these devices. On the other hand, if the household fills out the survey by themselves, the probability of incorrect filling out the form will be higher due to misunderstanding of the question. Therefore, the questionnaire needs to be distributed directly so that reliable and accurate answers can be obtained. The data collection process took place for 1 month and collected 115 votes. However, after processing (cleaning) the data, 5 invalid votes were eliminated because the participants only filled in 1 answer for different questions, which did not guarantee reliability.

In addition to the survey survey with a quantitative approach, primary data was also collected through in-depth interviews by purposefully sampling six people with certain knowledge about the aspects and issues that the topic asked. I want to clarify. The questions aim to clarify and provide more in-depth analysis of the factors affecting market access of green tea in Ven village and help explain the regression results.

3.2. Researching hypothesis

Based on an overview of previous research papers, the author has developed a research hypothesis about the market accessibility of green tea in Ven village as shown in **Figure 1** below:

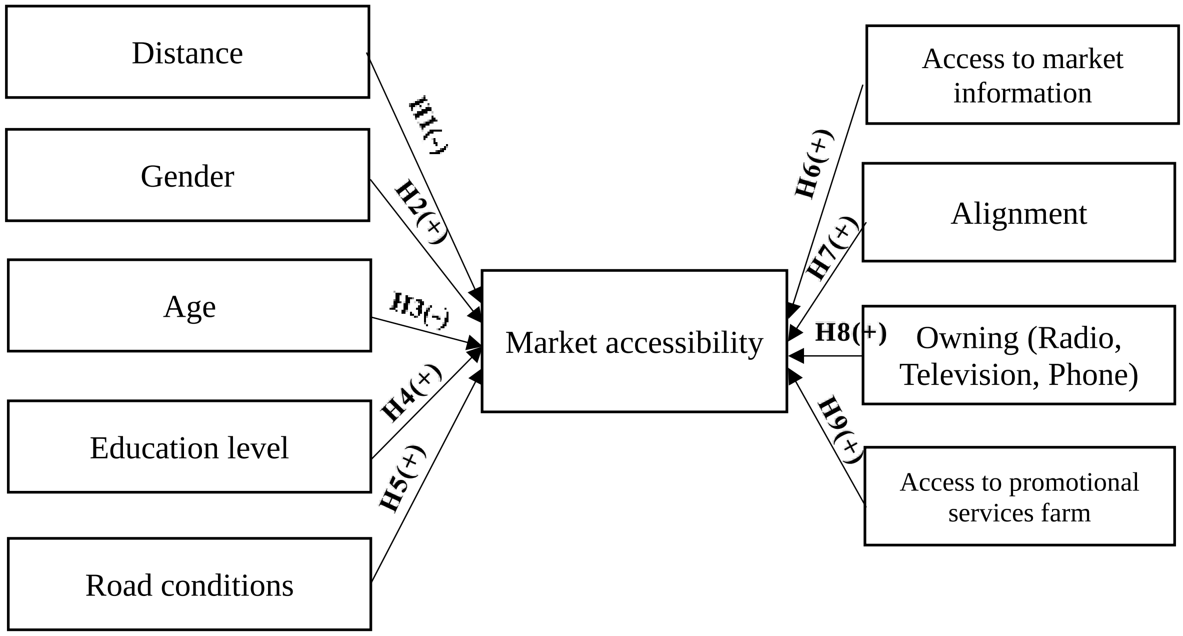

Figure 1: Research hypothesis about market access of green tea in Ven village

Source: Author's team

3.3. Researching paradigm

Many previous studies have used quantitative research methods with multivariate regression models to identify factors affecting the ability to access output markets, such as the study of La Nguyen Thuy Dung & Mai Van. Nam (2015), Nguyen Quoc Nghi & Mai Van Nam (2014), Ahmed et al (2016), and Kihiu & Amnuakwa-Mensah (2020). Based on those studies, this study builds a regression model of factors affecting market access of green tea in Ven village as follows:

$$MA=\alpha+\beta_1*DIS+\beta_2*GEN+\beta_3*AGE+\beta_4*EDU+\beta_5*ROAD+\beta_6*INF+\beta_7*ASS+\beta_8*OWN+\beta_9*EXT+\mu$$

Insides: α, β_1, β_2, β_3, β_4, β_5, β_6, β_7, β_8, β_9 are the coefficients; μ is the error

Accordingly, MA: Accessibility to market, DIS: Distance to market, GEN: gender of owner of household or cooperative, AGE: Age of farmer or cooperative, EDU: Education level of farmer or cooperative , ROAD: Road conditions, INF: Access to market information, ASS: Alignment, OWN: Owning at least one of three radio, TV, smartphone devices, EXT: Access to promotional services farm.

4. Results

4.1. Testing result Cronbach's Alpha and EFA

To check the reliability and suitability of the measure, the authors used Cronbach's Alpha test and Exploratory Factor Analysis (EFA). The test results show that the values of Cronbach's Alpha coefficient are all greater than 0.7, so the measure used is good. In particular, the two total variables Connectivity and Market Access have Cronbach's Alpha coefficients of 0.957 and 0.968, respectively, very close to 1, reflecting this measure very well. Thus, there is no case where removing the observed variable can make the Cronbach's Alpha of these measures greater than the value of its Cronbach's Alpha coefficient. At the same time, no observed variables will be removed from the measure because their correlation coefficients with the total variable are all greater than 0.3. Therefore, all observed variables are accepted and will be used in the next factor analysis. In other words, the measures all meet the requirements of statistical reliability.

For EFA exploratory factor analysis, the results of KMO coefficient and Bartlett's test both reflect that the factors in the model are consistent with the research data and there is a correlation between the observed variables in the factors. element. Besides, the results also show that the Eigenvalue at the fourth variable is 1.142 (> 1), which implies that 04 factors are significant and will be retained in the model. Furthermore, the cumulative variance is 72.972% (>50%), so the EFA model is completely suitable. This means that 04 factors in the model are explained by 72.972% of the variation of observed variables. In addition, the analysis results of the rotation factor matrix also show that there is no change in the observed variables measuring the independent variable compared to the original. Thus, through Cronbach's Alpha coefficient test and EFA exploratory factor analysis, it can be seen that the independent and dependent variable measures ensure the reliability to perform regression analysis.

4.2. Status of market access of green tea in Ven village

Table 1 below presents the status of market access of green tea in Ven village. All observed variables for the MA factor have a minimum value of 2 and a maximum value of 5. The observed variable MA1 has a mean value of 3.09, which is normal, reflecting the products from Green tea in Ven village has not really met the needs of consumers. Besides, the average value of the observed variable MA5 is 3.52, which is greater than 3.5, so it can be said that the survey participants agree with the view that the difference between production and consumption Is negligible. In other words, the amount of tea inventory after each crop is relatively low.

In contrast, with other observed variables of MA such as MA2, MA3, MA4 and MA6, the mean value is relatively low, below 3. Therefore, the descriptive results of the observed variables MA2, MA3, MA4 and MA6, showing that the green tea market in Ven village is not known to many people, the market has not been expanded, has not been consumed in many parts of the country and the farmers in Yen The are still not really satisfied. about the current selling price. On the other hand, the average agreement of the observations of the MA variable is 2,735, less than 3. Therefore, it can be concluded that the accessibility to the green tea market in Ven village, Yen The district, Bac Giang province is still poor.

Table 1: Statistics describing the status of market accessing

Variable name	Describe	N	GNNN	GTLN	Average	Standard deviation
MA1	I see that green tea products in Ven village are gradually meeting the needs of consumers better	110	2	5	3,09	1,064
MA2	I noticed that green tea products in Ven village are becoming more and more popular	110	2	5	2,8	1,107
MA3	I noticed that green tea in Ven village has more and more new markets	110	2	5	2,46	1,163
MA4	Currently, the market for green tea consumption in Ven village is available in many places across the country	110	2	5	2,23	0,974
MA5	I find the difference between total production and total consumption to be negligible	110	2	5	3,52	1,141
MA6	I feel satisfied with the current selling price	110	2	5	2,31	1,139
MA					2,735	

Source: Analysis from the author's survey (2021)

4.3. Analysis of factors affecting market accessing

Linear regression results in the analysis model of factors affecting market access of green tea in Ven village are shown in Table 2 below. Specifically, the research results show that the sex variable is not statistically significant in the regression model because the Sig coefficient has a value of 0.706 (>0.1). Thus, this result is completely similar to the study in Vietnam by La Nguyen Thuy Dung & Mai Van Nam (2015), but contrary to the previous conclusion of Asfaw et al (2012) and Sigei et al. (2014) in an output market access study in Kenya.

Besides, the ownership factor does not affect the market access of green tea in Ven village because the Sig coefficient of the OWN variable is 0.269 (>0.1). This result is in contrast to previous studies where most of the authors believe that owning a smartphone, radio or TV will help them increase their market access (Asfaw et al., 2012; Bwalya & associates, 2013; Mwangi et al., 2015). Therefore, the research results do not support the hypothesis H2 and H8.

Table 2: Regression results of the market access model of tea in Ven village

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	-2.671	.398		1.684	.095		
	DIS	-.017	.025	-.025	-1.495	.038	.736	1.359
	GEN	.026	.028	.013	.378	.706	.887	1.128
	AGE	-.606	.003	-.593	-2.116	.037	.513	1.851
	EDU	.100	.055	.099	1.821	.072	.334	1.493
	ROAD	.882	.079	.865	3.560	.000	.481	1.079
	INF	.918	.044	.914	1.407	.035	.797	1.255
	ASS	1.218	.068	1.398	7.641	.000	.235	1.263
	OWN	.006	.041	.008	1.111	.269	.833	1.200
	EXT	.795	.019	.794	3.320	.000	.292	1.423

a. Dependent Variable: MA

Source: Analysis from survey (2021)

On the other hand, with 95% confidence, the variables DIS, AGE, ROAD, INF, ASS and EXT are statistically significant in the regression model because their Sig coefficients are all less than 0.05. However, the EDU variable is not statistically significant at the 95% confidence level because the Sig coefficient has a value of 0.702 (>0.05), but it is statistically significant at the 90% confidence level. Thus, the market accessibility of green tea in Ven village is affected by 07 factors, including distance, age, education level, road conditions, access to market information, linkage and access to agricultural extension services.

The values of the normalized regression coefficients show that the link between the actors in the tea consumption in Ven village has the strongest and positive impact on market access, similar to the research results of Anteneh & associates (2011) and Kuma (2012).

Next, the second positive and strong factor affecting market access is access to market information with a standardized regression coefficient of 0.914 (hypothesis H6 is supported). Indeed, most of the previous studies also came to the same conclusion that the relationship between access to market information and market access is a positive and very close relationship (Ahmed et al., 2016; Apind et al., 2015; Maziku, 2015; Nguyen Tien Hung, 2009; Onoja et al., 2014).

Morever, road conditions and access to agricultural extension services are also factors that positively and greatly affect the dependent variable, similar to the research results of Kyaw et al (2018), Kassa et al. (2017), and Siziba et al (2011). In other words, hypotheses H5 and H9 are supported. Moreover, the study also shows that the variable 'age' has a large and negative influence on the market access of green tea in Ven village. This means that young people will have better market access than older people (hypothesis H3 is supported). This result is similar to other studies (Asfaw et al., 2012; Kassa et al., 2017; La Nguyen Thuy Dung & Mai Van Nam, 2015).

In contrast, the correlation between distance and market access is very weak. With a standardized regression coefficient of -0.025, distance is the negative and least influential factor on market access (hypothesis H1 is supported). Indeed, the greater the distance from the subject's home to the market, the worse the market access and vice versa. This finding is also shown in the study of Kyaw et al (2018), Kuma (2012), and Nguyen Tien Hung (2009).

Besides, education level also has a small impact on market access with a standardized regression coefficient of 0.099. With such a regression coefficient, education level has a positive and relatively small impact on market access (hypothesis H4 is also supported). In other words, the higher the education level, the better the accessibility to the green tea market in Ven village. Although previous studies have also concluded that the correlation between education level and market access is positive, most scholars have demonstrated that education level has a strong influence on market access. market access (Ahmed et al., 2016; Bwalya et al., 2013; La Nguyen Thuy Dung & Mai Van Nam, 2015; Nguyen Quoc Nghi & Mai Van Nam, 2014).

Thus, the degree of impact of the independent variables on the accessibility of green tea market in Ven village in order from strongest to weakest, respectively as follows:

ASS>INF>ROAD>EXT>AGE>EDU>DIS

From the research results, we have a linear regression function:

$$MA = -2{,}671 - 0{,}017*DIS - 0{,}606*AGE + 0{,}1*EDU + 0{,}882*ROAD + 0{,}918*INF + 1{,}218*ASS + 1{,}795*EXT$$

To clarify some quantitative research results, this study also uses qualitative research methods through in-depth interviews. All three farmers participating in the in-depth interviews said that the reason why owning electronic devices does not affect their market access is because most of the farmers research prices and input markets. out through merchants and neighbors. In addition, finding market information through electronic devices helps them know prices and market information, but finding markets and connecting with new markets costs a lot, so they will choose sell to traders instead of looking for new markets and new customers. This is reflected in the following excerpt from the interview with Ms. HL: “Even if we find out what the customer wants on the internet or TV, we will still accept that we can't do it, because it spends a lot of money that we can't afford. Here, we only sell dried tea, if they ask for incense, we will do it."

Not only that, most of the participants in the in-depth interviews also agreed that the association and cooperation between the participants strongly influenced the accessibility to the green tea market in Ven village. Mr. TNK, an officer of Yen The district's Department of Economic and Social Affairs and Ms. LTH (Than Truong Cooperative) said that "Currently, the linkages in tea production and consumption have been established in Yen The district, however, there are still some gaps in production and consumption. very limited, links between localities, cooperatives, enterprises and farmers are still poor. Thus, making tea prices highly dependent on merchants, making it difficult to expand and connect with new markets and meet the needs of customers in big cities such as Hanoi, Quang Ninh, Hai Phong, etc. ...".

As for farmers, the longer their relationship with traders is, the more stable the price is and the easier it is to sell tea. Ms. HL shared: “She sells to 1 person for a long time, compared to neighboring households, she still doesn't have to force the price because she can still buy the price, she still sells normally...”. Thus, the impact of the linkages between actors in the consumption of tea in Ven village on market access are similar between quantitative and qualitative results.

5. Discussion and Conclusion

5.1. Conclusion

Research results show that the market accessibility of green tea in Ven village, Yen The district, Bac Giang province is relatively low. The products are not diverse and rich, mainly dry tea, so they have not met the needs of consumers. Besides, the consumption market is mostly in the district and surrounding areas, so the ability to recognize the green tea brand in Ven village, especially in big cities like Hanoi and Quang Ninh, Hai Phong, Da Nang, ... are still low. The size of the green tea consumption market in the village is still small, it is still limited in expanding and connecting with new markets due to the lack of linkages in product consumption and the form of advertising and promotion of products has not yet been established effectively. Besides, tea farmers in Yen The have not yet decided on the price of their products, and are still heavily dependent on traders.

On the other hand, this study shows that linkage is the main factor affecting the market access of green tea in Ven village. Moreover, the dependent variable is strongly influenced by factors such as access to market information, road conditions, access to agricultural extension services and age, however, the direction of impact is opposite. While age has a negative relationship with market access, the remaining factors are positively correlated with the dependent variable. On the contrary, the dependent variable is positively and very little affected by the educational level factor. However, distance is the negative and least impacting factor on the accessibility to the green tea market in Ven village.

5.2. Policy implications

Good market access not only helps to raise incomes and improve people's living standards, but also contributes to promoting social - economic development of the locality. Therefore, the state and local authorities need to issue policies to support and encourage actors in finding, expanding and connecting the market. From the results of the correlation regression analysis and in-depth interviews, the study provides a number of policy implications to increase market access to green tea in Ven village, Yen The district, as follows: 1) It is necessary to strengthen the linkages between the two countries. cooperation in the consumption of green tea in Ven village, based on the principle of ensuring the harmonization of the interests of the parties involved; 2) Promote access to output market information; 3) Policy to increase investment in transport infrastructure; 4) Strengthen agricultural training and extension policies.

Specifically, Yen The is a mountainous district with a low starting point and poor social - economic development conditions, facing many difficulties in mobilizing external capital sources and attracting investment. Therefore, the state should have policies to attract enterprises to invest in building tea processing factories; investment in regional transport infrastructure; encourage private investment to develop transport services from tea plantations to national highways and to city centers such as Hanoi, Hai Phong, Quang Ninh, Bac Ninh, etc. Policies to attract investment Investment can be capital support, preferential land use and creating a stable legal environment.

To promote market access, this study indicates that it is necessary to strengthen close linkages between farmers, extension workers, local authorities and other stakeholders, creating opportunities for farmers to have can accurately, fully and timely capture information on output market and prices. On the other hand, regularly organize training classes for local officials and cooperative officials to improve management capacity and foster knowledge related to market, marketing and application of science and technology. Next, this study also emphasizes the role of training and extension services to help farmers master tea growing and care procedures to meet standards like Vietgap and find outputs for farmers to grow. ensure that the output they produce is procured in its entirety at a good price.

Abstract

Entrepreneurship has become a widely research topic in Vietnam in recent years. This topic covers a wide range of unit of analysis from national level (entrepreneurial ecosystem), firm, individuals to university level. This study aims to scrutinize the impact of entrepreneurship education at the university level on entrepreneurial intentions of students. Using a quantitative research method based on a sample of 210 students at the National Economics University, this study shows that aspects of entrepreneurship education entrepreneurship intentions of students in various directions. From the study results, the paper also offers some policy implication for entrepreneurship education of higher education institutions in Economics and Business Management.

Keywords: *Entrepreneurial intention; Entrepreneurship; National Economics; Vietnam*

1. Introduction

Entrepreneurship and innovation are seen as an important tool to tackle global challenges in the 21st century. It contributes to sustainable development by creating new areas of employment, providing employment opportunities, economic growth and improving social welfare. Enterprises are an important component contributing greatly to economic growth, poverty alleviation and job creation in the economy. Entrepreneurship is considered an important content in Vietnam's strategic development orientation in order to use and exploit resources and potentials to contribute to economic growth. The 12th National Party Congress first mentioned the issue of entrepreneurship and designated 2016 as the Year of Startup Countries. According to the "Vietnam Business White Paper 2020", as of 2019, Vietnam has 758,610 operating enterprises, contributing over 60% of the country's GDP. The strong startup trend in Vietnam is demonstrated by thousands of newly established companies and millions of entrepreneurs who have been trying to start a business. Recognizing the importance of entrepreneurship, the Government has focused on supporting and promoting the development of the startup ecosystem through training workshops, mentoring programs (mentorship programs), business incubation centers and projects to support young businesses (young business accelerator project).

However, according to the results of the GEM 2017/18 study, the percentage of people intending to start a business tends to be opposite to the level of economic development. Countries with a development process based on unskilled labor and natural resources have the highest average proportion of people intending to start a business (30.3%), followed by countries with a development process. efficiency-based (26.3%) and finally countries with innovation-based development (15.2%). Although the rate of people intending to start a business in Vietnam has increased rapidly over the years and reached 25% in 2017, compared to other countries with the same level of development and ASEAN countries, it is still is still low, even lower than the average rate of people intending to start a business in developed countries based on performance (26.3%).

This study has the following major contributions

Theoretical contributions of the study include: the study explains the relationship between entrepreneurship education and the entrepreneurial intention of the learners. On the other hand, this study approaches the role of entrepreneurship education on the sub-components of entrepreneurship education, besides the factors belonging to the learners themselves.

The research's practical contributions include: the results of this study are suggestions for policy change in entrepreneurship education from the perspective of managers and policy decision-makers in the field of education. , especially higher education.

This study focuses on analyzing the following main contents: (1) Factors of entrepreneurship education affecting students' intention to start a business; (2) The degree of impact of entrepreneurship education on students' entrepreneurial intention.

2. Literature Review

Theoretical basis and research model

Some researchers have explored the relationship between entrepreneurship education and entrepreneurship intention of students. Studies suggest that education has become an important way to stimulate entrepreneurship for a variety of reasons (Sánchez, 2011). First, education provides individuals with a sense of independence, self-control, and self-confidence. Second, education makes people aware of career alternatives. Third, education broadens people's horizons, making them better able to perceive opportunities. And finally, education provides knowledge for individuals to develop new business opportunities. Through a proper entrepreneurship education, an individual can acquire the skills and knowledge needed to create and grow a new business. According to Drucker (1985), entrepreneurship is like a subject, and like any course, it can be learned. The presence of successful entrepreneurs and the increase in the number of entrepreneurs in society depends on the extent to which potential entrepreneurs are educated in entrepreneurship.

Béchard & Toulouse (1998) consider that entrepreneurship education is a series of training courses to teach students about models of business formation and development. It focuses on stimulating the passion for entrepreneurship in students through imparting the knowledge and skills needed to create a business and guiding the business in its early stages to growth. According to the definition of Byabashaija & Katono (2011), entrepreneurial behavior can be classified as planned behavior while behavior is influenced by individual intentions. Indeed, according to Ajzen & Fishbein (1975), intention is a measure of an individual's readiness for a future behavior and it is considered as an important basis directly determining human behavior. According to Ajzen (1991), intention is often considered the sole predictor of an individual's participation in a planned behavior. Behaviors, whether simple or complex, are derived from the intentions of the performer. Intentions play an important role in whether we decide to perform a behavior or not. The stronger the intentions, the more motivating and motivating the individual to perform the desired behavior.

Many models have been used in the study of entrepreneurial intention, but the dominant theoretical model is the theory of planned behavior (Theory of Planned Behavior) developed by Ajzen in 1991. According to this theory , the intention to perform a behavior is influenced by three factors: the individual's attitude towards the behavior, common norms and perceived ability to control the behavior. An individual's attitude toward a behavior is developed based on the individual's beliefs about whether the behavior is positive or negative. Common norms refer to an individual's perception of the beliefs of other individuals. It is the fact that groups with close and important relationships with the subject approve or disapprove of the performance of a certain behavior. Perceived behavioral control is a perception of how easy or difficult it is to perform a behavior within the limits of one's own abilities and resources.

Besides, according to the social cognitive theory (Social Cognitive Theory) developed by researcher Albert Bandura in 1986, human behavior is explained through the mutual interaction between 03 factors as individuals. , environment and behavior. From the perspective of the relationship between environmental factors and behavior, Bandura's theory emphasizes the importance of mimicking recorded behaviors through observing patterns from the environment.

Christensen (1991) suggest that knowledge only becomes "useful if it were included in situations that require applications to solve specific problems." Research by Bell & Bell (2016) confirms the effectiveness of experiential learning through business planning. Their research shows the positive effects of this learning method on students' self-confidence and their belief in entrepreneurship.

Meanwhile, Laurillard (2002) points out that feedback is also part of interaction and reflection. Feedback gives learners the opportunity to adjust behavior as needed. Laurillard (2002) also suggests that if students receive feedback during the course, students' entrepreneurial intentions may also be affected.

From the above theoretical analysis, the authors develop the following hypotheses:

Hypothesis H1: Positive attitude to start the business of students increases the level of their intention to start a business

Hypothesis H2: There exists a relationship between standards and subjective way of starting a business and entrepreneurship intention of students

Hypothesis H3: Student's strong perception of the possibility of success in starting a business positively affects their intention to start a business.

Hypothesis H4: The level of access to inspirational figures in entrepreneurship education has a positive impact on students' entrepreneurial intention.

Hypothesis H5: The use of business planning activities in entrepreneurship education has a positive effect on students' entrepreneurial intention.

Hypothesis H6: The provision of feedback in entrepreneurship education have a positive impact on entrepreneurship intention of students

3. Method

The research method used in this study is the quantitative research method. The analysis includes: measure test analysis to check and determine the reliability of the measure. This is a preliminary research phase, conducted to recalibrate the quantitative measures that were used before to suit the conditions and practical basis of the research.

Regression analysis: The purpose of this research step is to measure the impact of 6 variables on students' entrepreneurial intention.

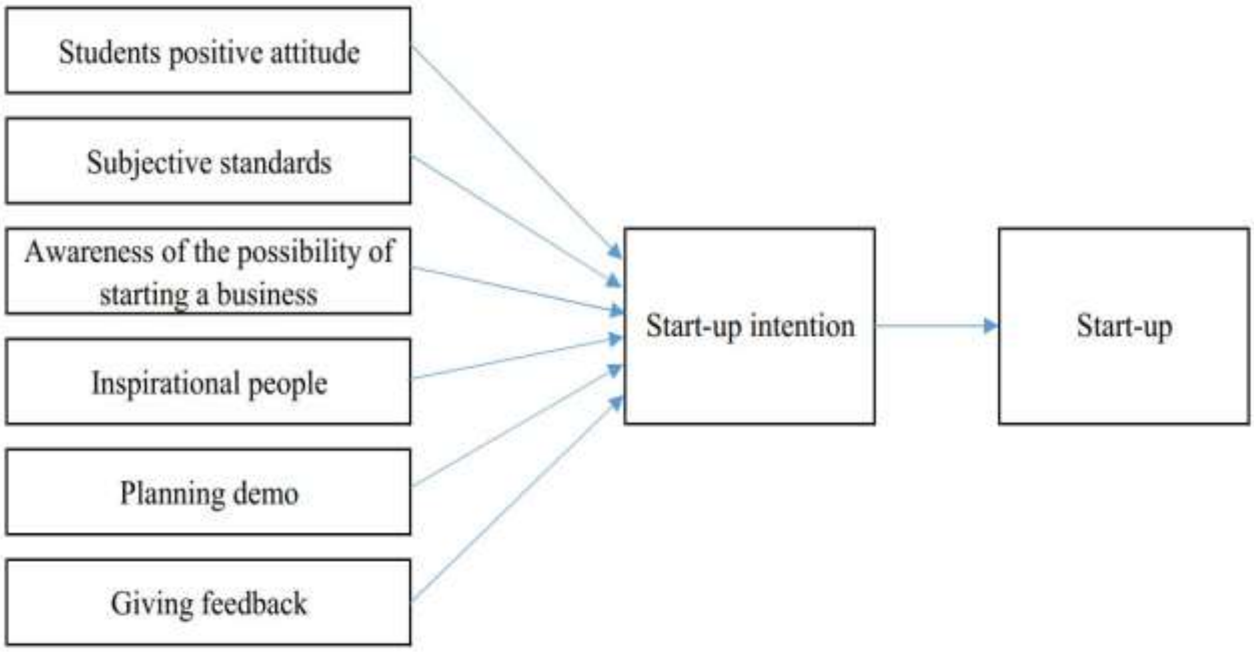

Figure 1: Research diagram

According to Hair et al. (2010), the minimum sample size can be determined based on the number of variables in the analysis. Generalized by the formula, we have: n = k x N (where, n is the minimum sample size; k can take the value 5, 10 or 20; N is the number of variables included in the model). In this study, the author uses the formula with k = 20, the number of variables included in the study includes 7 variables (1 dependent variable, 6 independent variables). Therefore, the minimum number of observations to be collected is 20 x 7 = 140 observations. Thus, the minimum sample size for this study is 140 observations.

Data used in the study is primary data, collected through questionnaires online. The data collection process was carried out from December 2020 to March 2021. The number of observations was 216, including students of different programs of the full-time and international training at the University. Studying National Economics. After data cleaning, the number of valid observations was 210. Thus, the size of this survey exceeded the minimum sample size required to perform the tests and run the model.

After the data was collected and cleaned, the data processing was done through SPSS software. The main results will include the test of the suitability of the measure, linear regression using OLS estimation, and analyzing the effects of the factors of the entrepreneurship education program on the intention to start a business student's career.

4. Results

4.1. Descriptive statistics

Table 1: Information about the respondent

Sample: n = 210		Frequency	%
Majors	General economic field	67	31,9
	The field of business administration	82	39,05
	Other areas	61	29,05
Sex	Female	109	51,9
	Male	101	48,1
School year	First year	31	14,8
	Second year	53	25,24
	Three years	78	37,14
	Last year	48	22,82

Source: Results from the author's survey

The survey sample shows that there is not much difference between the groups of students represented in this sample. The author has divided the group into 3 groups of fields including: 1) General economic sector (including Development Economics); 2) The field of business administration (including the majors of the Faculty of Business Administration, the Institute of Business Administration, the Entrepreneurship and Business Development major of the International Training Institute, ...) and 3) The field of business administration. Other fields (Banking - finance, Accounting - Auditing, ...).

4.2. Check the suitability of the measure

The results of testing the reliability of the measure show that most of the observed variables (items in the questionnaire) of both independent and dependent variables have high reliability. For items 2, 5, 14, and 29, because the coefficient value is less than 0.6, it will be removed to increase the reliability of the measure in the fact that the observed variables are still many. . (Details see Appendix 1.))

4.3. EFA exploratory factor analysis

Results of KMO test and Bartlett's test

- KMO coefficients of the independent variables are all (> 0.5). Concluded that this factor analysis consistent with reality.

- P-value of Bartlett test we get 0.000 < 0.05. There is a correlation between the observed variables in each factor.

- Test of extracted variance of factors (% Cumulative Variance): Cumulative coefficient results are in the range from 0.74 (> 0.5) to meet the standard. We conclude that 74% of the variation of the factors is explained by the observed variables. In other words, the observed variables used measured about 74% of the factors it measured.

Next, the authors use the factor rotation matrix to reduce the measure.

The results from the factor rotation matrix (presented in Appendix 2) show that, after removing the items after Cronbach's Alpha test, the remaining items all accurately and uniquely reflect the factors it measures. In other words, now the measure has reached the standard for further analysis tích.

4.3. Regression analysis

Before conducting regression analysis, the author checks the defects of the model (function form, variable variance, multicollinearity).

Results (see Annex 3) allow give some important conclusions following:

- The model has no defects in functional form.
- The results of the B-G test show that the model is not defective in terms of variable variance.
- Magnification factor coefficients of the independent variables are less than 10 so the model does not suffer from multiple disabilities collinear.

Carrying out the model regression, we have the following results (details see in Appendix 4)

The P-values of the variables in the model are statistically significant.

R2 = 0.56 means that the variables in the model explain on average 56% of the variation of the dependent variable

From the results in the table above, we replace the values of the coefficients from β_1 to β_6 into the model, we get the following results:

yd= - 0.65237ph - 0.48368do + 0.99014ko + 0.95177at + 0.74270cm + 0.44292nt + 0,01248

In the above model, the influence of the independent variables is statistically significant because the P-values of all variables are less than 0.05. The above model shows that students' curricula have some 'positive' effects on students' intention to start a business. Among them, the use of design lectures with the participation of entrepreneurs (inspirational characters) or based on their real stories has the greatest impact on this intention. Next, students' attitudes also greatly influence their intentions. Smallest influence is aware of the possibility to establish enterprises. This can be explained from the fact that students do not fully understand the difficulties, challenges or opportunities when starting a business while still in school. On the contrary, the results of this study indicate that the feedback and hands-on demos did not deliver the results of the program's design goals. However, this result also shows the great role of the curriculum in relation to entrepreneurship for students' entrepreneurship and entrepreneurial intentions.

5. Discussion and Conclusions

The results of the study indicate that different aspects of entrepreneurship education affect students' entrepreneurial intentions differently and policy makers can apply the results of this study to implement change policies in line with the goal of promoting entrepreneurship among students.

Recommendations include:

- *Increase the use of inspirational characters about entrepreneurship*

The results of this study suggest that entrepreneurship education programs need to be designed more vividly and practically, rather than focusing only on theories. The introduction of entrepreneurial stories or ideally the participation of entrepreneurs in the teaching process of entrepreneurship has a great influence on students' entrepreneurial intentions. This poses a requirement to change the current program design in many universities - where only theory is taught in a field that requires practical content such as entrepreneurship.

- *Increased provision of feedback on student learning*

Teachers have an important role in enhancing students' self-regulation ability. Feedback from teachers is a source for students to assess progress. Furthermore, teachers can detect students' mistakes rather than letting students be self-aware of their own mistakes. Therefore, providing feedback to students is very important to ensure student learning.

- *Expand opportunities for dialogue between teachers and students*

One approach to increasing the value and effectiveness of the feedback provided is dialogue, rather than just conveying information. Feedback in the form of dialogue means that students will not only receive written feedback, but also have the opportunity to discuss the feedback afterward. In this case, to make feedback more effective and valuable, students must understand it before it can be used to improve performance.

- *Encourage the confidence of students*

Motivation can play an important role in learning and assessment because they help students understand self-regulation when they encounter failure. Therefore, teachers should evaluate students' progress instead of pointing out mistakes, instead commenting that pass or fail helps students recognize mistakes and find solutions to overcome.

Appendix 1: Checking the reliability of the measure

	Cronbach's Alpha coefficient	Total variable correlation coefficient	Overall Cronbach's Alpha coefficient
Feedback in the curriculum			**(0,71)**
1. I often get feedback on ideas or contribute during discussion	0,66	0,58	
2. After receiving feedback, I can do it myself	0,56	0,51	
3. Lessons with teachers motivated me to start-up	0,82	0,78	
4. Teacher comments - She is very clear and helpful	0,81	0,77	
Practical demos in the course			**(0,68)**
5. I am often encouraged to develop my own business ideas when I take classes	0,45	0,30	
6. In the class, I usually up ideas about business	0,70	0,62	
7. I enjoy the process of writing a business plan	0,88	0,85	
8. I learned about business ideas	0,79	0,69	
Introducing inspirational characters			**(0,82)**
9. I was listening to presentations by entrepreneurs	0,86	0,85	
10. Among startup influencers, I admire many of them	0,80	0,76	
11. The appearance or presentation they made me love the business	0,87	0,86	
12. I am interested in the process of learning from the example of a typical case of start-up	0,79	0,73	

13. Other students also like this design in the program	0,88	0,82	
Student's positive attitude			**(0,77)**
14. Start-up gives me many advantages	0,46	0,23	
15. A job like start-up attracts me	0,79	0,75	
16. If I have the opportunity and enough resources, I will start-up	0,75	0,74	
17. Between so many career options, the startup is my first choice	0,71	0,70	
18. Start-up helps me fulfill my passion	0,65	0,63	
Subjective norms			**(0,84)**
19. Start-up is what to do with students	0,80	0,77	
20. Start-up is highly appreciated by society	0,87	0,68	
21. Start-up gives me confidence	0,9	0,79	
22. I appreciate start-up in young people	0,79	0,76	
Awareness of the possibility of establishing business			**(0,62)**
23. I think starting a business and running it is easy for me	0,76	0,73	
24. I was prepared to ready to start-up	0,79	0,74	
25. I can control the start-up process	0,73	0,7	
26. I know what it takes to start-up	0,66	0,64	
27. I know how to develop a project to start-up	0,65	0,6

AN EVALUATION ON STABILITY OF COMMERCIAL BANKS IN VIETNAM THROUGH FINANCIAL STABILITY INDICATORS AND BANKRUPTCY RISK SCORE

Dr. Nguyen Thi Hoai Phuong

phuongnh@neu.edu.vn

School of Banking and Finance, National Economics University, Hanoi, Vietnam

Abstract

Recently, in Vietnam, financial stability has always been regarded as the priority. In particular, maintaining the stability of banking system plays such a significant role in stabilizing macro-finance. Under the impact of widespread and intensive economic integration, Vietnam's commercial banking system in recent years has experienced various changes. In fact, financial instability appeared due to stumbling blocks of financial market in general and banking system itself in particular. Especially, in the post-crisis period, Vietnam's commercial banking system confronted high risk of breakdown due to influences from external factors including global economic recession, and macro-economic instability as well as internal factors namely poor management capability and ethical risks, etc. This paper explores instability of Vietnam's commercial banking system from 2015 to 2018 based on the utilization of financial stability indicators (FSIs) and bankruptcy score (Z-score) in order to propose essential evaluation.

Keywords: *Bankruptcy score, Financial stability indicators, Fiscal policy, Monetary policy.*

1. Introduction

1.1. The necessity of the research

The process of international economic integration has brought many development opportunities but also made financial markets become complicated and risky. Over the past 20 years, the world has witnessed many large-scale financial-monetary crises. The losses that these crises have caused to the economy are extremely serious. Consequently, ensuring macroeconomic stability, especially stability of banking system, is becoming an important goal in the monetary policy conducting of central banks and governments in many countries around the world. This paper explores instability of Vietnam's commercial banking system from 2015 to 2018 based on the utilization of financial stability indicators (FSIs) and bankruptcy score (Z-score) in order to propose essential evaluation.

1.2. Theoretical basis for financial stability and banking system stability

1.2.1. Definition, characteristics of financial stability and banking system stability

There have been different concepts about financial stability based on a close relationship between financial stability and banking system stability. Crockett (1997) associated banking instability with non-financial stress, which might cause damages in huge banks and bankruptcy in smaller ones. Consequently, banks with stable financial status were capable of satisfying their own responsibilities without any external support.

According to International Monetary Fund - IMF (2006), financial stability meant avoiding both the breakdown of great number of financial organizations and the interruption of financial intermediary function of banking system on the basis of payment, saving, credit distribution as well as efforts in supervising capital users and minimizing risks.

Borio (2003) explored financial stability with two major models, which based on micro and macro conservative elements. In particular, while micro conservative elements would help in decreasing bankruptcy possibility in each bank, macro ones should concentrate on economic system in general to reduce all negative impacts of the financial crisis. There have been certain studies demonstrating apparent findings related to those effects through the usage of loan loss provision out of total loan, and non-performing loan as measurement of credit risks which would put negative impacts on financial stability.

According to European Central Bank, ECB (2007), financial stability should refer to the status, of which the financial system would be comprised of financial intermediary, financial market and infrastructure being capable of handling risks and shocks caused by financial unbalance. This would lead to the decrease in possibility of breakdown of financial intermediary, which initially has negative impacts on saving distribution and investment.

1.2.2. Measurement of financial stability and banking system stability

Criteria for the evaluation of financial stability in general and each financial institution in particular: Financial stability indicators - FSIs have significant meaning in the evaluation of healthy of credit institutions. In 2006, IMF introduced financial stability indicators with 39 ones divided into two categories. Particularly, the first one would cover core indicators, including 12 ones related to banking area. The rest 27 indicators should belong to the second category with other banking indicators, which are linked with non-banking financial organizations, non-financial companies, households, financial market and real estate market. The introduction of non-banking indicators reflected the connection between financial sector and other real economic sectors, for example, disadvantages within enterprise sector illustrated by bank's loan portfolios might cause negative impact on financial stability.

In parallel with financial stability indicators published by IMF, ECB co-operated with the central banks of other country members in order to release measurement method and collect macro-prudential indicators – MPIs to observe financial performance of the banks, which would help in identifying possible risks arising from financial sector, especially banking area.

According to Geršl and Heřmánek (2007), there were huge differences between indicators introduced by IMF and those applied by ECB. *Firstly*, MPIs would demonstrate more numbers than FSIs. Different supervised areas and categories revealed that MPIs made great efforts in identifying and measuring numerous influencing factors on financial stability of banking sector in the Europe. *Secondly*, most MPIs related to the banks were published based on integrated principle, which meant that indicators for the banks in a specific country should cover branches, subsidiaries and other financial organizations controlled by those banks in other European countries.

There have been other indicators reflecting banking stability, which helped in reflecting stability of the financial system. So far, academic materials have been inconsistent in identifying representative indicators for banking risks in order to define risky banks and risky behaviours of the banks. Therefore, a wider but more specific concept of risk based on Z-score was approached serving the evaluation on financial stability, and aggregate risks or bankruptcy of the banks. **Bankruptcy score** (Z-score) was introduced by Ed Ward I. Altman in 1968 in order to forecast bankruptcy possibility of the banks and enterprises in the future. Additionally, Z-score was also regarded as a useful tool to identify fraud in financial statements. According to Altman (1968), managers might use Z-Score model to predict managing problems, especially those related to financial management in order to make timely decisions so that they could tackle arising matters, which might result in bankruptcy. At first, this study could forecast just 72% of bankruptcy possibility of a particular bank. Also, Z-score was created to give prediction of manufacturing companies. However, there were series of studies following this model. In the work by Altman (2000), Z-Score could help in the prediction of non-manufacturing companies. Altman and Hotchkiss (2006) researched changes of Z-Score to provide accurate prediction for most kinds of enterprises and financial sectors.

In order to be used for the prediction of bankruptcy, Z-score formula should be shown as the following:

$$Z\text{-}score = \frac{ROA + EA}{\sigma(ROA)}$$

ROA meant return on assets, EA meant equity-to-asset and σ (ROA) meant standard deviation of ROA. The greater the Z-score was, the more possibility of high financial stability or low aggregate risks. This score would be completely based on accounting data, illustrating the number of standard deviation of interest, at which if expected ROA value decreased, the equity would be dried up and it would be impossible for the banks to pay. This score also considered three important aspects in the evaluation on banks' performance, including capital adequacy ratio (CAR), profit and risks (reflected by standard deviation of ROA, or fluctuation of the profit) (Roy, 1952).

So far, Z-score has been regarded as an advisable representative indicator for aggregate risk of the banks, or a suggested tool for financial measurement because when this score decreases, the bankruptcy possibility would increase. According to Chiaramonte et, al. (2016), 76% of failure possibility of the banks could be predicted by well by Z-score. This score can be used to calculate risk-taking behaviour of the banks through their capitalization, profit and asset changes. These fluctuations would be appropriate with the evaluation of financial stability of the banks. Furthermore, another advantage of Z-score is its requirement of limited data and convenience to be calculated with available information on financial statements. This creates great priority for Z-score to be used in the evaluation of financial stability or aggregate risk of banking system in its development period.

2. Method

The authors used qualitative method through descriptive statistics; system observation method; analysis and synthesis method. In parallel, the financial indicators were used to analyse the financial and business situation of Vietnamese commercial banks. The secondary data was collected and synthesized from actual data in annual reports of Vietnamese commercial banks and the State Bank of Vietnam. In addition, data sources were also collected from official reports, official websites; scientific works related to the research topic.

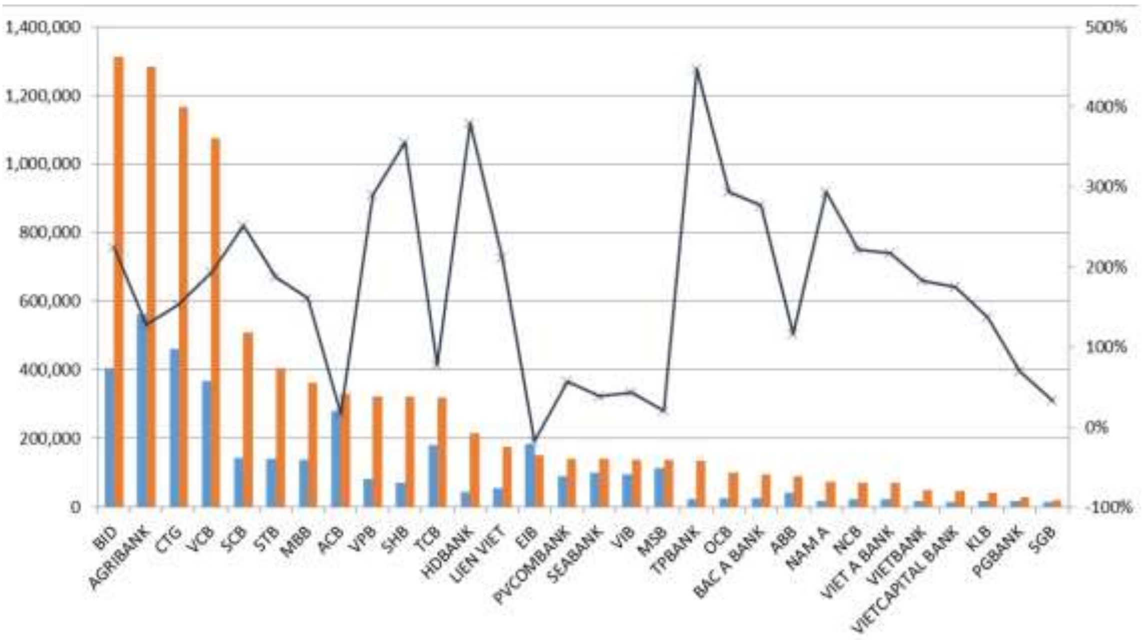
3. Results

3.1. Status of financial stability of commercial banking system in Vietnam based on FSIs

- ***Asset scale***

In 2013, there were 4 commercial banks with asset scale accounting more than 10 billion USD. However, by the end of 2018, there had been 11 banks achieving total asset with 10 billion USD.

Unit: Billion dong



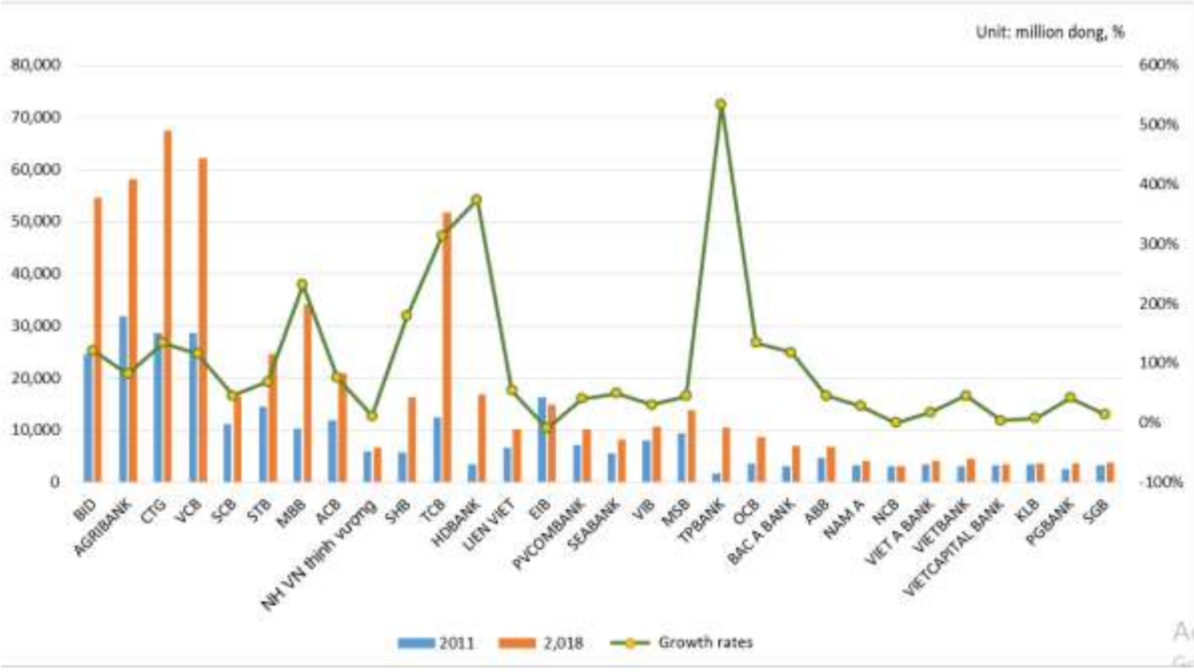
Source: Annual reports by Vietnamese commercial banks

Figure 1: Total asset of commercial banks in Vietnam

Most of these banks were those with great influence due to their market share accounting for 2/3 of deposit market and mobilization. In the past 5 years, the scale of credit organizations in Vietnam has been doubled. Total assets of Vietnam's credit organizations reached approximately 11 quadrillion at the end of 2018. Total asset of 30 banks at the end of 2018 was calculated at nearly 7,62 quadrillion, which increased by 10,35% compared with that number in the late of 2017.

➢ ***Equity capital scale***

This is the condition and the basis for a commercial bank to identify its operating scale. Despite its small or even extremely small proportion of total capital, equity capital is compared with a "mattress", which can prevent risks for operating activities of the banks. Equity capital also contributes to CAR, especially when the application of Basel II is approaching. Banks applying regulations of CAR at pre-deadline time would be prioritized by the State bank for their credit growth in 2020. Therefore, pressure on capital increase appears in commercial banks to successfully increase their capital so that they can achieve Basel II prior to the deadline.



Source: Annual reports by Vietnamese commercial banks

Figure 2: Equity capital scale of commercial banks in Vietnam

While total assets and equity capital of commercial banks have considerably grown up, the charter capital has slightly increased. By the end of 2018, charter capital of credit organizations in general had been supplemented with 152 trillion, of which, the number of charter capital of commercial banks accounted for the highest proportion with the best growth rate of 38% compared with that number at the end of 2013.

➢ *Capital mobilization scale*

In the past time, capital mobilizing activity of commercial banks in Vietnam has obtained considerable successes. Particularly, capital mobilization scale has experienced an upward trend through the years.

Table 1: Capital mobilization scale of commercial banks in Vietnam

Unit: Billion dong

No	Bank's name	2015	2016	2017	2018
1	Sacombank	259.428	302.806	325.461	370.136

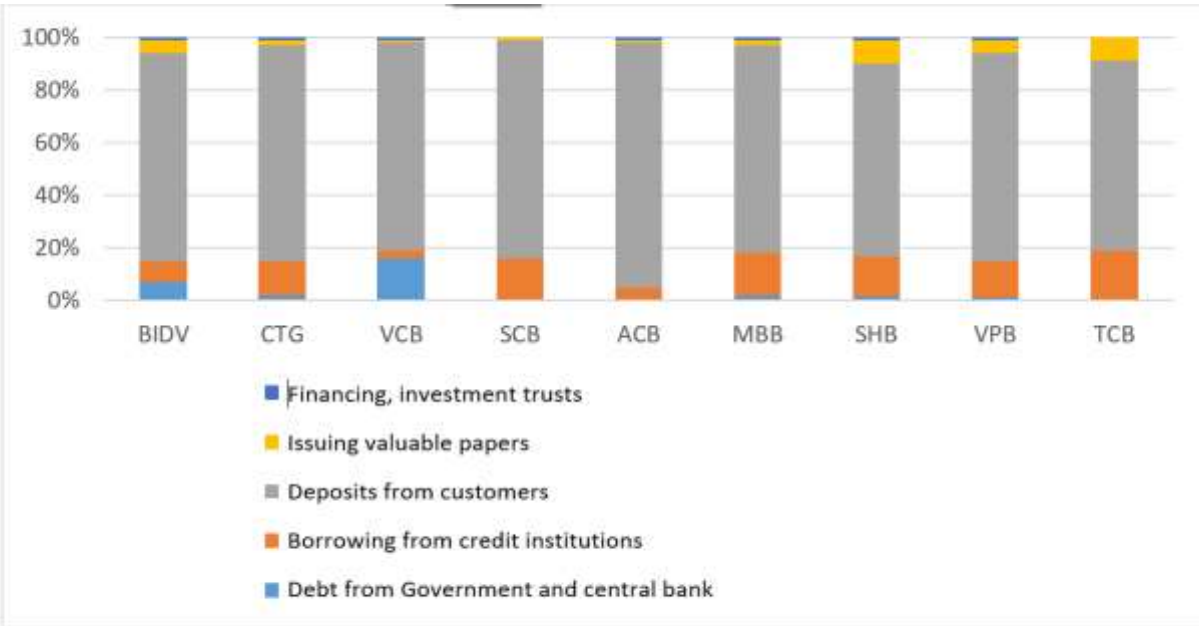
11	ACB	175.000	207.000	241.000	270.000

Source: Annual reports by Vietnamese commercial banks

The average capital mobilization structure of commercial banks in Vietnam in the period of 2015 - 2018 is illustrated in figure 3 below:

Unit: %



Source: Annual reports by Vietnamese commercial banks

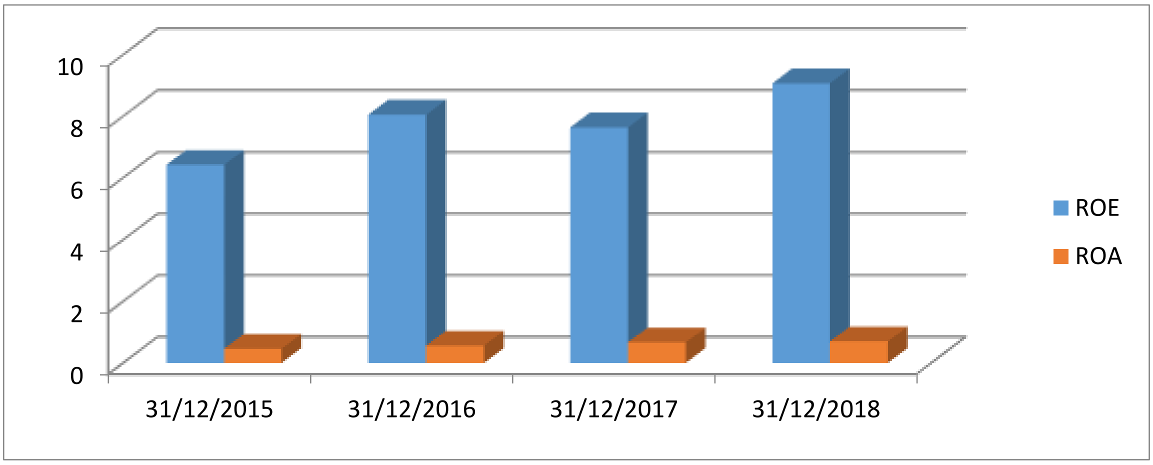
Figure 3: Capital mobilization structure of commercial banks in Vietnam

The above data reveals that capital mobilization source in the period of 2015 - 2018 concentrated mostly on customers' deposit. The second big capital source was loans from credit organizations and issue of commercial papers.

➢ ***Profitability***

Profitability is an important factor noticed by both managers and investors because when the banks attain high profit, they can keep their capital source, attract investment and increase market share.

Unit: %



Source: Annual report by the State bank of Vietnam

Figure 4: ROA and ROE of commercial banks in Vietnam

Two criteria to evaluate profitability of the banks are so-called ROE and ROA. The number of ROA and ROE depends on banks' scale, risks and seasonal business period. ROA of joint stock commercial banks (0,76%) was higher than that of the state commercial banks (0,62%), that number of foreign joint-venture banks was 0,88%. ROA of the whole banking system in four recent years has been more stable, which increased from 0,46% in 2015 to 0,7% in 2018.

Table 2: ROA, ROE of certain commercial banks in Vietnam

Unit: %

Bank's name	ROA				ROE			
	2015	**2016**	**2017**	**2018**	**2015**	**2016**	**2017**	**2018**
STB	0,27	0,03	0,29	0,46	3,23	0,40	4,40	7,48
SHB	0,43	0,42	0,59	0,55	7,32	7,46	11,03	10,66
VPB	1,34	1,86	2,54	2,45	24,38	28,26	27,48	22,83
SGB	0,26	0,76	0,27	0,20	1,25	4,04	1,58	1,22
SCB	0,03	0,02	0,03	0,03	0,54	0,49	0,78	0,95
VIB	0,63	0,59	0,99	1,67	6,09	6,47	12,83	22,55
TCB	0,83	1,47	2,55	2,87	9,73	17,47	27,71	21,52
MBB	1,18	1,20	1,21	1,81	12,5	11,91	12,93	20,10
BID	0,84	0,66	0,61	0,59	16,97	14,62	15,34	15,08
VCB	0,85	0,93	1	1,39	12,03	14,70	18,10	25,18
CTG	0,79	0,78	0,73	0,48	10,28	11,64	12,03	8,30
ACB	0,54	0,61	0,82	1,67	8,17	9,87	14,08	27,73

Source: Annual reports by Vietnamese commercial banks

It can be seen that different banks experienced different growth rate of total assets and profit. Banks with small and medium scale obtained high ROA whereas public-owned banks maintained relatively low ROA compared with the average number of the sector. The rest banks mainly achieved the rate between 0,5% and below 1%. The group of banks with effective performance, creating great profit obtained ROA from 1% to 2%. However, it is noticeable for the banks that activities with higher profit will be in parallel with higher risks.

Especially, ROE was contrastive to ROA. Also, medium and large scale banks had higher ROE than small scale ones. Based on the Circular No. 41/2016/TT-NHNN, banks should keep increasing equity capital to satisfy CAR in 2018. However, the growth rate of equity capital of the banks was not the same as post-tax profit growth rate. Therefore, ROE was still at high rate. Noticeably, in three years from 2016 to 2018, huge banks shared the same trend of decreasing ROE. At the same time, certain ones with small capitalization grew up gradually and even at sudden number.

Although all the banks tried to achieve positive profit, their effectiveness of asset and capital source exploration was differentiated. In particular, 3 banks with state capital namely BIDV, VietinBank and Vietcombank were those with the biggest assets and equity capital. However, they were not those with the most effectiveness exploration of asset and equity capital. Indicators in the report showed that there were private-owned commercial banks performing great effectiveness of asset usage.

➢ *Outstanding debt, non-performing loan*

Table 3: Non-performing loan ratio of commercial banks in Vietnam

Unit: %

Bank’s name		Non-performing loan ratio			
		2015	2016	2017	2018
1	STB	1,86	6,91	4,67	2,11
2	SHB	1,72	1,88	1,90	2,4
3	VPB	2,69	2,91	3,39	3,51
4	SGB			2,98	2,20
5	EIB	186	2,95	2,27	1,84
6	VIB		2,58	2,64	2,52
7	TCB	1,67	1,58	1,61	1,75
8	MBB	1,61	1,32	1,20	1,32
9	BID	1,68	1,99	1,62	1,69
10	VCB	1,84	1,50	1,14	0,98
11	CTG	0,92	1,02	1,14	1,56
12	ACB	1,32	0,88	0,70	0,73

Source: Annual reports by Vietnamese commercial banks

In 2015, the rate of non-performing loan of banking system decreased at nearly 3% of debit balance. Particularly, 60% of non-performing loan was tackled by cash collection, disposition of property and increase in loss provision. In 2016, the rate of non-performing loan experienced an upward trend compared with that number in the late of 2015. Total non-performing loan grew up to more than 14.876 billion, equal to an increase by 43% compared with 2015. In 2017, the whole banking system significantly decreased the rate of non-performing loan from 11,9% to about 9,5% because potential non-performing loan was restructured, receivables were hard to be collected and corporate bonds decreased. Financial reports in 2017 of 13 huge and average banks in Vietnam showed that total non-performing loan was at 60.533 billion, slightly increasing by 0,7% compared with early months of the same year. In 2018, generally, non-performing loan was handled with dramatically decreasing react. Based on the report by the State Bank, by the end of December, 2018, all credit organizations resolved 149,22 trillion, the rate of non-performing loans within credit organizations was 1,89%, showing a decrease compared with 2,46% at the end of 2016 and 1,99% at the end of 2017.

➢ *Capital adequacy ratio (CAR)*

During two continuous years, 2015-2016, average number of CAR of banking system in Vietnam was greater than 9%, which followed the regulation. This number was obviously categorized among small and large scale banks. The former ones had higher CAR, whereas the latter one had smaller CAR. In 2016, it can be seen that there was no increase in CAR. However, banks' profit grew up positively. According to the report by the State bank, CAR of Vietnam's banking system was 12,84% in 2016, which was not much different from 2015 with 13%. Also, joint-venture and foreign banks had CAR at 33,2%, that number of state-owned commercial banks was 9,92%, and joint stock commercial banks was 11,8%.

Table 4: Capital adequacy ratio of certain commercial banks in Vietnam

(Unit: %)

No	Bank's name	2015	2016	2017	2018
1	Sacombank	10,96	9,61	11,30	11,9
2	SHB	11,40	13	13,00	11,88
3	VP Bank	12,20	13,20	14,60	12,3
4	SGB	15,23	15,72	14,07	14,03
5	VIB	18,04	13,25	13,07	12,9
6	TCB	14,74	6,18	12,73	14,3
7	MB	12,85	12,15	10,99	10,9
8	BIDV	9,81	9,50	10,90	10,3
9	Vietcombank	11,04	11,13	8,80	12,1
10	ACB	12,80	13,19	11,49	12,81

Source: Annual report by the State bank of Vietnam

Data by the State bank showed that at the end of January 2018, CAR of the banking system was 12,37%; this number on February 2019 was 11,8%, of which, CAR of state-owned commercial banks was 9,42% and that of joint stock commercial banks was 10,76%. Compared with the findings at the end of 2018, CAR of the whole system and that of two above groups decreased at the end of February 2019. Consolidation of reports by 20 commercial banks presented in annual meetings in 2019 demonstrated that there were 16/20 banks publishing CAR. Also, there were certain banks evaluating that their CAR in 2018 improved compared with the previous year. By the end of December 2018, CAR of all the banks had decreased compared with early months of the year. In particular, the lowest number belonged to banks with the state capital (9.52%) and joint stock ones (11.24%). In regard of joint stock commercial banks, pressure on capital increase was rather slight when they were capable of keeping post-tax profit. At the same time, CAR within these banks was at safer level than the state-owned ones.

3.2. Status of financial stability of Vietnam's commercial banks based on Z- score

The above analysis shows the status of financial stability of Vietnam's banking system through FSIs indicators including total assets, total capital source, equity capital scale, CAR, indicators reflecting operating competency like ROA, ROE and those reflecting possible risks such as non-performing loan, outstanding debt. Based on these findings, the author calculated data to show the average index for the whole banking system, which also includes Z-score.

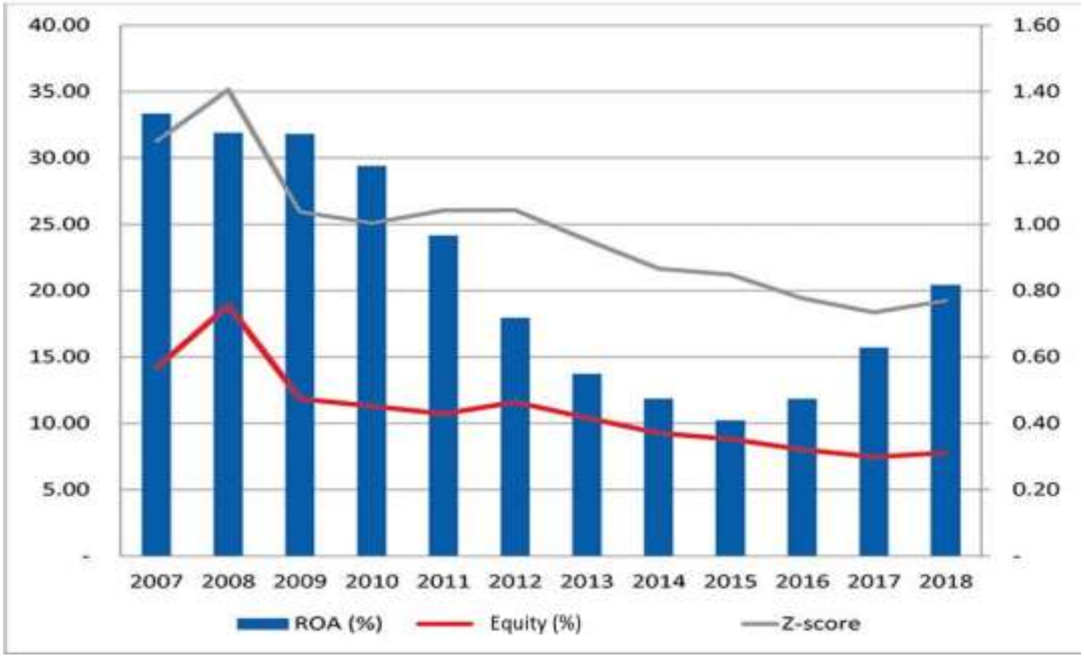
The statistical report is presented in table 5. It is obvious that operating performance, credit risks and capital adequacy of Vietnam's commercial banks have experienced great gaps with considerable differences between the extremes of measurement as well as huge deviation.

Table 5: Distribution value of indicators for the evaluation of stability of Vietnam's commercial banks

Indicators	Average	Standard deviation	Min Value	Max Value
ROA (%)	0,82	0,77	-5,51	5,95
Equity ratio (%)	10,75	7,42	3,25	80,83
Z-score	24,27	12,96	0,59	93,21
Provisioning rate (%)	1,27	0,62	0,00	3,97
NPLs ratio (%)	2,27	1,48	0,08	11,40

Source: Consolidation and calculation from annual reports by Vietnamese commercial banks

The above data states that ROA fluctuates from -5,51% to 5,95%, with the mean of 0,82%, showing deviation in terms of performance of Vietnam's commercial banks. The relatively low mean is appropriate with the status of initial development stage of banking system in Vietnam.



Source: Consolidation and calculation from annual reports by Vietnamese commercial banks

Figure 5. Financial stability of Vietnam's banking system based on Z-score

This figure reveals that Z-score dramatically decreased in 2008, when there was global financial crisis. This was partially distracted by the decline in ROA as analyzed above, which was an important part in the formula to calculate Z-score. However, it can be seen that the increase in benefit in 2015 was inadequate to create parallel rise in Z-score. This demonstrates that the increase in profit could not compensate for the poor capital buffer of the banks in this period. At the same time, although Vietnam's commercial banks were required to increase capital, especially in the context of Basel-based capital advocacy establishment; obstacles from too fast growth in credit and decreasing credit quality put pressure on the banks' capital buffer. Furthermore, the rise in capital within State-owned commercial banks was largely connected with the Government's managing direction and control. Therefore, it is possible that the continuously decreasing Z-score from 2008 better reflected the status of capital advocacy of Vietnam's commercial banks than fluctuations of comparative profit.

4. Discussion and Conclusion

Evaluation on stability of Vietnam's commercial banks based on financial stability indicator and Z- score.

Asset and equity capital: The equity capital to total asset ratio calculated for 25 commercial banks showed that the average number in 2017 and 2018 was 8,29%. Among these banks, there were 15 ones owning higher index than the average number of the group. The data stated that the equity to total asset ratio of three among four Big4 banks (Vietcombank, BIDV, Vietinbank) was smaller than the average number of the group. This reveals that huge banks were under the trend of using financial leverage with higher rate than equity capital. The reason for this was the banks' capability of attracting big deposit. Also, equity-to-assets ratio reflected a highly potential risk related to liquidity of the banks. In fact, the equity is the mattress to minimize shocks causing risks for the banks. So, if it is too weak compared with total capital source, the banks would find it difficult to satisfy liquidity. Despite their small equity-to-assets ratio, huge banks have good reputation, large capital scale, which would help them in stable performance and competency to confront strong economic changes. However, in regard of other banks, if the above ratio is too small, it would cause an alarming situation for the stability and development of Vietnam's commercial banking system.

Deposit**:** The ratio of total deposit to total outstanding balance for all the surveyed banks was 125,47%, of which, 15 banks achieved higher number than the average of the group. If compared with that ratio for Philippines and Indonesia (164,57% and 144,72% respectively), it can be seen that the above number for Vietnam's commercial banks was much lower than countries in the same region. This means that capital mobilized from deposit was not strong and huge enough to satisfy lending demand and payment of Vietnam's banks, which would result in instability in the operation of banking system in the case of unexpected affairs as well as impact on liquidity assurance of the banks.

Profitability**:** mean of ROA was calculated at 0,82%, which was lower than Philippines (1,28%) and Indonesia (1,87%). This means that ROA of commercial banks in Vietnam was weaker than other countries in the same region. There were 18 out of 25 surveyed banks having greater ROA than the average number of the group. In regard of ROE, with 15,80%, ROE of Vietnam was higher than Philippines 12,50%, although it was lower than that of Indonesia 17,51%. An insight into the banking system shows that there were 12 banks owning ROE higher than the average number of the group. This was compatible with banks in the research because when most huge commercial banks in Vietnam mobilized large loan, the ratio of equity to capital would be small, resulting in huge ROE.

Non-performing loans*:* The average ratio of non-performing loans to total debit balance was 2,27%, which was lower than Indonesia 2,57% and Philippines 3,56%. So, it can be stated that the status of credit risk and non-performing loans in Vietnam's commercial banking system was lower than that of other countries in the region. The fact that most large banks owning higher non-performing loans than the average rate revealed poor credit quality. This might be caused by pressure from credit growth, which led to poor concentration on project approval, review and returning capability of the borrowers.

***Z-score**:* Mean Z-score 24,27 of Vietnam's commercial banks was at compatible rate with the average number of more than 1.000 commercial banks in 29 new emerging countries in the world. In particular, that number of banks in Middle and Eastern Europe, Latin America and Asia was 24,61 in the period of 2000-2012 (Chen et, al., 2017). However, when compared with banks in developed countries in European area, Z-score of commercial banks in Vietnam was lower. Specifically, Z-score of 20 developing countries in the Europe was 28,22 in the period of 2000–2015 (Brana et, al., 2019). Previous studies stated that banking system in developing countries was highly stable. At the same time, in new emerging and developing economies, the stability of the banks was demonstrated to be lower.

Statistics indicated that based in Z-score, the decline in capital buffer would probably be the most important influencing factor on the stability of Vietnam's commercial banks. In other words, if the banks were incapable of sponsoring for their supplementary instruments like CAR assurance, they would have difficulties in providing possible responses to tackle with any financial obstacles. By contrast, post-tax profit of the banks would not contribute much to the reflection of financial instability. At the same time, risks in lending activities might cause damages for stability of the banking system, which would have huge delay.

DEVELOPMENT SUPPLY CHAIN OF SAFE FOOD IN HANOI

MSc. Duong Thi Hoa

hoadt@neu.edu.vn

Faculty of Marketing, National Economics University, Hanoi, Vietnam

Abstract

The issue of safe food has been receiving great attention in countries like Vietnam and in Hanoi specifically. To ensure food safety, the supply chain needs to be analysed and improved. The result of qualitative research has shown that most supply chains providing safe poultry and vegetable in Hanoi have very loose relationships and most participating members do not care about how the safety of their food is ensured throughout the chain. This research calls for immediate changes in the behavior of participating members of the chain, in supply chain management and in policies as well.

Keywords: *Supply chain, supply chain management, safe food.*

1. Introduction

Food consumption has always been important in the lives of Vietnamese people. The strong urbanization process has led to an increasing demand for food in both quantity and quality in the large urban markets. Food quality is directly related to human health. The consumption of unsafe food not only negatively affects the health of the people but also the development of the race and the future of the whole Vietnamese nation, causing frustration for the whole society. The issue of ensuring safe food supply for consumers, especially in big cities, is gathering more and more attention in Vietnam. The supply chain of food items is a system of network of livestock establishments, processing facilities, food distributors and the final consumer. Therefore, research in developing supply chain models linking the stages of production, processing, distribution, circulation, consumption by industry, group or food item with many participants, in order to ensure the supply of safe food for the people is an urgent requirement of Vietnam today. With safe food supply model, food hygiene and safety will be controlled from the origin and throughout the entire circulation process from farms to the consumer's table.

Hanoi with a population of about 9 million in 2020, in which the urban population accounts for a large proportion, this is a large market for food products. The reality of the Hanoi market is that there are many types of food that are not safe and hygienic while they are an important commodity for Hanoi consumers. Businesses providing safe food products are facing many difficulties because they have not been able to convince consumers to buy and use them. There are also supermarkets and retail chains such as Big Green, Big C, BacTom, etc being interested in organizing the supply chain of products sold in their system.

In fact, the supply chains of safe food for the Hanoi market in the direction of linkage are few and their activities are very limited. In addition, state management agencies do not have good mechanisms and policies to manage the food market, control food hygiene and safety, and protect people's health and the living environment. How to develop effective safe food supply chains for the Hanoi market? How to change the method of buying and selling food in the direction of modern civilization and safety? How to organize and manage the entire food production and distribution process according to safety standards and achieve business efficiency? Which safe food supply chain model should be developed for the Hanoi market? The above are pressing questions for safe food manufacturers and regulators. For the above reasons, the research aims to develop safe food supply chains for the Hanoi market. In the results of this study, the authors focus on presenting two main chains: safe poultry chain and safe vegetable chain.

2. Method

- Approach: The study uses a supply chain approach in the analysis of safe food supply chains for the Hanoi market. The study will use this approach to map the safe food supply chain, describe the activities and functions of the chain, and describe the actors involved in the chain from producers, processors, distributors. distribution, to the final consumer. Comprehensive study of actors involved in the safe food supply chain across all aspects of business operations wil be conducted. The research comprehensively analyzes the theoretical basis of the safe food supply chain for markets to provide objective perspectives, principles and steps in the process of safe food supply chain management.

The research project of safe food supply chain models has been successful at home and abroad to draw lessons for safe food supply chain management for the Hanoi market. The thesis researches the issue of safe food supply chain management from the point of view of system administration and in relation to other activities of business entities. In particular, the topic also studies the role of state management, the legal system in the management of safe food supply chains for the Hanoi market. With the above scientific approach, the research will propose specific orientations and solutions for safe food supply chain management for Hanoi market in particular and Vietnamese cities in general. The proposed solutions include both short-term and long-term ones to ensure high applicability in practice.

- Information/data to be used in the research: Primary and secondary information

- Data collection and analysis method:

+ Empirical survey: The project is expected to investigate and survey groups of members in the supply chain of safe poultry and safe vegetables for Hanoi market, including: Group of households, farms , enterprises; Group of organizations and household businesses, wholesale and retail of safe vegetables; The final consumer is the household,...

+ The topic investigates the above groups to collect information about the supply chain such as behavioral characteristics of actors participating in the chain; scale, structure and characteristics of customers consuming safe poultry and safe vegetables for Hanoi market,...

+ In-depth interview: the topic conducts in-depth interviews with state management agencies, businesses, and households participating in the supply chain to collect qualitative information about the supply chain.

+ Group discussion: conducted with a group of retailers (each group of 15 retailers) and consumers (each group of 15 consumers) to collect qualitative information about their ability to participate in supply chain, job allocation in the chain, governance, innovation and upgrading capabilities in the chain.

3. Results and discussion

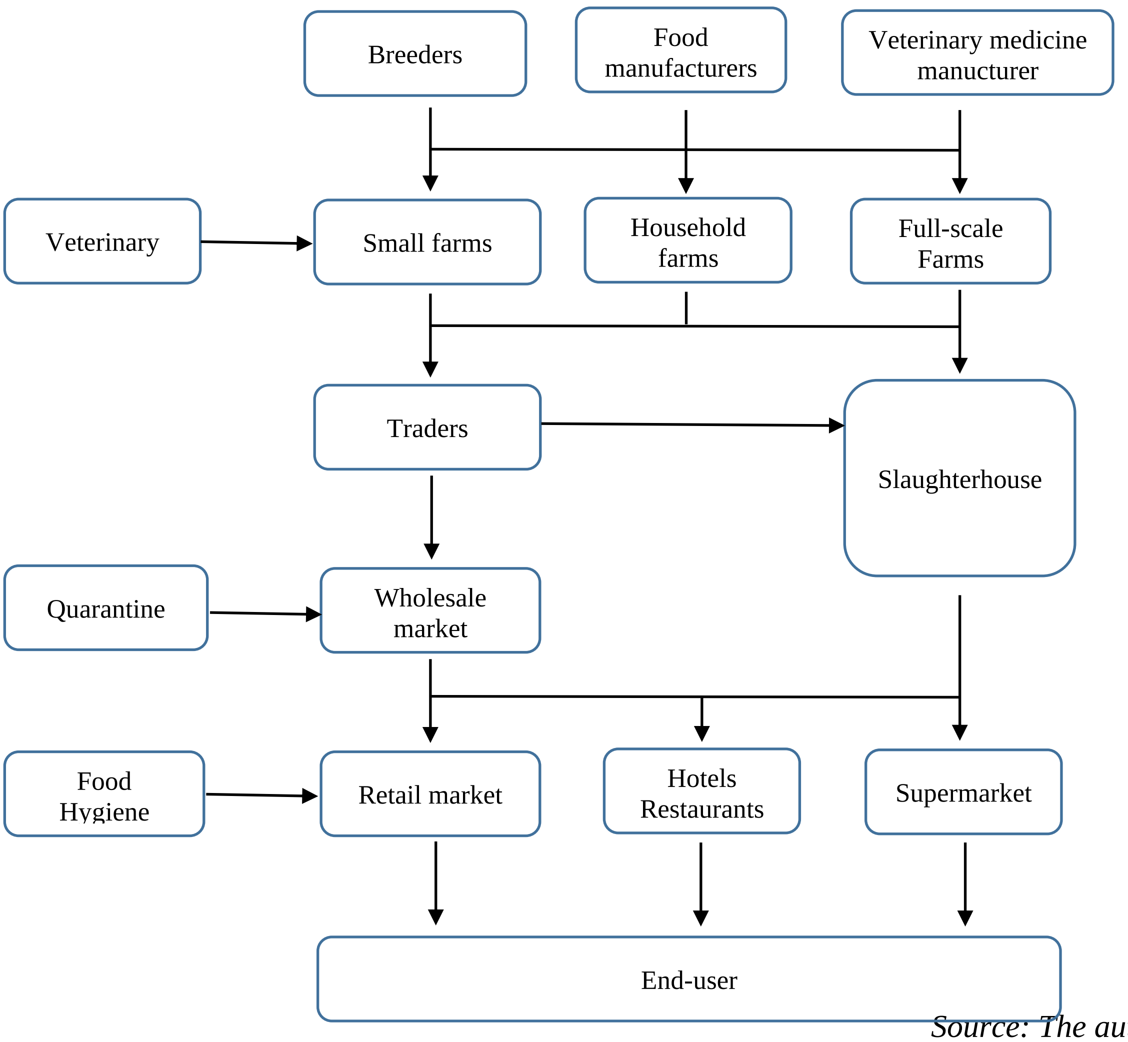
3.1 Current state of poultry product supply chains for Hanoi market

3.1.1 Current state of poultry product supply chain models

It can be seen that, to serve the inner-city market of Hanoi with nearly 9 million people is a network system of many complex poultry supply chains with many different intermediaries and many different types of poultry, participating business organizations and poultry supply chains intertwine and integrate with other food supply chains in the market. Most poultry supply chains are small in scale, with a narrow market scope. Besides the traditional poultry supply chain system, modern poultry supply chains have also been formed (although the number is still small).

A survey of poultry supply chain models serving the current inner-city market in Hanoi shows that most of the poultry supply chains operate in a pure market relationship model (meeting 80% of market demand).). Only about 20% of poultry products reach consumers' tables through organized supply chains, mainly supermarkets and large processing enterprises. The results of the survey of chain participants from poultry farmers to poultry distribution participants show that the chains are organized and governed in the style of a pure market relationship with many organizations/enterprises and participating individuals have formed a complex supply network in the Hanoi market. Poultry from raising households through traders is concentrated to sell to wholesalers at wholesale markets and from there through these poultry business households for further distribution to retailers and end consumers. and. With tens of thousands of livestock from households in the suburbs and neighboring provinces, hundreds of collectors, hundreds of wholesalers at wholesale markets and thousands of retail poultry shops in markets throughout the inner city. Hanoi has made the poultry supply network quite complicated. According to statistics, there are 1,042 markets in Hanoi's inner city; 417 supermarkets and fresh food stores; about 4,200 establishments consuming poultry meat products such as restaurants, hotels and collective kitchens. As a result, the poultry supply chain for Hanoi often has to go through many intermediaries, leading to increased transportation costs and high selling prices. Moreover, because there are many intermediaries and many members are involved in each stage of the supply chain, it is difficult to trace the origin of poultry and it is difficult to control food safety due to the steps in the chain. Therefore, the quality and safety of poultry products sold to Hanoi consumers are not guaranteed. Through the survey of large poultry raising areas such as Yen The, Ba Vi, Chuong My, the farming households all reflect that the consumption of products is completely dependent on traders. Traders buy according to their consumption capacity and market price at the time, with no commitment to livestock producers. On the contrary, livestock households do not have commitments to sell poultry to specific traders. The form of a product sales contract and a mechanism to ensure contract performance are not yet available. Traders depend on the orders of wholesalers at the wholesale market. However, the binding between traders and wholesalers is also loose and based on the commitment of each deal. Linkages between breeders, traders, wholesalers and retailers have not yet been formed. In the traditional poultry supply chains on the Hanoi market, the business relationship is often through buy-and-sell transactions between two adjacent members. Traders collect and buy poultry from farms and sell them to wholesalers at wholesale markets. Farmers only know about traders who buy and sell and do not care how their poultry continues their journey to consumers' tables. Breeders, traders, wholesalers and retailers participate in transactions only to seek direct profits, they are not interested in the operation of the entire chain. Therefore, the division of work and benefits between members in the chain is often not reasonable or fair. The operation of the chain is expressed through free transactions between independent business organizations/individuals who do not have a leadership role in the activities of all stages in the supply chain. In the current poultry supply chain structure, there are many competitive acts both horizontally and vertically, including conflicting acts. As a result, the chain of operations is inefficient, there are many conflicts that take place, breaking the existing business relationship, such as disagreements about operating locations, prices, delivery conditions, quantity and product quality, etc. When there are conflicts, chain members are willing to abandon the current business relationship in search of another (other supply chain) relationship that is more profitable, increasing circulation costs due to the disruption from overlapping functional operations in the chain.

Figure 1: Poultry supply chain for Hanoi inner city



Source: The author

Due to the large number of livestock raising households, small-scale collectors and retailers, the transaction relationships in the chain are very complicated, sometimes overlapping. The lack of system-wide management has led chain members to pursue short-term profits and their own goals, and has also given rise to negative issues in food safety and hygiene such as the use of banned substances in raising and preserving poultry meat causing unsafe food.

3.1.2. Current state of relationships and linkage mechanisms among members in the poultry product supply chain for the Hanoi market

As pointed out above, the food supply chains for the inner city market in Hanoi are mainly chains according to traditional market relations, so the linkage between chain members is very loose. Business transactions are mainly on a case-by-case basis, with little commitment to maintaining a long-term business relationship. The mechanism to create the link is mainly based on the credibility of the business person. Sanctions to create a solid guarantee of purchase and sale relationships between organizations participating in the supply chain are incomplete and not yet effective.

Relationships among members in traditional supply chains

First, the relationship between farms and livestock households with customers who are traders or slaughterhouses. Breeders sell products to these customers on a one-to-one basis. Traders buy poultry from households and then sell it to wholesalers at wholesale markets, accounting for the largest proportion (95%), in addition, poultry slaughterhouses also buy directly from households. Poultry household farms in the suburbs of Hanoi and neighboring provinces are mostly small-scale ones. Poultry sold to traders usually does not have a legal contract. Quantity and price agreements are based on acquaintance and trust between individuals, payment is mainly in cash.

Second, the relationship between traders and wholesalers at wholesale markets. These links are relatively loose. Wholesalers at the wholesale market can import goods from many different traders. Although, traders also have prior contacts with wholesalers regarding the number of batches of poultry. However, the wholesaler's commitment on the quantity of imported goods is usually on a per shipment basis, with no long-term commitments. Wholesalers easily switch to import goods from new traders if they see better prices and supply conditions.

Third, the relationship between wholesalers at wholesale markets, poultry slaughterhouses, retail establishments, and processing facilities. The link and coordination between the members of the chain at the last stage before the poultry reaches the consumer's table is less binding. As mentioned above, consumers have the habit of buying fresh poultry and poultry products. This leads Hanoi people to buy poultry mainly from small retailers in traditional markets and poultry retail business households buy poultry from wholesalers for slaughter, preliminary processing, and sale. for consumers. Due to the small daily consumption, retailers do not usually rely on long-term, secure supply contracts.

A general assessment of the limitations in the linkage relationship between members of the traditional poultry supply chains for the Hanoi market can be seen:

First, the lack of a leading link in the chain. Except for the chains of large companies and traditional supply chains, the cooperation is mostly spontaneous and usually occurs in only a few stages of the chain. There has been no cooperation from the stage of business planning of each chain member, only stopping at the stage of direct purchase and sale of poultry products.

Second, the degree of linkage between the stages in the chain is often loose, the level of commitment is very low, the cooperation and consistent implementation of commitments *among the chain members are not high, resulting in commitment terminating*. The act of mixing poultry products of unknown origin into the supply of goods delivered to buyers is relatively common. Trust among chain members on the stability of long-term business relationships is low, so they often conduct business according to short-term benefit calculations.

Third, in the chain, there are many intermediary stages that do not significantly contribute to the real value of the chain (5%) but account for a large share of economic benefits, accounting for 19-21% of the chain's profits, compared to 4.5 – 8.5 % of the farmers (according to the survey results of the Department of Livestock Production).

Fourth, it is not possible to create a system of organizations supporting the poultry trading activities of the chain members effectively, for example, to coordinate in transportation, to share information on the consumption market, to buy input materials of the livestock industry, and to coordinate to increase the economic value of by-products, etc.

Fifth, business transactions are often not planned in advance. The majority of enterprises and organizations participating in the poultry supply chain admit that they make business transaction decisions mainly based on habit rather than on scientific research, and that the transaction process is an iterative one. Iterative, in which later decisions are based on discoveries and experience drawn from previous (possibly erroneous) decisions and of other firms.

Sixth, the lack of respect for legal contracts in the course of business transactions is quite common in poultry supply chains for Hanoi, showing the low level of effectiveness of Vietnam's legal system. In addition, the business culture of entrepreneurs is oriented towards free transactions without regard to legal issues. Confidence in the protection of the law for the rights and responsibilities of each party in business transactions is still low.

Seventh, the chain members are not interested in cooperation links in the chain, making them unable to ensure food hygiene and safety througout the whole chain. Loss of food safety and hygiene can occur in every stage of the poultry supply chain. The participating members do not see their responsibility to ensure food hygiene and safety for the final product. The organization of business transactions is fragmented in a random fashion, and management is based on experience, not knowledge. Additionally, poultry supply chain participation is very low. Safe food traders in general and safe poultry in particular are very vulnerable to changes in the macro environment, bankruptcy or downsizing of their businesses.

3.2. Situation of safe vegetable supply chain for inner city of Hanoi

Through the survey, the farmer households all reflected the reality of consuming safe vegetables mainly through retail stores and supermarkets in Hanoi. These retailers buy according to their consumption capacity and market prices at the time, with no long-term commitments. This relationship is relatively loose based on the commitment of each deal. In traditional supply chains, there is no link between farmers, wholesalers and retailers. Business relations are direct transactions for profit, the parties are not interested in the operation of the entire chain. The lack of system-wide management has led chain members to pursue short-term profits and their own goals, which has also generated negative effects in ensuring food hygiene and safety. The analysis shows that safe rations cannot be supplied to the market through the current free market mechanism supply system. Safe vegetable must be supplied to customers along proactively organized and managed supply chains that link from farmer to retailer.

A relatively typical model of a safe vegetable supply chain for the Hanoi market is the *Dominant model of Supply Chain Management*. Dominant supply chain management occurs when smallholder farmers are dominated by large distributors/buyers who have the power to control all stages of the supply chain. Organizing and operating these chains is a large retailer with a chain of safe food stores that actively places orders, commits to purchasing and consuming safe agricultural products for smallholder farmers in production areas. For example, Hon Dat State Company Limited, with a chain of 22 food stores under the brand name Bac Tom in the inner city of Hanoi, has established the supply of agricultural products from hundreds of small farmers in safe production areas. with certain commitments. The company has staffs to supervise the agricultural production of farmers to ensure the correct safe production process and that the agricultural products meet the standards set by the company.

A number of large retailers have been implementing supply chains that are managed in the style of enterprises signing contracts to ensure the supply of seeds and agricultural materials to farmers, and at the same time cover all safe agricultural products. . For example, Vietnam Joint Stock Company has invested quite successfully with the 3F business model from feed production to livestock farms and retail stores. Some other supply chains are organized by large supermarkets such as Vinmart and Big C import safe vegetables regularly from a number of large contracted purchasing centers.

However, the reality is that many safe vegetable supply chains operate inefficiently, and some chains even fail. The relationship between agricultural farmers and consumer enterprises is still loose. The fact that the retail company organizing the chain has not been able to manage the entire operation of the chain, leading to the failure to ensure the quality standards of safe vegetables and not to create the trust of customers. Many chains have not yet been able to sign contracts between retailers and farmers. If there is a contract, contract enforcement is not serious. Some contracts between purchasing focal points and supermarkets are not supervised to ensure compliance with the commitment to safe vegetable quality standards. In fact, even the safe food supply chains organized by large supermarkets have strict management processes but still allow contaminated food products or excessive antibiotic and banned substances residues. There are many reasons for the inefficient operation of the chains, including the inherent behavior of chain actors, which has led to difficulty in managing the supply chains of safe vegetables in the Hanoi market.

Figure 2: A typical model of a safe vegetable supply chain in Hanoi

Source: The author

4. Conclusion

To successfully develop safe food supply chains for the Hanoi market, it is necessary to have policies and solutions to accelerate the transformation and upgrade of existing supply chains and build organized supply chain models led by a large and powerful member. At the same time, it is necessary to improve the effectiveness of law enforcement in the field of ensuring food hygiene and safety, ensuring regulations and quality standards for products sold on the market.

Transforming and upgrading existing traditional supply chains with many limitations such as unsanitary products, low economic efficiency and low competitiveness is a process that requires strong and long-term efforts of many organizations and actors. Understanding the factors driving this process will help organizations participating in the safe food supply chain transform and upgrade themselves to achieve better business results and better meet consumer needs. Institutional actors such as authorities, functional agencies implementing food hygiene and safety monitoring also need to improve laws, processes, procedures and implementation methods to apply pressure to accelerate the transition process.

Therefore, there is a need for a fundamental and comprehensive change in the roles and activities of organizations and actors involved in the supply chain of safe cities for Vietnamese cities. The process of improving the strength and capacity of chain management of members will also be the process of shifting supply chain management from discrete market relationships, from unorganized to organized chains that have leadership members based on association with higher business efficiency, ensuring better food safety and hygiene. The legal system and the operation of food safety management agencies need to change in order to better supervise and create a fair business environment for all participants in the supply chain.

CULTURE WITH QUALITIES AND BEHAVIORS OF BUSINESS LEADERS – THE FOUNDATION OF SUSTAINABLE LEADERSHIP

MBA. Tran Thi Le Na
lenalongdhv@gmail.com
PhD. Luong Thu Ha
haluongthu@yahoo.com
National Economics University, Hanoi, Vietnam

Abstract

Leaders are often envisioned as powerful and influential individuals in all fields from politics, society, and business. The leaders are always charismatic; hence, they can gather and inspire a large number of people. They can build powerful empires; assemble huge armies; build - operate - pass on sustainable businesses over the centuries... It is undoubtedly that sustainable leadership results are the desire achievements of all leaders.

This study was carried out with the aim to determine a theoretical model of the relationship between culture and leadership qualities – behavior. The authors believe this relationship is sustainable because culture is permanent. It is also the foundation for leaders to influence their employees to create a stable, engaged, and devoted workforce, thereby helping leaders attain sustainable leadership results.

Keywords: *leadership qualities, leadership behaviors, relationships, regional culture*

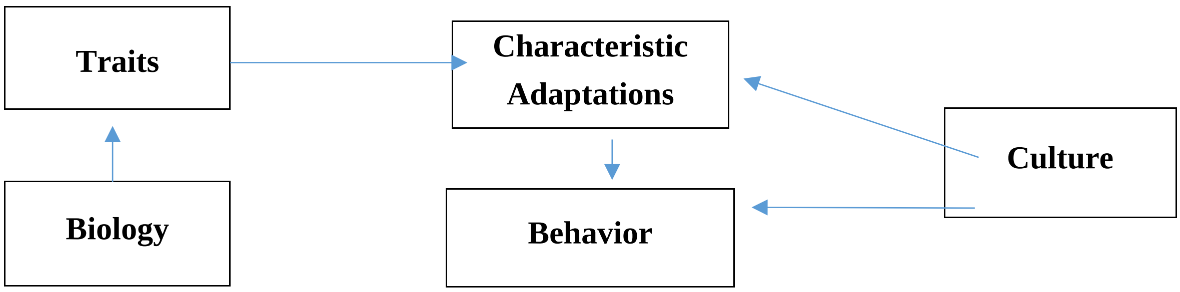
1. Introduction

The North Central region includes 6 provinces: Thanh Hoa, Nghe An, Ha Tinh, Quang Binh, Quang Tri, and Thua Thien Hue. According to Ngo Duc Thinh (2004), this cultural region can be divided into 3 sub-regions: Thanh Hoa, Nghe Tinh (including Nghe An and Ha Tinh), and Binh Tri Thien (including Quang Binh, Quang Tri, and Thua Thien Hue) cultural sub-regions. During the analyzing process, the author believed that Thanh Hoa's cultural sub-region is intermediate and transitional between the Northern and North Central cultural regions. Similarly, the culture of Thua Thien Hue in the Binh Tri Thien sub-region also bears the transition of the North Central Coast culture and the South Central as well as Southern culture. Hence, the Nghe Tinh sub-region can be considered a typical representative of the culture of the North Central region. Moreover, further research regarding the culture of the Nghe Tinh cultural sub-region will contribute to clarifying that of the North Central. Therefore, in order to build a theoretical model between cultural factors, leadership qualities, and behaviors as well as sustainable leadership results, this paper's authors will focus on enterprises in the Nghe Tinh cultural sub-region.

2. Theoretical Background

According to C. Marx, the social side is the nature of the human being and the biological side of the socialized person. The process of formation and development of human society also shows that human personality is influenced by social relations, such as relations of production, community relations, and social groups. It is the interaction between individuals with the natural and social environment that their personality and qualities are formed and adjusted (Tuyen Tran Nguyen, 2005).

Figure 1: *The original model of the factors that shape individual qualities and behaviors*



Sources: McCrae & Costa (1999), McCrae (2004)

Research by McCrae & Costa (1999) and McCrae (2004) showed that the qualities and behaviors of people are influenced by many factors, including external factors like culture (Figure 1). Thus, each person's personal qualities are influenced by natural and innate factors and by socio-cultural factors. From the original model, the study focuses on examining the impact of the culture of the North Central region of Viet Nam (a case study of Nghe Tinh culture) on the qualities of the people here, thereby affecting their behavior.

3. Results

3.1. The effect of regionally cultural concept on the quality and behavior of the North Central people

3.1.1. Quality of "Studiousness" – Behavior of "Inquisitiveness – Aspiration for growth"

Nghe Tinh has an extremely harsh and extreme climate with frequent droughts, storms, and floods. In other words, to make a living there by farming, breeding and fishing are very difficult, strenuous, and high-risk. Therefore, Nghe Tinh people have been struggled to survive, even in their daily life. Consequently, these hardships have created in them the character of endurance, providence, and especially their will to advance, to master their fate, and to act proactively with nature.

Furthermore, Nghe Tinh people accept to live in adversity so that their children and grandchildren can escape destitution, establish great fortune and break free from hardship. As a result, they have constantly transformed themselves to adapt and develop, and this is one of the reasons why Nghe Tinh's students can overcome all difficulties and distresses to forge their character, wisdom and advance the working positions based on their education.

The studious qualities and the inquisitive behavior, the aspiration for growth of Nghe Tinh people are shown in detail in Table 1.

Table 1: Quality of "Studiousness" – Behavior of "Inquisitiveness – Aspiration for growth" of Nghe Tinh people

3.1.2. Quality of "Overprotectiveness" – Behavior of "Factionalism, Localism"

Due to its nature as a far-away region, regularly being attempted to invade by foreigners, along with special natural and social conditions like a barren land, harsh climate, terrain with many rivers and passes, mountains cut into the sea, the Nghe people must rely on each other and unite to build a close community relationship so as to survive on a daily basis. To illustrate, Dinh Gia Khanh (1997) documented the personality of Nghe Tinh people: “While having a strong sense of community and passionately loving the motherland are some of the positive traits of Vietnamese citizens in general, Nghe Tinh people are the most exact embodiment of these traits in specific”.

Table 2: Quality of “Overprotectiveness” and Behavior of “Factionalism, Localism” of Nghe Tinh people

Source: Compiled by the authors

It can be indicated that the communal activities in Nghe An, for many generations, have been very close and friendly. They are also tightly associated with festivals, as well as daily activities. And it is worth noting that the closeness and friendliness in such community activities is also a mechanism to control and encourage as well as emulate each other.

No matter where, in the South or the North, in the country or abroad, just hearing the voice of their local jargon will immediately catch the Nghe people’s sympathy. In other words, they will make friends, side with each other and support each other openly and publicly. When living away from home, it is this type of cohesion that creates strength for Nghe Tinh people. Thanks to such interrelation, Nghe people are willing to help each other, facilitate all problems for each other to forge ahead and strive for success.

However, in Nghe Tinh, the care, protection, and cohesion have been pushed too far, leading to the idea of making sectarianism, localism, family relations, relatives, compatriots, villages, communes, group interests (Ngoc Them Tran, 1999). In addition, excessive cohesion is shown in the way that when a Nghe Tinh person being disciplined, the whole Nghe Tinh community will stand up for that person, causing many difficulties for businesses and the local authority (Si Dung Nguyen, 2019). As a result, this is one reason why some southern provinces are afraid to recruit Nghe Tinh workers.

To conclude, the authors associate these qualities with the factional and local behavior of Nghe Tinh people, which are shown in Table 2.

Living in difficulties, residents of Nghe Tinh understand the value of labor. Nature does not favor them, but they themselves are industrious, enthusiastic about working with a sense of respecting their labor, not wasting their wealth, thrift, and work diligently to create a better life. Therefore, they possess beautiful qualities such as hard-working, not afraid of asceticism, always persisting in accumulating small amounts to make a large amount, always thinking to overcome life's obstacles. Accordingly, when assessing the general characteristics of the Nghe people, scholar Thai Mai Dang (1960) said: "Courage to negligence, industrious to reckless, resolute to stiff and saving at "wooden fish" level". The authors summarize the relationship between the quality of "Thrifty - Comfort is better than pride" and the behavior of "Frugality, Simplicity" in Table 3.

3.1.4. Quality of "Integrity, Toughness, Courage" – Behavior of "Righteousness, Allegiance, Bravery"

Based on the topography, Duong Lich Bui (1993) commented on the people of Nghe Tinh: "The area has a flow from Quy Chau, majestic mountains, stagnant rivers, so people here are more heroic and braver", and "In Dong Thanh and Nam Duong districts, there are many martial artists, and their auras are also inclined to magnanimity and bravery".

Because of the harsh nature, the Nghe people's personality is straightforward; they speak out what they think and respect love. The elites of Nghe Tinh said that "Nghe Tinh people always put their qualities above all", so they are dignified, polite, and not demeaning. The residents are industrious, hard-working, loyal, and righteous (Duong Lich Bui, 1993).

In terms of code of conduct, Nghe Tinh people are often sincere, straightforward to the noble level, which Vu Ngoc Khanh (1997) called "tough in communication". Therefore, in relationships, they are not always easy to be understood and accepted by people from other regions. When first contacting Nghe Tinh people, people from other regions are not always comfortable, but after being in contact for a long time, it is easy to get close because Nghe Tinh people are generally very sincere and enthusiastic with friends.

Along with this, Nghe people also have the spirit of fighting for the right. They will not be afraid to act when they see what they do is right. What they think is right, even if it is difficult or they might lose, they still do it. From here, another personality trait is also formed, which is integrity. Nghe people regard that the person is worthy, then they support. If they are supporters, they will be completely loyal. This is also the reason why since ancient times, the closest bodyguards of kings and lords were often Nghe Tinh people (Si Dung Nguyen, 2019).

All in all, through the process of analyzing and compiling studies on Nghe Tinh culture - representing the culture of the North Central region, the authors determined the influence of cultural factors on human qualities and thereby shaping their behavior.

3.2. The effect of the leadership quality – behavior on business leadership results

3.2.1. Leadership results and leadership performance measurement

Many researchers have approached and measured corporate leadership results in general under the influence of many factors. In which, the indicators for assessing leadership results are divided into two groups, financial and non-financial indicators. Financial indicators are often used less often than non-financial indicators because leadership is quite challenging to quantify as it is directly related to people and usually lagged. On the other hand, plethoral studies have documented that leadership results are derived from non-financial indicators such as employees' perceptions of the leader's prestige and leadership results; the compliance of subordinates; work motivation and commitment to the organization; job satisfaction, and some other issues related to the working environment.

In this paper, the authors will focus on the results of employee leadership through employee satisfaction and employee commitment to the organization.

Job satisfaction: Employees are satisfied with their job when they feel satisfied with their current job, when they work passionately and enthusiastically, or when they feel that the job is exciting and seemingly never-ending, always opening up new opportunities (Thunn, 2009). Pierro et al. (2005) also indicated that satisfied employees always feel satisfied with their jobs.

Table 5: Criteria for measuring business leadership results

No.	The authors	Criteria for measuring leadership results
1	Piero, Cicero, Bonaiuto, Knippenberg & Kruglanski (2005)	Perception of leadership results Job satisfaction Personal self-assessment Desire to change job
2	Knippenberg & Hogg (2003)	Work results and motivation Readiness for innovation Obedience, compliance Leadership results and prestige
3	Koene, Vogelaar & Soeters (2002)	Leaders' reputation Operational results + Net profit + Controllable costs Enterprise environment + Ability to organize activities + Readiness for innovation + Communication in enterprises

Source: Compiled by the authors

Commitment to the organization: According to Thunn (2009), good leadership results are when employees have the intention or peace of mind to stick with the group, department, organization, or enterprise until the end of their working time; they are excited, ready to share with their relatives and friends about where they are working. The employees also choose to commit when they feel that the business is a crucial part of their family, and they are willing to share difficulties and challenges with their organizations. Contrary to these criteria, Pierro et al. (2005) measure the employee's level of commitment to the organization through the desire to change jobs. The stronger this desire is, the lower is the level of commitment to the organization, and thus the leadership results are also limited.

3.2.2. The relationship between leadership qualities – behavior and employee satisfaction and commitment

A plethora of studies have supported the existence of a relationship between employee satisfaction, commitment, and leadership behavior (Halpin, 1954; Patchen, 1962; Nealy & Blood, 1968; Greene & Schriesheim, 1977; Katerberg & Horn, 1981; Wycoff & Skogan, 1994). However, within these studies is a debate about the nature of this relationship, whether positive or negative.

Nealy & Blood (1968); House & Filley (1971); Greene & Schriesheim (1977) also focused on studying the relationship between leadership behavior and employee satisfaction and commitment by giving a group of specific leadership behaviors – Consideration leadership behavior and Initiating structure leadership behavior. They concluded that the former behavior bears a positive impact on satisfaction, while the latter negatively affects job satisfaction and employee commitment. Nevertheless, a number of researchers found a negative correlation between the Consideration leadership behavior and job satisfaction as well as employee commitment (Halpin, 1954; Patchen, 1962; Hodge, 1976). Not confusing enough, other studies documented that both of these leadership behaviors have a positive influence on employee job satisfaction and employee commitment (Katerberg & Horne, 1981).

With a more comprehensive approach, Jon Aarum Andersen (2006) examined the relationship between the leader's personal qualities and the leader's superiority, the perception of leadership results, the leader's behavior, and the organization's effectiveness. In which, the research focused on four areas includes:

- The relationship between the leader's qualities and the leader's superiority and the perception of leadership results.

- The relationship between leadership qualities and leadership results (measured through employee satisfaction and employee commitment).

- The relationship between the leader's personal qualities and the leader's behavior.

- The relationship between leader's behavior and organizational leadership results (measured through employee satisfaction and employee commitment).

Figure 2: The relationship between personal qualities, behavior, and leadership result

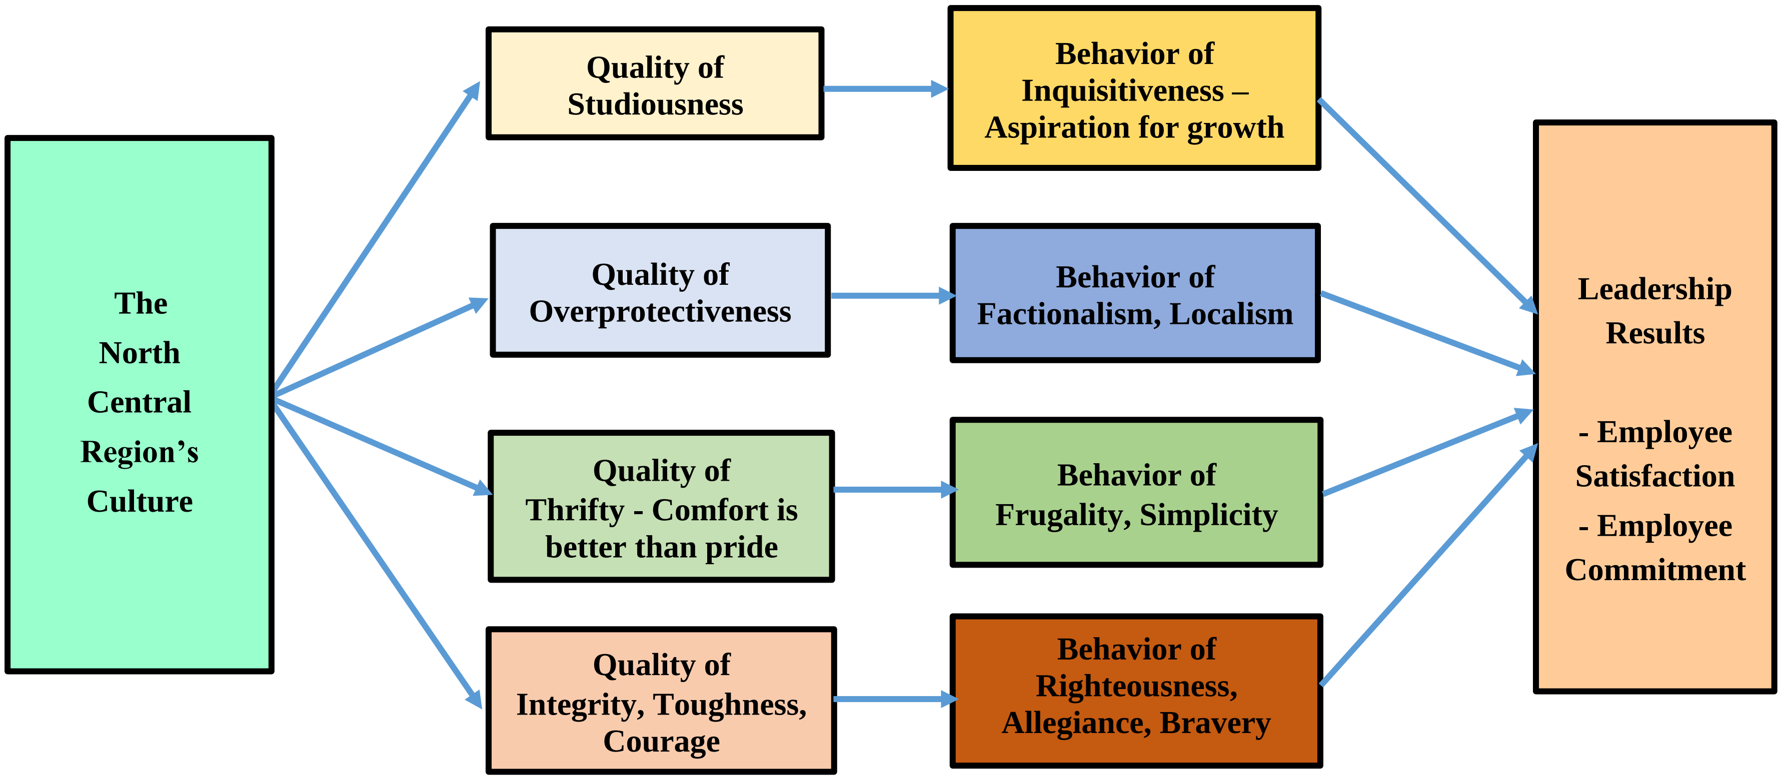
4. Disscusion and Conclusion

Based on the research of McCrae and Costa (1999), McCrae (2004), Jon Aarum Andersen (2006), along with the study of documents, the authors have shown that the culture of the North Central region affects qualities, thereby shaping the behavior of people here. The authors qualitatively researched these behaviors to determine how leaders in the North Central region exhibit these behaviors in organizational management and administration activities.

In particular, through interviews with 06 experts, 04 researchers, and 05 leaders in the North Central region in 2020, the authors found that in the management and administration of organizations, leaders in the North Central region show inquisitive behaviors - the aspiration for growth through the following manifestations: always learning and looking for opportunities to learn, attaching importance to learning and the educated; encouraging organizational members to learn and collaborate in groups within the organization. In addition, there is a factional and local behavior with the following manifestations: prioritizing relatives and acquaintances who have village relationships; forming local cliques in the organization; protecting relatives and acquaintances. Furthermore, the North Central region leaders also display thrifty - simple, straightforward - loyal - courageous behaviors.

Therefore, the authors build a research model: the effect of cultural factors with qualities and behaviors on measuring leadership outcomes in enterprises in the North Central region, shown in Figure 3.

Figure 3: Proposed research model



Source: Suggested by the authors

Based on the research of McCrae & Costa (1999), McCrae (2004), Jon Aarum Andersen (2006), along with the study of other documents, it can be confirmed that leadership qualities and behaviors do influence leadership outcomes. The research team also expects that among the 4 groups of leadership behaviors of leaders in the North Central region, the group of Behavior of Factionalism, Localism will have a negative impact, while the remaining 3 groups of behaviors will positively affect employee satisfaction and commitment.

However, within the framework of this article, it only proposes research models and hypotheses. In the coming time, the authors will continue to have quantitative studies with the expected number of samples selected according to the non-probability sampling with the technique of questionnaires (5-level Likert scale). The questionnaire would be sent to about 250-300 employees working in small and medium enterprises in the North Central region to assess the impact of leadership qualities and behaviors on leadership results, employee satisfaction, and commitment to the organization to create sustainable leadership outcomes. As a result, measures to increase the efficiency of management and administration of business leaders in the North Central region can be proposed to generate sustainable business development in a volatile business environment.

Abstract

Entrepreneurial research has grown tremendously in the last few years in developing countries but most research focused on factors that impact entrepreneurial intention only. This paper aims to identify some factors that impact entrepreneurial behavior of individual in Vietnam, Laos, and Cambodia. Based on an extensive review of literature, this paper proposes 3 factors that were found to have impact on entrepreneurial behavior in some countries but not the others for empirical test in the Indochina context. These are university entrepreneurial support, entrepreneurial intention, and external institution support. The survey was conducted with 845 respondents from November 2020 to Apr 2021. Research results showed that entrepreneurial intention and external institution support have a positive direct impact with entrepreneurial behavior in the research context of Indochina. There is no evidence to conclude an impact of university entrepreneurial support to entrepreneurial behavior. Furthermore, the combination impact of these variables explains more than 52% the changes of entrepreneurial behavior of the underlying survey population.

Keywords: *Entrepreneurial Behaviour, Entrepreneurial Intention, University Entrepreneurial Support, External Institution Support.*

1. Introduction

The importance of entrepreneurship to economic growth and technological change was under debate for years both at national, regional and international scale. After World War II, scientists around the world believed that large-scale enterprises must be developed to benefit a nation economy. The reason is that large firms have an advantage over small ones because of their economy of scales, international competitiveness and a better chance to survive in this ever-changing environment. But in recent years, studies and facts have shown that small businesses play an important role in economic development and start-up activities motivate socio-economic development in many countries around the world. Entrepreneurship is considered as the fourth variable, named entrepreneurship capital in the "New growth theory" next to the 3 traditional variables of physical capital, human capital and knowledge capital.

Nowadays, it is a widely accepted fact that SMEs and start-ups play an important role in building, developing and maintaining prosperity for every economy (Schramm, 2006; Giagtzi, 2013). Since the early 1990s, researcher had found that in a modern economy SMEs create jobs for the majority of workers in the private sector (Acs & Audretsch, 1993). Recently, in the large economic blocs i.e. European Union…, SME sector still accounts for more than 99% of all businesses of the underlying region (Giagtzi, 2013). Many scholars mention the irreplaceable role of entrepreneurship in sustaining the dynamics of the modern market economy and the emergence of new businesses that help create competition and economic growth (Wong et al, 2005; van Praag & Versloot, 2007, Altinay et al, 2012; Sorensen và Fassiotto, 2011). Entrepreneurship hence becomes the motivation for economic development thanks to its ability in creating new jobs, promote creativity, enhance competition, and improve production. Along with the increasing importance of entrepreneurship globally, there is an urgent need to understand the factors affecting entrepreneurship, especially entrepreneurship behaviour. In recent years, policy makers in many countries such as Israel, USA, EU, China, Japan... have focused their attention to the creation of a friendly environment for businesses and start-ups.

Entrepreneurship is perceived widely as the driving force of competition and innovations (Luthje & Franke, 2003; Kokobe & Kebede, 2015). There are numerous theories and approaches related to the study of entrepreneurship that have been proposed by scholars over the years. Amongst those, many confirm the role of entrepreneurial intention as an accurate predictor for future entrepreneurial behaviours (Covin & Slevin, 1991; Krueger & Carsrud, 1993; Lumkin & Dess, 1996; Elenurm et al., 2007). According to Ajzen (2011), previous studies often focused on explaining intention, while research on entrepreneurial behaviour is still limited and the literature may have paid less attention to behaviour than we should have. Since then, there were more studies attempted to close the intention-behaviour gap, in many different field including entrepreneurship, but the number is still modest in comparison to that of intention and results are still mixed. In addition, entrepreneurial research, while under development in Vietnam, still mostly focused on intention, and at starting point in Laos and Cambodia. Recognizing the above gap, this study will focus to investigate the factors that impact entrepreneurial behaviour of individuals in the three Indochina countries.

Entrepreneurship, according to the Vietnamese dictionary, is starting a new business. In the field of academic research, it is a multidimensional concept. Entrepreneurship can be: i) starting a new business, a new venture creation or ii) self-employment. Human behavior has long been studied and explained by psychological researchers based on mental states of intention, desire, and belief. According to psychology, belief helps people identify their goals, from which desire to achieve these goals will lead to individual behavior. Depending on the research context, the definition of behavior may varied. While some defined behavior as “an obvious, observable response in a given situation to a certain goal” (Ajzen, 2006), others have viewed behavior as “an action performed in the subconscious of an individual or otherwise called an action performed by someone" (Sukaris et al., 2021). Entrepreneurial behavior is the activities that lead to the formation of a business (Aldrich and Martinez, 2001) which would require development as well as a concentration of different resources (including knowledge) that can be combined into an organization (Garner et al., 2010). This study inherited the definition of entrepreneurial behavior by Gartner et al. (1992) where it was viewed “as the various behaviors and activities that individuals engage in when creating new organizations – and contrast them to the behaviors and activities of individuals involved in established organizations”.

One of the most well-known behavioral intention research early works is Theory of Reasoned Action (Fishbein and Ajzen, 1975; Ajzen and Fishbein, 1980; Ajzen, 1985) which later was further developed into the popular Theory of Planned Behavior. After the primary studies, other Intention - Behavior models were introduced such as those of Bird (1988), Ajzen (1991) etc. that further explain the relationship between individuals and their behavior. Researchers have concluded that intention is an effective indicator for predicting an individual's next behavior (Ajzen and Fishbein, 1980; Ajzen, 1991) such as job-seeking (Van Ryn and Vinokur, 1990) or career choice (Kolvereid, 1996). These models become the basic to investigate intention and behavior of entrepreneurship nowadays. The relationship between intention and behavior, more specifically entrepreneurship intention and entrepreneurial behavior, is widely demonstrated in previous studies (Ajzen, 1991; Krueger et al, 2000; Elfving et al., 2009; Gielnik et al, 2015; Linán and Fayolle, 2015). Although the accompanying independent variables may differ between different research, they generally confirm the existence of a positive direct influence from entrepreneurial intention to behavior (Frese and Gielnik, 2014; Gielnik et al., 2015; Kautonen et al., 2015; Obschonka, 2015; Rauch and Hulsink 2015; Kautonen et al., 2015; Reuel và cộng sự, 2016). More recently, studies have begun to investigate the intention – behavior gap and the non-intentional factors that help to explain behavior including entrepreneurship behavior. Most studies agree that intention alone is often not sufficient to explain why behavior is conducted because many highly intended persons did not end up in acting up to their intention (Kautonen et al., 2015, Gaofeng Yi, 2020). Recent research found out other non-intentional factor that might impact behavior such as external institutional support (Li and Atuahene-Gami, 2001; Turker and Selcuk, 2009; Hunt, 2015) or university entrepreneurial support (Rothaermel et al., 2007; Fichter et al., 2013; Gaofeng Yi, 2020) etc. The relationships are also more complex than simple direct influence. However, the number of behavioral empirical studies is still far more modest than that of intent studies, thus more research is needed to fill this gap.

Hypothesis 1: Entrepreneurial intention has a direct impact on entrepreneurial behavior.

Previous studies by Baumol (1990, 1993, 2005) and North (1990, 1994, 1997, 2005) have provided important background about entrepreneurship in different institutional environments. Institutional support varies from country to country. It might include policies, regulations, and programs that the country has implemented to support start-ups (Turker and Selcuk, 2009) or can be Operational Support, Emotional Support, and Financial Support (Sithabile, 2011) or others (Volchek et al, 2013; Laxmi and Hyderabad, 2014). Previous studies have shown that external institutional support is a general reflection of support, such as policies, programs implemented, financial assistance, technical assistance, and other support from the government and government agencies (Li and Atuahene – Gima, 2001). A good business environment will help promote the economic development of an entire country. Therefore, external institutional support plays an important role in the market economy, supporting the functioning of the market mechanism. They facilitate the efficient operation of market transactions without incurring undue costs and risks (North, 1990). A number of other studies such as Deephouse and Carter (2005) also acknowledge that external institutional support can promote the behavior of entrepreneurs in accordance with dominant social norms and values, such as socially responsible for environmental and green protection, increase the legitimacy of their operations and enhance their reputation. Mainly external institutional support is believed to encourage entrepreneurial behavior through two methods of persuasion and commitment (Radu and Redien-Collot, 2010). Therefore, this study proposes to test the following hypothesis:

Hypothesis 2: External institution support has a direct impact on entrepreneurial behavior.

Research results both domestic and abroad so far have confirmed there is a connection between university entrepreneurial support and entrepreneurship. In a research by McIntyre and Roche (1999), university entrepreneurial support is defined as the process of providing individuals with the concepts and skills to recognize opportunities that others have missed, and to gain insight and the self-esteem to act where others have hesitated. It includes guidance on identifying opportunities, aligning resources in the face of risks, and starting a business venture. Universities are often seen as engines of growth in the knowledge economy and commercialize university research has been studied for long (Laursen and Salter, 2006). In addition to research and teaching, universities have a third role to play in promoting technology transfer, patenting, and commercial output in an increasingly knowledge-based world. In addition to individual factors that influence students' entrepreneurial behavior, many other studies have shown that entrepreneurial behavior can be stimulated through education. Vanevenhoven and Ligouri (2013), through global research, have shown that entrepreneurship education promotes the entrepreneurial intentions of students. Souitaris et al. (2007) argue that entrepreneurship programs improve entrepreneurial attitudes and intentions, and increase the chances of students trying entrepreneurship at some point in their lives. Essentially, the support system helps turn college students' entrepreneurial intentions into actual business behavior. Therefore, the study of (Gaofeng Yi, 2020) considers university entrepreneurial support as having both direct and moderate impact on entrepreneurial behavior. Nevertheless, Gaofeng Yi's moderate impact is not supported in any other similar studies of the same field, therefore, this study proposes the following hypothesis:

Hypothesis 3: University entrepreneurial support has direct impact on entrepreneurial behavior.

The research model, therefore, includes 3 independent variables - Entrepreneurial Intention, External Institutional Support, and University Entrepreneurial Support and a dependent variable - Entrepreneurial Behavior.

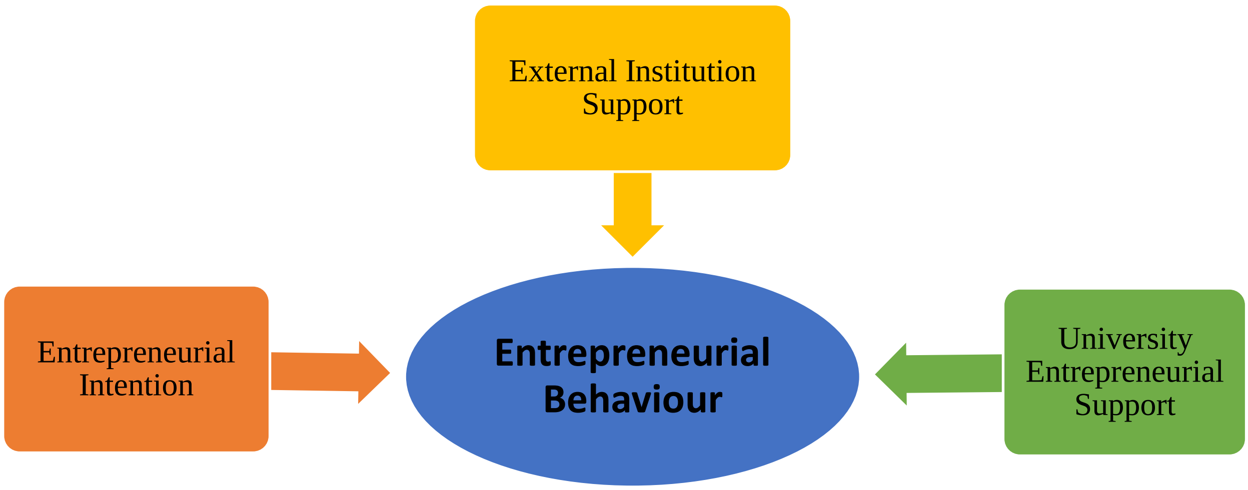

Diagram 1: Research model

2. Method

The research sample was gathered from individuals living in the Indochina countries of Vietnam, Laos and Cambodia. Most respondents are within working age with smaller proportions of the other age groups as well to investigate entrepreneurial behavior in different age groups. Because this study aims to focus on behavior, participants are required to at least conducted certain entrepreneurial behavior(s) in the past for example set up a company, soft open a new business, registered the company, during funding process etc. There is a question about whether the respondents participated in entrepreneurial behaviour before at the first section of the questionnaire to help eliminate unqualified answers. The survey was conducted both online (via Google Survey) and offline (via support from lecturers in National University of Laos and Phnompenh Economics University in Cambodia) in 4 languages (Vietnamese, English, Laos and Cambodian). The original questionnaire in English was translated into 3 other languages using authorized paid translation service in Notary offices at each country. Translated versions were sent to a lecturer with background in entrepreneurship and the respective language to correct terminologies, if necessary, before sending out. Due to the impact of the pandemic, limited time and budget, small scope of research (respondent must conducted entrepreneurial behaviour before to be qualified), convenient sampling method is chosen with best effort to ensure representativeness in different dimensions (age groups, education levels, gender …) in all three countries.

The questionnaire consists of 3 parts: i) Opening letter and General information; ii) Research model variables' questions; iii) Extra multiple choices questions to get more facts and figures regarding entrepreneurial behavior and related issues in the Indochina. With 4 variables in the research model, this study chooses to inherit the measurement scales from the following studies (Listed in Table 1): i) External Institutional Support from Li and Atuahene-Gima (2001) with 4 questions; ii) Entrepreneurial Intention from Syed et al. (2019) with 3 questions; iii) University Entrepreneurial Support from Gaofeng Yi (2020) with 4 questions and iv) Entrepreneurial Behaviour from Wan và cộng sự (2012) with 3 questions. The scales were adapted to entrepreneurial context.

Table 1. Research model's variables and inherited scales

No	Variables	Inherited scales
1	External institution support	Li và Atuahene-Gima (2001)
2	University entrepreneurial support	Gaofeng Yi (2020)
3	Entrepreneurial intention	Syed và cộng sự (2019)
4	Entrepreneurial behaviour	Wan và cộng sự (2012)

Sources: Authors' summary

The total survey invitations sent out was 1000 in which 882 answers returned (88.2%). After elimination of unqualified answers, 845 answers were used for data analysis (84.5%). Data analyses consist of 4 steps: scale reliability test using Cronbach's Alpha, discriminant and convergence test using EFA, Pearson's correlation test and multiple regression to test the hypotheses.

Yes	210	24,9
No	635	75,1

Source: Authors' work

The respondents in this study are relatively evenly distributed between men (53.1%) and women (46.9%). Although the number of men participating in the survey was higher, there was not much difference between the two genders. The study has also a relatively wide age spectrum given the large scope (3 countries) and the stricter qualifying condition (respondent must conducted a type of entrepreneurial behaviour before) however the number of respondents in the age group of 41 and older is relatively small (4 out of 845 people) so it is safe to conclude that this study focused on subjects under 40 years old. In terms of education level, the sample has 99% of respondents with high school education or higher, only about 0.9% (8 people) have other qualifications thus the quality and correctness of respondents' answers are better safeguarded. The number of survey participants with college and university degrees is the largest, accounted for 60.4%. The qualification group with the second large number of respondents is Intermediate and Vocational School with 27.6%. The survey team obtained 483 valid responses from Vietnam (57.1%), 207 valid responses from Laos (24.5%) and 155 valid responses from Cambodia (18.3%). Although Vietnam accounted for a large part, the number of valid samples from Laos and Cambodia was significant enough to conduct comparative analysis. In the Vietnamese sample, there is a majority from the North and relatively fewer in the Central and Southern regions. This is a limitation that future research should attempt to improve. Out of 845 valid responses, about 25% have ever attended courses and training courses on entrepreneurship and the remaining 75% have never attended any.

Reliability tests

Scales' reliability is tested using Cronbach's Alpha. All variables in the model show a satisfactory reliability with lowest Cronbach's Alpha of entrepreneurial intention (0.775) and highest of external institution support (0.857) and no Corrected Item – Total Correlation less than 0.3 (Hair et al., 2009). Thus all variables are qualified for convergence and discriminant test using EFA. Analysis results showed that the KMO value of this sample is $0.5<0.840<1$ with Bartlett's test sig. <0.05 thus the change of factors explained by observed variables with Eigen greater than 1 is therefore satisfactory. The factor rotation matrix gives good results in terms of convergence and discriminant test between the variables in the model with minimum factor loading of 0.69 (>0.5 as required by Hair et al., 2009). Therefore, all variables are kept for Pearson and regression steps.

Hypotheses test

Pearson correlation between dependent variable (entrepreneurial behavior) and 3 independent variables are statistically significant at 5% level (sig < 0. 05). In the analysis, the strength of correlation between variables is at average level ($r <0.5$) thus there is no signal of multicollinearity phenomenon. Hierarchical regression was conducted for all variables in the model with 1st step including all control variables. Results show that control variables can explain roughly 4.9% of the changes in entrepreneurial behavior. When research model's independent variables were added to the 2nd regression step, they add a further 47. 6% explanation of the changes in entrepreneurial behavior, a significant improvement which show the importance of these independent variables. In total, this research model can explain roughly 52. 6% of the changes in entrepreneurial behavior which is significant.

Other model fit's indicators such as ANOVA F figure improved significantly after 3 independent variables is added to the regression and in both case F's sig <0.05 indicate statistical meaning at 5% level. Regression coefficients show that only 1 control variable is statistically significant with sig <0.05. That is entrepreneurial course participation. However, standardized beta shows that the more people get trained in entrepreneurship the less entrepreneurial behavior they will conduct (-0.069). The results of 3 independent variables proves some variation in comparison to previous studies. Entrepreneurial intention still the most powerful factor that impact entrepreneurial behaviour with highest standardized beta of 0. 406 and sig <0. 05, followed up by External institution support with standardized beta of 0. 0.074 and sig <0. 05. However, contradiction to previous studies' results, this study found no statistical evidence to conclude an impact of university entrepreneurial support on Entrepreneurial behaviour in the research context of the Indochina countries. VIFs are all <2 thus there is no multicollinearity phenomenon. Hence, regression results support hypothesis 1 and 2, and reject hypothesis 3.

Table 3. Regression results for hypotheses testing

Variables	Adjusted R square	ANOVA F	Standardized Coefficient (β)	Sig.	VIF
Living area	.049	6.603	.076	.088	1.141

University entrepreneurial support			.060	.103	1.543
External institution support			.074	.038	1.477

4. Discussion and Conclusion

Research results show that entrepreneurial behavior of individuals in Vietnam, Laos and Cambodia is positively affected by Entrepreneurial Intention and External Institutional support, in which:

i) Entrepreneurial Intention is the strongest impact factor with a positive influence on Entrepreneurship Behavior of individuals in Vietnam, Laos and Cambodia ($\beta = 0.406$). This result is similar to a number of previous studies (Ajzen, 1991; Altaf and Norashida, 2016; Nguyen Anh Tuan, 2020; Duong Cong Doanh, 2019...) and it implies that the higher the entrepreneurial intention, the more likely such person is going to perform the intended behavior.

ii) External institutional support is the second factor that impact entrepreneurship behavior. This result is in line with results from previous studies published in Vietnam and internationally (Turker and Selcuk, 2009; Sithabile, 2011; Volchek et al, 2013; Laxmi and Hyderabad, 2014). It shows that government and external institutions play a positive role in encouraging more entrepreneurial behaviors in Vietnam, Laos and Cambodia. This comes to no surprise as the more supportive a potential entrepreneur gets, the easier the work to set up a new business venture thus the higher the chance he/she will engage in entrepreneurial behavior.

iii) Contrary to many previous studies, this study cannot find sufficient statistical evidence to support the impact that University entrepreneurial support has on entrepreneurial behaviours. This result is different in the context of the Indochina countries in comparison with the others (Wu and Wu, 2008; Aşkun and Yildirim, 2011; Hong et al, 2012; Nguyen Anh Tuan, 2020). The reason for this might rooted from the ineffective program itself but also from cognitive recognition of participated individuals. In terms of university support program, most Vietnamese universities stopped at providing courses, competitions, talk shows, networking events and the like while 27% respondents claim their difficulty in setting up new business is calling for investment fund (survey multiple choice question result), the area Vietnamese universities do not support yet. In addition, university entrepreneurial support is not established yet in most Laos and Cambodian schools. This may have impacted the respondents' judgement about the influence of this factor.

With the above results, governments of Vietnam, Laos and Cambodia should pay more attention in creating a flexible and supportive start-up ecosystem for entrepreneurs in Indochina. Policies and national level programs should be promptly reviewed to ensure the update and fitness with changes in the business environment in order to create favourable condition for start-ups. Supporting centres and free consultant services might be very helpful for early-stage start-ups and entrepreneurs. Schools at all levels should pay attention into revamping their curricular to enhance pupils' and students' entrepreneurship spirit with aim to create positive attitude about starting a business right from high school time. Higher education institutions in Indochina should further promote entrepreneurial support in response to the changing needs of their students. Apart from courses, competitions and the like on the academic side, the higher education section should promote more connection activities in terms of commercialization, funding, incubating, and accelerating start-ups.

This study has a few limitations that future research in this field can pay more attention to improve. First, future study can pay more effort to further improve the representativeness of the survey sample. While this sample has representative of all the groups, the weight of certain group is significantly higher than other which may impact the result. Second, the combination impact of this model independent variables can only explain roughly 5.6% the changes of entrepreneurial behaviour. This means that there are other impact factors that were not included in this research. Future research should extend the independent variable list to further explore such area.

Abstract

This study aims to examine the relationship between interactive marketing and customer engagement behavior in education and training service in digital age. A survey of 480 students of National Economics Univeristy was conducted in March 2021 to collect the data. Regression model is used to test the hypothesis on the relationship between four dimensions of customer engagement behavior - augmentting behavior (AG), co-development (CO), influencing behavior (INF), mobilizing behavior (MB) and interactive marketing activities. Research results confirm that interactive marketing has a positive impact on engagement behavior of students with the university. Some managerial implications are also discussed in the paper.

Keywords: *Interactive marketing, Customer engagement, customer engagement behavior*

1. Introduction

Recent years, the fact that a lot of new universities are continuously established or upgraded from collegge has led to intense competion among universities in recruiting students. Frequent topics in articles published every year is about enrollment activities and how much obtacle numbers of universities have to face in recruiting enough annual student quota. Universities need students to survive and develop like any business needs customers. Hence, whether the relationship between the university and students is the relationship between businesses and customers? This is such an interesting topic that if you scroll through the forums or search on the topic on Google, you can easily see the controversial opinions.

The arguing topics are often around the issue of how to balance between attracting students, ensuring enrollment targets for the school and the quality of student input, between ensuring training quality, the role of the teacher and the role of students and their satisfaction. These controversies may never come to an end because of different approaches. However the answer to the question whether universities need to understand market needs, understand student needs, and find ways to improve the quality of teaching and learning is always Yes, especially under the marketing approach.

The digital era leads to great changes in all human activities thanks to the internet of things (IOTs), artificial intelligence (AI) and other modern digital technologies. The public not only receives information about brands, also known as one-way marketing messages, but they also actively interact and express their personal views on the brand. This is the foundation for the birth of interactive marketing. Websites, peer-to-peer tools like Facebook, YouTube, Twitter, eBay, Tiktok or information search sites like Google are growing like never before. Besides, mobile platforms give people the opportunity to connect widely with more people anywhere any time. Accordingly, brands increasingly utilize these tools in the implementation of interactive marketing activities. In this rapidly developing digital technology context, universities as the education and training service providers are not out of the race in updating 4.0 technologies in managing and operating of all school activities to achieve their goals in recruitment, training quality improvement as well as brand development.

One of the benefits that interactive marketing can bring is to create a connection between the students and the university, therefore helping the universty improve their position and brand image as well as improve the service quality in the most accurate way. The fact is that alot of universities have been updating digital technology and exploiting the digital platforms as online channels to interact with their students. Accordingly, student satisfaction and engagement with the school are of great importance besides training results.

All of the above transformation require investment in facilities, adjustment in the organization structure and efforts of each staff and lecturer to create effective interaction with students. So in fact, how the students perceive and evaluate the factors that make up the service quality from the perspective of interactive marketing and how these factors affect their engagement to the university? This study was conducted to measure the influence of interactive marketing activities on student engagement behavior. In which, interactive marketing activities are measured through students’ assessment on interactive marketing activities that NEU has implemented.

2. Literature review

Interactive digital marketing

The term interactive marketing have been used in a lot of research papers in the US before, but it is often understood in the form of relationship marketing, internet marketing or data-based marketing. According to Blattberg and Deighton (1991), interactive marketing is the exchange of information between each other. During the interaction, needs, interests, and abilities are gradually identified. Such relationships are established over a period of time which helps the company accumulate a database that brings benefits to the company. Ch. Gronroos (1995) defines interactive marketing as managing the relationship between buyers and sellers. Later on, interactive marketing is a defined as the combination of conventional marketing planning with methods of resolving relationships between consumers, including technology to allow the establishment of common interactive relationships. and attract new consumers (T. Kendrick and K. Fletcher, 1999).

It can be concluded that interactive marketing is a form of marketing in which customers and businesses exchange and discuss information with each other through a digital environment to establish a relationship. close relationship between the parties.

Characteristics of interactive marketing

By its very nature, interactive marketing plays an important role in the development and success of businesses. Interactive marketing is different from other previously defined terms such as online marketing or relationship marketing because it shows through the following aspects:

- A two-way dialogue between businesses and customers. Unlike traditional marketing, interactive marketing is about creating a two-way dialogue between businesses and customers. Based on customers feedback and preferences, marketers can come up with more appropriate marketing messages so that they can easily lead customers.
- Lower cost than traditional marketing. It can be said that doing online advertising is significantly less expensive than television, print or radio advertising and often generates a higher rate of return.
- Enterprises can implement interactive marketing programs through digital communication channels. Instead of just watching ads on TV within 20 seconds, nowadays, customers can learn about the product and brand by a predefined route that the business provides, which are the website, email, Mobile / SMS, Game, etc. Forum,…
- The measuring indicators and tools. Some authors emphasize that measureability is an important aspect of interactive marketing as companies can quantify the feedback from communication efforts (Morwitz and Schmittlein, 1998). Or because of its measureability, accuracy, customizability, personalization, and easy targeting (Trappey III & Woodside 2005) that interactive digital marketing is arguably one of the most effective tools for marketers (Radzeviciute & Sliburyte 2005).

- Search engines are the most popular form of interactive marketing. When customers enter keywords into the search window of a search engine, ads will be displayed based on their search terms.

- The source of information through the interaction that customers leave is large. It is also called digital footprints. Their demographics and personal preferences are all revealed through their online behavior. This allows companies to track and store this data for future use in marketing campaigns. The more relevant marketing is to the immediate wants and needs of customers, the more likely it is to make a sale.

The role and importance of interactive marketing

Although interactive marketing is classified as a form of direct marketing, its widespread use makes it a stand-alone form of marketing. Interactive marketing plays an important role in spreading brand image information on the online space, besides it saves costs as well as a number of other benefits as follows:

Firstly, the sales conversion rate becomes higher. A successful interactive marketing strategy is one that helps convert consumers from receivers to buyers. Unlike traditional TV and radio advertising, interactive marketing tools give audiences the opportunity to buy on the spot, which in turn also makes it easier for potential customers to reach your business.

Secondly, interactive marketing will help businesses save costs. Costs including hiring, payroll, shipping and printing will be reduced when the technical tools of interactive marketing are leveraged on e-commerce sites or online stores, The cost for warehouses, showrooms, sales reps and cashiers also reduces because transactions are done online. In addition, printed publications will also be replaced by electronic publications and this information can easily be updated more frequently.

Thirdly is the ability to engage with customers. Many interactive marketing tools allow merchants to engage with their target audience and provide a novel shopping experience that also allows them to learn more about their customers. Experiences such as letting customers express their own personality and preferences for the company's products will also make customers feel more connected to the business, thereby increasing their loyalty.

Fourthly is the ability to attract new interactions. When there is a connecting of existing customers, they will share their information and interests in the business with friends or others. This helps businesses attract new interactions, thereby increasing the number of potential customers in the future.

Finally, through interactive marketing, businesses can receive feedback that will be an important factor in the growth of the company. This is explained by the fact that if the customer has direct feedback, the business will receive different multi-dimensional information about the business. It can also help businesses to change more positively or have good suggestion in the next marketing campaigns. Even without direct feedback, businesses can measure the effectiveness of their interactive marketing activities by analyzing other metrics such as how many times an ads has been read and shared, the period of time spent on reading a PR articles or website, etc.

Elements of interactive marketing

Most of the research papers on interactive marketing often consider the elements of interactive marketing like those in service marketing or relationship marketing. Baron and Harris (2003) presented seven key elements of relationship marketing as: level of trust between two parties, level of commitment to the relationship, long-term relationship, communication channel, service personalization, service quality, customer satisfaction and quality commitment. Ndubisi (2006) in the study of the influence of gender on loyalty under the relationship marketing approach also proposed four main factors underpinning relationship marketing such as trust, commitment, communication, handling complaints. Dushyenthan et al. (2012) in the study on the influence of interactive marketing on customer satisfaction, provided 7 main factors showing the influence of interactive marketing: Trust, Relationship Commitment, Quality. Staff, Atmosphere quality, Familiarity, Service personalization, Complaint handling.

In this study with the context of the digital interactive environment in the university education services, the authors selected and evaluated 6 main elements of the university's interactive marketing: Facilities, Service Quality, Trust, Responsibility, Relationship Commitment, Complain Handling. All these factors are built on scales associated with the digital technology environment: the facilities are online technology infrastructure such as wifi, software, online interactive channels; interactive services and activities are provided and implemented through online channels such as websites, social networks, online learning systems, email…

Customer engagement (CE) and customer engagement behavior (CEB)

Customer engagement has been attracting considerable attention among practitioners as well as academicians in recent years. Customer engagement is a concept that is being explored as a tool to facilitate predictive power of customer behaviour including loyalty and referrals (Brodie et al., 2011; Calder et al., 2009; Pham and Avnet, 2009). Scholars have conceptualized engagement in varied forms including consumer and customer engagement (Bolton, 2011; Van Doorn et al., 2010), customer-brand engagement (Brodie et al., 2013; Hollebeek et al., 2014), community engagement (Brodie et al., 2013), customer-medium engagement (Calder et al, 2009; Kim et al., 2013), engagement for co-creation (Jaakkola and Alexander, 2014; Sawhney et al., 2005) etc. Such varied conceptualizations reflect the evolving state of the construct. It also reflects on the growing interest among scholars from different viewpoints.

The latest common cited definition is from Hollebeek, Srivastava và Chen (2019). They defined customer engagement as a customer's motivationally driven, volitional investment of focal operant resources (including cognitive, emotional, behavioral, and social knowledge and skills), and operand resources (e.g., equipment) into brand in- teractions in service systems. Accordingly, customer engagement has the following characteristics:

– more than just buying behavior

– showing the customer's long-term and intimate relationship in cognitive, behavioral and emotional aspects

– presenting the customer's willingness to share physical and operand resources in interaction with the business

– a multi-stage process that is monitored and measured

– ease of access thanks to digital technology

Up to this time, customer engagement has primarily been examined from four broad perspectives: (i) as a behavioural manifestation, originating from work conducted by van Doorn et al. (2010); (ii) as a psychological state as per Brodie et al. (2011); (iii) as a disposition to act (e.g. Storbacka et al. 2016); and (iv) as a process including several steps or stages of the customer decision making process (e.g. Maslowska et al. 2016). Literature focusing on behavioural manifestations commonly refers to customer engagement behaviours (CEB). Van Doorn et al. (2010, p. 254) specify CEB as behaviours that "go beyond transactions and may be specifically defined as a customer's behavioural manifestations that have a brand or firm focus, beyond purchase, resulting from motivational drivers". While Kumar et al. (2010) argue that CE should include transactional behaviours, most scholars (Van Doorn et al. 2010; Bijmolt et al. 2018, Jaakkola and Alexander 2014; Verleye et al. 2014) concur with van Doorn et al. (2010) that customer engagement only involves behaviour that extends beyond transactions, and thus beyond purchase. Since behaviours can be easily observed and measured, this study also focuses on the behavioral manifestations of CE.

Jaakkohla and Alexander (2014) identified four types of CEB as follows:

– Augmenting behavior: Customer uses resources to expand/add value to product/business (for example, discovering new ways to create a product/service)

– Co-developing behavior: Customer contributes resources to the development of the product/business (e.g. supporting the development of an idea such as testing a new product)

– Influencing behavior: Customer influences other people's perceptions, preferences and perceptions of the business (e.g. blogging about experiences, introducing hotels)

– Mobilizing behavior: Customer uses one's own resources to entice and mobilize others to participate in business-oriented activities (e.g. product boycott)

This study used this classification to establish scales for customer engagement behavior factor in the research model.

3. Method

Study site

The field study was conducted in National Economics University (NEU) and the research population chosen was that of NEU students. NEU has enthusiastically taken to online activities and moved into the digital age aggressively to keep up with that of Vietnam in general.

According to the report on "Mobile Application Market 2021" released by Appota, Vietnam has about 70% of the population using mobile phones, of which 64% of subscribers have 3G and 4G connections. The percentage of the population using the Internet accounts for 70% in which the number of users using the Internet via mobile devices accounts for about 95% and they spend 3 hours and 18 minutes on average. This is quite an impressive number proving that smartphones are being prioritized as the main connected devices thanks to their convenience and popularity. Thanks to the low cost, the internet is easy to access with just about 260,000 VND/month, along with the increasingly improved Internet quality which has now reached 60.88 Mbps increasing about 40.7% compared to 2019. These facts make the Internet widely covered and put Vietnam in the TOP 12 countries with the cheapest Internet prices globally and ranked 2nd in Southeast Asia in terms of mobile Internet speed.

Moreover, in NEU, students get free access to the internet, including free emailing and web surfing. They are also frequently required to search online for information related to their coursework. Every student has account to access NEU e.library, Learning management Systems (LMS) and Turnitin so they can search for needed materials and submit assignments on system as per lecturers' request. Notices related to the students are published on NEU website and some facebook groups of NEU studens like "Goc hoc tap Neu" and "Goc thong tin Neu". Besides, they can access to their record like personal information, payments, practicing and studying gradings on online system "daihocchinhquy.neu". All departments and institutions in NEU have their own webpage and fanpage to interact with their students as well.

Research design and hypothesis

A systematic sampling technique targeting all students was employed in distributing the questionnaires on fanpage “Goc thong tin NEU” in March 2021. The 6 elements underpinning interactive marketing activities mentioned in the questionaire are: Facilities, Service Quality, Trust, Responsibility, Relationship Commitment, Complain Handling, and 4 dimensions in Customer Engagement Behavior adapted from the classification of Jaakkohla and Alexander (2014) including: Augmentting behavior (AG), Co-development (CO), Influencing behavior (INF), Mobilizing behavior (MB).

The scales of student’s engagement behavior to the university in the context of interactive marketing are explained as follows:

- Augmenting behavior (AG) is understood as active preparation for lessons such as reading online course materials and lectures before class; interacting with lecturers on online learning system, email or Facebook; writing blogs, posts or post pictures about your experiences at school.
- Co-developing behaviour (CO) means providing feedback at term ends on curriculum and teaching methods; participating in seminars (on topics of their interest) and contributing ideas to improve school services such as dormitory services, parking services, etc. through online surveys, or Online feedback channel of the university and faculty…
- Influencing behavior (INF) is demonstrated by actions such as posting or forwarding information about the faculty and university to classmates, juniors; providing feedback/guidance to other students about the information and announcements of the faculty and the university; providing information to high school students/ their parents about the university majors.
- Mobilizing behavior (MB) is reflected in the student’s involvement in convincing friends and other students to participate in the activities of the union, student clubs in the university; mobilizing and persuading high school seniors (or their parents) to consider the university after high school graduation.

4. Results

The research obtained 480 valid answer sheets, the data of which was processed and analyzed by tools to test the reliability of the scale, exploratory factor analysis and regression analysis.

The results of testing the reliability of the scale

Cronbach's alpha coefficient and total variable correlation coefficient were used to test the reliability of the scale. The results of factor analysis explore the scales of the following factors:

Sub-factor	Cronbach Alpha	Correlation coefficient
Facilities	0.767	0.554-0.668
Service Quality	0.925	0.694-0.875
Trust	0.761	0.508-0.629
Responsibility	0.721	0.514-0.699
Complain Handling	0.769	0.510-0.711
Relationship Commitment	0.851	0.651-0.746
Co-development (CO)	0.737	0.484-0.676
Influencing behavior (IN)	0.737	0.513-0.652
Augmentting behavior (AG)	0.804	0.563-0.663
Mobilizing behavior (MB)	0.808	0.472-0.744

According to Peterson (1994), Slater (1995), the value of Cronbach Alpha > 0.8 is a good scale; from 0.7 to 0.8 is usable. According to Nunally & Burnstein (1994), the correlation coefficient of the total variable must be > 0.3. Thus, all scales are reliable and qualified to perform exploratory factor analysis.

The results of exploratory factor analysis (EFA)

According to Hair et al (1998), the exploratory factor analysis test results are satisfactory when the KMO coefficient is between 0.5 and 1; factor loading factor greater than 0.3; Barrtlet's test reached statistical significance (Sig < 0.05); extracted variance is over 50%. Result of factor analysis of independent variables for coefficient KMO = 0.751; Barrlet test has Sig = 0.000 (< 0.05); The total variance extracted is 69.164% and Rotated Component Matrix[a] is as follows:

	Component				
	1	2	3	4	5
CLDV1 National Economics University always provides me with good quality online services	.883				
CLDV2 NEU always fully equips me with online materials related to my majors	.883				
CLDV3 NEU always fully provides me with updated information and trends related to my major	.829				
CLDV4 The online services of NEU make my study more efficient	.663				

	Component				
	1	2	3	4	5
TN1 I believe that NEU always provides online services quickly		.784			
TN2 People working at NEU are always willing to help students		.708			
TN3 People working at NEU are always ready to meet students' requirements		.652			
NT1 NEU always shows professionalism in its online services		.625			
NT2 I believe that NEU solves my problems quickly		.550			
NT3 I believe that NEU always treats students fairly		.495			
NT4 I believe that NEU has resolved my complaints satisfactorily		.478			
CKMQH1 The relationship between me and NEU is clearly committed			.833		
CKMQH2 The relationship between me and the NEU deserves to be maintained by the university with maximum effort			.778		
CKMQH3 The most important thing for NEU is to maintain relationships with students like us.			.736		
CKMQH4 I realize that NEU always commits to solve students' problems honestly			.643		
GQPN1 I am satisfied with the way the NEU solves my problems				.862	
GQPN2 I had a good experience solving my problem with NEU				.703	
GQPN3 I am very satisfied with the complaint handling by NEU				.655	
GQPN4 NEU has provided me with a satisfactory solution to my specific problem				.550	

	Component				
	1	2	3	4	5
CSVC1 National Economics University has attractive online interactive channels					.850
CSVC2 NEU has well managed online interactive channels					.807
CSVC3 I feel very convenient when I study under the IT infrastructure of NEU					.788

The results of exploratory factor analysis show that all scales have factor loading coefficients that meet statistical standards (the smallest coefficient is 0.478). All the independent variables load on the right factor except for the responsibility and trust scales which are loaded in the same factor. This can be explained that for students, their trust in the university and their assessment on the university responsibility towards students is closely related. Thus, if the university improves students' perception about the responsibility that they perform, it would lead to higher students' trust in the university. The results of the EFA analysis of the independent variables forming the representative variables for the factors are renamed as follows: Service quality; Trust and responsibility; Relationship commitment; Complaint handling and Facilities.

The results of factor analysis of independent variables give the coefficient KMO = 0.709; Barrlet test has Sig = 0.000 (> 0.05); total variance extracted reached 66.529%. The results of exploratory factor analysis showed that all scales had factor loading coefficients that met statistical standards and reached values > 0.5. All the independent variables are loaded with the correct theoretical kernel. The results of EFA analysis, the dependent variables form the variables representing the factors named as follows: Augmentting behavior (AG), Co-development (CO), Influencing behavior (INF), Mobilizing behavior (MB).

Results of regression analysis

The influence of interactive marketing activities on student engagement behavior was examined through regression analysis with independent variables presenting students' assessment on 5 new sub-factors of interactive marketing (*CLDV: Service Quality; NT_TN: Trust and Responsibility CKMQH: Relationship Commitment; GQPN: Complain Handling; CSVC: Facilities)* and Dependent variables including Augmentting behavior (AG), Co-development (CO), Influencing behavior (INF), Mobilizing behavior (MB)., respectively.

The results of the regression analysis on the influence of interactive marketing activities on Augmentting behavior (AG) for R2 = 0.639 (independent variables explain 63.9% of the change in Augmentting behavior), F= 168.222 with Sig of F test equal to 0.000

(< 0.05). Thus, the regression model is eligible to generalize and apply to the population. The results of the normalized regression function are as follows:

AG = 0.333*CLDV + 0.314*NT_TN + 0.175*CKMQH + 0.251*GQPN + 0.259*CSVC

Students' perception of all interactive marketing activities positively affects augmenting behavior, in which the perception of service quality has the strongest influence. In fact, the convenient and 24/7 online channels help students be more active in the learning process. They interact more easily with faculty and administrative departments related to all of their activities in the university

The results of the regression analysis on the influence of interactive marketing activities on co-developing behavior gave the results R2 = 0.624 (the independent variables explain 62.4% of the change in co-developing behavior), F= 157.219 with Sig of F test equal to 0.000 (<0.05). Thus, the regression model is eligible to generalize and apply to the population. The normalized regression function is as follows:

CO = 0.298*CLDV + 0.464*NT_TN + 0.172*CKMQH + 0.243*GQPN + 0.199*CSVC

It can be concluded that students' perceptions of all interactive marketing activities positively affect their co-developing behavior, in which feelings of trust and responsibility have the strongest influence. In fact, behaviors such as providing opinions and feedback at the term-end about teaching methods and curriculum, facilities and other support services of the university through online survey and possibly in the anonymous way really works. Students feel better about the responsibility and willingness of the university to understand the needs and aspirations of students. It enhances more trust in the university, thereby promoting the participation of students in the learning process and contribution to the development of the university.

Regression analysis results on the influence of interactive marketing activities on influencing behavior for the results R2 = 0.628 (independent variables explain 63.9% of the change in the influencing behavior), F= 159.718 with the Sig of the F-test equal to 0.000 (< 0.05). Thus, the regression model is eligible to generalize and apply to the population. The results of the normalized regression function are as follows:

INF = 0.346*CLDV + 0.389*NT_TN + 0.197*CKMQH + 0.249*GQPN + 0.246*CSVC

It shows that students' perceptions of all interactive marketing activities have a positive influence on students' influencing behavior, in which the perception of Trust and responsibility and Service quality have the strongest impact. Once students appreciate the responsibility and quality of service and have trust in the university, they are more likely to share their experiences with others. They actively share useful information related to their learning experience and skills in online groups that built and managed by the university and the faculty, alongside with their own personal space on social networking sites like Facebook, Tiktok, Instagram...

The results of the regression analysis on the influence of interactive marketing activities on the *mobilizing behavior* gave the results R2 = 0.545 (independent variables explain 54.5% of the change in *mobilizing behavior*). development), F= 113,619 with Sig of F test equal to 0.000 (< 0.05). Thus, the regression model is eligible to generalize and apply to the population. The results of the normalized regression function are as follows:

MB = 0.329*CLDV + 0.253*NT_TN + 0.219*CKMQH + 0.222*GQPN + 0.337*CSVC

Students' perception of all interactive marketing activities positively affects mobilizing behavior, in which the perception of facilities and service quality has the strongest influence. These positive feelings and evaluations are the basis for students to not only share but also entice and convince other people such as high school seniors and their relatives to choose the university they are studying. It is the students of the university that can be seen as an important link connecting and attracting potential customers for that university.

5. Conclusion

In general, the results of this study support the positive effects of interactive marketing activities on students' engagement behavior. Interactive marketing activities have exploited the advantages of interaction in the digital platforms such as the immediacy and continuity, as well as the ability to systematically and clearly measure and capture learners' feedback. Good service quality and facilities, strong responsibility and commitment of the university are good basis for students to share and spread positive information to other community. These behavior would contribute significantly in building and developing the university brand.

The limitation of this study is that it has not been able to clarify the evaluation of interactive marketing of each interaction channel, separated departments and faculties in the university. As the results, it can not suggest specific implications or solutions for the university. For example, survey results show that there is a high level of satisfaction with facilities or service quality, but this evaluation may not be the same across different channels of interaction or among different departments. Further studies in the future shall be designed to fix this limitation.

CREDIT RATING AGENCY: INTERNATIONAL EXPERIENCES AND SUGGESTIONS TO DEVELOP IN VIETNAM

MSc. Pham Thi Thuy Dung

dungpt@neu.edu.vn

Department of Monetary and Financial Theories, School of Banking and Finance, National Economics University, Hanoi, Vietnam

Abstract

The activities of Credit rating agency (CRA) were created since 1909 by John Moody. After hundred years, CRAs gradually showing their special role in capital market of many countries. During the past decade, CRAs also draw a lot of attention from investors, policy makers, especially during the financial crisis in 2008. This report will illustrate some specific issue around these agencies, include: the overview of CRAs, the role of CRAs on financial crisis, positive and negative effect of "Credit Ratings Mistrust" during crisis, and the chance to run a CRA in Vietnam, as well as some suggestion to improve their performance in risk assessments.

Keywords: *Credit rating agency, Financial crisis, credit ratings mistrust, financial market, bond market*

1. Introduction

Although Credit Rating Agency is a specific type of companies who does not directly invest in financial market, their role to the financial system is undeniable. CRAs not only reduce the asymmetric information but also take part in risk management of investors. Theoretically view, CRAs also helps to predict the financial crisis. However, CRAs have potential problem in their business model. Global Financial Crisis 2007-8 exposed these shortcomings. Despite the misleading credit rating of CRAs during the Global Financial Crisis, the role of CRAs in enhance the efficient of financial market is worth to considered. A Vietnamese credit rating agency is an interesting business for financial market and policy makers to setup.

2. Overview of credit rating agencies

2.1. Who are Credit Rating Agencies?

There are 2 main problems in the capital market, which make this market less attractive: transaction cost and asymmetric information. When a lender gives money to a borrower, the first and most important matter they care about is whether they can get their money back. In order to solve this problem, the lender require more and more information about their counter parties. However, it is not easy to collect all information about partners, especially when they have too many borrowers. In this case, the existence of a third party who can record and analyze companies' information became necessary.

CRAs aim to provide their opinions about the securities' debt risk, including private corporations and all levels of government. On the other words, based on the information about firms' framework, sovereign, capital… and specific instruments of CRAs, such as: financial analysis, statistical modelling, risk volatility assumptions… CRAs give their subjective judgments about the firms' securities, whether the issuers can keep their promises of interest and principal payment on due date (Bilson & Delacour, 2011)

It is clear that the operation of CRAs reduce the asymmetric information in the capital market. By dint of these analyses, the investors can nurture their knowledge about the firms and their securities, hence, they can make the right decisions in relationship with their risk taste. (Elkhoury, 2007)

2.2. How to run Credit Rating Agencies?

All of the very first and biggest CRAs in the world are U.S companies. The first CRA is Moody, which was found by John Moody in 1909, followed by the Poor's Publishing Company in 1916, Standard Statistics in 1922 and the Fitch Publishing Company in 1924 (White, 2010). Although they have the same objective, CRAs is different in several sectors, the important are: Business model and methodology.

- *Business model*

- <u>"Investor-pays" model</u>

From the beginning, 4 major CRAs worked as the model "investor-pays". To specific, these CRAs released their judgment about several securities of a company or portfolios, and then sold their assessments of credit worthiness to investors.

This model was used in half of the century until the early 1970s, when several issues occurred, which made the model of these CRAs changed. (White, 2010)

- First, free-riding or information leak problem, which reduce the revenue of CRAs.
- Second, regulation changes which made the issuers had to pay for CRAs to rate their securities in order to put their securities in portfolios.
- Third, as CRAs working in the information market, they could be paid by both issuers and investors.

Consequently, the new model for CRAs business was held, called "issuer-pays".

- <u>"Issuer-pays" model</u>

In the "issuer-pays" model the bond issuers had to pay for the rating while these grade was public to the investors with no charge. "Issuer-pays" model is the most common model to be used in CRAs.

Despite its popularity, the "issuer-pays" model raises the conflict of interest, this lies on the potential relation between CRAs and their clients. Theoretically speaking, CRAs should rate the issuers' securities based on its risk, or more particular, the abilities of paying back their loan. However, although there are only few rating agencies which are recognised in the world, the competition is still exist. Consequently, to keep their market-share and revenue, CRAs may distort ratings or provide ancillary services to enhance the relation with their customers. Moreover, they may gain some further business from clients. For example, CRAs can give their clients pre-rating assessments, so that the issuers can modified to obtain the rating they want, this is called “ratting-shopping”. (Pagano & Volpin, 2010)

- *Methodology*

Each CRA has their own methodology to rate securities. In forming their opinions of credit risk, rating agencies typically use analysts or mathematical models, or a combination of the two. (S&P Global Ratings, 2019)

- Model driven ratings.

A small number of credit rating agencies focus almost exclusively on quantitative data, which they incorporate into a mathematical model. For example, an agency using this approach to assess the creditworthiness of a bank or other financial institution might evaluate that entity’s asset quality, funding, and profitability based primarily on data from the institution’s public financial statements and regulatory filings.

- Analyst driven ratings.

In rating a corporation or municipality, agencies using the analyst driven approach generally assign an analyst, often in conjunction with a team of specialists, to take the lead in evaluating the entity’s creditworthiness. Typically, analysts obtain information from published reports, as well as from interviews and discussions with the issuer’s management. They use that information and apply their analytical judgment to assess the entity’s financial condition, operating performance, policies, and risk management strategies.

2.3. The roles of Credit Rating Agencies

- *Role of Credit Rating Agencies in financial system*

- Reduce asymmetric information

Providing risk rating scales of securities is the main target of CRAs. In order to fulfill their goal, CRAs need to collect not only public but also nonpublic information from the clients, such as industry report, price trends, acquisition agreements, business forecasts, firm’s future project,…With high experience employees and professional methods, the rating of CRAs contain superior information. The investors can base on CRAs opinions to evaluate their own investment’s value and risks. Hence, CRAs is useful to minimize information asymmetries. (Mullard, 2012)

- Tool to maintain regulation

In the early 1930s, when the regulation of investment became more tighten, the role of CRAs became more important. For example, in order to issue a new security to the market, the rating of CRAs become a regulatory license and requirement. Hence, issuers need to pay for CRAs to rate their new securities. Moreover, the law restrictions also require some types of investors, such as commercial bank, pension fund…to follow the minimum credit rating policies, which make the role of CRAs become higher. In a sense, CRAs became a tool of regulation, used for regulatory purpose in the world to reduce risk in the market.

- Source for risk management

The higher risk, the higher return the investors require. CRAs provide an indication about clients' risk, therefore, became a source on risk management of investors. The assessments of CRAs can affect the interest rate of payment in a contract, or even can break a deal of clients. In addition, for some buy-side companies (for instance: insurance companies, pension funds…) or sell-side companies (such as broker dealers), the result of credit rating process is an important input to their investment analyses

- *Credit Rating Agencies in anticipating future financial turmoil*

Theoretically, CRAs could satisfy their role, even in anticipating future crisis. With independent working and high reputation, the result of credit rating process will be the main source for investors to make decision. CRAs will reduce the asymmetric of information by provide the issuers risk level. In addition, with the reliable report, investors can evaluate their risk and have suitable reserve for their investment. The result of credit rating should remain valuable in a long period of time. Therefore, the downgrade of many issuers also indicate that the crisis may happened.

However, in CRAs' business model, their work is not independent. It is clearly that "issuers pay" model exist the conflict of interest. This conflict raises the question of the credit rating accuracy. In this case, instead of disclosing information, CRAs make the market less transparent. Moreover, overrating securities leads to the mistake in risk management, and become worthless in regulation. The incorrect risk appreciation cannot be the source to predict financial crisis. Hence, the business model of CRAs make them fail their roles.

3. Credit rating agencies and financial crisis

3.1. Financial crisis in 2007 - 2008

The recent financial crisis in 2007-8 can be recorded as the biggest global crisis after World War II, which led to bankrupt of large financial institutions. Down Jones Industrial Average was stood at more than 14.000 in September 2007, however, 1 year later, this figure was only 8.000, 40% was lost in 1 year (Reavis, 2012). Not only was stock market suffer from the crisis but credit market also were nearly paralysis. Unemployment rate in U.S raise dramatically, loans could not be made, and other countries beside U.S also suffer with the crisis.

The very first source of the crisis was US housing market. It was blamed that the significant rising in the house price from 1990s in relation with several contributing factors, such as low interest rate, was key points to let the market down.

In 2006, the houses' price in U.S was about 4 times of average family income, which illustrated the high demand of this asset. In spite of flat incomes, household was able to buy their own house by the easy access to capital of bank, which created the subprime loan in the market.

The securitization process transformed these subprime loans into subprime Mortgage Backed Securities (MBSs) and Collateralized Debt Obligations (CDOs) and was held by many investors in the market.

The crisis occurred when the balloon of houses blew up. Housing price dropped dramatically. Households could not pay back their loans to their lender. The subprime loans became bad debt. The securities based on these type of loans became worthless. And the revenue of investors became negative.

The explosion of the house' balloon also pull down the stock index. Hence, the crisis happened and many firms, especially financial institutions was involved.

3.2. Role of Credit Rating Agencies in Global Financial Crisis

In order to have clear evaluation of CRAs' role in the financial crisis, the report will discuss the securitization process, therefore, summary the huge effect of their misleading credit ratings.

- *Securitization process and affections of misleading credit rating*

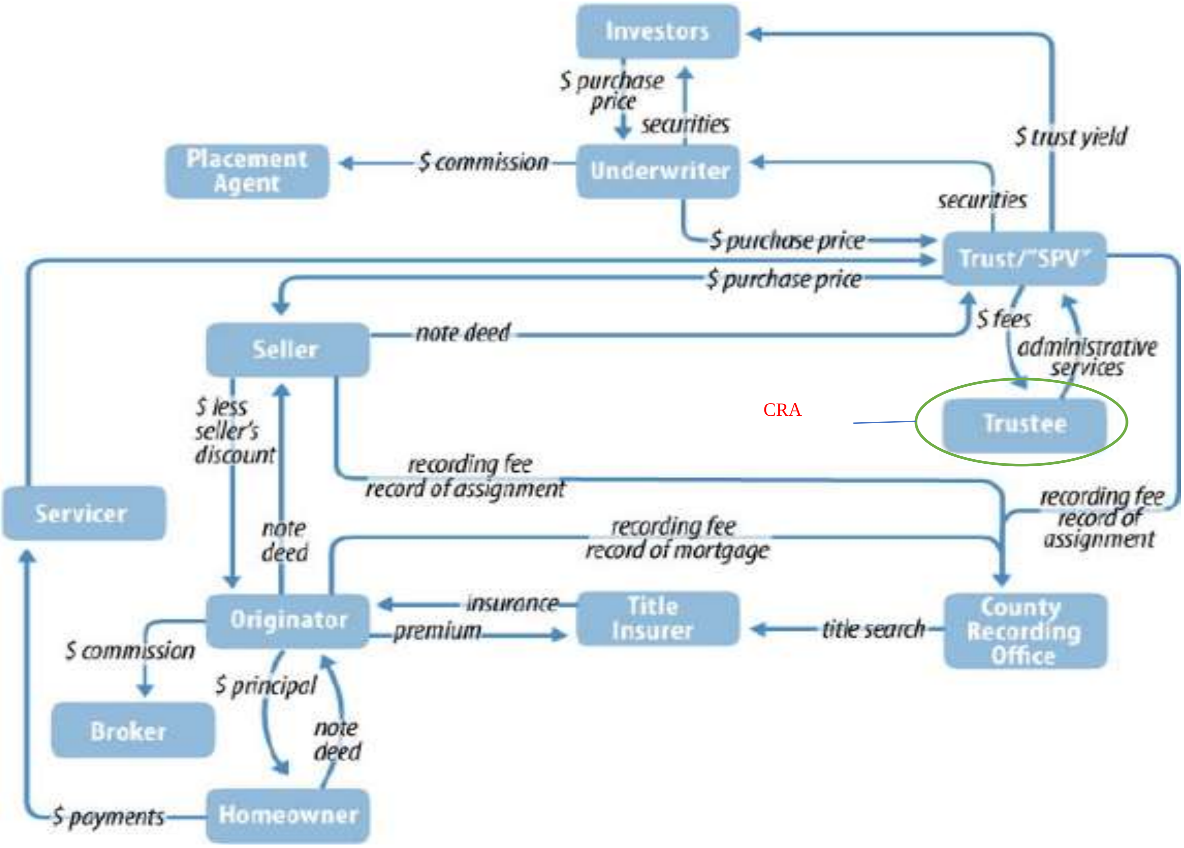

Diagram 1: Securitization process (Peterson, 2009)

It can be said that the misleading credit rating of CRAs exacerbate the Global Financial Crisis. (Mullard, 2012)

First, the misleading of CRAs provided favourable condition for SPV to sell the subprime MBSs and CDOs in the market. The mix and match of the securities in the portfolios made it complicated and then the information became coarse. CRAs, in that case, became more important on deducting information asymmetry. However, their misleading only raise the gap between the subprime securities and its source, subprime loans.

Consequently, when the housing price dropped, its negative effect not only affected the originators, but also put the investors in the secondary mortgage market in danger. The domino effect made many big financial institution suffer, and with the limit power, FED could not rescue them all.

Second, the high rate of securities increased the liquidity in the market. The originator, instead of waiting for their borrowers pay back their debt, could sell the loans to other institutions, and continued lending money for the subprime homeowners. This situation, in some case, made the originator suffer more from the broken of housing balloon. The same problem also was recorded in other investors in the market. Moreover, the securitization process also reduced the responsibility of the lender in the loan contract.

Third, the misleading credit rating also meant that the risk of the portfolios was low. In this situation, the holder of the portfolios did not require large provision for the investment. Therefore, they became passive when crisis happened.

- *Causes of the misleading credit rating*

From the beginning, secondary mortgage market working normally for decade. But after the Dot com crisis, U.S government decided to reduce the interest rate, which given favourable condition for homeowner to make a loan. However, these loans did not conform the standard, so that it was called subprime loan. After securitization process, these loans became subprime MBSs and CDOs. From 2001, subprime MBSs increased significantly as shown in table 3. The misleading in credit rating of CRAs played the main role on this trend. (Pagano & Volpin, 2010)

Firstly, the conflict in the business model of CRAs made them give the portfolios which included subprime MBSs highest rating. In addition, the untighten regulation in CRAs' operation made their conflict of interest became more serious. There were no regulation restrict CRAs provide their rating requirement to the clients. Hence, the issuers can modified their financial situation to meet the certain rating, or on other words, shopping the rating. Furthermore, CRAs was concerned as "journalists", so they did not have responsibility for their rating result. The only thing that made them giving the right rating was reputation and tradition. Hence, when they wanted to keep the market-share and revenue, they may misleading their rating result. The relation between their rating and revenue was significant. From 2001 to 2006, three biggest rating agencies recorded dramatically rise in revenue, from $3 billion to $6 billion. They also charged for the triple-A rating securities, as Moody's received 4.75% for triple-A rated and 3.5% for AA rate.

Secondly, it is undeniable that the securities in the secondary mortgage market were very complex. Hence, it was not easy to evaluate the creditworthiness of these instruments. However, CRAs, instead of warning investors about the different between bonds and asset-backed securities, was very confident to assert that the risk level between triple-A bonds and triple-A securities was similar. This reassurance encouraged investors to purchase riskier AAA securities, and expand the market. "The FCIC estimated that Moody's and S&P rated some 10,000 securities as triple-A between 2005 and 2007 and that Moody's had rated US$4.7 trillion in RMBS and over US$400 billion in CDOs".

Table 1: Issuance of mortgage backed securities and CDOs over time

	Total mortgage origination ($bn)	Subprime origination		Subprime MBS		CDO issuance ($bn)
		($bn)	(% of total mortgages)	($bn)	(% of subprime mortgages)	
2001	2,215	190	8.6	95	50.0	6
2002	2,885	231	8.0	121	52.4	36
2003	3,945	335	8.5	202	60.3	30
2004	2,920	540	18.5	401	74.3	157
2005	3,120	625	20.0	507	81.1	272
2006	2,980	600	20.1	483	80.5	552
2007Q1	680	93	13.7	52	55.9	186
2007Q2	730	56	7.7	30	53.6	176
2007Q3	570	28	4.9	16	57.1	93

Source: Gorton (2008)

Thirdly, CRAs also had problem with their methodologies and experience employers. It seems that they were lack of historical data of subprime market, as well as the correlation in the default that may affect the securities. The demand for CRAs rating also increased, which could be describe by $4 trillion mortgage-back securities during 6 years from 2000 to 2006 that needed ratings. The rating process, which should be run in 1 months, reduced to 2 weeks. Therefore, the employers in CRAs always had to handle the stress time. These are some reasons which made the rating result become mistrust.

4. Suggestions for credit rating agencies

Theoretically speaking, CRAs should reduce the asymmetric information and provide sufficient reports for investors. However, in the past decade, especially during crisis time, CRAs did not satisfy their role in risk assessments.

Some suggestion in term of regulation, which should be bring forward to improve CRAs' performance will be discuss below:

First, the potential problem of CRAs is the business model. In long-term, CRA should change the "issuer-pays" model into "subscriber-pays" model to solve the conflict of interest. The new model should have the participation of a third party to fund the CRA on behalf of investors.

Second, in short-term, while changing the model is difficult to implement, a regulation restrains the relation between issuers and CRAs in the old model must be released. For example, prohibit issuers from shopping rating, restrict CRAs sell ancillary services, which has strong relation with the result of rating.

Third, the penalty of giving mistrust rating should be considered. Although CRAs are working as a "journal", the impact of their credit rating is enormous. Raising their responsible in credit rating is necessary, and also improve their trust.

Fourth, in order to enhance transparency, the issuers should public the portfolios data. Furthermore, CRAs also should be asked to disclose more complete and detailed data about the credit rating process.

5. Vietnamese credit rating agency

Although CRAs has some potential problem in the business model and methodology, which exacerbates the Global Financial Crisis, CRA is developed in many countries. Credit rating can be applied in the following areas/instruments:

- ✓ Equity shares
- ✓ Rating for banking sector
- ✓ Individual credit rating
- ✓ Rating for insurance sector
- ✓ New instruments, floating rate notes, index based bonds, long-term deep discount bonds, etc.
- ✓ Rating of intermediaries in financial services
- ✓ Securitization
- ✓ Rating of companies raising funds overseas.

However, in Vietnam, CRAs normally do their rating on bonds and show important role to boost bond market.

5.1. Vietnamese financial market

The role of CRAs is significant with the development of bond market. The Vietnam corporate bond market has grown rapidly since 2017 and issuances of $12.8 billion in 2019 were larger than those for Indonesia and the Philippines. Private placements accounted for 94% of corporate bond issuances in 2018 and 2019 following easing of disclosure requirements and issuance conditions. However, the lack of a credit culture poses significant risks to the bond market and the financial sector, particularly as individual investors currently own almost a fourth of all bond issues. (Kathpalia, et al., September 2020)

Table 2: Vietnam Bonds issuance

Year	Government	Guaranteed	Municipal	Corporate	Total
2012	141.3	52.6	4.8	28.7	227.5
2013	181.1	47.4	8.5	34.4	271.3
2014	248.0	27.7	7.1	48.0	330.9
2015	256.2	47.9	7.5	42.8	354.4
2016	312.2	34.5	3.5	97.4	447.6
2017	244.2	34.4	2.2	115.4	396.2
2018	221.0	26.2	0.8	238.4	486.3
2019	229.8	17.5	1.0	296.7	544.9

Source: Techcombank securities and Vietnam Bond market association

There are 4 types of bonds in Vietnamese bond market:

Government bond, which normally issued by the Ministry of Finance, accounted for the largest amount of bond in the market from 2012-2017.

Government guaranteed bonds is issued by state-own policy banks or state-own firms.

Municipal bonds issued by provinces to fund their own budget.

Corporate bonds saw a dramatic increase from 2012 to 2019, with the issued amount excess the government bonds in 2018 and 2019, accounted for the biggest type of bond that is established in the market.

5.2. Domestic credit rating agencies in Vietnam

The potential of bond market and financial market in Vietnam is huge. With the successful in controlling COVID-19, financial market in Vietnam grows stronger than ever. The urgent need for a domestic rating agency in Viet Nam is clear based on feedback from investors, intermediaries, issuers, and government officials. A credible domestic rating agency is a critical missing jigsaw piece in the orderly development of a healthy sustainable bond market in Viet Nam. (Kathpalia, et al., September 2020)

The first CRA in Vietnam is VietnamNet Credit ratings central, which is launched in 2005 but the demand for rating is poor, which led to it closed in a year. It is clear that in 2005, the financial market in Vietnam was run for 5 years, litter instruments was traded, therefore, the need for CRA was not existed.

In 2017, Phattinh Rating was the fist Vietnamese credit rating agency to be licensed under regulations. It has rated 30 enterprises, financial institutions and debt instruments. Later, in 2020, FiinGroup (formerly known as StoxPlus) became the second credit rating agency to be licensed by the Ministry of Finance. In 2019, it provide over 7000 reports on SMEs in Vietnam and created a scoring model to rate this type of firm. Fiin Rating is worked under an “investor pay” model.

5.3. Develop credit rating agencies in Vietnam

In Vietnam, The Ministry of Finance can grant up to 5 CRAs, therefore, the chances for this business is exist. Running a CRA in Vietnam bring both positive and negative effect on solving the mistrust of credit rating.

- *Positive effect*

First of all, setting up Vietnamese CRA is a good idea. To begin with, Vietnamese CRA works in Vietnam, therefore, they acquainted with the regional economic fundamental, hence, they may create better model to evaluate the risky of sovereign debt of their members, in case of FiinGroup.

Secondly, the asymmetric information in Vietnam financial market is high. Investors hardly access the real financial situation of the firms in the market, especially with the bond market, this makes it become inefficient. CRAs will provide more information for investors, therefore, bring the Vietnamese financial market into higher level and attract more local and foreign investors.

Last but not least, the more CRA, the higher information is provided. Each CRA has their own business model, so there will be the conflict between interest of the owners. This lead to the mistrust of CRA. FiinGroup is an "investor-pay" company, so they may face the problem of this model and may change into an "issuer-pay" firm. But "issuer-pay" model gave some wrong rating during the financial crisis, which exacerbated the recession. There is one more type of CRA that can be considered, which is "state-own" company. So different types of CRA will decrease the mistrust of the rating, and make the information more transparent.

- *Negative effect*

However, contrary policymakers claimed that this agency will put the reputation of credit rating in danger. Vietnamese CRA is a new agent, therefore, it is convincing that investors may consider about their rating scale and standard. The different of the standard on credit rating may help the bonds or stocks gain high level. More or less, Vietnamese CRA works under the funding of someone, and they have their own interest, so the risk of the wrong rating is existed. The mistrust on the result of credit rating result also raises the adverse effect on the growth of Vietnamese financial market.

SESSION 3:

INFORMATION TECHNOLOGY AND DIGITAL ECONOMY

VIETNAMESE CUSTOMERS' AWARENESS TOWARD DIGITAL TRANSFORMATION IN F&B SERVICES INDUSTRY IN DIGITAL ECONOMY ERA

MA. Tran Minh Anh

anh.tranminh@hust.edu.vn

Department of Industrial Management, School of Economics and Management, Hanoi University of Sciences and Technology, Hanoi, Vietnam

PhD Candidate, Department of India and ASEAN Studies, Graduate School of International and Area Studies, Hankuk University of Foreign Studies, Seoul, Korea

Abstract

Being referred to as a "dragon being unleashed" in terms of digital economy within Southeast Asia, Vietnam's industries are seeing numerous changes in their nature, especially the F&B services sector. Moreover, when the Covid-19 pandemic has hit hard on the performance of this sector, with 95.5% of F&B services businesses in Vietnam being affected, the application of digital technology has been emerging as an opportunity for traditional F&B services businesses to transform and find way to survive in this natural selection. Within the current context of digital economy in Vietnam, this study identified Vietnamese customers' view toward digitalization in F&B services industry.

Through a survey done with 430 respondents, it has been observed that Vietnamese customers are having a friendly view toward digitalization in F&B services industry, being reflected in the increasing trend to use online ordering, digital payment, digital marketing channels and the overall preference toward using digital technologies in F&B services outlets. However, we cannot ignore the socio-cultural aspect, including the habit of using cash and eating at home, the lacking of digital skills or even the unequal development of digital infrastructures which can bring about challenges to F&B services enterprises in promoting digitalization.

Keywords: *Covid – 19's impacts, customers' digitalization awareness, digital economy, F&B services industry*

1. Introduction

Reality has shown that the third wave evolution and the Industrial Revolution 4.0 has greatly impacted almost all aspects of our lives, creating many profound shifts in the society, among which is the emergence of digital economy. Digital economy was first mentioned in Japan by a Japanese professor and research economist during Japan's economic recession in the early 1990s. The term, later, spread to the West and was coined in Don Tapscott's book "The Digital Economy: Promise and Peril in the Age of Networked Intelligence" published in 1995. As believed by Don Tapscott, by combining knowledge and creativity, a new concept of an economy that focuses on the networking of humans through technology so as “to create new social norms on wealth creation and social development” was inevitably formed (Tapscott, 1995). Since then, there have been many different interpretations as well as definitions of digital economy. For us, we would define digital economy as a branch of economic studies that encompasses economics activities based on the combination of knowledge and digital technologies. Such activities are not only limited to the ICT sectors and industries in which their business models based primarily on digital technology but also cover even traditional industries that use digital technology to support their business practices. With the spread of digitalization into the real economy, we can firmly say that the digital economy is undoubtedly turning into just the economy nowadays.

Digital Economy Report 2019 shows that the global digital economy was worth $11.5 trillion USD in 2016, accounting for 15.5% of global GDP. Taking the regional factor into account, with its current rate of development, ASEAN is believed to have a full potential to enter the top 5 digital economies in the world by 2025 (Leopairote 2017). Within this region, Vietnam can be referred to as a “dragon being unleashed”. While the average growth rate of the whole Southeast Asia region had reached 33% since 2015, Vietnam's digital economy growth rate in the same period increased by 38%. The value of Vietnam’s digital economy in 2019 was $12 billion USD (4 times higher than in 2015), contributed 5% to the national GDP. It is true that Vietnam is now one of the most popular digital investment destinations in Southeast Asia, just behind Indonesia and Singapore.

Digital economy started its “invasion” into Vietnamese economy along with the advent of computers, especially, laptops in the end of the 1980s. By the end of the 1990s, when Internet first came into Vietnamese people’s lives, digital economy entered a blooming period within the whole country. Later, when smart phone usage densities reached 50% in 2000, the digital economy gradually became a popular term. The beginning of the 21st century is believed to be the milestone for the development of digital economy in Vietnam with the emergence of the Industrial Revolution 4.0 along with smart phones, AI, blockchain and cloud computing etc. … Nevertheless, despite the fact that the growing speed of digital economy has been quite high in Vietnam, it has been observed that Vietnamese digital economy has basically been in a spontaneous development stage for the previous years without official management from the Government. In fact, not only until 2020 did digital economy receive much attention and become a significant development concern of Vietnamese government, implied through the introduction of the National Digital Transformation Programme. One of the reasons for such concern being raised comes directly from the Covid-19 pandemic, which is believed to be one of the most recent change agents of the digital economy in the world in general and in Vietnam in specific. Besides its negative impacts, we cannot deny the fact that this pandemic can be considered as a natural selection, bringing about an opportunity for the economy to regenerate. For Vietnamese businesses, Covid-19 is a push that led them to be forced into a situation of change. In other words, Covid-19 for Vietnam's digital economy is a significant boost, especially for businesses to engage in digital transformation ranging from corporate governance to online sales etc.

F&B services industry can be said to be an indispensable part of any economy, playing a vital role in many countries' economic growth, including Vietnam, by not only contributing significant value to the economy, but also creating employment opportunities. However, this Covid-19 pandemic has hit hard on this sector. According to a survey done by Vietnam General Statistics Office in April 2020, a large number of economic sectors have a high proportion of businesses being affected by the negative impacts of Covid 19, typically: aviation 100%; accommodation services 97.1%; travel agency activities 95.7%; F&B services 95.5%; education and training 93.9% etc. Most notably, among the businesses negatively affected by the Covid-19 pandemic, the rate of businesses in the F&B services industry having to temporarily close down is 54.0%; the revenue decline rate over the same period is 59.7% (only behind the aviation industry with 76.5%). Besides, one fact that cannot be denied is that along with the development of the economy, Vietnamese customer's demand for F&B services is also increasing and reshaping significantly, followed by the appearance of diverse business models as well as competitiveness in the industry. Therefore, the application of digital technology has been emerging as an opportunity for traditional F&B services businesses in Vietnam to transform, especially when agility has now become the competitive advantage almost all businesses seek to develop in this digitalized world.

After Directive 16 / CT-TTg of the Prime Minister on nationwide social distancing, many F&B enterprises from famous brand like Starbucks, Golden Gate, The Coffee House etc. ... to many other small and medium F&B outlets all simultaneously promoted online sales and delivery model to proactively cope with the situation. In fact, by the end of March 2020, before the government officially requested to close unnecessary business services including coffee chains, Starbucks Vietnam's delivery revenue increased by 50% compared to average sales in February. Like Starbucks, The Golden Gate Group also switched to using online technology by launching G-Delivery and I-Cook service home delivery. At The Coffee House chain, revenue from the delivery segment as of March 29, 2020 increased 20% comparing to the previous weeks. Online sale and delivery have really become the saviors of the F&B services industry, especially at the present time, when the "ghost" of Covid-19 is still lingering. Also, in 2020, the food delivery market in Vietnam was estimated to have a capacity of $195 million and is expected to reach $330 million by 2023. It is worth mentioning that the segment of food delivery through applications is growing to more than 30% per year. This is an indispensable trend in the F&B services industry in Vietnam. However, whether this trend will continue to grow or not is a real question posed for the F&B services industry in specific and the whole economy in general.

Thanks to digital technologies, the role of consumers has become more important. It's even not exxagerate to say that within digital economy, the consumers have become more empowered than in the traditional economy, being in charge of deciding the rules of the games. Thus, the final target of digital transformation is to put customers at the center of the business and here comes the need to understand customers' expectations and preferences toward digitalization so as to reach the highest possible level of growth. For such reason, the main purpose of this paper is to identify how Vietnamese customers are perceiving the usage of digital technologies in F&B services industry.

2. Method

Since the main aim of the research is to identify the digital awareness of Vietnamese customers in F&B services industry, it was determined that a quantitative methodology would be appropriate. In more detail, this research consisted of an empirical, quantitative survey and used a self-developed questionnaire. At first, we planned to have the survey done in person, however, due to the Covid-19 situation at the time the surveys were conducted, the online-survey method was chosen. This fact, to some extent, is a reflection of digitalization in our everyday life, which interestingly coincide with the focus of our research topic. The surveys were conducted from August 2020 to October 2020. To ensure that the sample is unbiased representation of the total population, a random sampling technique was used. In terms of questionnaire design, the questions were devised to try to capture almost all aspects of digitalization in F&B services industry, including digital payment, digital marketing, online ordering as well as customers' preference toward digital technology usage in such aspects as digital style services, outlet's own application and platform application. In addition to this, a set of questions relating to Covid – 19 and its impact on reshaping customers' behavior in F&B services industry was also developed.

The total sample size was reached by balancing the level of confidence in the results received with such issues as time and budget. In total, there were 430 valid responses. Among 430 participants in the surveys, 135 respondents were male and 295 respondents were female. The majority of participants were Millennials (Generation Y) from 25 to 40 years old, accounting for 57.21%. This is completely consistent with the fact that the Millennials generation in Vietnam is the largest group, having the most purchasing power in the society and is the segment by age that many brands are targeting. In addition, the pattern of respondents by age group is similar to the standard distribution of the population. 85.35% of participants hold at least bachelor degree, which is higher than the average education levels. In terms of income levels, the respondents' answers represented the standard distribution of level of incomes in Vietnam, with the average ranging from 5 million VND to 10 million VND per month. Over half of the respondents were office workers. The survey sample was constructed to be representative of Vietnamese population in terms of geographical area, with 55.81% of respondents from the North, 26.51% from the Central area, and 17.68% from the South. Respondents coming from 3 major cities including Hanoi, Danang and Ho Chi Minh City accounted for 69.77%.

Table 1. Demographic characteristics of sample

Question	***Answers***	***Percentage***	***Answers***	***Percentage***
Gender	*Female*	68.60%	*Male*	31.40%
Age group	*< 25*	23.02%	*41 – 55*	14.88%
	25 – 40	57.21%	*> 55*	4.88%
Educational level	*High school*	10.93%	*Bachelor*	50.47%
	College	3.72%	*Higher degree*	34.88%
Income level	*< 5 million VND*	18.37%	*10 million VND – 15 million VND*	20.00%
	5 million VND – 10 million VND	31.63%	*15 million VND – 20 million VND*	11.63%
	> 20 million VND	18.37%		
Jobs	*Office worker*	55.81%	*Students*	14.88%
	Lecturers / Teachers	16.28%	*Unskilled labor*	3.26%
	Others	9.77%		
Geographic area	*Hanoi*	42.79%	*Other Central cities / provinces*	10.00%
	Other Norther cities / provinces	13.02%	*Ho Chi Minh City*	10.47%
	Danang	16.51%	*Other Southern cities / provinces*	7.21%

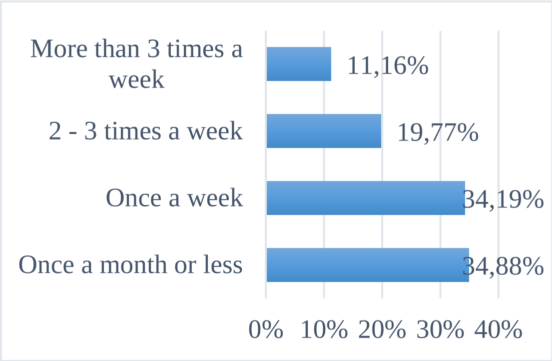
3. Results

3.1. Frequency of eating out and ordering online

In terms of eating out habit, 34.88% of the participants being asked went to restaurants or coffee shops once a month or less, while 34.19% ate out about once a week. The remaining 30.93% goes for participants who frequently ate out (at least 2 times a week). Counting the generations factor, it can be seen that eventhough in general, traditionally a Vietnamese would prefer to eat at home, the increasing number of Generation Y and Generation Z in Vietnam along with their exposure to global culture has raised the tendency of using food services anytime, anywhere among Vietnamese, especially when compared with the previous generations. This indicates the potential growth of F&B services industry in Vietnam. In fact, the F&B services industry in Vietnam is developing more and more thanks to the increasing eating out habits of young people.

Figure 1. Frequency of eating out *Figure 2. Frequency of eating out by*

generation



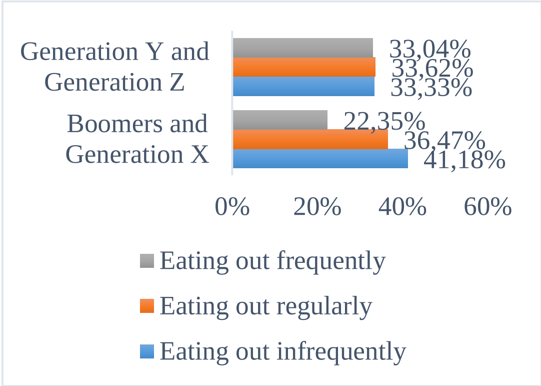


Figure 3. Frequency of ordering food and beverages online

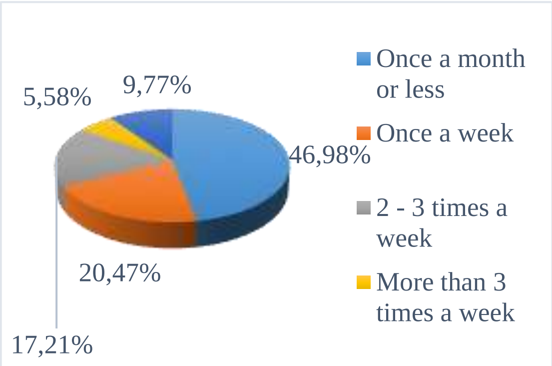
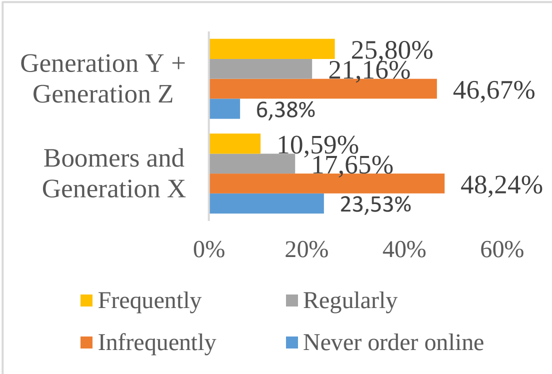
Figure 4. Frequency of ordering food and beverages online by generation



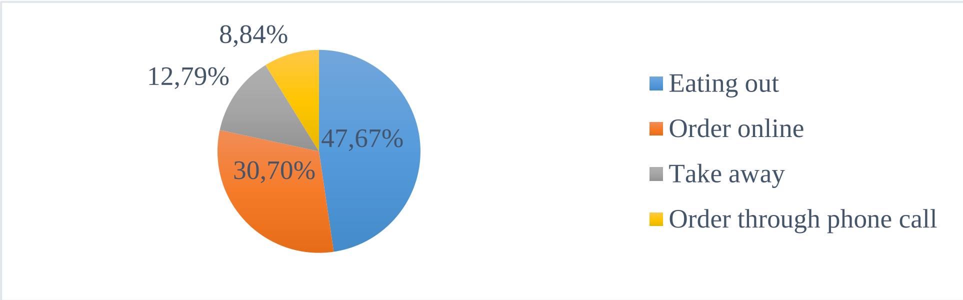


When mentioning the frequency of ordering food and beverages online, almost half of the participants (46.98%) engaged in such activity on an infrequent basis, while 20.47% ordered online regularly. The other 22.79% ordered food and beverages online frequently. One interesting fact is that 9.77% of participants asked never order food and beverages online. Taking the generation factor into account, the differences can be seen rather obviously. While the majority of both groups ordered food and beverages online infrequently, the trend is that Generation Y and Z seemed to use the online ordering function more often than the previous generations. Only 6.38% of the participants in Generation Y and Z had never ordered food and beverages online, comparing to 23.53% of the participants in Boomers and Generation X. Also, the number of the youth ordering cuisine products online on a regular or frequent basis was higher than the old (21.16% and 25.80% in comparison with 17.65% and 10.59% respectively). This is a promising foundation for the utilization of online ordering function for the F&B services sector, emphasizing the increasing number of Generation Y and Z in Vietnamese society.

3.2. Expenses on F&B services

When being asked about the type of F&B services activity that participants spent more on, 47.67% chose eating out, while placing order online stays at the second position with 30.70%. This is a true reflection of Vietnamese's customers' view toward F&B services outlet as a socializing hub. However, ordering food and beverages online has also become an indispensable trend within Vietnamese society. Only 12.79% of participants spent more on take away form. The remaining 8.84% was on calling the outlets directly to place order.

Figure 5. Expenses on F&B services

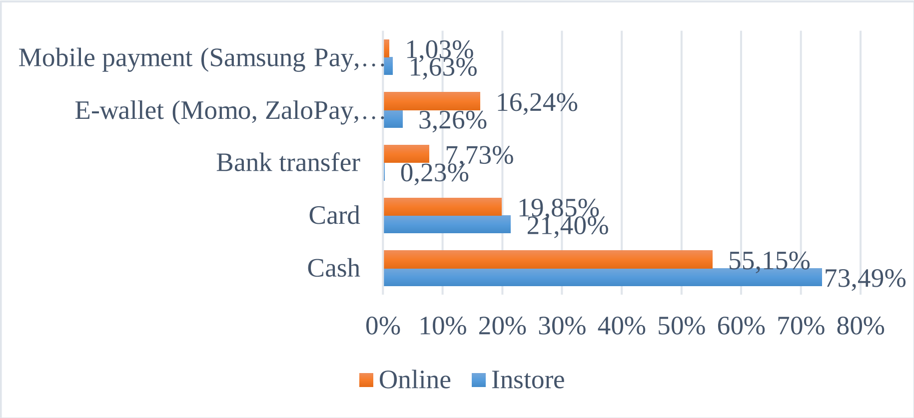


3.3. Digital payment

Talking about payment methods when eating out, the majority of participants mainly used cash (73.49%), showing a true reflection of Vietnamese's image of a cash society. Despite the government's effort in promoting cashless payments along with the increasing number of Vietnamese having bank accounts, only 21.40% of the participants used card as their payment method. Other digital payment methods including e-wallet, Samsung Pay, QR Code etc. … accounted for only 4.88%. Counting the generation effect, the payment methods the Boomers and Generation X used were either cash or card only. On the other hand, Generation Y and Z tend to try various other forms of payment.

Regarding online payment for food and beverages, again, the majority of respondents preferred to use cash-on-delivery, accounting for 55.15%. Card was still the second most preferred method of online payment with 19.85%. E-wallet and bank transfer's usage as online payment method increased significantly with 16.24% and 7.73% respectively in comparison with instore usage. Participants who chose these online payment methods mainly were Generation Y and Z.

Figure 6. Preferred payment method instore vs. online



The most commonly stated reason for cash being chosen as the main method of payment both when eating out and ordering online is that cash was considered to be the most convenient payment method for its simplicity, being fast as a direct result of its popularity in Vietnam when making payment. The other not less important reason is the person's habit of using cash and having cash with them all the time. For instore payment, the lacking of digital payment infrastructures in most of the small F&B services outlet or in the rural area is the third most concern factor. Whereas, for online payment, safety issue is the third major rationale for cash-on-delivery to be chosen. To be more precise, secure online payment as well as secure delivery service were what customers concerned about. Besides these reasons, some others factor was also noted including the person's lacking of digital skills to use digital payment methods (mainly for the old generation), the ability to manage income and expenses easily when using cash etc. One significant factor affecting Vietnamese online payment context in F&B services industry came from the shippers, most of whom would require to receive cash when products were delivered.

For other payment methods, the most popular reasons mentioned was the ability to get discount through cashback programs of card issuing banks or earning points which can be redeemed for vouchers, along with the convenience of not having to bring cash or change. Especially with e-wallet or mobile payment, all you need to bring is just a smartphone.

Figure 7. Reasons for using cash when eating out vs. online

	Convenient	Habit	Lacking of digital payment infrastructure	Lacking of digital skills	Safety issue	Shipper's issues	Others
Instore	54,05%	26,01%	10,47%	2,36%	1,35%	0,00%	5,74%
Online	46,91%	23,20%	2,58%	0,52%	15,98%	4,12%	6,70%

3.4. Digital marketing

Figure 8. Usage of online marketing channels to find information about F&B services outlets

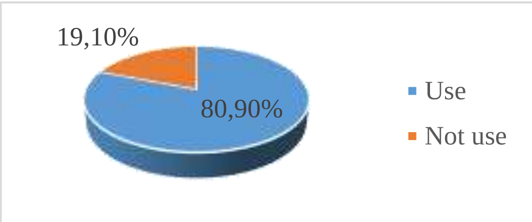


Figure 9. Satisfaction of online marketing channels when finding information about F&B services outlets

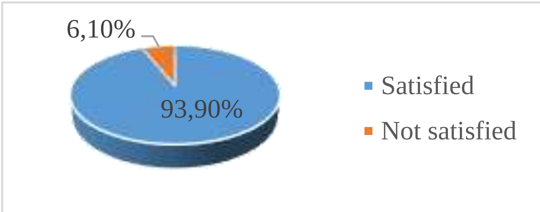
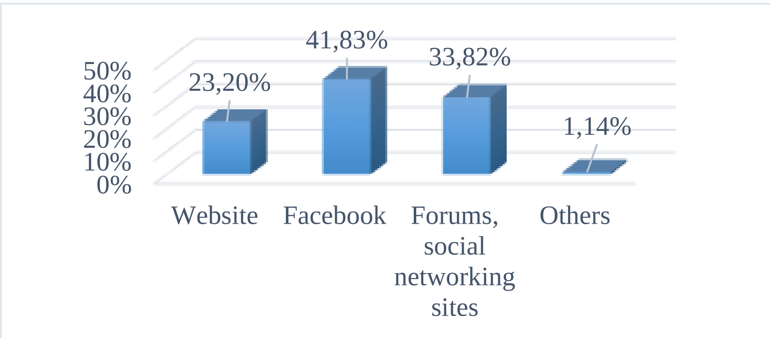


80.90% of the participants usually used online channels to find out information about restaurants or coffee shops, reflecting the development of online marketing channels in Vietnam in these recent years. Among them, 93.90% were satisfied with the information from these online channels.

Figure 10. Popularity of online marketing channels for F&B services



Among many types of online marketing channels, Facebook was the most popular one to help users find out information about F&B services outlets. The next channel that most of the participants used was forums or social networking sites, for example: Foody, Tripadvisor, Now etc. …. The main reason for these two channels' popularity is the increasing numbers of social networking sites, especially Facebook user base in Vietnam. According to Kepios (2018), Vietnam ranks 7th in terms of largest user base on Facebook, with 58 million active users. In fact, the context in Vietnam is that where there is a community, where there is a review, wherever someone talks about the product, Vietnamese customers will believe more than information given by the brand. Besides these channels, website of F&B services outlets and Google Maps were also used to support customers in finding the right restaurants or coffee shops.

3.5. Channels to order online

The most used channel to order food and beverages online was through such platform applications as Grab Food, Now or Go Food etc. … (accounting for 64.59%). 28.87% of respondents used Facebook or outlet's website as their ordering channels. Due to the limited number of restaurants or coffee shops having their own application, only 5.67% of respondents chose to use this channel.

Regarding the satisfaction when using these online ordering channels, the majority of respondents were happy with the services they received (91.24%). Only 8.76% had bad experiences when ordering food and beverages online.

Figure 11. Preferred online ordering channels

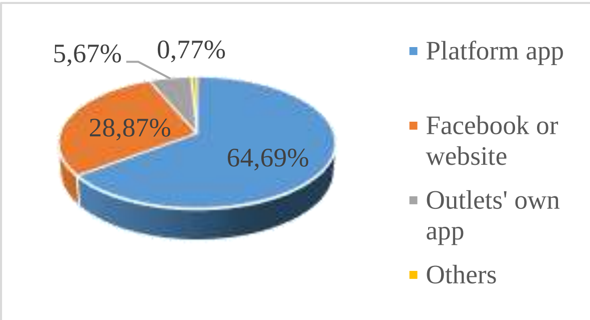


Figure 12. Satisfaction of online ordering channels

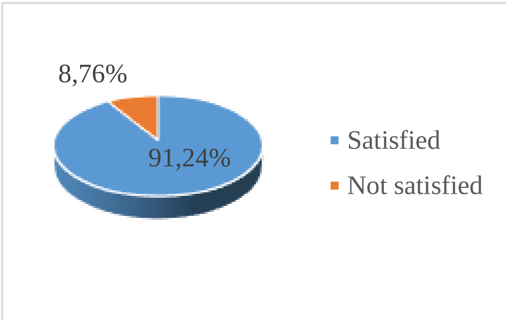

3.6. The impact of Covid–19 pandemic

Covid-19 pandemic is the most concerned issue at the moment, not only from international perspective but also from national perspective. Under the hard situation of Covid-19 with lockdowns as one of the main measures to control the pandemic, the customers' behaviors are also reshaped accordingly.

When being asked how the pandemic Covid-19 has changed their habits of going to restaurants or cafes, the majority of the answers was that participants tend to cook at home more often and reduce the frequency of eating out under the impact of Covid-19. Only 19.20% of the response was switching to ordering online instead of going out to F&B services outlets. Also, during the national lockdown period, only 46.91% of the respondents who had experienced ordering online, increased the frequency of ordering food and beverages online, while 53.09% still kept the same basis.

Figure 13. Customers' behaviors changed in the Covid-19 pandemic

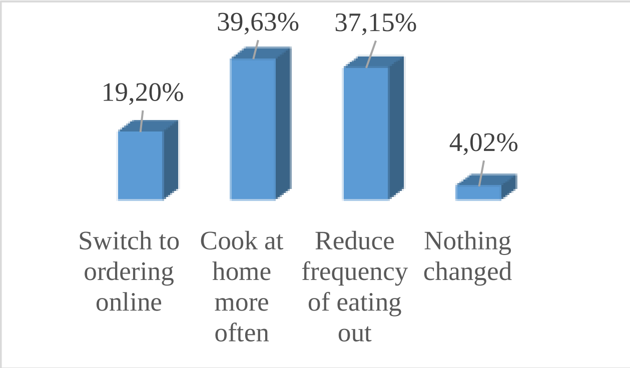

Figure 14. Frequency of ordering online changed during the national lockdown period

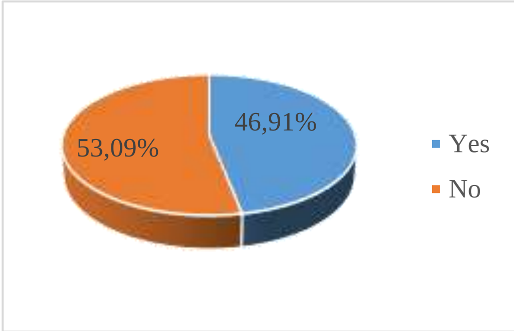

3.7. Customers' interest toward different types of technology being used in F&B services outlets

So as to assess customers' attitude toward different types of technology being used in restaurants or cafes, participants were asked to determine their interest level toward technology in two categories: digital style services and functions of F&B services outlets' application.

*** Digital style services:**

Looking at customers' interest toward different digital style services at F&B services outlets, a majority of participants were interested in using mobile phones to make payment, using tablet as a menu and placing orders or making payment with self-service kiosk (50%, 48.14% and 38.84% respectively). While mobile payment and tablet menu has existed in Vietnam, self-service kiosk is indeed a new style, promising room for development within Vietnamese F&B services sector.

Unlike three others digital technology, waiter robot technology seems not to receive much concern, with 42.56% of neutral interest and only 24.42% of interest (much lower than other types of technology). Only 4.65% showed great interest in seeing a waiter robot. In fact, in Vietnam there used to be coffee shops using robot as waiters both in Hanoi and Ho Chi Minh City. However, the first robot coffee shops, ROBO Café, had to close after less than 1 year of operation. The other cafes' performance was also not as good as expected.

*** F&B services outlets' application and Platform application:**

Mentioning different functions in the restaurants' or coffee shops' application, the majority of respondents showed interest in all functions, all of which accounted for more than 50% except the function of making payment through application (both online and instore). This is probably a direct result of Vietnamese people's preference of using cash rather than other payment methods, when 39.53% of participants showed interest and another 40.23% said they had only neutral concern. This is also the functions that received more "not interested" choice than any other types.

Summing up the data on this question, the two most liked technology was the function of using promotion codes when making payment, with an average value of 4.04 and the function to accumulate points and redeem offers, with an average value of 3.90. Waiter robots was the least liked technology application, with only 2.96 average value. Other technology's average value ranged between 3.33 to 3.89, showing that there was no high favor or high dislike toward these technologies. However, overall, digital technologies underlying in different functions of F&B services outlets' application are more favored than digital services style.

Figure 15. Customers' interest toward different types of technology being used in F&B services outlets (digital style services)

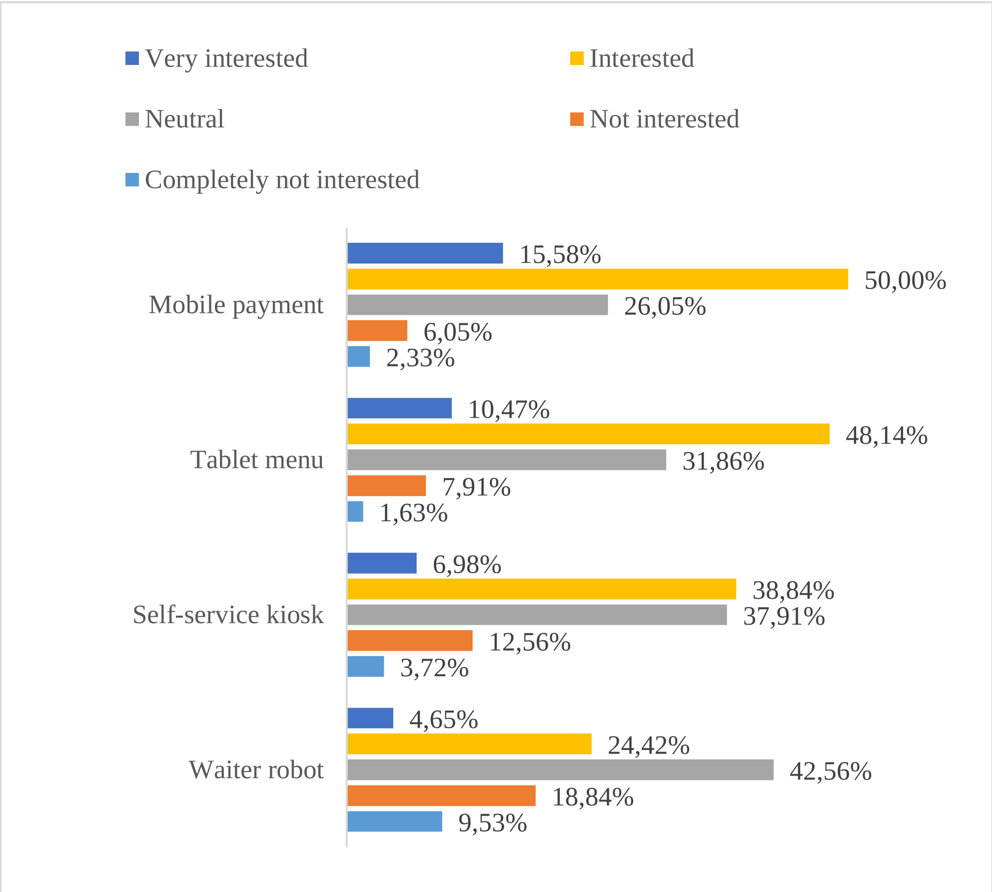

Figure 16. Customers' interest toward different types of technology being used in F&B services outlets' application and platform application

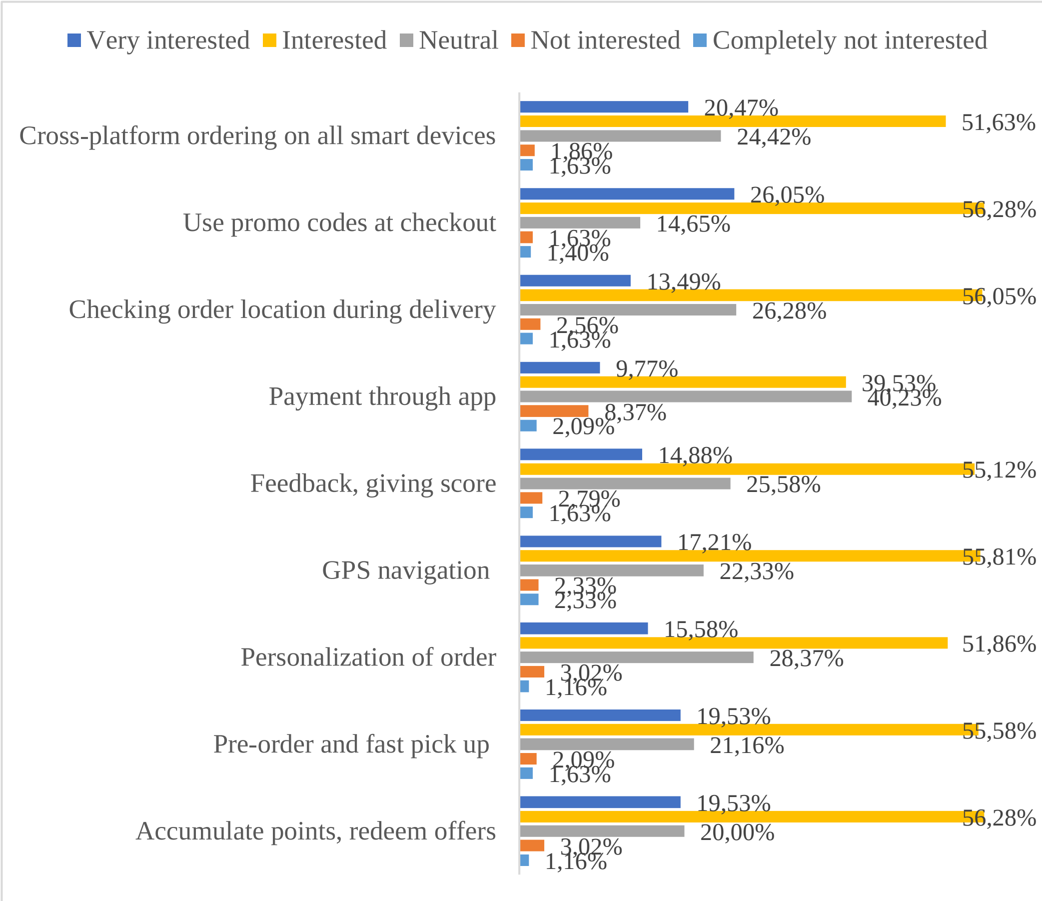

Table 2. Average value of responses on level of interest toward digital technology used in F&B services sector

	Digital technology	***Average score***	***Category***
1	Use promo codes at check out	4.04	Platform application
2	Accumulate points, redeem offers	3.90	F&B services outlets' application
3	Pre-order and fast pick up	3.89	F&B services outlets' application
4	Cross-platform ordering on all smart devices	3.87	Platform application
5	GPS navigation	3.83	F&B services outlets' application
6	Feedback, giving score	3.79	F&B services outlets' application
7	Personalization of order	3.78	F&B services outlets' application
8	Check order location during delivery	3.77	Platform application
9	Mobile payment	3.70	Digital style services
10	Tablet menu	3.58	Digital style services
11	Payment through application	3.47	F&B services outlets' application
12	Self-service kiosk	3.33	Digital style services
13	Waiter robot	2.96	Digital style services

4. Discussion and Conclusion

People often think of digital transformation as the game of those who have a lot of money. However, digital transformation does not mean applying huge, expensive digital technology but, it underlies in the rethinking of business model, turning itself into a customer-oriented organization. To put customers at the center, enterprises have to use data, use tools to capture data, build databases and start analyzing. It is not necessarily to have a big data system but a platform for creating customer data sets, analyzing their behavior, developing customer care and retention etc. … is of great importance. The essence of digital transformation is that we focus on the customer, understanding the customer and knowing how to satisfy the customers. It is true that Vietnamese customers are having a friendly view toward digitalization in general and digitalization in F&B services sector in particular. While Millennials (Generation Y) are the generation with expanding spending power, Generation Z are considered as the "connecting generation" or "the kids in the dot com age”. With the growing number of Generation Z and Y, the key generations in the global force, who will determine the consumption future of the economy, Vietnamese customers are more open to digitalization in F&B services sector. This can be proved through the increasing trend to use online ordering, digital payment, digital marketing channels as well as the overall preference toward using digital technologies in F&B services outlets. However, we cannot ignore the socio-cultural aspect of Vietnamese society, including the habit of using cash as the most secure payment method, the frequency when eating at home comparing to eating out, the lacking of digital skills among the old generations or even the unequal development of digital infrastructures between the urban and rural areas, which can bring about challenges to F&B services enterprises in promoting digitalization.

THE IMPACT OF INDUSTRIAL REVOLUTION 4.0 ON TRAINING AT UNIVERSITIES: A CASE STUDY AT THE NATIONAL ECONOMICS UNIVERSITY, VIETNAM

Dr. Vu Thi Uyen

uyenvu75@gmail.com

MSc. Nguyen Phuong Mai

nguyenphuongmaiisme@gmail.com

Faculty of Human Resource Economics and Management, National Economics University, Hanoi, Vietnam

Abstract

Along with the rapid development of the industrial revolution 4.0, information and communication technologies are increasingly being applied widely in different fields of the economy. Digital technology affects every person and organization including businesses, educational institutions, and society as a whole. Enterprises invest in high technology to make business more flexibly and will eliminate unskilled jobs and increase the need for people who are capable of researching, creating, mastering machines and performing jobs that require complex thinking that robots or artificial intelligence cannot do. Universities have the mission to provide such kind of high-quality human resources for the whole society and also apply digital technology in its training activities. Online training is an advanced, comprehensive training method, capable of connecting and sharing knowledge very effectively but at lower cost and ensuring training progress even when the environment is highly volatile. The advent of online training has marked a major turning point in the application of information and communication technology to the field of education and training. Especially, the shocking covid-19 pandemic has pushed urgently universities around the world to shift from offline to online teaching that accelerates the digitization in universities. Higher education in Vietnam is not out of that trend. With the direction of the Vietnam Government, specifically the Ministry of Education and Training, universities across the country have been developing and improving online teaching and learning to adapt to the rapidly changing environment when the need for lifelong learning meets the increasing needs of the knowledge economy and to adapt to the Covid-19 pandemic, which affects offline training. This paper is based on secondary and primary data about the impact of the IR 4.0 on digitization of university training in the world, the situation in Vietnam and the reality at the NEU – one of the pivotal universities in Vietnam, thereby propose several recommendations to stakeholders to promote the development of 4.0 technology application in university training in the coming time to meet the learning needs of students at anytime and anywhere. That helps the universities ensure accountability to outcome standards in a highly volatile environment and is more integrated with global education.

Key words: *impact, industrial revolution 4.0 (IR 4.0), offline training, online training.*

1. Introduction

Industrial revolution 4.0 - the era of integration and explosive technology, providing a huge amount of information, fast transmission speed has a strong impact on changing training methods in the world, especially education and training at universities. Instead of providing one-way knowledge, universities in Vietnam are gradually making full use of 4.0 methods in order to arouse student's spirit of proactive learning, the ability to deepen research, enhance their self-study skills and respond quickly to the changing environment. In which, e-learning is a technology solution chosen by many universities. Since the beginning of 2020, there has been a worldwide upheaval due to the widespread Covid -19 which is difficult to be controlled despite the cooperation of WHO and countries around the world, having a great impact on all sectors including education - training. In the context of a highly complicated epidemic in many countries, universities have chosen online teaching as one of the optimal solutions to maintain and continue to develop their activities. E-learning is one of the online training methods using an Internet connection to serve learning. Through the e-learning system, students can not only receive lectures but also interact with others on the online training system without face-to-face communication. When applying technology to teaching, students can experience more new forms of learning, access to technology to have a new view of learning and problems of time and distance are also solved; lecturers can share a variety of new, rich and diverse knowledge to make the online lessons much lively. However, online training comes with some limitations such as technology, control of geometry and difficulty in imparting knowledge to students due to the lack of direct interaction. This paper is based on statistical data, survey and practical experiences of authors at the NEU, will provide a general picture of the impact of IR 4.0 on training at universities around the world, as well as in Vietnam generally and at NEU particularly, then propose some recommendations for stakeholders to exploit advantages and overcome difficulties in order to improve the training quality when applying 4.0 technology in the university training process.

2. Method

The research is based on both primary and secondary data. Secondary data was taken from articles and scientific studies related to the impact of the industrial revolution 4.0 on university training around the world and in Vietnam. Primary data was collected through a survey on lifelong learning of 320 students in different universities in Hanoi during the period from February 2020 to March 2020 (through sending link of Google forms widely to social networks for students), along with observations and practical experience in training at NEU of the authors. Based on these data, the authors have synthesized, analyzed and compared quantitatively and qualitatively to point out the concerned issues about the 4th revolution impact on human resource training at universities. Then the paper draws some recommendations to boost the application of IT in training to keep up with the 4th industrial revolution, develop students' self-study capability, and respond as quickly as possible to volatile environment in order to ensure the training process in accordance with the commitment to the society on output standards through combining offline and online training via the internet, on television; strengthen the relationship between the school and family in organizing and supporting students' learning; Adjusting teaching content is considered to be important tasks and solutions**.**

3. Results

3.1. Industrial Revolution 4.0

Countries around the world are witnessing a technological revolution, commonly known as the Industrial Revolution 4.0. According to Hyoung Seok Kang et al. (2016), the concept of IR 4.0 was derived from the term "Industrie 4.0", first introduced at the Hannover Technology Fair 2011 and stated in an official report of the German government in 2013. IR 4.0 refers to a very new production model with a convergence of advanced information and communication technology (ICT) and production technologies to realize smart manufacturing, not only in some processes and factories, but to other business or supply chain. Cutting edge technologies in different fields are applied: internet of things, service internet, and virtual reality cyberspace systems must be set up to integrate existing complex systems that require various information and communication technologies, simulation technologies, modeling, big data, cloud computing, sensors, intelligent energy.

Klaus Schwab (2016) explained the difference between IR 4.0 and the previous ones as: "The First IR used water and steam power to mechanize production. The Second used electric power to create mass production. The Third used electronics and IT to automate production. The Fourth one is building on the Third, the digital revolution that has been occurring since the middle of the last century. It is characterized by a fusion of technologies that is blurring the lines between the physical, digital, and biological spheres."

Thus, while the 3^{rd} IR is associated with the information age and a transition from an industry-based economy to an economy based on computerization, the IR 4.0 marks a distinct era - digital technology era – where there is a convergence of all advanced technologies related to cyber-physical system, internet of things, and internet of services. The digitalization of information and communication processes has led to an explosion of information “Big Data” and has driven the computerization of production, service delivery, and even the private sphere. Advances in areas such as machine learning, artificial intelligence, and mobile robotics as well as the increasing usability of big data will further facilitate a computerization of the economy.

IR 4.0 is expected to affect all industries, sectors and the entire economy. IR 4.0 is disrupting most traditional manufacturing platforms in every country and making big change in a non-linear way at an unprecedented rate. Smart manufacturing happens when innovations in digital technology are deployed in workplace as machines will be connected to interact with each other and with people on a single cyberspace. The smart factory control system gives us the ability to visualize the entire production chain, even makes decisions autonomously (*iontech.vn, 2021*). IR 4.0 also applies biotechnology to make leaps in agriculture, fisheries, medicine, food processing, environmental protection, renewable energy, chemistry and materials. It is rapidly advancing technology through increased use of mobile communication and internet connection, big data, artificial intelligence, robotics, autonomous vehicles, 3D printing, nanotechnology and biotechnology, computing technology v.v. Digital technology is strongly affecting people's lives, work, communication and learning relationships. It affects every person and organization including businesses, educational institutions, and society as a whole.

3.2. Trends of IR 4.0, digitization and their potential impact on society and labor market

From the beginning of the 21st century, IR 4.0 took place firstly in the US, in developed European countries and more recently in the Asia Pacific region. Digitization can refer to anything from IT modernization to digital optimization, such as putting services online or legacy modernization for public sector or the invention of new digital business models. IR 4.0 in general and digitization in particular are foreseen to be associated with the widespread development of technology and the internet as well as big changes in society and in the labor market in the future.

Firstly, the revolution rapidly increases the access to ICT and global connectivity while having a major impact on wages and labor productivity in labor market and in the workplace (*Human Development Report, 2015*). IR 4.0 is and will make drastic changes in the entire production, management and administration system and thus bring both opportunities and great challenges to human resources. Strong developments of digital technology greatly affect businesses. Enterprises need to be proactive and change the way of management, leadership as well as in production activities. Traditional methods need to be replaced by innovative methods in managing comprehensively the production process to gain the best benefits. Digitization will drive the progress of the technical equipment of an economy. It potentially increases productivity without using much labor services. Enterprises are actively transforming the number of operating, sales and production models to provide products and services to quickly catch up with new trends. Many business models based on new technology have been born, making full use of AI, IoT, Big Data, Blockchain,... Enterprises invest in high technology to make business more flexibly, do not depend too much on human power as well as save time and operating costs significantly. Of course, enterprises must have high quality and suitable labor force to efficiently use machines and equipment, adapt to new management methods and take full advantage of the benefits of technology. However, automation replaces manual labor in the economy means that robots could replace people in different fields. In that case, millions of workers around the world could fall into disrepair if they do not quickly adapt to the change.

Secondly, IR 4.0 will eliminate unskilled jobs and increase the need for high quality human resources, capable of researching, creating, mastering machines and performing jobs that require complex thinking that robots or artificial intelligence cannot do. That is why the requirement for high quality human resources is getting more attention.

The World Economic Forum (*WEF, 2016*) has been interested in how the workforce needed to be prepared for the IR 4.0. The Future of Jobs report 2016 showed that the most important employees' competences in 2015 were problem solving, teamwork, people management, critical thinking, negotiation, quality control, service orientation, judgment and decision-making, active and creative listening. This report predicted the 10 most important competencies that employees need in 2020: solving complex problems, critical thinking, creativity, human management, teamwork, emotional intelligence, judgment and decision-making, service-oriented, negotiating, and cognitive flexibility. According to WEF's Future of Jobs Report (2020), businesses believe that by 2025, critical thinking and complex problem solving are still the top competencies, but the ability to manage themselves as master learning, mobility, resilience, stress relief and flexibility are new requirements emerging from 2020.

According to ILO (2018), possessing the right skills to strengthen the capacity to adapt to the needs of the labor market and accelerate the process of technology improvement is extremely important. Training, skill diversification, retraining, lifelong learning play an important role both inside and outside of work. Education and training systems must be prepared to develop skills for the future human resources of the economy. In particular, there is a need for coordination between policy makers, businesses and training institutions to ensure sufficient supply and demand in the labor market.

3.3. Training at universities in the technology era: digitization and lifelong learning in emphasis

Together with businesses and the Government, universities have a very important role in providing high-quality human resources for the whole society in the context of IR 4.0.

According to Professor Maria Clavet, Aalto University, the education system can have two approaches to the IR 4.0: training “change-followers” or training “change-makers”. Change-followers are those who have the right skills to adapt to changing workplace and to learn to keep pace with technological developments. Change-makers are people who are not only knowledgeable about the world of technology, but can also make decisions regarding usability, sustainability, safety and ethics in the world of technology. Digitization, robotization, artificial intelligence and the internet are all increasing levels of immaterial labor. The economy today is built on the basis of production, distribution and use of knowledge and information, which means that economic development no longer relies heavily on natural resources but on knowledge, on science and technology. Therefore, in addition to knowledge, students need to equip and enrich soft skills, unique human abilities such as sharing ideas, critical thinking, empathy (*universitiesofthefuture.eu, 2020*).

According to Hai-woong Park (2018), the pioneering universities in the industrial revolution 4.0 are innovating its training in the following directions: (i) reforming the formal training program towards combining theory and practice, pay attention to developing new competencies for students with a focus on problem solving and lifelong learning because learning new skills and adapting to different situations are required in the technology age, (ii) conducting live and online lifelong learning activities for faculty and professionals; (iii) strengthening the cooperation with business organizations to improve training capacity and business support.

Higher education institutions in the world, especially developed countries, have been applying digital technology to research, training and administrative management activities (digital transformation) for decades, but unequally and slowly, until Covid-19 pandemic occurs.

The role of universities in the technology era is not only to provide knowledge to the elites of society but also to add a larger economic and social role, which is to enhance knowledge creation and create innovations in the knowledge economy to meet the lifelong learning needs of society. In addition to traditional training programs, universities also have diversified training methods to expand their influence, provide mass training programs to disseminate knowledge to all levels. Online training is a solution for universities to achieve these goals, helping to increase revenue and strengthen position in the field of training both at home and abroad.

In the late 20^{th} century, the development of the Internet marked the emergence of online training as a form of distance learning where the resources were mainly distributed over computer networks. Initially, only video lectures are recorded from traditional classes, later developed into downloadable resources for users. Today, through the Web, teachers can give instructions online (images, sound, presentation tools) to learners everywhere. The online training system, including a learning management system (LMS) and a learning content management system (LCMS), allows the full implementation of training activities with the advantage that learners can learn every time and everywhere, save travel costs and study time.

By the early 2000s, universities in a number countries which have developed education systems began to promote online training, exploit the MOOCs (mass open online courses) to reach many students, cut down staff and training costs as well and plan to replace conventional traditional courses. According to the statistics of the American Society for Training and Development (ASTD) by 2004, about 90% of the US universities and colleges had built online training models. According to Cyber Universities, currently nearly 90% of universities in Singapore use online training method.

Covid-19 pandemic is the shock that accelerates the digitization in universities. The pandemic has profoundly impacted every aspect of life and hindered higher education. The urgent shift from offline to online teaching has been forced by teachers and students around the world. The influx of international students and researchers is strongly blocked. The decline or rupture of family finances has made more difficult for students therefore governments of many countries have to provide emergency financial aid to students or for graduates to defer loan payments. Many higher education institutions are negatively affected by their budgets and have to cut faculty and staff. New graduates find that economic activity and employment in some economic areas have decreased (with a few areas increased), affecting career plan, forcing some to have new skills, new certificates and new qualifications. However, digitization has some “side effects”: risks in the privacy of learners' personal information, in academic evaluation; loss of important outside classroom experiences such as learning from friends, hands-on learning opportunities; increasing inequality due to differences in access to digital technologies; the difference in the capacity of faculty and students to make the most of the potential of digitalization. Policy makers increasingly recognize that realizing the potential of digitalization of university training will require further review and issuance of relevant policies, including funding for faculty and students, and ways of supporting and encouraging faculty motivation, monitoring and quality assurance, and learning accreditation and recognition. Some countries have policies to officially recognize education in national education digitization strategies.

Over time, Covid-19 pandemic would decrease or disappear. Economic activities will recover, making budgets for schools and families less tight and recruitment will be able to recover. Enrollment of international students may return to historical levels even though majors may change. However, a number of hindering influences are renewing higher education systems and could lead to a long-term change in the way they operate. One long-term impact is the deeper digitization. After the pandemic, it is possible that universities will use more digital technology to provide and manage training programs to quickly adapt to changing environments. The digitization of higher education has many better promises, including expanding access for non-traditional learners, reducing teaching costs, expanding teaching, increasing self-adaptation and personalization. This opens up opportunities for technology businesses to promote innovation.

3.4. Digitization of higher education in Vietnam and case study at the NEU

Not out of the trend, according to ILO (2018), Vietnam is also witnessing the impact of the industrial revolution 4.0 with the innovation and application of technology in the workplace at a faster speed than ever before in different professions. This process will be stronger in the coming time because on June 3, 2020, former Prime Minister Nguyen Xuan Phuc signed Decision No.749 approving the "National Digital Transformation Program to 2025, with a vision to year 2030". Under this program, Vietnam is pioneering in testing new technologies and models, fundamentally and comprehensively innovating the management and administration activities of the Government, the production and business activities of enterprises as well as the way people live and work, developing a safe, humane and widespread digital environment. The program has a dual goal of developing digital government, digital economy, digital society, and forming Vietnamese digital technology businesses with global capacity (*Vietnamnet, 2021*).

The Government prioritizes eight areas of digital transformation: health, education, finance - banking, agriculture, transportation and logistics, energy, natural resources and environment, and manufacturing. The program has determined the digitization of education as followings: "To develop the platform supporting distance training, thoroughly applying digital technology in management, teaching and learning; digitizing documents and textbooks; building a platform for sharing teaching and learning resources in both offline and online forms; to develop technology for education towards individualized training. To ensure that 100% of educational institutions implement distance teaching and learning, in which online learning accounts for 20% of program content at minimum. To apply digital technology in delivering homework and checking students' preparation before going to class... To promote social digital transformation, focusing on skill transfer, offering mass open - online courses, and cooperating with large organizations and enterprises in the world to train, improve knowledge and skills in digital technology, digital transformation, and digital culture. To prepare human resources for digital transformation to develop digital society with no one left behind." (*Prime Minister, 2020*).

Up to now, there are many universities approaching online training in Vietnam. Depending on the application of information and communication technology in training, the level of investment in e-learning materials and training purposes, the implementation of e-learning in each training institution is different. However, in 2020, when the Covid-19 happened, many universities were forced to close. This is also the reason for the popularity of teaching and learning on online platforms. Nearly 50% of universities in Vietnam have organized online teaching during the epidemic season. Online teaching applications such as Zoom, Microsoft Teams, and Google Classroom,... are also becoming more and more popular and used by many teachers and schools. Blended-learning is used even in the controlled translation phase. The development of online training models in Vietnam has even been recognized by reputable organizations around the world. According to the Organization for Economic Co-operation and Development (OECD), online training in Vietnam has more positive points than other countries and territories (*Vietnamnet, 2021*).

Foreseeing that trend, the NEU, in addition to developing traditional distance learning programs, has provided online training model NEU-EDUTOP led by Distance Training Center. This program is the cooperation of 2 units of NEU and EDUTOP 64 Investment and Training Development Joint Stock Company from 2012 to 2019; developed and sponsored by Microsoft, Qualcomm, Hewlett Packard, USAID, World Bank Infodev and Vietnam Foundation, with diverse, rich and up-to-date learning materials with practical requirements. In addition to printed books in the traditional form of learning, e-learning students are provided (free of charge) on the system of supporting materials for the following self-study process: Study plan of the subject class; course guide (text); electronic textbooks (e-book); multimedia lecture (audio, video, slides); Online multiple choice question bank (for self-practice test at least 10 times for a test, test questions and group instruction (submit member assessment file and test content file according to schedule, sample exam questions for pre-exam practice; case studies/open discussion topics on the subject discussion forum (undertaken by business lecturers) and the H2472 system for answering questions when problems arise to train specialties: Economics and Business Law, Business English, Banking, Economic Management, Tourism Administration, Business Administration. The training program is designed according to the model (Trainee - Image - Efficiency - Activity), and at the same time applying training combining online and offline coordinated by professional and business lecturers. According to the design of the program, the duration of each course (subject) lasts for 9 weeks through theoretical learning on multimedia materials, online inquiry, online homework and offline final exam; ensure the quality of the outcome and the objectivity in assessing the quality of learning.

By 2018, the NEU has designed its own NEU e-learning training software and start to apply it, enrolling from 2019, not only for students who register to distance program but also for full-time students who can choose a number of e-learning subjects if necessary. That could help full-time students study faster and save money on studying while ensuring output standards as committed. This can be realized when the information infrastructure (training content, courseware), software infrastructure (LMS and CAS) and communication and network infrastructure of the university are invested suitably in continuously upgrading and modernizing over time.

Since 2020, in response to the Covid-19, improving adaptability to environmental changes, the NEU has issued official letter No.99/TB-DHKTQD on using the LMS. Accordingly, the LMS is used as an auxiliary tool, creating an effective communication environment between lecturers and students, and among students. The LMS helps teachers increase interaction, create excitement for students; they must be able to work independently with a high sense of self-awareness. Teachers can create weekly lessons, put materials in different format on the system, put essay tests, quizzes ... for students to self-study, self-test and self-evaluate. Teachers can also use the LMS take attendance or evaluate the active participation of students in discussions and give them timely feedback. Learners get used to making a plan that is suitable for self-directed and well implemented learning plan. During the epidemic, training through LMS and other online software (MS-teams, Skype for business, zoom) could be combined to ensure that students' learning is not interrupted and follow progress with accountability to society. Despite the fact that online training is not as effective as offline one (because the control cannot be tight and it directly depends on learners' sense of self-consciousness), in general, progress and quality are ensured at the expected level in violate environment.

At NEU, the application of IT is also used for exam purposes such as performing multiple-choice tests on computers, widely applied from the academic year 2019 - 2020 for general subjects with the high number of students taking the exam at the same time. Many students can take the final exam on the pre-designed software, helping the university save a lot of time and money for exam questions, print copies and mark exams. Students' results will be known as soon as the test is submitted by the candidate according to the specified time.

Moreover, the NEU's e-library project supported by the World Bank has gradually come into operation, creating links with major publishers in the world, help students access and search information quickly, promoting students' self-study and information retrieval in both academic and scientific research.

3.5. A glance at Vietnamese students' adaptability to digitization and lifelong learning

In the context of global integration and the digital age, today's students have to live, study and work in a more complex, unpredictable and more competitive environment, so their career paths will be risky, more roaming and less continuous. Students need to have an effective way of learning to update their new knowledge, successful transition from school to the world of work, and have to adapt and mature on a par with young people in the world. They not only receive knowledge once for all, but need to learn how to continuously improve the knowledge throughout their lives to develop and assert themselves, to connect and contribute to the development of the community actively. That means they need lifelong learning skills and know how to apply digital technology in learning effectively. Survey results on lifelong learning and online learning (online or e-learning) of 320 university students in Hanoi from February 2020 to March 2020 shows some aspects of Vietnamese students' adaptability.

In terms of lifelong learning, in addition to formal learning at university, students are currently focusing the most on self-study, reading and part-time jobs; followed by club membership and taking online and offline short (extra) courses outside university (*Figure*

1). A special point is that online learning is an important learning channel for students today.

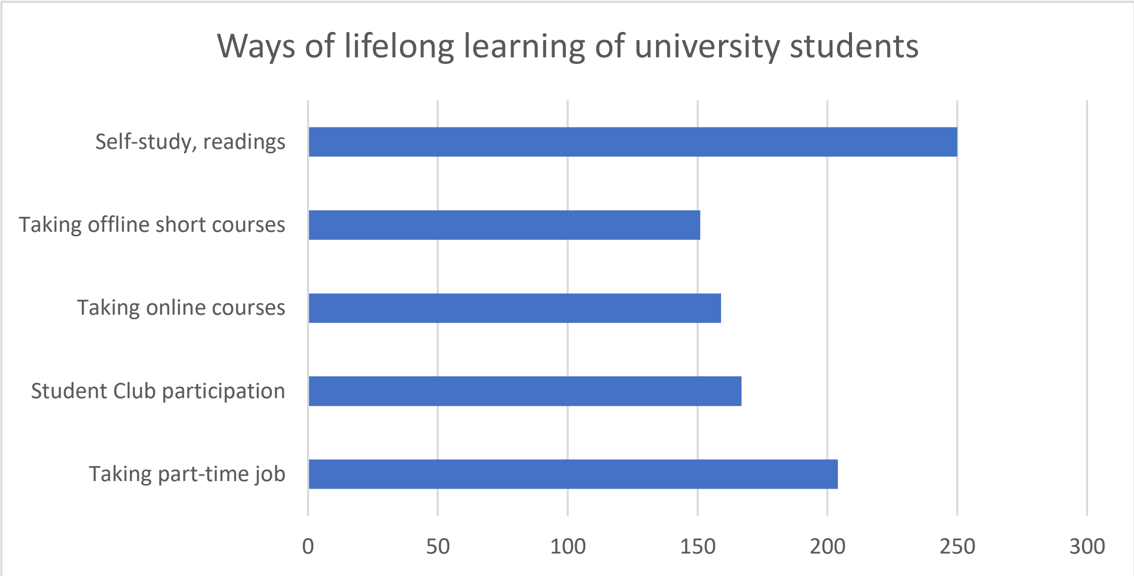

Figure 1. Ways of lifelong learning of university students

Source: survey of the authors, 2020

Out of 320 students who answered the question "Which channels are you learning (other than university)?", only 9.5% chose the face-to-face study, 8% chose to study online, and 85.9% study both face-to-face and online (so-called blended learning) (*Figure 2*).

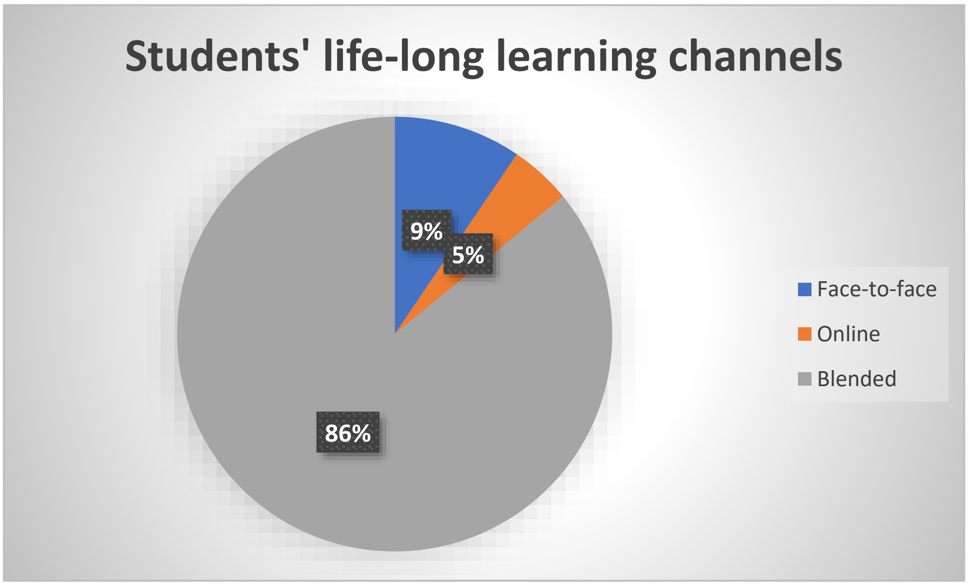

Figure 2: Students' lifelong learning channels

Source: survey of the authors, 2020

Figure 3 shows the students answers to the question "How do you evaluate the effectiveness of online learning?" Up to 164 students out of 320 say that online learning is effective, accounting for 51.3%. In addition, 16 students, accounting for 5% of the total number of respondents, found that online learning was extremely effective. Only 7 students rated it extremely ineffective and 14 students rated it ineffective. The rest give a neutral opinion, accounting for 37.2%. Thus, more than half of the students found that online learning was more or less effective. In terms of interests, more than half (52.5%) of students liked the method of online learning, 28% of students did not *(Figure 4)*.

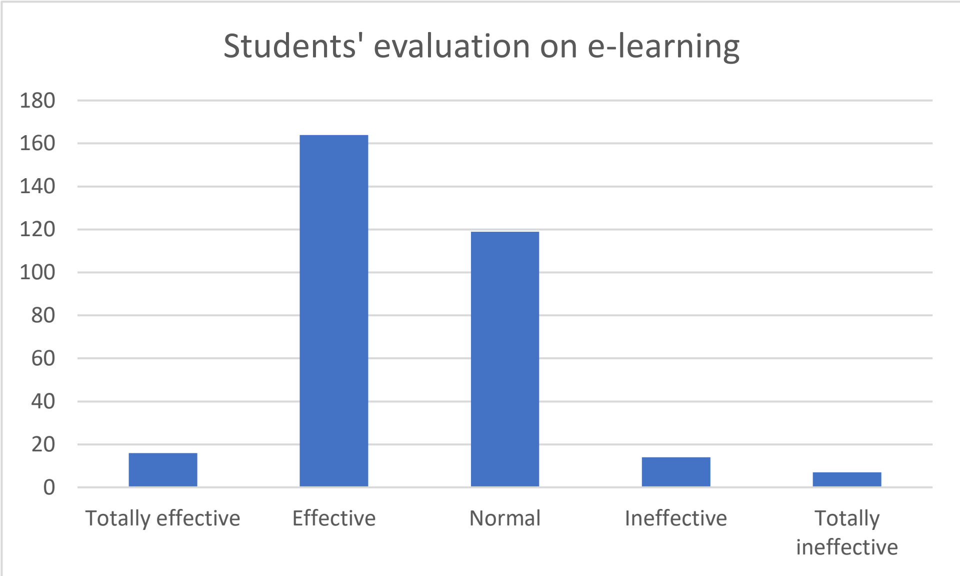

Figure 3: Students' evaluation on online learning

Source: survey of the authors, 2020

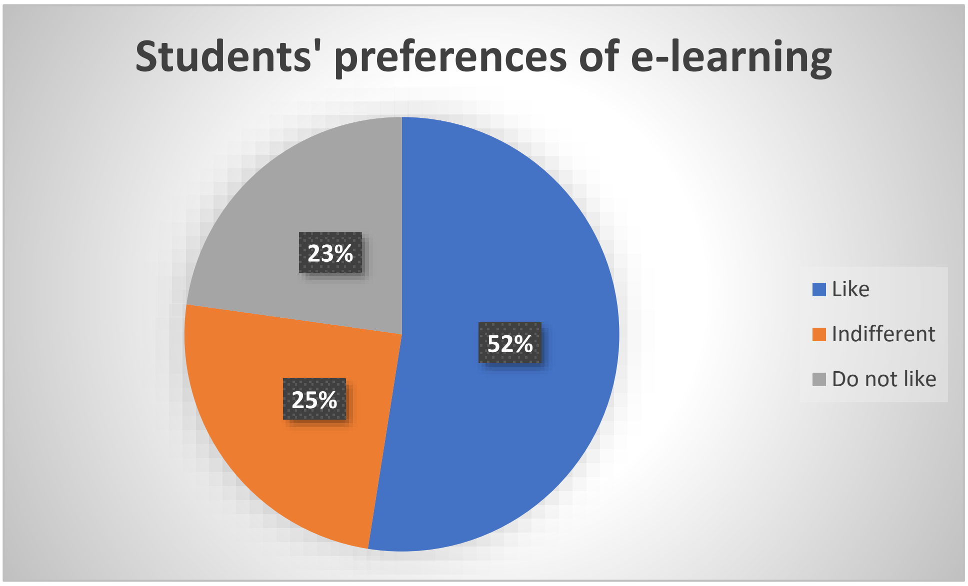

Figure 4. Students' preferences of online learning

Source: survey of the authors, 2020

Some of the benefits of online learning for lifelong learning highlighted by students in the survey are:

- In terms of time: online learning helps students to be more active, student can study anytime, anywhere, can focus on studying without being affected by the crowded environment.

- In terms of costs: students can save travel costs. Online learning supports students to review lectures, reduce the cost of re-study. Moreover, online courses also have a much lower fee than offline courses.

- In terms of learning content: students can actively register for courses with content they want to learn. Online courses are diversified. Then, students can easily exchange and impart knowledge on demand with teachers and learners without face-to-face communication.

- In terms of self-development: self-study will help students remember the lesson more easily, boost ability to self-explore and develop themselves, motivates students to self-study and to think independently.

The reasons for students who do not like online learning mentioned in the survey are only objective factors such as unstable internet quality, inappropriate characteristics of some disciplines that require a lot of practice, such as engineering, students are not given detailed answers about the problems of making projects due to the difficulty in communicating and interacting with teachers.

From the above analysis, it shows that Vietnamese students' readiness to learn online in the era of digital technology is not a challenge or an obstacle to the digitization of higher education, the problem is to what level digitization comes and communication work to change the perception of real communication habits with the support of communication devices.

4. Discussion and Conclusion

IR 4.0 is continuously grown to new heights. We may not fully understand all the necessary skills, but many businesses have applied new technologies to exploit their potentials for development. Universities need to work closely with businesses, government agencies, and student/ex-student associations to update skills and competency needs. Universities need to renew their training programs and apply ICT to training. On the other hand, universities, lecturers and students also need to be proactive. Instead of assuming that just one training program or a single specialist is enough to provide all skills needed for IR 4.0, we need lifelong learning and the collaboration of different institutions and different experts in the same field to contribute the added value to society.

In order to improve the efficiency of applying the benefits of IR 4.0 in the field of higher education, universities in general and NEU in particularly need to pay attention to the following aspects:

Firstly, it is necessary to invest in upgrading online training software with modern technology in the world in order to increase the security and authenticity of the program as well as to increase the accessibility of the program especially for students in remote areas with weak infrastructure network. Investing in infrastructure for online training requires both time and financial resources, so universities need a roadmap to ensure investment in the right direction, along with the training process, does not affect learners who are and will study the program**.**

Secondly, attention should be paid on the compilation, review and upgrade of program's materials provided via e-learning, LMS in particular, to ensure that the teaching is linked to reality and stimulates students to actively participate in discussion and forums, to enhance interactions in order to promote students' creativity and knowledge acquisition. A special attention need to be put on copyright protection measures so that lecturers are ready to share all the possible materials to help students increase their chances of multi-dimensional information access in all learning circumstances. In reality, students are still limited to participate in discussion forums, but if they participate, they are sometimes just formal to ensure attendance, so the students' discussions can be taken superficially, not highly creative yet. In order to improve the effectiveness of online forums, to assert the role of interaction in course assessment and student outcomes, program design needs to emphasize the role of interaction in assessment of study results. Furthermore, in order to bring the content of the courses closer to practical needs, cooperation with organizations/businesses should be strengthened in the following two directions: (1) Designing online training programs with the closer connection between the University and the organization/business to provide learners with the knowledge and skills that businesses need, contributing to making the labor supply closer to the demand in labor market. (2) Designing online training programs with close connection between the University and enterprises according to the orders of enterprises wishing to learn through e-learning but not yet capable enough to perform by themselves (This is a potential training market, when employees need to improve their professional knowledge but do not have enough time to participate in concentrated courses).

Thirdly, the university needs to pay more attention to periodic refresher courses for lecturers participating in the program in order to update training technology and manipulate quickly, promptly meet the needs of program learners to enhance the dynamism and rapid adaptability of trainers to training that combines online and offline training. In addition, the IT department should periodically send links to guide both students and lecturers on how to access the system and note points for learners to increase their awareness and responsibility of online training program confidentiality.

Finally, the university needs to concentrate on communication strategies for e-learning and LMS programs more effectively in order to increase the attractiveness of the program not only within the country but also taking into account the trend of exporting program to regional and international markets. The university also needs to consider cooperating with prestigious universities around the world to design and provide MOOCs to provide basic knowledge for those in need of lifelong learning. This is a good opportunity to promote access to the e-learning training market in the world, to attract international students, consolidating the university's position in the training field and to achieve development goals set out in the new situation. Regular communication will boost both students and lecturers to gradually change face-to-face communication to communicating through the media quickly and easily. As a result, they adapt to changing environment more easily**.**

DIGITAL ECONOMY DEVELOPMENT IN SINGAPORE AND LESSONS FOR VIET NAM

MA. Tran Thi Thanh Huyen

huyenapa2010@gmail.com

Department of Linguistics and Cultures of ASEAN, University of Languages and International Studies (ULIS), Vietnam National University (VNU), Hanoi, Vietnam

Abstract

In the current digitalization era, the digital economy has become an inevitable development trend for the global economy in general and Vietnam in particular. The digital economy includes many new and diverse economic forms. These types of economy also create many opportunities for agencies and businesses and create many job opportunities for workers. However, developing the digital economy is also a challenging issue in the current period considering problems of infrastructure, human resources and so on to boost the digital economy. Singapore is an experienced country in developing the digital economy in Southeast Asia today. In this article, the author focuses on some economic development experiences of Singapore, one of the countries with the highest level of digital economic development in Southeast Asia, thereby drawing some lessons for Vietnam in the process of developing the digital economy.

Keywords: *Singapore, Vietnam, digital economy, development*

1. Introduction

The Digital Economy also referred as the New Economy. It refers to an Economy in which digital computing technologies are used in Economic Activities. Digital economy is underpinned by the spread of Information and Communication Technologies (ICT) across all business sectors to enhance its productivity. Digital transformation of the economy is undermining conventional notions about how businesses are structured, how consumers obtain services, informations and goods and how states need to adapt to these new regulatory challenges.

Singapore is one of the leading countries in the region in terms of digital economy development. Now aday, Singapore is drastically conducting digital transformation with the ambition to become the first smart country in the world and has solid foundations ready for the 4.0 era. Human capital, digital competitiveness, and production capacity of Singapore are among the top in the world. Up to 2020, Singapore is also one of the leading Southeast Asian countries in developing facilities for promoting the digital economy.

In the current digitalization era, the digital economy has become an inevitable development trend for the global economy in general and Vietnam in particular. With a population of nearly 100 million people, Vietnam is considered as one of the countries with a good digital economy development rate in the ASEAN region. With a large proportion of Internet and smartphone users, and relatively wide coverage of Internet and telecommunications infrastructure, Vietnam has great potential for developing the digital economy. However, there are many challenges that Vietnam has to face such as technological infrastructure, human resources to develop the digital economy... In this article, the author focuses on some economic development experiences of Singapore, one of the countries with the highest level of digital economic development in Southeast Asia, thereby drawing some lessons for Vietnam in the process of developing the digital economy.

2. Method

In the presentation, the authors use method of document collection, document analysis method to: analyzing Singapore's experiences in digital economic development, thereby drawing some lessons for Vietnam. Synthetic method: from the collected documents about Singapore, Vietnam and the digital economy, logically arrange and systematize the content. Analytical method: exploiting documents and selecting information about the digital economy, analyzing documents to come up with relevant content for the presentation

3. Results

Singapore is a multi-ethnic, multi-lingual country with almost no resources. After separating from Malaysia in 1965, Singapore faced many difficulties and urgent issues such as security, economy, ethnic conflicts, etc., Former Prime Minister of Singapore, Lee Kuan Yew assessed Singapore at that time, compared to many other countries: a huge gap with the uncertain future of survival (Lee Kuan Yew, 2000, p.19). Recognizing that, the Government had a series of correct and appropriate policies to bring the country from *the third world* economy to *the first world* economy. Through groundbreaking policies, Singapore has made a spectacular transformation and has become one of the four dragons of Asia. Today, Singapore is considered one of the world's major trade centers. People can live in a green, clean and modern environment. GDP per capita is ranked among the highest in the world.

Singapore is one of the leading countries in the region in terms of digital economy development. For many years, Singapore has focused on policies that promote economic restructuring towards economic innovation and increased labor productivity. Singapore has a very clear goal in developing the digital economy to become the world's leading digital economy. To achieve this goal, Singapore has implemented many different solutions, focusing on supporting businesses in digital transformation and preparing conditions and supporting factors for the development of the digital economy. It can be said that Singapore is drastically conducting digital transformation with the ambition to become the first smart country in the world and has solid foundations ready for the 4.0 era. Human capital, digital competitiveness, and production capacity of Singapore are among the top in the world. Up to 2020, Singapore is also one of the leading Southeast Asian countries in developing facilities for promoting the digital economy. This is also an example that many countries are interested in and consulted about, including Vietnam.

3.1. Singapore's digital economy development experiences

3.1.1. Infrastructure

In upgrading the digital infrastructure to promote capacity and expand the application of digitalization in businesses, Singapore has made remarkable progress. In 2010, the fiber optic network was put into use. In 2011, it was 4G mobile network. Thanks to the fiber optic network, Singapore's average internet connection speed has increased on par with countries like Japan and Finland. The average internet connection speed rose from 5.4 Megabits (Mbps) per second to 20 Mbps from 2012 to 2016 (Singapore, 2019). Thanks to continuous investment in infrastructure, Singapore is considered as one of the top countries with the fastest 4G connection speed in the world. According to data from the Singapore Information Media Development Authority (IMDA) between 2012 and 2016, after efforts to improve the digital infrastructure system in Singapore, there has been a double in the number of subscriptions to 4G services and broadband fiber networks. From 2012 to 2016, the total number of subscriptions to optical fiber broadband (OFB) services increased from about 0.3 million to over 1.1 million households; from 2013 to 2016, the total number of accounts registered to use 4G networks (both prepaid and postpaid) more than doubled from 2.1 million to nearly 4.9 million subscribers (Singapore, 2019)

For the corporate sector, the government has pushed business leaders to invest more in digital assets, developing digital infrastructure to improve their digital skills. In the period 2013 to 2015, the total capital expenditure of enterprises in fixed digital assets (including computers, peripheral devices and information and telecommunications equipment) achieved Compounded Annual Growth Rate (CAGR), at 7.1% (Singapore, 2019). In addition to investing in digital assets, businesses also in turn and continuously apply digital tools in their business activities.

Being aware of the importance of 5G technology will be the basis for the development of new applications, new business models and so on. Singapore has rapidly developed this advanced wireless mobile network technology. In 2019, the Singapore Information Media Development Authority (IMDA) implemented programs such as “5G Innovation” to research and support businesses; or “5G Grant” to promote research projects on applications and solutions for 5G technology. 5G networks provide data download speeds many times faster than 4G (Singapore, 2019). According to IMDA, at least 50% of the country will have independent 5G coverage by the end of 2022 (Singapore, 2019) Newly designed infrastructure using dedicated technologies for 5G is to develop new applications around smart factories, self-driving cars, and self-connected devices. This new investment will be more effective than upgrading the infrastructure from the existing 4G.

In addition to the above prominent trends, the level of application of digital tools and capabilities such as cloud computing services, smart factories, and so on has also increased rapidly in recent years. Singaporean Governments always strivie to digitize the economy, maintain and develop the level of digitalization of households and businesses.

3.1.2. Support for digital economic transformation

Singapore has long been known as a country with a dynamic economy with the strongest potential for growth in the East Asia - Pacific region. With a favorable business environment, professionalism, and high-quality human resources, Singapore has attracted many foreign investors. From 2003 to 2017, Singapore was continuously ranked as the country with the highest global business climate index in the region. In 2018, 2019, Singapore continuously ranked second in the world on the ranking of business environment published by World Bank. This index shows that Singapore possesses a favorable regulatory environment that businesses to operate in the island nation. In the field of digital economy, Singapore is currently home to many large companies in the global technology field such as Google, Facebook, Alibaba, or leading businesses in the region such as Garena, Grab, Lazada and Razer,…(The World Bank, 2003). Besides, the Government of Singapore also introduces preferential policies to attract investment capital from abroad, encouraging multinational companies to set up headquarters in their country (Singapore Economic Development Board, 2019). At the same time, the Singapore government also promotes development through start-up projects in the fields of technology and science by offering preferential financial policies, supporting business orientation, building a startup ecosystem with the aim of acting as a bridge in cooperation, combining core values between organizations, businesses, and investors (Startup Decisions, 2019). Government digitization has contributed to make Singapore one of the best business environments in the world for many years in a row. Through two projects, SME Go Digital and SME Digital Tech Hub, small and medium enterprises (SMEs) in Singapore will better understand the opportunities and development potentials in digital technology application such as accessing new markets, improving high productivity and operational efficiency. It is not just about the media, government projects also provide businesses with suitable transformation roadmaps for each industry, specific advice on digital solutions from experts that was proven in each stage of the company's development and other support during implementation (SNDGO, 2018, p.32)

In addition, the Start Digital project supports small and medium enterprises to train human resources in digital marketing, electronic payments, and network security within 18 months. Enterprises are exempt from tuition fees for the first 6 months and reduce tuition fees for the remaining time. At the same time, Singapore also arranges experienced experts to give free advice from A to Z for small and medium enterprises in implementing digital transformation. During the Covid-19 pandemic, Singapore has used the threat as a driving force to accelerate digital transformation in order to control and minimize the consequences of the pandemic, and on the other hand, to quickly reach the goal of becoming the first country that is smart in the world. As a result, up to 73% of both medium and large businesses have accelerated the pace of digitization in various ways to respond to the pandemic, from launching digital products, digital payments to e-commerce and automation.

In addition, Singapore has also implemented many other projects to support and encourage people and businesses to access, understand and apply digital technology in life and business. Through SkillsFuture or SG Innovate, the government builds and provides people with courses and media events on information technology, artificial intelligence (AI), robotics, blockchain and many more other in-depth technological topics…

Singapore also pays special attention to recruiting experienced technology experts with strategic vision to take the lead in the digital transformation journey. This is an important factor for Singapore's success in digital transformation. The reality shows that many countries make good policies, but due to the lack of effective implementation support institutions and talented and dedicated commanders, policies are often not implemented properly or they just exist on paper.

Singapore sets out key roadmaps each year, focusing on specific areas for innovation and digitization. The digital transformation journey is carried out step by step with a clear roadmap so that people and businesses have time to get used to and gradually adapt. Digital products and services are constantly being improved to be more complete. When problems arise between the Government and the people, even the smallest problems must be resolved immediately.

3.1.3. Building a smart nation

In 2014, the Singapore Government launched the “Smart Nation” initiative. In 2017, they announced the establishment of the Smart Nation Digital Government Office (SNDGO) to coordinate efforts from different government agencies towards the goal of becoming the world's first smart country.

The “Smart Nation” project aims to solve the main challenges that countries around the world are facing, which are 5 challenges: high urban population density, population aging, increasing demand for health care, difficult urban transport and lack of energy. By applying digital technologies to solve these problems, Singapore hopes its “Smart Nation” model can become a model for other countries.

Singapore's smart nation model aims to include the following contents: greener, cleaner and safer living environment for urban residents; more choices of means of transportation, better home health care for the elderly; more convenient public services and better living opportunities for citizens. Jurong Lak, a district in western Singapore has been chosen as a testbed for the smart city initiatives.

The Smart Nation Platform (SNP) is set up with many important features to support individuals, governments and businesses, focusing on 3 aspects: connection, collection and understanding.

With ambitious and people-pleasing goals, Singapore has mobilized the whole system to participate, bringing together high-class technology experts, elite talents, businesses and people to join hands to build a Digital Government.

The most significant achievement of the implementation of the Smart Nation is the application of information solutions in implementing digital government, providing public services through a digital platform in order to reduce number, time, and cost for administrative procedures in not only businesses but also people's daily lives (SNDGO, 2018, p.32). According to the 2020 Business Environment Assessment Report of the World Bank (WB - The World Bank), the Singapore government has built digital platforms for receiving, processing and returning the results of documents for businesses, supporting businesses and experts to access information about land and plan publicly, in detail and completely free of charge. The digitization of government has contributed to make Singapore one of the best business environments in the world for many years in a row (The World Bank, 2020). In the social field, SNDGO has built and launched a lot of useful applications, in supporting Singaporeans and families to have a modern, smart, and easy life.

People participate in most of the stages of making digital products and services with a strict 5-step process: Surveying and collecting people's opinions; tested from the use of people; defect assessment; redesign and improve service digitization.

The government built 11 service journeys with essential utilities of the people such as those from birth to high school, workers looking for jobs, healthcare... All of them implemented as a one-stop shop, thus saving costs, time and effort, and changing awareness, habits and working methods of officials.

Typically, the application “Life Singapore” (LifeSG) has received the attention and enthusiastic participation of a large number of people. This digital service integrates more than 40 convenient services such as registration of birth certificates, child benefits, finding the best schools, information about programs, priorities for the elderly, about jobs, skills development courses, updating the latest government welfare programs...

Efforts in improving the living conditions of the people, have contributed to help Singapore attract highly qualified laborers from all over the world to work, live, and contribute to the development of this small country.

3.1.4. E-payment development

Singapore is one of the first countries to apply electronic payments (EP) in the world. This is also the fastest growing e-commerce market in ASEAN countries. E-commerce activities have developed at a relatively fast rate. Since 2015, the country's e-marketing index has been around 56%-57%. According to the Singapore e-commerce survey, almost everyone in Singapore has a smartphone, but 9 out of 10 people still want to pay for day-to-day transactions the old-fashioned way with cash. 43% of Singaporeans surveyed said they use cash the most, almost double the 25% in China. (Central Institute for Economic Management, 2018, p.4). The reason is that Singapore has many e-commerce programs, but there is a lack of connection and connection between these payment systems, so it causes a lot of trouble, especially people have to carry many cards and businesses also have to pay to install multiple systems.

Advocacy to turn Singapore into a cashless society is unanimously necessary to simplify and unify the different payment systems. To accelerate the process, the Monetary Authority of Singapore has launched an initiative with 2,000 POS systems (machines that accept card payments for customers to swipe cards) for uniform payment at more than 650 retail stores across the country. These POSs support a variety of payment options, including Samsung Pay and Apple Pay. Responding to the Government's policy of promoting e-commerce, many businesses have been implementing many innovative initiatives such as using RazerPay, Grabpay, NetsPay, etc.

POS has the advantage of being compact, occupying only a very small area, and can be easily installed in many places. In addition, the Singapore government has planned to develop a fast payment system, using a common QR code (a type of code that can be scanned with a smartphone) to conduct e-commerce across the country. In fact, QR codes offer a cheaper and less infrastructure alternative to debit and credit card schemes. Therefore, at present, QR codes are increasingly used in e-commerce, contributing to the promotion of cashless payments.

In 2020 Singapore's e-commerce market reached SGD 9.3 billion (about 7 billion USD) and is expected to grow by 40% in the next 4 years. Credit cards, e-wallets and bank transfers are the most popular online payment methods in Singapore, with 45%, 20% and 12% respectively in transaction volume. Among the above payment methods, e-wallets such as GrabPay and DBS PayLah are expected to account for about 27% of the Singapore market by 2024. (Hoang Linh, 2020)

E-commerce activities develop at a relatively fast rate. Even public services are allowed to pay electronically, from public services to fines. Singapore encourages specialized people to support the elderly and small businesses to use the Internet. To encourage more merchants to use electronic payments, the Singapore government plans to provide S$300, equivalent to VND5 million per month, to small businesses for a period of five months. The goal of this activity is to support 18,000 small businesses and 100,000 elderly people to know and be able to use the electronic payment solution within 1 year. (Hoang Linh, 2020)

Before the global Covid-19 pandemic, Singapore made positive changes in the digital transformation process. This has reduced the consequences of the Covid pandemic in recent years. The government has spent more than S$500 million to support businesses and citizens to accelerate digital transformation to mitigate the impact of this crisis. In response to the pandemic, businesses and the government are also accelerating the digitization process. Singapore is considered one of the best countries to control the Covid-19 epidemic in the world. Because of this, the World Economic Forum chose Singapore instead of Switzerland to hold its annual conference in 2021.

3.2. Lessons learned for Vietnam

Until now, most countries in the world have attached great importance to the development of the digital economy, considering it a new development step and a new economic model in the future. Currently, the industrial revolution 4.0 has penetrated all aspects of social life. Right from the means of transportation through mobile booking applications such as Grab, Uber; living online thanks to Twitter, Instagram and Facebook to ordering food online or apps using cloud technology… It can be seen very clearly that the digital economy is booming in the world, becoming the leading factor driving the growth and development of each country.

With a population of nearly 100 million people, Vietnam is considered as one of the countries with a good digital economy development rate in the ASEAN region. Vietnam has recorded the emergence of digitization trends in many fields and economic sectors, from commerce and payment to transportation, education, and healthcare. In addition, the e-commerce market is also growing. With a large proportion of Internet and smartphone users, and relatively wide coverage of Internet and telecommunications infrastructure, Vietnam has great potential for developing the digital economy. However, there are many challenges that Vietnam has to face such as technological infrastructure, human resources to develop the digital economy... The strong development of the Internet and technology is expected to create a support for the digital economy to develop rapidly and make an increasing contribution to Vietnam's economy in the coming time. However, for the digital economy to develop sustainably, it is necessary to have synchronous support solutions and efforts from many sides. From the experience of Singapore, we can draw lessons for Vietnam:

First, it is important to focus on investing and upgrading digital infrastructure as well as modern digital technology solutions, accelerate cashless payment applications, and make e-government efficient…. There is a need to develop the fundamental fields of the digital economy such as digital infrastructure, digital resources, digital services, digital market.... This helps to deploy smart connected digital applications, accelerate non-cash payment applications, effective e-government, etc. For Vietnam, first of all, it is necessary to focus on developing digital economy fields to help expand markets and promote consumption. These are the areas that help Vietnam take advantage of the opportunities of international integration, especially free trade agreements, but also do not require a high level of technology. At the same time, the Government needs to provide digital service platforms to support businesses and reduce transaction time and costs such as online licensing and license approval... in the most convenient and fastest way.

Second, in addition to focusing on upgrading digital infrastructure, the issue of human resources to meet modern technology also plays a very important role. It is essential to focus on developing human resources for the digital economy, in which focus on developing and attracting digital technology experts and digital entrepreneurs. Paying attention to educational innovation and training, making the workforce catch up with digital technology trends are necessary. Accordingly, updating and supplementing training curricula on digital technology and digital skills in schools; create conditions for learners to access the technology field as soon as possible; promote training and practice linkages between schools and the business sector in digital technology application; focus on flexibility, practical learning, practice, lifelong learning, taking practice as the focus of the training program.

Third, there is a need to build and perfect institutions, laws and policies to create a framework for the development of the digital economy. The institutional framework must be able to adjust at the national, sectoral and corporate levels. Viet Nam need to develop very specific plans and guidelines on digital transformation for businesses, these plans are associated with financial sources and annual funds to facilitate business access to the economy.

In addition, it is necessary to pay attention to the development of policies on standards, to standardize production stages and processes to increase connectivity, interconnection and synchronization. Develop and promulgate laws and policies on network security and information security to serve as a basis for promulgating standards for information exchange between entities and to ensure information and data for organizations, individuals and businesses in the digital economy. Currently, only about half of ASEAN member states have comprehensive data protection laws and authorities have limited capacity to protect data. Therefore, Vietnam needs to complete and connect policies with the region for more effective implementation. In addition, the Government needs to have policies to exploit the digital potential effectively.

Fourth, the potential contribution of the digital economy to society is not small, but there are also many problems arising in the process of developing the digital economy: the disadvantages arising in the development of the digital economy; occupations that will be "dead", new occupations appear, workers will be replaced by robots, artificial intelligence; contradictions, conflicts between traditional business types and mechanisms and new ones appearing... Therefore, it is necessary to increase the awareness of people and businesses about the digital economy, paying attention to the benefits and challenges that come with it, with specific contents for each industry and field, especially through agencies, offices, factories and schools.

4. Discussion and Conclusion

In conclusion, in today's digital age, the digital economy has become an inevitable development trend for economies around the world. Until now, most countries in the world, both developed and developing countries, have attached great importance to the development of the digital economy, considering it a new development step, a new economic model in the future, and a new economic model, offering solutions to transform to the digital economy. However, each country with its own characteristics and strengths will have different mechanisms, policies and measures to develop the digital economy. The Singapore Government's digital economy development policies and strategies have achieved many results, which focuses on supporting businesses in digital transformation, preparing the conditions and supporting factors for the development of the digital economy, supporting digital transformation on a large scale, and supporting digital transformation in each field. This is also an issue that many countries care about and refer to, including Vietnam. However, in this digital economic transformation, Vietnam also has to face many problems such as technology infrastructure, human resources to develop the digital economy... Therefore, digital economy requires synchronous support solutions and efforts from many sides.

Abstract

The objective of this research study is to investigate the influence of using digital technology to electronic payment intentions of customers in Northern Vietnam. A quantitative research with 360 respondents who have used or had intention of using electronic payment in Northern Vietnam was conducted. Results revealed that 7 factors including Perceived usefulness, Perceived ease of use, Risk perception, Trust, Digital technology activities, Subjective norms and Perceived behavioral control have influence to customers' electronic payment intention. Among them, three factors of Perceived usefulness, Perceived ease of use and Perceived behavioral control have a significant impact customers' electronic payment intention.

Keyword*: digital technology, electronic payment, electronic payment intention*

1. Introduction

Due to the popularity of Internet and strongly development of e-commerce, electronic-payment (e- payment) has increasingly become a global trend. E- payment is gradually asserting its position with preeminent benefits such as speed, convenience and accuracy in transactions, and easy control of spending. This payment form also brings benefits in the socio-economic field such as promoting sustainable economic development, creating transparency in expenditures and transactions, and creating a transparent cash flow. Governments of many countries have introduced policies to encourage the development of e- payment, especially in the context of Covid-19 pandemic, which further motivates people to change their money usage habits. Switching to electronic transactions help people ensure safety and limit the spread of disease in the community.

According to the statistics of Datareportal Vietnam, there were 68.17 million Internet users in January 2020, up by 6.2 million users (10%) over the previous year. As well, approximately 145.8 million mobile devices connected to the Internet in 2020, an increase of 2.7 million devices (1.9%) comparing to the 2019's figures. The mass adoption of digital technology is one of the main reasons for the tremendous growth in online payment in Vietnam. In addition, there are great benefits in using online payment such as having a wide selection of platforms offering unique features and customized services to meet users' increasing needs and demands. Rural areas are the next destinations for Fintech companies in the future as the Government's policies continue to encourage online payment .

Although the data in the Landscape 2020 e-payment market report shows a boom in Vietnam, cash is still the most popular payment method, accounting for up to 80% of the transaction rate; 20% of the transaction rate comes from the electronic payment market throughout Vietnam. In addition, according to statistics from the State Bank of Vietnam, in 2020, approximately 31% of people own bank cards. The main reason is that Vietnamese people's habit of using cash has been ingrained for a long time. Electronic payment methods are still very new and have not been widely disseminated due to users' anxiety of insecurity and risk. In the context that the application of digital technologies in payment is becoming increasingly popular, it is important to research customer behavior to make customers feel secure in paying using technology. Investigating the influence of digital technology to customers' e-payment intentions helps to enhance customers' e-payment intentions

2. Theory and hypothesis development

Due to the fact that the use of internet has been becoming popular, there have been a number of researches on factors affecting the customer's e-payment intention, for example, a study by Zlatko Bezhovski's group, Goce Delchev University, and Krste Misirkov (2016) on the future trend of mobile payments, focusing on one a wide range of issues with electronic payment methods including security, privacy and consumer acceptance of e-commerce for payment; or the study "Factors affecting the intention to use Mobile Banking" by the group of authors P. Luarn, H.-H. Lin (2005) emphasizes perceived usefulness and two factors of perceived behavioral control (perceived self-efficacy and perceived financial costs) on customers' intention to use mobile banking services. In Vietnam, there have been several studies on the topic such as "Factors affecting the intention to accept mobile banking products of individual customers - a case study for Vietcombank" by Nguyen Binh Minh, Trinh Xuan Truong; "Research model of factors affecting consumers' decision to use electronic payment methods" by Master Vu Van Diep. Since none of them consider digital technology use determinant factor to customer's electronic payment intention, study on the relationship between digital technology use and customer's electronic payment intention is needed.

Digital technology and electronic payment

Fitzgerald et al. (2014) defined digital technology as social media using forms such as mobile, computer, analytic, or embedded usage. These digital technologies include the

Internet of Things - IoT (Perkel, 2017) with next-generation telecommunications networks - 5G (Ting, Wong and Sim, 2019); Big Data (LeCun, Bengio, and Hinton, 2015); artificial intelligence - AI using deep learning (Ting, Wet and Nat, 2018); and block- chain technology (Heaven, 2019). Digital technology has transformed aspects of life from work, travel, shopping, entertainment, and communication. Realizing its popularity, Paul (2021) pointed out the important benefits of digital technology including social connection, multi-tasking ability, automation, information storage, etc.

Dennis (2004), described an electronic payment system as a type of financial commitment between a buyer and a supplier connected by the use of electronic infrastructure. In addition, Briggs and Brooks (2011) see online payments as a form of relationship between associations and people supported by banks and companies that convert between financial transaction empowerment. Electronic payment is a form of the electronic transaction including money transfer, money receipt, and withdrawal via the Internet. An electronic payment service exists under a web interface that allows customers to remotely access and manage their bank accounts and transactions (Weir et al. 2006, Lim 2008). Electronic payment systems can be classified into five categories (Lawrence et al. 2002, Guan and Hua 2003, Abrazhevich 2004, Dai and Grundy 2007, Schneider 2007), including electronic money, debit cards, credit cards, prepaid cards, and electronic checks. K. Peffers and W. Ma (2003; 2015) classify electronic payment systems including electronic checks, electronic money, credit cards, and electronic transfers. Currently, popular forms of electronic payment worldwide include credit card, debit card, e-wallet, mobile payment (mobile banking, QR code), electronic money, payment via the gateway.

Hypothesis development

Perceived usefulness

Perceived usefulness is defined as the degree to which a person believes that their job performance will be enhanced by using a particular system (Davis, 1989). Wen et al. (2011) introduced another concept of perceived usefulness as consumers' evaluation of the benefits of product information and perceived usefulness when shopping online. Perceived usefulness is an important determinant of intention to use (Al-Maroof and Al-Emran, 2018). In electronic payment, perceived usefulness variable is measured by transaction speed, user-friendliness, customer experience, accuracy, convenience... (Liao, ZQ and Cheung, 2002). Several studies have shown that perceived usefulness has a positive relationship with intention to use electronic payments (Al-Fahim et al., 2015; Ayo et al., 2010; Chin and Ahmad, 1970, 2015; Dutot., 2015; Lee, 2009; Meharia, 2012; Nasir et al., 2015; Pham and Ho, 2015; Santouridis and Kyritsi, 2014; Sinha and Mukherjee, 2016; Upadhyay and Jahanyan, 2016). Thus, the first hypothesis can be stated as follows:

H1: Customer's perceived usefulness positively influence on electronic payment intention.

Perceived ease of use

Perceived ease of use is defined as the degree to which a person believes it will be effortless to use a particular system (Davis et al., 1989). Ease of use is also studied in the documents on intention to use electronic payments (Cabanillas 2014, 2017; Gefen 2003; Phon Tanuki Thaworn, 2016; Yang, 2015). The less complex the perception of using electronic payments, the more positive customer attitudes towards e-banking services. Therefore, the second hypothesis is introduced as follows:

H2: Customers' perceived ease of use positively influence on electronic payment intention.

Risk perception

Risk perception is the ability to express the loss associated with achieving desired outcomes when using e-services (Yang et al, 2015). Previous studies have demonstrated that risk perception is one of the most important impediments to customers' acceptance of mobile banking (Akturan and Tezcan, 2012; Cruz et al., 2010; Hanafizadeh et al., 2014; Lee et al., 2007). Zhao et al. (2008) pointed out the risks that customers face when using online banking services including privacy, financial, security and performance. Featherman and Pavlou (2003) and Littler and Melanthiou (2006) hypothesized that risk perception encompasses five dimensions in the context of banking services: financial risk, performance, timing, mentality and security. According to the Federal Reserve Board (FRB, 2012), consumer adoption of mobile banking and mobile payment technology is hampered by concerns about information theft and security. The third hypothesis is established as follows:

H3: Consumers' risk perception positively influence on electronic payment intention.

Trust

Trust is the foundation of interpersonal communication and a catalyst in transactions between sellers and buyers to achieve customer satisfaction as expected (Yousafzai et al., 2003). Trust is considered an important factor in determining intention to adopt technology (Chong et al, 2012; Zhang et al., 2012; Chong, 2013). Many studies on the influence of trust on electronic services (Featherman and Pavlou, 2003; Gefen et al., 2003), electronic banking (Gao and Waechter, 2017, Nguyen and Nguyen, 2016; Pham, 2013) proved that trust is one of the factors that strongly influence the electronic payment intention. When making a comparison between traditional payment and electronic payment, it is found that the more people use the electronic payment channel, the higher the level of trust in electronic payment. Dahlberg et al. (2003), Shin (2009), Amoroso and Watanabe (2012), Xin et al. (2013) and Ho Pham (2014) argued that the trust factor can be used as a strong predictor of e-wallet adoption.

Research conducted Gefen et al (2003) found that perceived trust has a positive and significant relationship with perceived usefulness. Thus, the fourth hypothesis is as follows:

H4: Consumers' trust positively influence on electronic payment intention.

Digital technology activities

Previous studies have identified technologies related to society (Li et al., 2017; Oestreicher-Singer and Zalmanson, 2012), mobility (Hanelt et al., 2015a; Pousttchi et al., 2015), analytics (Duerr et al., 2017; Günther et al., 2017), cloud (Clohessy et al., 2017; Du et al., 2016), and Internet of things - IoT (Petrikina et al., 2017; Richter et al., 2017). Digital technology has been identified as a source of disruption (Karimi and Walter, 2015) to consumer behavior and expectations, the competitive landscape, and data availability. Changing consumer behavior and expectations of digital technology have profound effects on the behavior (Chanias, 2017; Hong and Lee, 2017) of common consumers (Yoo et al., 2010a) to approach information and communication capabilities (e.g. using social media on phones, laptops). Applying these technologies, customers become active participants in the relationships that take place between an organization and its stakeholders (Kane, 2014; Yeow et al., 2017). Thus, the fifth hypothesis is established as follows:

H5: Consumers' digital technology activities positively influence on electronic payment intention.

Subjective norms

Subjective norm or social influence is people's perception of social pressure to perform or not their behavior (Ajzen and Fishbein, 1975; Park et al., 2006). These social pressures come from family, friends, co-workers and surrounding media. Previous researches have shown a positive correlation between subjective norm and customers' intention to use electronic payments (Ravi, Carr & Sagar, 2007; Bhattacherjee, 2000; Nasir, Wu, Yago, & Li, 2015; Goh 2017). Research by Nysveen et al. (2005) demonstrated the above correlation that individuals can accept a certain system when under huge pressure from society and the influence of the elders or friends. In particular, they are directly influenced through word of mouth about electronic payments. Thus, the sixth hypothesis can be established as follows:

H6: Customers' subjective norms positively influence on electronic payment intention.

Perceived behavioral control

Perceived behavior control factor was proposed by Ajzen (1985) to improve the TRA model for more realism. Perceived behavioral control plays an essential role such as an individual's self-assessment of the difficulty or ease of performing a behavior. The more resources and opportunities they are getting, the fewer barriers they will face, so that it will be more difficult to control their perceived behavior perception. According to Ajzen (1991), this element is developed from the self-belief of the person intending to perform the behavior, and the easy and favorable conditions for performing this one. Taylor and Todd (1995) argued that perceived behavioral control of customers is obtained when the person intending to perform the behavior has all the information necessary for personal decision and self-assertion. Through these studies, perceived behavioral control has been shown to have a positive effect on behavioral intention. Thus, the seventh hypothesis is stated as follows:

H7: Customers' perceived behavioral control positively influence on electronic payment intention.

Given the seven hypotheses, the research model can be illustrated as followings:

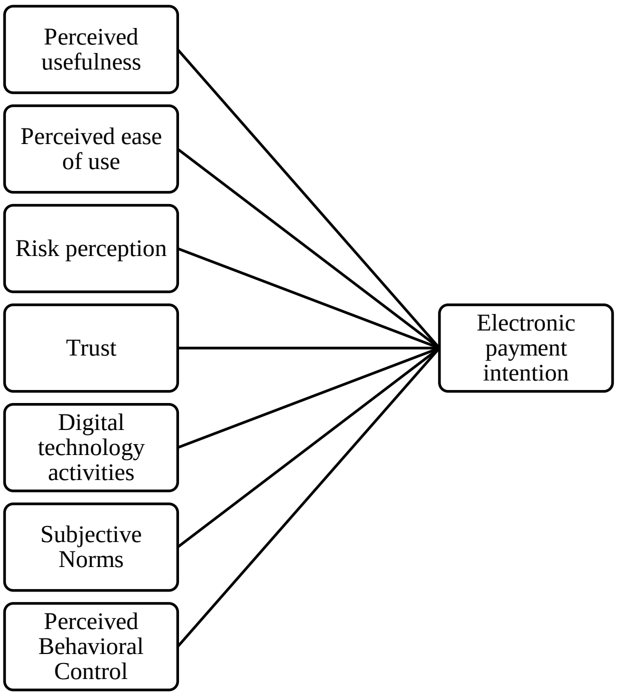

Figure 1: Proposed research model

3. Method

In this research, the authors used two main methods: qualitative research and quantitative research. Regarding the qualitative method, the research team has carried out in-depth interviews combined with referring to more documents related to the topic in order to figure out the elements in the proposed model. Regarding the quantitative method, using a questionnaire designed on a 5-likert scale to assess the degree of agreement of the respondents with the assertions given in the questionnaire. Then, the authors collect data through 360 final qualifying results and analyze it using tools such as descriptive statistics, exploratory factor analysis (EFA), scale testing (Cronbach's Alpha), correlation analysis and analysis regression - hypothesis testing.

Data analyzed using sample size N=360. According to statistics, men accounted for 34.72%, women accounted for 64.72%, and other 0.56%. The age of the respondents is highest at 18-25 years old (94.17%), with a large difference in the age ratio. People attending university education accounted for the highest rate of 88.61%. Respondents' income is mainly under 10 million dong.

4. Results

Cronbach's Alpha

In the first measurement, the reliability analysis for all indicators of the factors has Cronbach's Alpha coefficient of the total variable greater than 0.6, which means that all are accepted for reliability. However, when looking specifically at each indicator of the factors, the research team found that Cronbach's Alpha if item deleted of *Digital technology activities* 03 is 0.843 which is larger than the Cronbach's Alpha coefficient of the total is 0.765 and *Perceived usefulness* has Cronbach's Alpha if item deleted is 0.934 which is greater than Cronbach's Alpha coefficient of total variable is 0.921, so these two indicators are removed. The new results give a table of Cronbach's Alpha coefficients as below:

Table 1: Cronbach's Alpha

Factor name	Number of indicators	Cronbach's Alpha coefficients
Perceived Usefulness	5	.934
Perceived Ease of Use	5	.931
Risk Perception	5	.895
Trust	5	.889
Digital technology activities	3	.843
Subjective Norms	4	.852
Perceived Behavioral Control	3	.917
Electronic Payment Intention	3	.920

Source: results of the study

There are 33 indicators which are accepted to be used in exploratory factor analysis EFA and regression analysis.

Exploratory Factor Analysis (EFA)

The EFA results show that KMO = 0.949, Sig = 0.00< 0.005, the final results of it are presented in the following table:

Table 2: EFA analysis

	1	2	3	4	5	6	7
LI01	.875						
LI02	.786						
LI03	.759						
LI04	.724						
LI05	.708						
DSD01		.786					
DSD02		.752					
DSD03		.686					
DSD04		.661					
DSD05		.623					
RR01			.741

RR04			.699				
RR05			.643				
TT01				.693			
TT02				.685			
TT03				.657			
TT04				.644			
TT05				.629			
HĐ01					.789		
HĐ02					.724		
HĐ04					.703		
CCQ01						.788	
CCQ02						.745	
CCQ03						.684	
CCQ04						.651	
KSHV01							.697
KSHV02							.652
KSHV03							.631

Source: results of the study

The results of the first EFA analysis show that the KMO values and the sig coefficients of the Bartlett test are satisfied. The Eigenvalue numeric value has up to the 7th factor whose value is equal to 1,057 (greater than 1), and the cumulative percentage is as high as 69.032%. This proves that the indicators of seven factors *Perceived usefulness, Perceived ease of use, Risk perception, Trust, Digital technology activities, Subjective norm, Perceived behavioral control* have been satisfy the necessary conditions in exploratory factor analysis.

Correlation Analysis

Before the linear regression analysis, we analyze the correlation between the variables by building a correlation matrix. The results of the correlation matrix analysis between the independent and dependent variables are presented in table 3.

Table 3: Correlation matrix

		YĐ	LI	DSD	RR	TT	HĐ	CCQ	KSHV

TT	Pearson Correlation					1	.625**	.677**	.441**
	Sig. (2-tailed)						.000	.000	.000
	N					360	360	360	360
HĐ	Pearson Correlation						1	.587**	.414**
	Sig. (2-tailed)							.000	.000
	N						360	360	360
CCQ	Pearson Correlation							1	.464**
	Sig. (2-tailed)								.000
	N							360	360
KSHV	Pearson Correlation								1
	Sig. (2-tailed)								
	N								360
**. Correlation is significant at the 0.01 level (2-tailed).									

Source: results of the study

Regarding to table 3, there is a correlation between the dependent variable and the independent variables at the 5% level of significance. And in fact, at the 5% level of significance, the hypothesis that the correlation coefficient which is zero is rejected. This means that there is a linear correlation between YĐ and the independent variables LI, DSD, RR, TT, HD, CCQ and KSHV.

Table 4: Linear Regression Analysis

Model summary

Model	R	R Square	Adjusted R Square	STD. Error of the Estimate	Durbin – Waston
	.634	0.502	.533	.78179925	1.939

Source: results of the study

Regarding to model summary table, we focus on commenting on two values that are the calibrated R-squared value and the Durbin-Waston value. The adjusted R-squared value reflects the influence of the independent variables on the dependent variable. In this case, with the adjusted R-squared value of 0.533 (within the threshold of 50%, this value is acceptable), it means that the 7 independent variables explain 53.3% of the change in independent variable *Electronic payment intention*. Durbin-Waston value is 1,939, close to 2, showing that there is no first order series correlation in the model.

In this study, the team only selected a limited number of samples to investigate, thereby reducing the properties of the overall. Therefore, the group conducted ANOVA test to check whether this linear regression model is generalizable and applicable. The result of Sig value of ANOVA test is 0.000 less than 0.05, so the linear regression model (1) is suitable for the overall.

Table 5: Linear regression analysis

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
	Constant	0.147	0.065		0.000	1.000		
	LI	0.586	0.065	0.586	6.801	0.000	1.00	1.000
	DSD	0.527	0.065	0.527	4.417	0.000	1.00	1.000

	RR	0.511	0.065	0.511	5.311	0.000	1.00	1.000
	TT	0.381	0.065	0.381	4.195	0.000	1.00	1.000
	HĐ	0.347	0.065	0.347	4.871	0.000	1.00	1.000
	CCQ	0.214	0.065	0.214	6.125	0.000	1.00	1.000
	KSHV	0.198	0.065	0.198	4.987	0.000	1.00	1.000

Source: results of the study

In this regression table, the group focuses on analyzing three values that are Beta Standardized Coefficients, the Sig value and the VIF coefficient. We see that the Sig value of the 7 independent variables is 0.000 less than 0.05, so the independent variable is significant in this regression model.

YD = 0.147 + 0.586.LI + 0.527.DSD + 0.511.RR + 0.381.TT + 0.347. Contract + 0.214. CCQ + 0.198. KSHV

Considering Beta Standardized Coefficients, the results show that 7 independent variables have impact on the dependent variable *Electronic payment intention*, and the group also sees the *Perceived usefulness* factor which is the strongest impact with Beta coefficient of 0.586, followed by *Perceived ease of use* factor with Beta coefficient of 0.527 and *Risk perception* factor with Beta coefficient of 0.511, the weakest influencing factor is *Perceived behavioral control* with a Beta coefficient of 0.198; in which there is the element of risk perception that has a negative impact on the dependent variable because in the process of asking the questionnaire, the group asked the opposite questions. That is the reason why the beta coefficient is positive but the impact of this factor is negative, while the remaining factors have a positive impact on the dependent variable.

The VIF value is used to check the multi-collinearity phenomenon, with this research topic, if the VIF coefficient is less than 2, there is no multi-collinearity. The results show that the VIF values of all 7 factors are equal to 1 (less than 2) so there is no autocorrelation between these 7 factors.

5. Discussion and Conclusion

From the above results, it is found that the factor Perception usefulness has the most significant impact on the online payment intention of Vietnam customers. In order to promote the electronic payment behavior, the research team will focus on solutions to improve this factor. The contributions of organizations, businesses, and government are very important to meet the expectation of developing online payment in the future. Besides, it is necessary to develop infrastructure and promote communication policies in order that consumers will be aware of the benefits of electronic payment compared to the current traditional one. Organizations and agencies need to provide conditions for customers to experience and discover the benefits of this kind of payment. Enterprises ought to promote communication and advertising to get this form closer and deeper to everyone. In addition, the Government also should come up with policies and measures to support the development of infrastructure for digital technology. Contemporarily, Vietnamese consumers need to learn further to use this kind of payment correctly and effectively. If the bilateral relationship between consumers and organizations is implemented, perceived ease of use of electronic payment behavior will be enhanced. Thus, these actions will create favorable opportunities for payment transactions. E-payment services will become stronger in the future.

IDENTIFYING FACTORS AFFECTING DIGITAL TRANSFORMATION IN VIETNAM

Huynh Ba Thuy Dieu

thuydieudng@gmail.com

Vietnam - Korea University of Information and Communication Technology, Da Nang, Vietnam

Abstract

The entire world is now witnessing the Fourth Industrial Revolution and Artificial Intelligence (AI) is indeed altering the lives of the many in both developing and developed countries. Massive digital transformations are affecting the economies of those countries and are bringing with them many promised merits, as well as many challenges to face. This paper aims to focus on analyzing, identifying and measuring the factors affecting digital transformation in Vietnam. Research results show that there are five factors: policy system, leader's vision, network security, sustainable development of the economy and digital knowledge and skills. From there, the article recommends policy implications for state management agencies and other organizations that can help digital transformation in Vietnam will be more effective.

Keywords: *factor, affect, digital transformation, Viet Nam.*

1. Introduction

According to the report "Southeast Asia Digital Economy 2019", Vietnam's digital economy in 2019 was worth 12 billion USD (contributing 5% of national GDP in 2019), 4 times higher than the value of 2015. and is expected to reach 43 billion USD by 2025.

The digital shifts underway are reshaping economies and societies today and will continue to do so in the future. The ongoing digitalisation of the economy and society holds many promises to spur innovation, generate efficiencies, and improve services throughout the economy. Moreover, the successful transition to a digital economy is a necessary condition for boosting more inclusive and sustainable growth and enhancing overall well-being.

This paper seeks to study the factors affecting digital transformation for some countries. The paper is interested in examining the impacts of digital transformation upon the sample of some countries and accordingly come up with relevant and interesting implication for those countries.

Hence, the paper aims to add to the existing literature regarding some factors affecting digital transformation in the world. The implications of those factors are of significant importance to policy makers regarding how much support should be given to encourage the digital transformation and the promotion of artificial intelligence.

There are many different definitions of digital transformation that shown in the table:

Table 1. Definitions of the term "digital transformation"

Source	Definition
European Commission (2019)	"Digital transformation is characterized by a fusion of advanced technologies and the integration of physical and digital systems, the predominance of innovative business models and new processes, and the creation of smart products and services."
OECD (2018)	"Digital transformation refers to the economic and societal effects of digitization and digitalization. Digitization is the conversion of analog data and processes into a machine-readable format. Digitalization is the use of digital technologies and data as well as their interconnection which results in new or changes to existing activities."
Ismail, Khater, and Zaki (2017)	[Digital transformation is a] "process through which companies converge multiple new digital technologies, enhanced with ubiquitous connectivity, with the intention of reaching superior performance and sustained competitive advantage, by transforming multiple business dimensions, including the ***business model***, the ***customer experience*** (comprising digitally enabled products and services) and ***operation***s (comprising processes and decision-making), and simultaneously impacting ***people*** (including skills talent and culture) and ***networks*** (including the entire value system)."
Schwertner (2017)	"the application of technology to build new business models, processes, software and systems that result in more profitable revenue, greater competitive advantage, and higher efficiency."
Deloitte (2018)	"Digital transformation is the use of technology to radically improve the performance or reach of an organization. In a digitally transformed business, digital technologies enable improved processes, engaged talent, and new business models."
Bloomberg (2018)	"Digital transformation requires the organization to deal better with change overall, essentially making change a core competency as the enterprise becomes customer-driven end-to-end. Such agility will facilitate ongoing digitalization initiatives but should not be confused with them."

(Source: authors' compilation)

There are many kinds of digital transformation frameworks and these common patterns in most frameworks:

- Digitized business model
- Talent enhancement within the enterprise
- Customer-centric products and services
- Innovative culture
- Collaborative leadership

2. Literature Review

Pervasive and ubiquitous digitalization has brought new disruptive changes to the economy (Yoo, 2013), and environmental conditions are undergoing rapid change due to digital technology and digitalization (Hartl and Hess, 2017; Porter and Heppelmann, 2014). Digital technology, digital innovation, and digitalization are fundamentally altering business processes, products, services, and relationships (Karimi and Walter, 2015), and organizations need to fundamentally change the way they do business and employees' mindset, as well as restructure to survive (Hartl and Hess, 2017)

United State history shows that the state did not only facilitate the digital knowledge economy but also actively created it with a bold vision, enabling policies and targeted investments. For example, an in-depth examination of all the key technologies that make iPhone so smart were government funded: Internet, GPS, touch screen display, and SIRI voice-activated personal assistant (Mazzucato, 2013, chapter 5).

Organizations must have an e-leadership model in place to promote successful strategic change related to digital transformation and provide a level of much-needed stability during the change process (Li, Liu, Belitski, Ghobadian, & O'Regan, 2016). Any digital transformation requires a strategic model which will lead to a successful implementation and improved outcomes once the change is complete (Berman, 2012).

In the research Identifying Security Risks of Digital Transformation - An Engineering Perspective of Nguyen Anh Duc and Aparna Chirumamilla (2018) showed that the role of security in digital transformation, inclued mobile security, cloud storage security, sercuring big data and sercuring internet of things.

Early neoclassical models like Solow (1956) treated technical change as an exogenous variable, illustrating how long-run economic growth only depended on (exogenous) technical change. Arrow (1962), who endogenized technology by assuming learning by doing, stated that it grew at a constant rate, and found that long-run economic growth crucially depends on population growth. Other important contributions in the 1960s were made by Uzawa (1965), Phelps (1966), Conlisk (1967, 1969) and Shell (1967) among others, who all related technology growth to some specification based on labour resources devoted to the development of new technologies and ideas

In the research Digital Knowledge and skills of Natalija Kokolek, Bozidar Jakovic & Tamara Curlin (2015) showed that Digital transformation as a driver of positive and radical changes represents a complex issue which affects all segments of the society and the whole economy. Digital knowledge and skills implies the ability to operate in the digital economy on a professional and personal level. It means having in-depth understanding of the environment and the nature, role and opportunities generated by the digital environment in any aspect of your life.

3. Method

3.1. Model building and developing hypothesis research

Based on previous studies, the article proposes hypotheses affecting digital transformation in Vietnam: state policies, leader's vision, network sercurity, the sustainable development of the economy and digital knowledge and skills.

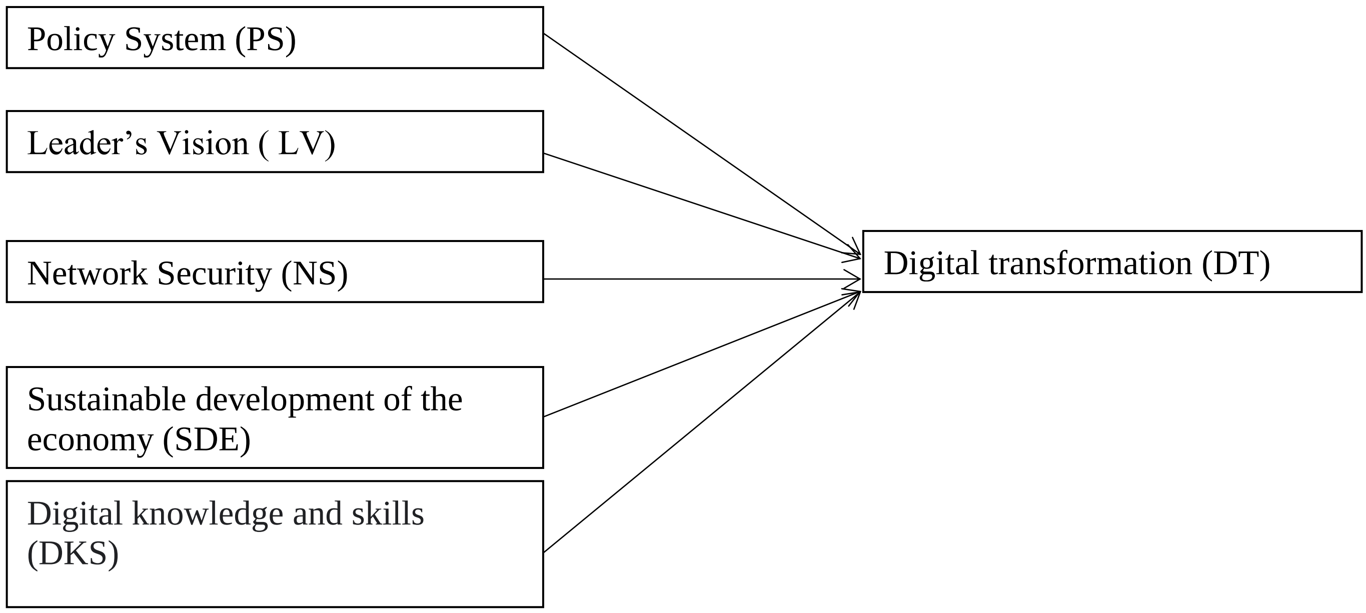
H1: A complete and clear policies and laws of the state will benefit digital transformation.

H2: The good national leader'vision will have a positive influence to digital transformation.

H3: The network sercurity will ensure for digital transformation.

H4: The sustainable development of the economy will support digital transformation.

H5: Digital knowledge and skills will advantage digital transformation.



3.2. Variables and mesures

Through qualitative research results, the author has built some of scale. Likert's scale with 5 levels (1 to 5) is suitable for measuring research.

- *Build the scale and describe the independent variable*

Policy system: the scale of this variable inherits from the study of Mazzucato (2013). The author has adjusted and added some of scales, the results have 5 observed variables.

Leader's Vision: the scale of this variable inherits from the study of Li, Liu, Belitski, Ghobadian, & O'Regan (2016). The author has adjusted and added some of scales, the results have 5 observed variables.

Network Security: the scale of this variable inherits from the study of Nguyen Anh Duc and Aparna Chirumamilla (2018). The author has adjusted and added some of scales, the results have 4 observed variables.

Sustainable development of the economy: the scale of this variable inherits from the study of Conlisk (1967, 1969). The author has adjusted and added some of scales, the results have 4 observed variables.

Digital knowledge and skills: the scale of this variable inherits from the study of Natalija Kokolek, Bozidar Jakovic & Tamara Curlin (2015). The author has adjusted and added some of scales, the results have 5 observed variables.

Build the scale and describe the dependent variable : Digital transformation (DT). The dependent variable in the research model is self-built by the author, based on collecting expert opinions from the case study method and background theory.

3.3. Data collection method

- Respondents: Professionals, leaders working in different organizations
- Survey method: The survey form for this research is surveyed in two ways: The questionares are sent directly to the respontdents and collected after the survey is completed; Email individuals that match the sample selection criteria.

3.4. Primary data collection

In a total of 378 responses, there are:

- 211 experts, employees and 167 administrators of different organizations;
- 198 males (52,4%) and 180 females (47,6%)

4. Results

4.1. The results of reliability and variables

By using SPSS 20.0 software to analise data and obtained the results of the synthesis of Cronbach Alpha coefficient as well as the correlation coefficient of the total variable, the reliability test of the independent variables all showed that the coefficients are large. more than 0.6 and all observed variables for the variables in the model, including the independent and dependent variables, have a reliable variable correlation coefficient. In addition, when analyzing the combined reliability and extracted variance, the combined reliability coefficients are all greater than 0.7 and the variance extracted for the factors is all greater than 0.5. Thus, it is possible to confirm the necessary reliability of the scales.

Table 2. Summary of Cronbach's alpha coefficient results

Independent Variables	**Cronbach's coefficient Alpha**
Policy System (PS)	*0,861*
Leader's Vision (LV)	*0,874*
Network Security (NS)	*0,789*
Sustainable development of the economy (SDE)	*0,801*
Digital knowledge and skills (DKS)	*0,842*
Dependence variable DT	*0,882*

(Source: authors' compilation)

4.2. Exploratory factor analysis results

Table 3. KMO and Bartlett's Test

KMO and Bartlett's Test		
Kaiser- Meyer-Olkin Measure of Sampling Adequacy		0,952
Bartlett's Test of Sphericity	Approx. Chi-Square	2863.393
	Df	213
	Sig.	.000

(Source: authors' compilation)

The results in Table 2 show that the KMO index of 0.952 is very close to 1.0, showing that the factor analysis is appropriate and the significance level is sig. if .000 is less than 0.05, it is statistically significant.

4.3. Linear regression analysis results

Correlation coefficient test (r)

Table 4. correlation matrix

		PL	LV	NS	SDE	DKS	DT
PL	Pearson Correlation	1	.359**	.377**	.428**	.407**	.567**
	Sig. (2- tailed)		.000	.000	.000	.000	.000
	N		228	228	228	228	228
LV	Pearson Correlation		1	.164*	.119	.298**	.447**
	Sig. (2- tailed)			.013	.074	.000	.000
	N			228	228	228	228
NS	Pearson Correlation			1	.295**	.175**	.406**
	Sig. (2- tailed)				.000	.008	.000
	N				228	228	228
SDE	Pearson Correlation				1	.429**	.455**
	Sig. (2- tailed)					.000	.000
	N					228	228
DKS	Pearson Correlation					1	.462**
	Sig. (2- tailed)						.000
	N						228
DT	Pearson Correlation						1
	Sig. (2- tailed)						
	N						228

(Source: authors' compilation)

The correlation t matrix shows that the correlation coefficient between the "obstructing factor" and the variables is as follows: with the variable "Policy system" (Pearson = 0.567), the variable "Leader's vision" (Pearson = 0.447), variable "Network sercurity" (Pearson = 0.406), variable " Sustainable development of the economy " (Pearson = 0.455), variable "Digital knowledge and skills" (Pearson = 0.462). Therefore, it can be concluded that the independent variables can be included in the model to explain the factors affecting university governance in the condition of educational autonomy including 5 independent variables

Regression analysis

The results of the linear regression test are shown in Table 4

Table 5. Linear regression test results

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.705[a]	.697	.686	.63049	2.013

a. Predictor: (Constant), PS, LV, NS, SDE, DKS

b. Dependent Variable: QTDH

Model		Unstandardize Coefficients		Standardize Coefficients	t	Sig.	Collinearrity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
	(Constant)	-.895	.302		-2.967	.003		
	PS	.370	.085	.243	4.369	.000	.644	1.752
	LV	.284	.059	.232	4.871	.000	.833	1.501
	NS	.225	.065	.185	3.489	.001	.834	1.099
	SDE	.222	.067	.168	3.329	.001	.712	1.005
	DKS	.196	.065	.199	3.026	.003	.724	1.382

(Source: authors' compilation)

The result shows that the adjusted R2 coefficient is 0.697. This means that the research model explains 69.7% of the variation of the dependent variable by the independent variables in the model. The VIF (Variance Inflation Factor) coefficients of the independent factors in the model are all low and less than 2.2 (from 1.005 to 1.752). This shows that there is no multicollinearity between the independent variables in the model (Nguyen Dinh Tho, 2011). Also the Sig coefficient. of the independent factor coefficients in the model are all less than 0.05. Therefore, all 5 factors affect the dependent variable.

The normalized regression model shows a simple linear relationship between the variables:

DT= 0,243*PS+ 0,232*LV+ 0,185* NS+ 0,168* SDE+ 0,199* DKS

The variable "Policy system" with Beta coefficient is 0.243 with high statistical significance >99.99% when the Sig index. reach 0.000; Similar variable "Leader's Vision" with Beta coefficient is 0.232 with statistical significance Sig. has a value of 0.000. Next are the variables "Network security" with Beta coefficient of 0.185 and Sig statistical significance. is 0.001, the variable "Sustainable development of the economy " with 2 values Beta and Sig. are 0.168 and 0.001 respectively. Finally, the variable "Digital Knowledge and skills" with a Beta value of 0.199 has a Sig statistical significance. is 0.003.

The results of this study show that the factor that has the strongest influence on university governance in the context of autonomous education is the policy-legal system. deciding on university governance, next is the organizational culture factor, the organizational model in the university also greatly affects the university administration and finally the cognitive factor of the staff. management in changing management

5. Discussion and Conclusion

5.1. Reconmedations

- ***Policy System***

The range of these roles includes setting national policies and priorities for the digital economy; supporting research and development of promising technologies; regulating and complementing market forces to ensure affordable access to the Internet; investing in human and organizational complements and institutional learning across all sectors and divides; leading public services transformation and governance; and creating state capabilities and institutions to plan, fund, and implement national digital transformation strategies. We elaborate only on a few.

State policy roles in the digital age extend to various forms of content and media platforms**.** The media is increasingly central to the functioning of markets and democracy. State policy aims to regulate, increasingly in a multi-platform environment, obligations, roles, and responsibilities of media service and content providers while creating, aggregating, and making available audiovisual content. Similarly, the state must work with stakeholders to set polices and regulations for data protection. The aim is to regulate data subjects' rights and data controllers and processers' obligations while collecting, processing, and using personal data. It also regulates transfer of data across national boundaries and roles and responsibilities in data-processing value chains.

Governments are required to manage the growing risks of concentration, inequality, and control that can undermine the promised shared prosperity. When the Internet and digital platforms deliver scale economies, but without competitive environment, the outcome could be excessive concentration and monopolies. When tasks are fast and automated but workers' skills are not continuously upgraded, the outcome will be greater inequality. When digital technologies help overcome information scarcity, but governments remain unaccountable, the outcome will be greater control rather than citizen empowerment and inclusion.

Continue to implement strong digital transformation in Party Committees, National Assembly, Government, Viet Nam Fatherland Front and socio-political organizations to ensure unity, interconnection and synchronization.

The Ministry of Public Security needs to speed up the development of a decree on personal data protection.

Ministries and local authorities need to step up the settlement of administrative procedures in the electronic environment, concentrate resources, increase the rate of online public service delivery at level 3 and level 4 and integrate service provision. on the National Public Service Portal.

-

- ***Leader's vision:***

Leader's visiong is a key factor to support digital transformation. The government considers the digital economy to be an important development driver to bring Vietnam to fast progress, taking shortcuts in development. vision to 2030 Vietnam becomes a digital, stable and prosperous country, pioneering in testing new technologies and models. This program aims at the dual goal of developing a digital government, a digital economy, and a digital society, as well as forming Vietnamese digital technology enterprises capable of going global. Awareness of digital transformation in parallel with advanced countries.

- ***Network security:***

In order to ensure information security and contribute to the development of information technology, according to experts, in the coming time, it is necessary to drastically and synchronously implement many solutions. State management agencies need to raise awareness about ensuring information security, this is an important and regular task of the entire Party and community.

Enhancing education, fostering and raising awareness of officials and people; focus on propagating and disseminating to students about the risks and threatening factors that cause information insecurity. So that, raising the awareness of using information services, especially from abroad; improve the ability to recognize, receive information, self-defense ability, "immunity" against fake, bad and malicious information. Beside, the state will invest to modern infrastructure, bandwidth is wide enough to overcome attacks causing network congestion, and have a backup storage system. Regularly review, detect and fix security "holes" throughout the system, add specialized equipment and software capable of checking and controlling information security and safety in the telecommunications network environment. communication, internet, radio frequency...

The establishment of a cyber safety monitoring center will be a solid stepping stone for Vietnam to master network safety equipment, aiming to ensure a safe cyberspace. At the same time, effectively respond to various types of cyber attacks, avoid exposing and leaking information of users, financial institutions - banks, enterprises...

- ***Sustainable development of the economy***

It is necessary to transform the growth model from breadth to depth, clarify issues of economic theory in order to clearly explain and give specific instructions for the economic management process. Apply forms of GDP measurement through full calculation of benefits, costs, development of clean energy, renewable energy. Develop and implement a green growth strategy. Use energy economically and efficiently, develop clean energy, renewable energy to ensure national energy security.

Sustainable development of regions and localities should focus on prioritizing development before key economic regions, and at the same time pay attention to less developed areas and have more difficult conditions in order to create balanced development.

Improve growth quality, ensure macroeconomic stability, especially financial and monetary policies.

Establish a healthy and fair competitive business investment environment, select good factors for the economy with investors, do business effectively, fire weak business organizations.

- ***Digital Knowledge and skills***

To be successful in digital transformation, state management agencies have policy system to support citizens in learning and developing skills to meet the requirements of national digital transformation. Accordingly, the state needs to widely propagate digital transformation knowledge to the people as well as develop projects to support organizations in developing digital skills for employees. In addition, the Ministry of Education and Training directs all levels of training to change training programs to suit digital transformation. Education implements the transcoding of thinking from instinct to meaning of development. "Learning to change the world, learning to write for hope" - these are also interesting and scientific suggestions from the above studies that become the premise to build a framework for transferring skills - from school level Preschool is social emotional learning, higher education includes critical thinking skills, creativity, communication. Transfer skills change, including computational thinking, is not to encourage students to become "robots" but to learn, a way of thinking that connects background skills with the ability to find problems, analyze problems and solve that problem in accordance with life: helping high school students prepare to connect learning with practice, between academic knowledge in school and the reality and requirements of the digital era that sometimes at times currently unknown.

5.2. Conclusion

Digital transformation has been developing strongly in Vietnam. For successful digital transformation, the state needs to have synchronous policies and solutions. In addition, the government needs to realize the long-term vision of digital transformation activities affecting the country, creating a healthy, solid and safe security environment. Futhermore, there must be some solutions for sustainable economic development and equipping citizens with knowledge and skills to be able to adapt to the digital environment

DIGITAL TRANSFORMATION AND ISSUES POSED TO TRAINING, RETRAIN HUMAN RESOURCES OF OFFICERS IN VIETNAM

MSc. Nguyen Hai Sinh

nguyenhaisinh.hvhc@gmail.com

Academy of Politics, Ministry of National Defense, Hanoi, Việtnam

Abstract

Digital transformation is an irreversible trend on a global scale. In Vietnam, digital transformation is becoming an indispensable driving force for development. In order to succeed in digital transformation, training and fostering human resources, especially cadres and civil servants maintains decisive positions and roles. This study focuses on clarifying the theoretical basis, current situation and impacts, challenges of digital transformation with training and fostering human resources of cadres and civil servants in State administrative agencies in Vietnam. By the data collection, analysis and synthesis of information, the research results have showed that digital transformation has posed many problems for training and fostering human resources of cadres and civil servants, such as: objectives; content; forms and methods; the quality of the teaching staff; technical facilities…. On that basis, the author proposes some solutions to promote digital transformation in training and fostering human resources for cadres and civil servants in Vietnam in the next period.

Keywords: *Digital transformation; training and retraining; officials; human resources*

1. Introduction

At the moment, digital transformation is an inevitable trend, an opportunity for all countries to rise up in the fourth industrial revolution. Digital transformation has a far-reaching impact, covering all socio-economic fields and industries, contributing to increasing labor productivity, transforming operation and business models towards innovation and creativity; improve the competitiveness of the country, opening up new development space, creating new values in addition to the inherent values. For Vietnam, this is an invaluable, "unique" opportunity to change the country's ranking and keep up with the development of countries in the region and on the world.

Aware of that, in June 2020, the Prime Minister approved the "National Digital Transformation Program to 2025, with orientation to 2030". In which, it is determined: By 2030, Vietnam will become a digital, stable and prosperous country, pioneering in testing new technologies and models; fundamentally and comprehensively renovating the management and administration activities of the Government, production and business activities of enterprises, people's ways of living and working, developing a safe, humane, and wide digital environment. (Prime Minister, 2020, p.1). According to Ho Tu Bao (2020), in order to conduct digital transformation, three basic elements are needed, which are people, institutions and technology. In which, human is the most important and decisive factor; in digital transformation, two main problems of human are awareness and human resources. Therefore, at present, training and fostering human resources, especially, human resources of cadres and civil servants have been a more important and urgent problem than ever.

In addition, in order to implement the National Digital Transformation Program, state agencies must be the motive force, which lead the entire digital transformation process of the country. Digital transformation of state agencies is the development of the digital government of central agencies and digital government, smart cities of local agencies at all levels. Among that, state agencies from central to local levels need to accelerate the digital transformation process by training and equipping their staff with digital transformation knowledge, digital skills and digital technology for leaders and a large number of cadres and civil servants. This problem puts increasing demands on the contingent of cadres and civil servants in terms of quality and capacity, especially knowledge and skills of digital transformation. At the same time, it is required that training and fostering of human resources for cadres and civil servants must be also innovated in terms of contents, programs, forms and methods, etc. in order to meet the require of state manegement in the digital transfomation background. For the purpose of analyzing and assessing the current situation, and clarifying the impacts, challenges of digital transformation on training and fostering human resources for cadres and civil servants, the research proposes a number of solutions to promote digital transformation in training and fostering human resources for cadres and civil servants in Vietnam.

2. Theoretical basis of the research problem

2.1. The concept of digital transformation

Digital transformation has many different interpretations, definitions and differences in each field. According to Gartner Information Technology Research and Consulting Company, digital transformation is the application of technology in changing business models of enterprises, thereby creating more opportunities and new values, helping businesses accelerate growth and achieve better sales. According to Microsoft, digital transformation is the restructuring of thinking in the coordination among data, processes and people to create new values. However, it can be understood in a general way: Digital transformation is a total and comprehensive changing process of individuals and organizations in the way of living, working and production methods based on digital technologies (Ministry of Information and Communication, 2020, page 15).

The foundation of digital transformation is the digitization process taking place everywhere, creating digital versions of things in the physical world, which means creating data that carries their information. Things in the physical world can be connected to each other through their digital versions on the Internet (Internet of Things), creating digital space (or cyberspace). This connection is also the connection between physical space and digital space (physical-cyber connection), leading to the possibility of activities in the physical world can be calculated and controlled from digital space. Therefore, in essence, digital transformation is about transferring our activities from the real world to the virtual world in the network environment.

For Vietnam, the goal of national digital transformation is to build and implement effectively digital government, economy and society. Among that, the Digital Government helps the Government not only operate more efficiently, effectively and transparently but also reduce corruption; The digital economy promotes innovation, creates new values, helps increase labor productivity, creates new growth engines and escapes the middle-income trap; the digital society helps people have equal opportunities to access services, training and knowledge, narrow the development gap and reduce inequality.

2.2. The concept of cadres, civil servants and training and fostering human resources for cadres and civil servants

2.2.1. The concept of cadres and civil servants

In Vietnam, in the common sense, cadres are considered as all people working in the apparatus of the Party, government, mass organizations, and armed forces. It was defines in The Law on Cadres and Civil Servants in 2008 that: Cadres are Vietnamese citizens who are elected, approved and appointed to hold positions and titles according to terms in agencies of the Communist Party of Vietnam, the State, socio-political organizations at the central, provincial and district levels (National Assembly, 2008).

It was defined in The amending law of the Law on Cadres and Civil Servants in 2019 that: civil servants are Vietnamese citizens who are recruited and appointed to ranks, positions and titles corresponding to the employment positions in the personnel and received salaries from the State budget in: agencies of the Communist Party of Vietnam, the State, socio-political organizations at the central, provincial and district levels; agencies and units of the People's Army that are not officers, professional soldiers or defense workers; agencies and units of the People's Public Security who are not officers, non-commissioned officers serving under the professional regime, public security workers (National Assembly, 2019).

2.2.2. The concept of training and fostering human resources for cadres and civil servants

In order to form and develop each individual's professional knowledge, skills and techniques, training is the systematically equipping process with basic knowledge according to a certain program. Generally, the concept of "training" includes the meaning of "retraining", so the phrase "training and fostering" is often used in conjunction with each other. However, fostering has basic characteristics which are different from training. Fostering is mainly the addition and updating of knowledge and information to the knowledge that the individual already had.

Currently, there are many different views on human resources. However, it can be understood that human resource is the total of physical and mental strength existing in the entire social labor force of a country. In which, they have been crystallized the tradition and creative work experience of a country in history and used to produce material and spiritual wealth for the present and future needs of the country. Thus, it can be understood that training and fostering human resources for cadres and civil servants is a process of equipping a contingent of cadres and civil servants with the necessary qualities, knowledge, skills and behaviors in order to perform the assigned duties and responsibilities excellently.

3. Methods

3.1. Study overview

At present, digital transformation is an inevitable development trend of countries around the world. Therefore, in Vietnam, this issue is interested in research by many scientists. In particular, many scientific seminars have been held to discuss digital transformation such as: the workshop "Digital transformation - The inevitable trend of development" of Dak Lak province (March 2021); seminar "Digital Transformation - Transforming Business Model" of Ho Chi Minh Computer Association in collaboration with Ho Chi Minh Investment and Trade Promotion Center (February 2021)... In which , the impacts of digital transformation on socio-economic fields, the position and role of digital transformation; opportunities, difficulties, challenges and proposing of some solutions for promoting digital transformation in Vietnam... have been pointed out in the majority of works.

Regarding the human factor in digital transformation, human resource training has been refered in a large number of the works such as: Phan Quoc Tan (2021); Van Anh (2021); Doan Phong (2021)… In which, all authors have agreed that in order to meet the requirements of digital transformation, human resources must be professionally and ethically trained. They are capable of mastering technology, creative and able to quickly adapt to the change of technology.

In particular, Phan Quoc Tan (2021) pointed out: with the characteristics of digital human resources, it is necessary for employees to change their mindset from just learning once to work for life to learning for life to be able to afford lifelong employment. Specifically: learning to improve education level; improving general knowledge, learning more foreign languages, informatics...; learning to improve professional skills; learning life skills: teamwork skills, industrial working style; dispute and conflict resolution skills, self-care skills, which are really important...

Besides, in terms of training and fostering cadres and civil servants, there are quite a few studies which has been carried out on this issue under the impact of digital transformation, but they are mainly researched under the influence of the first industrial revolution. Wednesday, such as: Tran Viet Quan (2020); Luong Trong Thanh and Ta Van Hung (2018)… The authors of the works have explained and clarified the impact of the fourth public revolution on training and fostering cadres in aspects such as training and fostering objectives; model of organizing teaching and learning activities in training and retraining; teaching methods and role of lecturers; content, curriculum, etc. However, these are valuable documents that the author can inherit and apply in research.

3.2. Research Methods

- Methods of data collection during the research: the author mainly uses the secondary data collection method. In which, the author searches, collects and synthesizes data from published works related to the research problem, such as textbooks, reference books, topics. , doctoral theses, scientific articles; legal documents of the State; reports and documents of the Ministry of Home Affairs and the Department of Home Affairs of the localities... In addition, the author also consulted opinions of some experts and scientists about the research content.

- Synthesizing and analyzing information method: the collected data is processed by excel software and made into tables. At the same time, they are arranged scientifically and logically in the statistical tables to help to compare, contrast and analyze in order to properly assess the nature of the problem to be researched.

- Descriptive statistical method: the author uses descriptive statistical method to assess the current status of the contingent of cadres and civil servants (ethical quality, education level, professional knowledge, skills and attitudes) and the actual situation of training and fostering human resources of cadres and civil servants about the program content; forms and methods; teaching staff; facilities…This is the practical basis for the author to evaluate the impacts of digital transformation on training and fostering human resources for cadres and civil servants and propose some solutions.

4. Results

4.1. The current situation of the quality of human resources of cadres and civil servants and activities of training and fostering human resources of cadres and civil servants in Vietnam

Regarding the quality of human resources of cadres and civil servants:

Over the past years, the human resources of cadres and civil servants have matured and developed in many aspects, increasingly improved quality, gradually meeting the requirements of the period of accelerating country industrialization and modernization. In the Seventh Conference Resolution of the Central Committee of the Vietnam Communist Party, Term XII (May, 2018), it was pointed out that the cadres have an ideological stance, solid political courage, simple lifestyle and morality, exemplary, consciously organized and disciplined; they always cultivate, train, raise level and capacity, strive and complete assigned tasks. Many cadres are dynamic, creative, adaptable to the trend of integration and capable of working in an international environment... (Central Committee of the Communist Party of Vietnam, 2018). Especially, commune-level cadres and civil servants has been estimated up to April 2020, the total number of them has 234,617 people, an average of 21 people/commune, in which, cadres have 113,672 people, civil servants with 120,945 people (Government, 2021); level of ability, capacity, responsibilities, styles and attitudes of commune-level cadres and civil servants have made certain improvements, the quality of official duty performance has basically met the requirements of tasks...

In addition, the quality of human resources for cadres and civil servants, including leaders and managers in a number of sectors, fields, agencies, units and localities, is still limited, uneven, and really unsatisfactory in comparison with meeting the country's digital transformation requirements. In the Seventh Conference Resolution of the Central Committee of the Vietnam Communist Party, Term XII (May 2018), it was also pointed out that many cadres, including unprofessional senior officials, work unproperly with their expertise and forte; foreign language level, communication skills and work ability in an international environment are still limited. Many young cadres lack bravery and hesitate to practice... Some leaders and managers, including the strategic level officers, lack role models, have low prestige, unworthy qualification with their duties, bureaucracy, alienation from the people, individualism, entanglement in corruption, wastefulness, negativity, group interests... (Central Committee of the Vietnam Communist Party, 2018). In particular, in the document of the 13th National Congress of Deputies, the Communist Party of Vietnam emphasized: A part of cadres and party members has lost their ideals, lost their will, hesitated difficulties and suffering, and depressed on political thought, morality, lifestyle, "self-evolution", "self-transformation" (Communist Party of Vietnam, 2021, p.92).

Regarding training and retraining activities for cadres and civil servants:

Activities of training and fostering human resources of cadres and civil servants are renewed, clearly assigned and decentralized. The system of training and retraining establishments has been rearranged and reorganized in a lean orientation, contributing to improving the quality and efficiency of operations. The organization and compilation of programs and documents have been paid attention to. In order to meet the requirements of digital transformation, the Prime Minister has approved many projects, such as: Project on training and retraining cadres, civil servants and public employees in the period 2016 - 2025; The National Program on foreign language learning for officials, civil servants and public employees in the period of 2019 - 2030... In addition, localities have organized many training courses to foster knowledge and skills on conversion. numbers for cadres and civil servants in state agencies.

In the period 2011 - 2015, the total number of trained and fostered cadres and civil servants was nearly 2,900,000 people, in which, training in professional knowledge and specialist skills was 1,870,000 turns of people, reaching a rate of nearly 65% of the total number of cadres and civil servants are trained and fostered. In the period 2016 - 2020 (estimated to March, 2020), the whole country has conducted training and retraining for more than 5.4 million turns of officials and civil servants. In which, about 697,036 people were trained and fostered in political theory; 447,181 people were received training on state management knowledge and about 4.2 million people were received professional training and retraining (2.3 times more than in the 2011-2015 period). According to reports from ministries and local agencies, until March 2020, the total number of civil servants trained and retrained in the period 2016 - 2020 at ministries and branches is 594,654 turns of people, meanwhile, in provinces, cities, the number is more than 1,151,654 turns of people (Government, 2021).

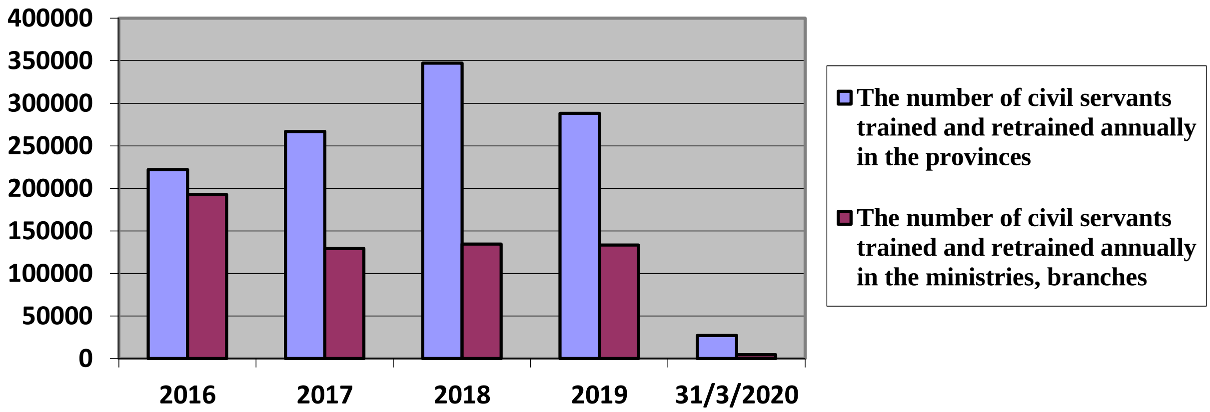

Figure 1: Number of civil servants trained and retrained on the national scale in the period 2016 - 2020

Source: Government (2021), Summary report of the State administrative reform overall program for the period 2011-2020 and orientation for the period 2021-2030, issued on April 19, 2021.

However, activities of training and fostering human resources for cadres and civil servants are still limited, such as: training and retraining programs still have contents that are not only really unattached to the needs of cadres and civil servants but also focused on theoretical issues and discounted on practical skills; the cadres sending for studying is not based on the needs of the job and the cadres and civil servants themselves, but it is mainly based on fully meeting the standards related to certificates and degrees; there are no mechanisms and policies to encourage cadres and civil servants to study actively in order to improve their professional qualifications and capacity...; facilities and equipment of training institutions are still poor, unsatisfiable the requirements of training and retraining activities in the context of digital transformation; the qualifications and capacity of the teaching staff are still limited, especially in foreign languages and informatics…

4.2. Issues for training and fostering human resources for cadres and civil servants in Vietnam in digital transformation

Digital transformation is becoming an important factor creating change in all industries and fields, in which, placing increasing demands on the quality of human resources, especially human resources of cadres and civil servants in Vietnam. In the current digital transformation period, there are many problems for training and fostering human resources for cadres and civil servants in Vietnam, such as: objectives; content; forms, methods; the quality of the teaching staff; technical facilities….

Specifically:

- *For training and retraining purposes:*

In the Project on training and fostering cadres, civil servants and public employees during the period 2016 - 2025, the Government has determined the goal: to create a drastic change in the quality and effectiveness of training and retraining, contributing to build a contingent of professional cadres and civil servants with sufficient qualities, qualifications and capabilities, meeting the requirements of serving people, the development of the country and international integration. In response to the requirements of national digital transformation, development of digital government, digital economy and digital society, the goal of training and fostering cadres and civil servants must be oriented to unleash potential and empower creativity for each individual; they must have the ability to think, innovate and skills in analyzing and synthesizing information; they also must have the ability to work independently, make decisions on the basis of data analysis, the ability to work with smart technology, international communication and life skills and the ability to connect and share. Obviously, in the face of the impact of digital transformation, the goal of training and fostering human resources for cadres and civil servants needs innovation in the direction of promoting the creative working ability of each individual.

- *For the content and program of the training and retraining program:*

Digital transformation has put great pressure on training and retraining activities for schools and organizations; from developing training programs, updating content to training skills for officials and civil servants to meet the requirements of the job. The training program needs to specify the output standards, the requirements of achieving the general quality, professional capacity, especially the knowledge and skills to serve for digital transformation. Previously, the content of training and retraining was often focused on transmitting simple knowledge. However, in the current digital transformation period, cadres and civil servants must not only have basic knowledge but also have the capacity and skills to work in an international environment, a digital transformation environment. Therefore, current training and retraining content includes: knowledge and skills related to cognition: systems thinking, critical thinking, ability to respond to change, ability to work creation…; physical skills: language and communication skills, digital skills and internet connectivity; social skills: communication, behavior, conflict resolution, teamwork, creating and maintaining relationships... That places increasing demands on schools and organizations for the building programs, renovating training and retraining content.

- *For forms and methods of training and retraining:*

In training and fostering process, digital transformation will support innovation in the direction of reducing presentations, transferring knowledge to developing learners' capacity, increasing self-study ability, creating learning opportunities anytime, anywhere. personalization of learning, contributing to the creation of a learning society and lifelong learning. In particular, many forms and methods of training and fostering have been developed with the explosion of technology platforms. Combining traditional methods (presentation, conversation, practice...) with new methods (analysis, criticism, proposal, problem-solving, situation, action-oriented teaching, exchange of ideas, etc.) group change…) have been carried out. At the same time, applying methods associated with modern technology, such as: E-learning online teaching, educational methods integrating science, technology, engineering and math (STEM education), methods simulation methods, digitizing lectures... have been practised. Especially, digital transformation effectively supports personalization of learning - each learner will be learned a separate curriculum and learning method unlike others; and they have access to a huge knowledge base in the network environment, which makes the interaction between learners and teachers quick and easy.

- *For the teaching staff:*

Digital transformation in teaching is understood as the application of services, technology and digital to help improve teaching quality and improve learning outcomes. However, in order to do this, it requires both learners and teachers, first of all, teachers have to be trained in the use of modern technical means. Therefore, in the digital transformation period, lecturers must not only have professional competence, teaching capacity, scientific research capacity, etc., but also have knowledge and skills in digital transformation. These are skills in using information technology, skills in exploiting, experting in foreign languages in communication and teaching, effective using of applications for teaching, etc. In particular, they have to know to use profiencially new teaching methods, forms in face-to-face training as well as online training. Besides, in the context of science and technology development, learners can search for knowledge and skills on their own in the Internet. Therefore, if teachers do not regularly improve their professional qualifications, the leading role of teachers will be gradually lost. Obviously, this is also a significant pressure on the teaching staff in the current digital transition period.

- For facilities:

Facilities play an important and indispensable role in the process of training and fostering. In order to meeting the requirements of digital transformation, it requires schools to modernize teaching facilities, especially modern equipment that is integrated with tools for digital transformation, such as: Skype video conferencing, Gotomeeting, Blue jeans; chat application, sharing resources Microsoft Teams; the OneNote application; Stream; reader analytics application Reader Analytics; Wolfram Alpha online service; Power BI tools and Blackboard, WebCT learning management systems... At the same time, they have to use multi-tools, such as computers, projectors, electronic lectures, smart boards, electric textbooks electronics, teaching software…; research and apply AI technology in synthesizing learning information, in assessing learners' capacity and needs...

In addition, digital transformation also affects school management, including digitizing management information, creating interconnected large database systems, deploying online public services, and applying online public services. using 4.0 Technologies (AI, blockchain, data analysis, ..) to manage, operate, forecast, and support decision making quickly and accurately; digital chemistry materials: electronic textbooks, electronic lectures, e-learning lecture warehouses, multiple choice question banks...

4.3. Some solutions to promote digital transformation in training and fostering human resources for cadres and civil servants in Vietnam

Firstly, it should be propagated and raised awareness about the position, role and importance of digital transformation.

This is the most important, inclusive and cross-cutting measure to promote digital transformation in training and fostering human resources for cadres and civil servants. Because, raising awareness about digital transformation is a prerequisite, making an important contribution to promoting the process of digital transformation, developing digital government, digital economy and digital society to keep up with the times. Digital transformation is also a revolution of the whole people, it is only truly successful when each citizen actively participates and enjoys the benefits that digital transformation brings. Therefore, it is necessary to propagate, disseminate knowledge, and raise awareness about the position, role and importance of digital transformation by various forms and measures, such as: setting up and developing websites on social networking platforms to propagate and raise awareness and skills for digital transformation; building, establishing and maintaining regular columns and pages on the mass media; visual propaganda, using billboards, posters, infographics; coordinating with international and national organizations in the region and around the world for implementing propaganda programs, disseminating knowledge, raising awareness about digital transformation...

Secondly, the content of the training and retraining program is suitable for every subject.

For leaders, it must be focus on contents, such as: digital transformation strategy; develop digital government, digital economy and digital society; organizing the apparatus according to the digital service model and the digital operation model; managing and tracking numbers within the organization; and other relevant contents for the management team and key cadres of state agencies and organizations from commune level upwards.

For full-time staff, it must be focused on training and fostering contents, such as: digital technology in the 4.0 technology revolution; digital technology, such as: AI, Blockchain, Bigdata, Cloud computing…; application and deployment of digital technology platforms and applications; digital technology platform management; planning the implementation of digital transformation, managing digital transformation projects and other related contents for technical staff of specialized information technology units and technical staff in agencies and organizations. state office.

For cadres and civil servants: it must be focused on training and retraining in knowledge and skills of digital transformation, exploitation of digital technologies, digital data, digital platforms, digital services, digital information processing, electronic transactions, skills in using information technology and digital transformation…

Thirdly, promoting the role of self-study and self-improvement of cadres and civil servants.

Meeting the requirements of digital transformation, it requires that cadres and civil servants have to change their thinking, from just learning once to work for life to learning for life to be able to work for life. Therefore, each cadre and civil servant should promote the spirit of self-study and self-improvement; studying at home, at work, studying via the internet, study based on books, newspapers, documents, mass media according to the motto "whatever you need to learn"; raising awareness and responsibility for lifelong learning, improving working capacity, capacity for performing tasks and official duties of the contingent of cadres and civil servants. Besides, the State and organizations facilitate and support cadres and civil servants to update their knowledge, skills, methods and working experience in order to improve the quality and efficiency of their work; it must be focused on formulating and concretizing title standards and criteria for evaluating results and efficiency in fulfilling responsibilities and tasks and of cadres and civil servants.

Forthly, strengthening international cooperation in training and fostering cadres and civil servants.

International cooperation creates opportunities for officials and civil servants to participate in study abroad programs for improving their professional qualifications; lecturers will be learned with advanced teaching forms and methods from international universities; creating opportunities for scientific research cooperation, improving the quality of training and fostering in the direction of approaching international standards. Therefore, it is necessary to strengthen international cooperation for exchanging experiences in training, digital technology research, digital economy and digital society; encouraging Vietnamese training institutions to build and implement training cooperation programs, lecturers and students exchanging with training and research institutions, researching digital transformation, digital technology, prestigious digital society and economics in the world…

5. Disscusion and Conclusions

Digital transformation is the comprehensively changing process of the social development model, the way of living and operation in the digital age. Among that, improving the quality of human resources, especially the human resources of cadres and civil servants have playes an decisive roles and positions. Because this is one of the strong driving forces for rapid and sustainable development; one of important factors for promoting the socio-economic development of the country. In order to meet the requirements of the digital transformation, the contigent of cadres and civil servants must be individuals of real capacity, thoughtful ability and quickly adaptation; people of knowledgement and skills in the digital transformation… To do that, the training and fostering activities for the human resources of cadres and civil servants must be conducted regularly, continuously and renewed in term of objectives, program contents and forms, methods….

Through the research, the author has some recommendations for management agencies as follow:

Firstly, the Government needs to quickly complete and approve the project: "Raising awareness, skill traning and development of the human recources for national digital transformations to 2025, orientation to 2030".

Secondly, the government should complete mechanisms, policies for facilitating, encouraging cadres and civil servants in self-studying for their level improvement.

Thirdly, it should be that the government organize training and fostering activities at home and abroad; have an evaluation mechanism for improving the quality and effectiveness of training and fostering.

Forthly, the government should strengthen public service awareness and ethic education for cadres and civil servants working in state administration agencies.

TAX ADMINISTRATION OF E-COMMERCE BUSINESS IN HANOI

Assoc. Prof. Dr. Nguyen Thi Thanh Hieu

hieunt@neu.edu.vn

Faculty of Political Theory, National Economics University, Hanoi, Vietnam

MA. Doan Cao Minh

minhdc@gmail.com

Master's Student of National Economics University, Hanoi, Vietnam

Abstract

Due to the development trend of the digital economy, many business models and activities are carried out on e-commerce platforms. In recent years, the Hanoi Tax Department has had many solutions to tax administration of this business activity, so the tax revenue in 2020 will increase nearly 5 times compared to 2019. On the basis of the development of e-commerce in Hanoi and the results of tax administration in the e-commerce business of the Hanoi Tax Department in recent years, the authors propose recommendations to strengthen the tax administration of this sector in Hanoi in the coming time.

Keywords: *e-commerce, tax administration,* ***the Hanoi Tax Department***

1. Introduction

In Vietnam, the trend of e-commerce business has been developing very strongly since 2010 with the emergence of many new types of e-commerce businesses. The development of e-commerce not only creates great benefits to the economy, but also brings many challenges in researching and promulgating policies to all of e-commerce activities.

There have been a number of studies on tax administration of e-commerce business. Typically, OECD (2001), *Taxation and Electronic Commerce - Implementing the Ottawa Taxation Framework Conditions,* recognizes that the mobility of e-commerce and its geographic sensitivity to tax differentials may exacerbate harmful tax competition. While a large number of web sites facilitating aggressive tax planning were identified, many of these appeared to be associated with a few promoting organisations, often based in tax havens. Most sites were physically located on servers in OECE Member countries, most likely due to bandwidth considerations and the availability of reliable telecommunication facilities. The ongoing development of e-commerce underlines the importance to all countries, both Member and non-member of curbing harmful tax competition.

According to Jing He (2015), *Chinese E-commerce Taxation,* China still lacks system e-commerce tax policty theory, so this blank makes a serious tax loss. Although China neither has a new e-commerce tax, the current tax system is still effective in B-B (business to business) mode and B-C (business to consumer) mode because these two modes mainly calculate and collect taxes in accordance to the existing turnover tax rules. However, everyone seems to ignore the taxation of the most widely used e-commerce C-C (user to user) mode. The comprehensive implementation of e-invoices and the check of electronic account records will help the Chinese tax authorities to monitor all transactions in real time.

While other countries in the world have had a number of studies on tax administration of e-commerce, this topic is still quite new to Vietnam. The author of the thesis "State Administration of E-commerce Business " - Dao Anh Tuan (2017), from the assessment results of state administration of e-commerce in Vietnam in the 2006-2012 period, proposed solutions to improve the state administration in this section: (i) Building a national e-commerce development strategy (ii) Completing e-commerce policies (iii) Completing the law on e-commerce (iv) Strengthening e-commerce training (v) Strengthening e-commerce inspection and examination. It can be seen that studies in Vietnam have mentioned the contents of tax administration or e-commerce, but there are no complete studies on tax administration in the e-commerce sector of the country in general and in Hanoi in particular, especially in the context of online business activities growing strongly.

This article analyzes the current situation of tax administration of the e-commerce sector in Hanoi from 2015 to 2020 in order to find out the causes and propose science-based solutions to strengthen tax administration of e-commerce in Hanoi in the near future.

2. Method

The authors collected secondary data on e-commerce and tax administration of this sector in Hanoi from 2015 to 2020 from reputable organizations such as the Vietnam E-Commerce Association (VECOM), the Hanoi Tax Department, then used the methods of statistical analysis combined with data analysis and processing to assess the current situation of tax administration of e-commerce to analyze the causes and to propose the solutions for strengthening tax administration and avoiding the state budget shortfall.

3. Results

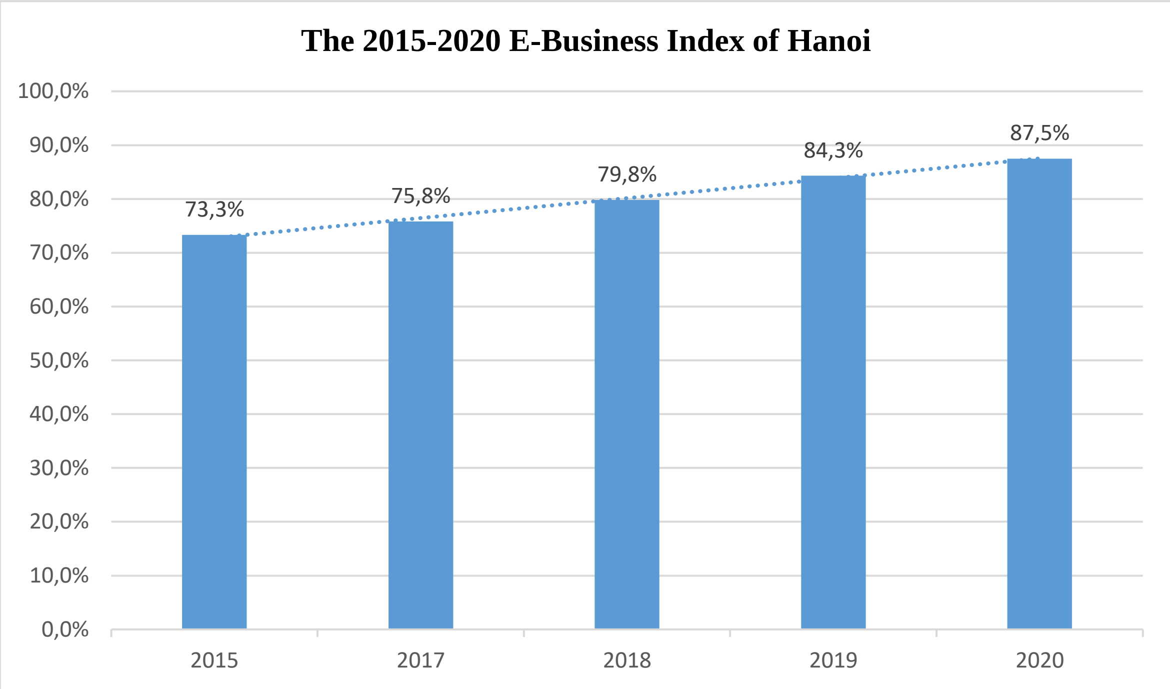
3.1. The growth of e-commerce in Hanoi

According to the report by Google, Temasek and Bain & Company, e-commerce growth in Vietnam was estimated at 46% in 2020. The total transaction value expected for 2020 was 14 billion USD, increasing by 16% over the same period last year. It is expected that the entire digital economy will be likely reach 52 billion USD in value by 2025.

Among 63 provinces and cities, Hanoi is considered one of the most dynamic e-commerce development markets. Over the years, Hanoi has always ranked second or more compared to the whole country in the E-Business Index (EBI).

In 2020, Hanoi ranked second with an aggregate score of 85.7 points, 1.4 points higher than the previous year. It is estimated that Hanoi and Ho Chi Minh City accounts for 70% of the national e-commerce scale. It can be seen that the scale of Vietnam's e-commerce market is still concentrated in these two largest economic centers, which have been ranked first and second in a row during the past years, having great differentials from other localities.

Figure 1: The 2015-2020 E-Business Index of Hanoi



Source: E-Business Index Report for recent years, Vietnam E-Commerce Association (VECOM)

75 percent of the total internet users in Hanoi have already made online purchases, increasing by 7% compared to that of 2019. 90 percent of the modern retailers, distributors; electricity, water, telecommunications service providers; and 25% of petrol stations have accepted cashless payments when buying or selling goods and services; up 5% compared to that of 2019.

3.2. Current situation of tax administration of e-commerce business in Hanoi

3.2.1. The organizational structure of Hanoi Tax Department

The Hanoi Tax Department has 3421 civil servants in total, which is divided into 24 divisions, 30 sub-departments and 312 tax administration teams.

It does not have a dedicated force of tax administration for individuals doing e-commerce business, which are naturally considered a type of household businesses monitored and managed by tax sub-departments (tax administration teams of communes, wards or inter-communes). According to Section 9 of Decision No 245 / QĐ-TCT dated March 25th, 2019 defining the functions and tasks of the teams of the tax sub-department:

Tax administration teams of communes, wards or inter-communes help the Head of the Tax Sub-Department in tax administration and collection from organizations (if any), individuals paying taxes in the assigned communes and wards (*including household businesses of industrial, e-commerical and service sectors; or including households paying personal income tax, non-agricultural land use tax, agricultural land use tax, natural resource tax* ...); and in making tax estimation for those whose they manage.

3.2.2. Information assistance and giving advice to taxpayers

In order to prevent tax revenue loss in e-commerce business, since 2017, the Hanoi Tax Department has actively reviewed individuals doing business activities through social networks. The tax department has sent text messages to subscribers who have sales addresses on social networks with 13,000 messages. As a result, more than 2,000 traders on social networks have registered for tax filing.

Table 2: The activities of information provision and tax advice to taxpayers

Forms of information provision and support	2018	2019	2020
Number of training sessions / number of participants	120 /22,335	194 /83,074	65 /11,335
Number of emails sent to enterprises, taxpayers	36,952	38,278	18,545
Number of seminars with enterprises and taxpayers/ number of participants	23/4,211	35/7,069	35/3,156
Number of direct responses to enterprises and taxpayers	18,373	7,065	49,480
Number of accepted recommendations	173	95	174
Number of radio broadcast sessions	20,472	18,155	32,125
Number of television broadcast sessions	42	98	104
Number of published articles on tax	670	1,199	1,606

Source: The Hanoi Tax Department

In order to make organizations and individuals know and proactively fulfill their tax obligations, the Hanoi Tax Department also holds propaganda in various forms, helping taxpayers to grasp tax laws.

3.2.3. Administration in tax declaration and accounting

Tax registration of organizations doing e-commerce business has been complied with the Circular No. 95/2016/TT-BTC of the Vietnam Ministry of Finance about guidance in tax registration.

Specifically, the Hanoi Tax Department has issued an official letter instructing individuals doing e-commerce business to carry out tax registration procedures. Besides, a set of procedures to guide individuals doing e-commerce business has been posted on the website of the department; and displayed on the bulletin board at the one-stop shop so that the officers who are assigned to receive tax registration dossiers can pay attention, or give support and specific instructions on tax declaration to taxpayers.

In order to increase the tax administration efficiency for e-commerce business, on June 13, 2019, the National Assembly passed the Law No. 38/2019 / QH 14 on Tax Administration. This law officially has taken effect since July 1, 2020, mentioning e-commerce activities and the responsibilities of relevant agencies in implementing tax administration of e-commerce business. Specifically, the article 15 of the law regulates the coordination responsibilities between ministries and branches in tax administration of e-commerce business. Based on legal regulations and practical situations in the e-commerce sector, the Ministry of Finance has instructed tax offices to implement tax policies and tax administration which are suitable for each model and each type of e-commerce activities. The Tax Administration Law in 2019 also stipulates that e-commerce businesses must issue electronic invoices when selling goods and providing services. This is an important legal basis for tax offices to tighten the tax administration of e-commerce businesses.

The Hanoi Tax Department has continued to coordinate with relevant agencies to collect information from organizations and individuals directly involved in, or related to the management, provision and usage of internet services, online information and games...Through collaboration with relevant agencies, the Hanoi Tax Department identified, categorized and collected data of E-commerce businesses and individuals; then had specific administration measures for each group. Basically, there are 3 main groups: individuals doing business, selling goods on social networks; organizations and individuals providing applications and products on Google Play, Apple Store, YouTube ...; organizations providing or selling services (websites, sales applications, e-commerce platforms, house rentals via Agoda, Booking.com, Airbnb,…)

3.2.4. Administration of Tax Payment and Tax Debt

Based on the results of data collection, the Hanoi Tax Department regularly coordinates with credit institutions and network operators to obtain data on business activities. Since then, the Tax Department has mobilized individuals to proactively declare and pay taxes. As of December 2020, the tax department's data system has managed the revenues of individuals operating on Google, Facebook, YouTube ... Up to now, over 300 individuals have paid taxes. Along with that, the Hanoi Tax Department built a database of more than 2,000 rental addresses, over 31,200 stores with e-commerce business activities to perform tax administration. According to the Director of the Tax Sub-Department of Cau

Giay district - Le Quang Hung, an individual declared their income of 330 billion VND and paid more than 23 billion VND in tax; and another individual earning 260 billion VND paid over 18 billion VND in tax; in 2020, at the district, 65 individuals doing online business declared their earnings and paid 55 billion VND in taxes.

Besides, the Hanoi Tax Department is concurrently building data on individuals and organizations doing online sales activities through inspection and examination of businesses and coordination with relevant agencies to identify individuals and organizations doing this type of business. The tax office has initially identified 25 cases with the tax payment of 4 billion VND.

Regarding housing rental activities through e-commerce platforms such as Agoda, Booking.com, Airbnb ..., the Hanoi Tax Department collected information and identified the lessors, then built and analyzed data, guided businesses or individuals to fulfill their obligation of tax registration, declaration and payment. Up to now, the personal tax amount paid to the state budget is nearly 94 billion VND.

Table 3: Results of tax collection and payment of Hanoi Tax Department

Unit: billion

Indicators	2018	2019	2020
Total domestic revenue	219,286	252,179	267,585
Tax debt collection	6,368	9,230	13,227
E-commerce business tax	-	25	123

Source: The Hanoi Tax Department

According to the Hanoi Tax Department, the total tax revenue in 2019 and 2020 for individuals earning from e-commerce business activities (Google, Facebook, Youtube) is 148 billion VND (25 billion VND in 2019, and 123 billion VND in 2020 - up 492% compared to 2019).

3.2.5. Tax inspection and examination

The Hanoi Tax Department said that in some cases where the taxpayers had been notified, guided and supported but did not register, declare and pay taxes deliberately; the tax office would conduct an inspection, examine and penalty for tax evasion and tax fraud according to regulations. For individuals who do not comply with the inspection and examination decisions, the Tax Department will synthesize and transfer their dossiers to investigating agencies for prosecution in accordance with law.

3.3. Difficulties

Tax administration of e-commerce business has initially achieved certain results. According to financial experts, the scale of Vietnam's e-commerce market is forecasted to reach 10 billion USD, however the contribution of this sector to the state budget is limited.

Regarding tax registration:

The majority of individuals doing e-commerce business in Hanoi have not registered their business, making it difficult for state agencies to monitor, manage and identify these subjects. Tax registration of these individuals is a difficult issue to manage. Actually, at the moment, tax offices have only encouraged and propagated these individuals to do tax registration voluntarily; put them under the tax admininistration; and required them to do tax registration.

Regaring tax declaration and payment:

There are several problems in tax declaration and payment:

- It is difficult for organizations and individuals to do tax declaration, especially for those who do online selling and advertising through Google, Facebook, Zalo ... Some common types of tax evasion that such businesses as Google and Facebook often do are avoidance of tax declaration, incorrect value added tax return, avoidance of contractor tax declaration for services of some multinational companies operating in Hanoi.

- Some e-commerce activities have not been included in the list of adjusted business lines or the list of business lines that are difficult to determine their nature, which makes it difficult to determine the applicable tax policy; for example, hight-tech ride-hailing service, "virtual" currency transactions, some activities such as doing business via online games, application rental for online advertising. These types of businesses have large revenue, but do not declare and pay enough taxes.

- The problem of determining revenue and income of e-commerce businesses is still complicated and difficult. Tracking and controlling the amount of goods, services and arising revenue of e-commerce activities is still difficult, mainly based on sales invoices and payment transactions via banks. Besides, it is difficult to require organizations and individuals doing online sales activities through social networks to declare and pay tax because it is difficult to manage goods transactions.

- Cash is still being used in the main payment process. If payments are made via banks, the bank accounts have not been registered with the tax offices, making it difficult to manage tax declarations and determine revenue of e-commerce businesses.

- Administration of tax collection is still difficult for cross-border e-commerce transactions, for example, in the case of online hotel or travel booking services, customers using these services often pay directly to an overseas enterprise, then this enterprise transfers money to hotels and accommodations ... so it is difficult to determine transactions, as well as revenue of these foreign enterprises to calculate and deduct tax.

Management of tax payer information:

One of specific characteristics of e-commerce is its large-scale of operation in the borderless internet environment whose transaction data can be changed, hiden or deleted easily. Thus, the management of taxpayer information for online sales is still a difficult issue. In fact, there have been millions of individuals and business households selling and exchanging goods on Facebook and other social networks, but the information of these organizations and individuals is not clear. Besides, their transactions are still in cash. They only use websites or social networks as a place to advertise…

Regarding tax inspection and examination: the inspection and examination methods of e-commerce activities are very different from the traditional methods, requiring tax officers having advanced knowledge of information technology and foreign languages besides the professional qualifications to trace transactions or extract historical data from these transactions as an evidence to fight against tax law violaitons…

3.4. Causes affecting the efficiency of tax policy implementation and tax administration in e-commerce sector

Objective reasons:

Firstly, cash is still the main means of payment in e-commerce business.

Secondly, because consumers rarely take the invoices when buying goods, stores and business households often do not issue invoices when selling goods to consumers via the Internet

Thirdly, the awareness of law observance of individuals selling goods on social media is still limited. The percentage of those who register and declare tax is still low.

Subjectives reasons:

Firstly, the legal basis for tax collection management of new business forms in the e-commerce sector has not been synchronized and completed, lacking a general legal framework on virtual currency, electronic money and virtual properties.

Secondly, it is difficult to apply penalties against foreign enterprises operating social networking sites in Hanoi such as Facebook, Google+ or Instagram if these businesses do not actually register on the electronic trading floor in Hanoi or provide information about organizations and individuals selling goods on their sites at the request of competent state administrative agencies because their headquarters are based in foreign countries.

Thirdly, the tax office's database is incomplete. The reality of using information technology applications for tax administration in e-commerce activities shows that related applications such as TPH, KTDL, TPR, BCTC, Khaithueonline are independent applications which have not been connected closely to each other and met the requirements of tax administration in this sector.

Fourthly, there has not been a tax administration agency specializing in the e-commerce sector. Tax officials and civil servants have not been equipped with specialized skills and qualifications of tax administration in this sector.

Fifthly, the coordination with ministries and functional branches has not caught up with the management requirements of the tax offices in the e-commerce sector.

4. Discussion and Conclusion

4.1. Some solutions to strengthen tax administration of e-commerce business in Hanoi

Firstly, it is necessary to promote tax propaganda and assistance for taxpayers in the e-commerce business.

Taxpayers should be enabled to easily access the information on tax regulations and tax administrative procedures. The list of tax administrative procedures should be displayed publicly and transparently at the "one-stop shop"of the Hanoi Tax Department to shorten the time of solving tax administrative procedures for taxpayers.

Tax offices need to regularly carry out activities to support taxpayers such as deploying the "Companion Months" to support taxpayers; implementing new tax policies and answering questions of taxpayers in the years of tax finalization.

Moreover, tax offices should strengthen coordination with relevant agencies to implement propaganda and support for taxpayers well; organize training courses for enterprises, especially newly established enterprises; cooperate with industry associations or agencies to organize training sessions according to the needs and specific topics.

It is also important to coordinate with associations and centers in organizing seminars, dialogues with taxpayers and relaying information on tax policies, timely detecting problems and recommendations of taxpayers in each area and each sector to find the most efficient solutions to implement tax policies and administrative procedures in Hanoi.

Secondly, enhancing the management of tax payment and tax debt should be emphasized.

To manage taxes of e-commerce activities, the Hanoi Tax Department needs to classify groups to deploy appropriate and efficient solutions fo the group of organizations and individuals providing applications and products on platforms such as Google Play, Apple Store, Youtube, etc. On the basis of this list, the Tax Department categorizes and invites individuals with large revenue to come to the tax office to propagate tax policies, provide tax codes, guide them through tax obligations and answer their questions about tax.

Regarding sales activities on websites and social networking sites:

- It is necessary to increase the dissemination of tax policies, provide guidance on how to calculate, declare and pay taxes for each group of taxpayers on newspapers, mass media, and information technology forums so that taxpayers who sell goods on the internet (on social networks such as Facebook, Instagram, Zalo; of on e-commerce trading floors such as Sendo, Lazada...; online auction floors like Hotdeal) can voluntarily fulfill their obligations of tax declaration. Tax officies need to collect information, determine the identity of the lessors; then build, analyze data, and guide business individuals to fulfill their obligations to register, declare and pay taxes. Besides, the tax officies should publicize individuals who do not strictly comply with their tax declaration and payment obligations on the mass media; and warn taxpayers who commit tax evasion about penalties in accordance with the law.

- The tax department should continue to closely coordinate with relevant agencies and departments (Department of Industry and Trade; Department of Planning and Investment; Department of Public Security; Department of Information and Communication; Department of Culture, Sports and Tourism) and central agencies to strengthen the management, inspection and examination of organizations and individuals conducting e-commerce business in the locality.

- The tax department should cooperate with inspectors from the State Bank of Vietnam in providing account statements of organizations and individuals doing e-commerce activities and opening accounts at commercial banks in Vietnam or non-bank organizations licensed by the State Bank to provide intermediary payment services.

- The tax department should also requires enterprises providing freight services to organizations and individuals doing e-commerce business (delivery companies; postal and telecommunications companies...) to provide information on the quantity goods transported, the amount of payment or collection on behalf of their customers (if any).

4.2. Regarding e-commerce activities on online trading floors or applications through which goods trading activities are carried out. Using online platforms to manage and collect taxes on e-commerce would be feasible and cost-effective. Accordingly, online trading floors and applications will collect and store information of goods providers. Owners of e-commerce trading floors are responsible for notifying tax obligations to goods providers or income earners; and making tax deductions before paying income or revenue to the goods providers or income earners. It is also applied to foreign goods providers operating on Vietnamese online platforms, in which tax deductions are made in accordance with regulations on foreign contractor tax.

- Fixed transaction addresses and online activities of individual businesses are just to advertise to attract more customers. The individuals under the tax administration should update information about their online transactions to adjust the increased business revenue if appropriate. In case an individual business does not have a fixed location to transact with customers, but only has an online address and personal account number, and sells goods with door-to-door delivery; the tax office should coordinate with the network operators to determine the identity, bank account number, and delivery method of this individual to request them to declare personal income tax everytime it is incurred according to regulations.

- Regarding foreign organizations and individuals (foreign contractors) doing e-commerce activities with income generated in Hanoi: If the buyer of goods or service provider is an enterprise or cooperative established under the Vietnamese law, the purchaser is obliged to declare and deduct contractor tax to pay tax according to regulations. If the buyer or service provider is another organization or individual, the foreign contractor must declare and pay contractor tax on the provided goods and services. If the foreign contractor does not have a permanent establishment in Vietnam, it can declare and pay tax through tax agents. This principle is specified in the Article 42 of the Law on Tax Administration 2019.

Tax offices need to closely coordinate with relevant ministries and branches in tax administration of e-commerce activities, especially the Ministry of Planning and Investment, the Ministry of Industry and Trade, the State Bank, and the Ministry of Information and Communication in the mechanism to coordinate information of e-commerce businesses, payment and other information in order to implement tax management.

In addition, the mechanisms, policies, and management for various types and forms of e-commerce business on many borderless and rapidly developing platforms must be oriented, predictable, and comprehensive; and catch up with the development of e-commerce activities…

Thirdly, it is necessary to strengthen tax inspection and examination; and penalties for tax evasion.

In case the taxpayers receive notifications, guides and support of tax obligations; but still deliberately fail to register, declare and pay tax; the tax offices will have inspection, examination and penalties for tax evasion, tax fraud according to regulations. If these individuals still do not comply with the decision on inspection and examination, the tax department will summarize and transfer the dossier to the investigation agency for prosecution in accordance with the law.

In case the taxpayers avoid declaring or declare incorrectly their transaction value, received income from e-commerce transactions, the tax offices need to collect data, create a data warehouse and analyze the common tax evasions in e-commerce businesses for easy identification. In a rapidly changing market like e-commerce with increasingly sophisticated mechanisms of tax avoidance, it is necessary to build a system to analyze, monitor and collect information about development trend of e-commerce as well as revenue from this activity from related agencies.

Fourthly, it is important to strengthen training and coaching activities for skills in searching, exploiting and gathering information on the internet to identify tax non-compliance and tax evasion cases; organize training courses on the forms of e-commerce business, skills of business data inspection, analysis and recovery.

Besides, the tax offices should organize training courses for civil servants in charge of tax administration of e-commerce activities in order to equip them with knowledge of e-commerce, foreign languages, information technology and skills of inspection and examination on computers. To accomplish this goal, in the Tax Administration Program for E-commerce 2025, the tax offices should cooperate with the Ministry of Industry and Trade and the Ministry of Information and Communications to organize training courses to improve management capacity for officials working in the e-commerce sector.

In order to equip tax officials with important knowledge and to improve their skills of tax management for e-commerce activities, the General Department of Taxation needs to organize domestic and foreign training courses and seminars about e-commerce and skills of searching and tracking data...

Fifthly, the tax department should enhance the application of information technology in tax administration for e-commerce activities; build a database of taxpayers and tax declarations.

It is necessary to continue to promote the application of e-invoices in the activities of providing or selling goods and services; build a database of tax offices integrated with the databases of relevant ministries and functional sectors, especially those of the banking system and telecommunications providers, etc., as well as intergrate information from online trading floors, e-commerce websites, social networking sites to ensure sufficient information for tax management.

DEVELOPING THE DIGITAL ECONOMY IN VIETNAM IN THE CONTEXT OF INDUSTRY 4.0

Dr. Do Anh Duc

ducda@neu.edu.vn

School of Trade and International Economics, National Economics University, Hanoi, Vietnam

Abstract

Digital economy is identified as one of the indispensable pillars and plays an important role in economic growth, creating a breakthrough growth for each country. In the context of Industry 4.0, which is strongly developing, the digital economy plays an increasingly important role in the economic structure of each country. Digital economic activities have developed strongly in recent years and are concerned and prioritized for development by the Government in Vietnam. This article has clarified the implications of the digital economy and the development of the digital economy in the world; evaluating the situation and trends of digital economy development in Vietnam and recommend solutions to promote digital economic development in Vietnam in the context of Industry 4.0.

Keywords: *Digital Economy, Industry 4.0, Vietnam*

1. Introduction

The digital economy is a recently-emerging phenomenon of increasing importance given estimates of double-digit annual growth around the world (WEF 2015). It is identified as one of the indispensable pillars and plays an important role in economic growth, creating a breakthrough for each country in the context of Industry 4.0. Currently, the digital economy is growing 15-25% per year in emerging markets; half of the world's population is connected online, one third is on social network, 53% is on mobile phones and is covered by all ages, races, geographies and backgrounds across the planet shows the strongly growing trend of digitizing the economy and social activities.

Industry 4.0 is having a strong impact on Vietnam, creating new opportunities for Vietnam to integrate more deeply and effectively into the world economy, move directly into the new industrial field, and take advantage of scientific advanced technology to speed up the process of industrialization and modernization of the country and narrow the development gap. In the context of Industry 4.0, which is strongly developing, the digital economy plays an increasingly important role in the economic structure of each country. Digital economy development will cause change in economic processes, systems and sectors, re-shaping existing consumer behavior, business interactions and business models (Dahlman et al. 2016). Vietnam is also not out of that trend, digital economic activities have developed strongly in recent years and are concerned and prioritized for development by the Government. According to research reports by Google and Temasek, Vietnam's digital economy reached a scale of about $ 3 billion in 2015, up to $ 9 billion in 2018 and forecast to reach $ 30 billion by 2025. Another research of Data61 Organization (Australia), Vietnam's GDP could increase by about 162 billion USD in 20 years if Vietnam successfully converts digital. On September 27, 2019, the Politburo issued Resolution No. 52-NQ/TW on a number of guidelines and policies to actively participate in the Fourth Industrial Revolution setting goals by 2025, digital economy is accounts for 20% of GDP.

This article has clarified the implications of the digital economy and the development of the digital economy in developed countries. Evaluate the current situation and trends of digital economy development in Vietnam and recommend solutions to promote digital economic development in Vietnam in the context of Industry 4.0.

2. Method

This study employs qualitative research methods that use secondary data sources. By synthesizing, analyzing, comparing, evaluating to related data and previous research outcomes, the study has clarified the implications of the digital economy and recommend solutions to promote digital economic development in Vietnam in the context of Industry 4.0 according to the goals of the article.

3. Results

3.1. Overview of digital economy.

The concept of "digital economy" has been mentioned for a long time before the Industrial Revolution 4.0. Early definitions (Tapscott 1996, Lane 1999, Mesenbourg 2001) focus specifically on the Internet while later definitions add new technologies such as mobile and sensor networks (DBCDE 2009), cloud computing and big data (G20 DETF 2016). Or they opt for the more generic notion of “digital technologies” as per the simple definitions. However, with the emergence of Industry Revolution 4.0, the digital trend or digital transformation really appears strongly in all fields, because the "core" of Industry Revolution 4.0 is digital transformation, with the integration of digitization, connection/hyperlink and intelligent data processing. According to Dahlman et al. (2016), digital technologies are spreading throughout the world at a faster pace than previous waves of technological innovation, and are re-shaping business models and sectors. Digital technology is applied in all fields and economics, from industry, agriculture to services; from production to distribution and circulation of goods to supporting infrastructure such as transportation, logistics, finance, banking, ... The digital economy is gradually becoming the economy itself. The function of digital economy also gradually coincides with the contents of the economic concept. Big data, connectivity and artificial intelligence are the buzzwords that stand for the next round of the digital revolution and underpin the concept of the digital economy.

Currently, there are many different views on the digital economy and it is not easy to define the digital economy. It is sometimes called the Internet economy, the new economy or Web economy. Cameron et al. (2019) defined a digital economy as an economy that contains all companies, services whose business is mainly related to buying, selling and supplying products, digital services or supporting infrastructure and equipment. Digital Economy Collaborative Group of Oxford said that the digital economy is "an economy operated mainly on digital technology, especially electronic transactions conducted through the internet". The digital economy is also sometimes referred to as the internet economy, the new economy or the network economy. Bukht and Heeks (2018) summarize 21 typical definitions of digital economy, saying that the first definition of digital economy appeared since 1999 and that there are more and more new definitions. The rapid development and widespread application of the Internet of Things to business has led to the high-speed formation and development of related economic activities, leading to the diversity and richness of digital economy definitions. The definitions of digital economy also include Information and Communication technology economy with the same target of consumption or ICT application; The penetration of information and communication technologies into the innovative economy will lead to the digitization of society 9 (Abdurakhmanova et al., 2020). It is the category that difference between the definitions.

Therefore, it can be understood that the digital economy is an economy operating mainly based on digital technology, especially electronic transactions conducted through the Internet. The current transformation caused by a massive onset of digitalization includes practically all areas of the economy and social life (Basl, 2017) such as industry, agriculture, services; manufacturing, distribution, goods circulation, transportation, logistics, finance and banking ...) that digital technology applied. Digitization of all sectors of the economy will not be easy, but without digitization it will not be possible to integrate into the world economy (Bulturbayevich and Jurayevich, 2020). In essence, these are the organizational models and operating modes of the economy based on the application of digital technology. In general, digital economy includes emerging phenomena, such as block chain technology, digital platforms, social media, e-businesses, software development-related businesses, etc., digital and media content development and application, related services and training, together with enterprises involved in the manufacture and development of information and communication technology equipment.

Characteristic of the digital economy is that it can be gathered in three main interlocking processes, including: material processing; energy processing; information processing. In which, information processing plays the most important role, information in all its forms becomes digital, which reduced to bits stored in computers and racing at the speed of light across networks ... The new world of possibilities thereby created is as significant as the invention of language itself, the old paradigm on which all the physically based interactions occurred (Tapscott, 1995). The interconnection between subjects and the economic cycle base on the achievements in information technology and the Internet helps to connect resources, eliminate many intermediaries and increase opportunities to access global value chains. The digital economy is causing rapid growth and the size of the economies is also increasing, in addition, it also changes the mode of production (infrastructure, resources, operation) and the structure of the economy. From that led to new waves: digital resources, digital wealth began to be concerned; Information power is leading the trend and the strength of each country today is measured by the development of technology, human intelligence and information.

In addition, the achievements that the digital economy has brought have contributed to stable economic growth, more efficient solutions proposed by technology to help solve problems of environmental pollution, optimized resource usage. Since the digital economy, social problems have decreased, creating opportunities for more individuals, fuelling inequality by preventing individuals, groups, regions, etc from participating in the digital economy (OECD 2015), organizations and businesses due to low cost of participation and easy access, thereby contributing to reducing the inequality gap of rich and poor, solving social problems.

3.2. Digital economy development in the world

According to Forbes (2016), the value of the world digital economic sector accounts for about 3.8% of the value of the global economy with 3,000 billion USD. In which, McKinsey data estimates that the Internet contributed more than 20% of GDP growth in developed economies during the five years to 2011 (Manyika and Roxburgh, 2011). Digitization has triggered massive structural changes across the economy and society. For ASEAN countries, this value is up to 150 billion USD, equivalent to 6% of the gross domestic product (GDP) of the member countries. The digital economy is estimated to make up around 5% of global GDP and 3% of global employment (Bukht and Heeks, 2017).

The current digital economy is developing rapidly and is reflected in the changing leadership positions of companies globally. Table 1 shows that 8 of the 10 largest companies by market cap in the world are technology companies or are directly related to technology with new digital-based business models. In recent years, industries with the number of billionaires appearing have been associated with high technology.

Table 1. List of 10 companies with the largest market capitalization in the world by the end of September 2020

Rank	Company	Year of establishment	Market capitalization (Billion USD)
1	Apple	1976	1.900
2	Saudi Aramco	1933	1.833
3	Microsoft	1975	1.500
4	Amazon	1994	1.500
5	Alphabet	2015	969
6	Alibaba	1999	729
7	Facebook	2004	711
8	Tencent Holdings	1998	637
9	Berkshire Hathaway	1839	499

10	Visa	1958	429

(Source: Yahoo Finance)

Recognizing this trend, developed countries in the world have set up a digital platform development strategy, in which applying technology to production activities in the economy is of top priority. Many of the most developed countries in the world such as the US, the origin of the boom of information technology with many famous companies, example of information search and sharing (e.g. Google, Facebook, Twitter, Pinterest), personal services (e.g. Uber, Airbnb), entertainment online (e.g. Netflix, YouTube, iTunes), and shopping (e.g. Amazon, eBay, Alibaba such as Google, Amazon, Facebook, Apple, (Manyika et al, 2016) ... are aware of the importance of the digital economy. Russia has developed a program of "Digital economy", providing for measures to create legal, technical, organizational and financial conditions for the development of the digital economy in Russia (Lowry, 2020). European countries also have plans to "Single Digital Market", Australia has "Digital Australia", ... Countries with the following developed economies such as Korea, China also take benefit of the advantages that go behind, learning experience from previous countries, concentrating resources for digital economic development. Korea has a Manufacturing Industry Innovation 3.0 strategy that helps small and medium-sized businesses build smart, optimal manufacturing processes. China in the 10 key areas of the "Made in China 2025" initiative has prioritized two main areas: information technology development, digital tools and robotics.

The digital economy development strategies are expected to increase the GDP of ASEAN countries by about 1.000 billion USD over the next 10 years. This issue has received the attention of many countries in the region. Specifically, Thailand has established the Ministry of Social and Digital Economy and Malaysia has set a target for the value of the digital economy to account for 17% of the country's economy, Singapore uses the slogan "Smart Nation" that taking technology as the core, ...

3.3. Digital economy in Vietnam

In recent years, Vietnam's digital economy has developed rapidly and strongly in both business market and infrastructure. With a population of nearly 100 million people, Vietnam is considered as a country with a fairly good digital economic growth rate in the ASEAN region. Vietnam has recorded the emergence of digitalization in many fields, economic sectors, from commerce, payment to transportation, education, health ... Up to now, Vietnam has about 64 million internet users, Vietnamese people on average spend 3 hours and 12 minutes per day using the internet on mobile devices such as smartphones and according to the regional average, the usage focuses on social networking and streaming communications applications (52%), video apps (20%) and games (11%), with other business apps.

Table 2. Economic development target of Vietnam by 2030

Year	GDP account for	Digital economy forms of each sector	Annual productivity	ICT Development Index (IDI)	Global Competitiveness Index (GCI)	Global Innovation Index (GII)
To year 2025	20%	10%	7%	Ranked in the top 50	Ranked in the top 50	Ranked in the top 35
To year 2030	30%	20%	8%	Ranked in the top 30	Ranked in the top 30	Ranked in the top 30

(Source: Decision 749/QD-TTg by 3/6/2020)

In September 2019, Resolution No. 52-NQ/TW expected the target of Vietnam's digital economy to be 20% of GDP, issued by the Politburo. On June 3, 2020, the Prime Minister issued Decision No. 749/QD-TTg approving the "National Digital Transformation Program to 2025, with an orientation toward 2030" with the goal that Vietnam belongs to group of 50 leading country in e-government, related to digital economic development, enhancing the competitiveness of the economy, the target by 2025 is digital economy accounting for 20% of GDP; the digital economy forms in each sector reaches at least 10%; by 2030, the digital economy will account for 30% of GDP; the digital economy forms in each sector reaches at least 20% (Table 2).

Vietnam has identified the goal of the digital economy to create digital-based business models based on all economic activities and digital economic development using digital technologies and data. Digital technologies create the right technical conditions for a series of new business models that can fundamentally alter the structure and competitive situation of existing markets and put old business models under pressure (Hungerland et al., 2015). Along with the development of the digital economy, organizations will shift to an eco-business model instead of the traditional business model, which means there is a link between production and application, from there contribute to improving productivity as well as labor efficiency. Enterprises in the digital economy will renew their production processes and use ecosystem models instead of traditional business models, linking production, commerce to consumption, and application of regulations process and use digital technology, thereby, increasing labor productivity and efficiency.

In recent years, Vietnam has always been looking for new momentum for growth and has proactively seized opportunities from digital in general and e-commerce in particular for economic growth. The policy system on digital economic development has been completed in the direction of creating favorable conditions for organizations and enterprises. The government and the state economic sector are the driving force behind digital economic development. During the transition to the digital economy, labor relations will change such as cooperation relationships, employer-employee relationship. In addition, employees will have improved skills, contributing to change and build Vietnam's digital economy. In many, especially rural areas of developing countries, 4G and even 3G are still inaccessible (Okeleke and Stryjak, 2015). Thereby, Vietnam's digital economy is still on the rise and contributes a large part to economic growth and structural change, helping to promote the development of science, technology and technology. In addition, Vietnam is also one of the first countries to deploy 5G early in the world. 5G network is the driving force for digital economic development in 2020, Vietnam has become the fifth country to master 5G technology, produce 5G phones and infrastructure equipment, which helps Vietnam catch up with the trend and keeping up with leading countries such as the United States, Korea, ...

4. Discussion and Conclusion

In the context of Industry 4.0, the digital economy is strongly developing and contributing to the economic development of many countries around the world such as the US, South Korea, China, ... Digital economy is considered to be an important goal for Vietnam in many coming years, contributing to the strong development of society, opening up opportunities to catch up for developing countries, including Vietnam. Alongside these opportunities, though, are various challenges, for example due to low levels of digital skill and technology penetration both within and between countries (Dahlman et al., 2016), lack of resources, capabilities, institutions, relations (Murphy and Carmody, 2015); specific volatility of developing country digital enterprises (Foster and Heeks, 2010). Therefore, to develop the digital economy, Vietnam needs to focus on the following solutions:

romote propaganda to raise awareness of the whole society about digital economy and development of Vietnam's digital economy: The fastest way to accelerate the digital economy is to use digital technology to change the way we produce and work. Using digital technology to solve Vietnamese problems, and from the cradle of Vietnam, these technology businesses will go global. Technology is born to solve problems, where there is a problem, there is technology, there is a solution. Problems are everywhere, it may in our daily work, and each of us can start a technology start-up to solve our problems. Therefore, the State needs to promote propaganda to raise awareness of the whole society about the digital economy. The press and media agencies need to guide the public opinion, help businesses, people and the whole society to have a correct awareness of the digital economy, thereby best preparing for the adaptation of this development trend. It is necessary to make society realize that Government, businesses and people all have separate responsibilities and roles in the digital economy. Enterprises need to actively prepare to seize opportunities and ensure international competitiveness in the global digital economy, must be ready for a digital future with new forms of business, must investing in technology infrastructure, human resources and ensuring network safety and security. Individuals also play an important role in the digital economy. Each individual needs to equip and improve their skills to use digital technology for future jobs, and must protect themselves against the dangers of being threatened or stealing personal information online.

Policies are often outdated that lead to unable to accommodate the emerging trends of new technologies and services offered through the digital economy (Van Welsum, 2016; Bukht and Heeks, 2018). Therefore, building and completing the institution to create a complete and comprehensive legal basis for the implementation and development of e-

Government,: The State needs to soon promulgate Decrees on data sharing; on personal data protection; about electronic authentication; on personal data protection and privacy protection; on reporting regime among state administrative agencies. In the coming time, it is necessary to study and propose the development of an e-Government Law and guiding documents to ensure the legal corridor for e-Government development based on open data and the application of new technologies towards the digital economy, digital society.

Completion of digital national databases: The State needs to focus on perfecting the construction of national fundamental databases, especially the digital national database on population, land ... And to ensure effective use of these national databases, it is necessary to build a platform for integrating and sharing data between central and local information systems; the interconnection system sends and receives electronic documents; electronic identity authentication system; linkage between the government's specialized digital signature authentication systems and public digital signatures; National payment gateway ... to ensure uninterrupted data and information among governments at all levels. To serve the management and administration of the Government, in the coming time, paperless Government Information Systems; Electronic system of policy consultation; The national reporting information system towards the construction of the Steering and Operation Center of the Government and the Prime Minister is being focused on research and establishment.

Investing in upgrading digital infrastructure, IT resources as well as modern digital technology solutions. According to Quinones et al., 2015 and Damarillo, 2011, infrastructural weaknesses are identified as a major barrier to digital entrepreneurship in the global South: The State needs to invest in upgrading the digital infrastructure system as well as modern digital technology solutions to deploy smart connection digital applications. Especially non-cash payment applications, effective e-government... The government needs to take the lead in applying information technology to management activities, formulating and publicizing the sectorial master plan on information technology development and application. On that basis, will issue standards for information exchange between agencies and units to create linkages and synchronization in the process. Along with building and developing modern telecommunications infrastructure, becoming a the foundation of the digital economy, it is necessary to focus on ensuring network safety and security, creating conditions for people and businesses to easily and equally access opportunities to develop digital content. Ensuring safety and network security will help Vietnam gain the trust of foreign partners, a safe environment for business investment, and also an opportunity for us to develop products serves network security.

Forming a team of senior digital economic experts: In the context of low economic level, Vietnam lacks senior digital economic experts who have sufficient knowledge and skills in many fields (science, technology, economy, management, society, etc.), to shape the development of the digital economy at national level. The government should form senior experts in relevant fields (science, technology, economy, management, society, etc.) to participate in the development of a digital economy plan. A plan that is tested in practice will create a premise for building a long-term national digital economy strategy.

AGRICULTURAL DIGITAL TRANSFORMATION AND DIGITAL VILLAGE MODEL IN THE CONTEXT OF INDUSTRIAL REVOLUTION 4.0

MA. Do Thi Phuong Hoa

phuonghoa@tmu.edu.vn

Thuongmai University, Hanoi, Vietnam

Abstract

The industrial revolution 4.0 is opening a new era in the development of mankind - the digital age. With scientific and technological achievements having an increasingly strong impact on all aspects of society, digital government, along with the digital economy and digital society, are becoming an inevitable development trend of countries in the world. Digital transformation is an inevitable trend, one of the top concerns of countries in the context of the 4.0 industrial revolution. Digital transformation takes place in many areas including agriculture and rural digital transformation. The desired results of digital agriculture are systems of higher productivity, which are safe, anticipatory and adapted to the consequences of climate change, to offer greater food security, profitability and sustainability. In the context of industrial revolution 4.0, in the world, many digital village models have appeared, typically in the EU, India, Korea, China... These models have provided valuable experiences for agriculture and rural digital transformation in Viet Nam.

Keywords: *digital transformation, agricultural digital transformation, the industrial revolution 4.0.*

1. Introduction

Digital transformation is an inevitable trend in the context of the industrial revolution 4.0. This trend brings many benefits to the socio-economic development of each country, including agriculture and rural areas. Digital transformation in agriculture helps farmers and businesses improve productivity, improve profits, optimize production and deliver value – greater expansion opportunities. Internet of Things (IoT) and artificial intelligence (AI) are simplifying and streamlining the overall collection, inspection, and distribution of agricultural resources with sensors and Big data data governance systems. The application of robots in agriculture can improve efficiency and lead to higher and faster yields. Unmanned aerial vehicles (UAVs) used to spray pesticides and pesticides can significantly reduce the use of agrochemicals. The most innovative part of digital transformation is the ability to use artificial intelligence (AI) in data mining and analysis to forecast trends as well as warn unusual situations, helping manufacturers to make informed decisions. decided even before the start of the season.

Currently, agricultural production in Vietnam is facing many challenges: *firstly*, due to the increasing population, the demand for food and food is constantly increasing; *secondly*, the area of agricultural land is increasingly narrowing due to the process of urbanization; *thirdly*, climate change is complicated, seriously affecting agricultural production; *fourthly*, the process of international integration requires increasing quality of agricultural products; *fifthly*, due to the impact of the Covid-19 pandemic, exporting agricultural products faced many difficulties.Therefore, digital transformation of agriculture and rural areas is the key to narrowing the gap between rural and urban areas, improving productivity, quality and brand of agricultural products, thereby improving the income and living standards of farmers.

1.1. Objective of the Study

The objective of this study is to clarify the general theory of digital transformation in the context of the industrial revolution 4.0. On that basis, the author analyzes the necessity and benefits of agricultural digital transformation; the basic conditions and important drivers of agricultural digital transformation. The article also introduces some typical digital village models in the EU, India, Korea and China. Successful digital village models in the world have provided valuable experiences for the digital transformation of agriculture and rural areas in Vietnam. The author also focuses on clarifying the current situation and proposing basic solutions to promote the digital transformation of agriculture and rural digital transformation in Viet Nam in the context of the industrial revolution 4.0.

1.2. General theory of digital transformation and agricultural digital transformation

The industrial revolution 4.0 will take place in three main areas: digital, biotechnology and physics. In particular, the core elements of digital in this revolution are: Artificial Inteligence (AI), Internet of Things (IoT), Big Data, Fast Data, Cloud Computing (Klaus Schwab,2018).

The industrial revolution 4.0 is opening a new era in the development of mankind - *the digital age*. With scientific and technological achievements having an increasingly strong impact on all aspects of society, *digital government*, along with the *digital economy* and *digital society*, are becoming an inevitable development trend of countries in the world.

According to the Report "Digital Infrastructure Policies and Regulations in the Asia-Pacific Region" (9/2019) of the international telecommunications union (ITU), ***the digital economy and digital society have the following basic characteristics*** (ITU, 9/2019)***:***

- *Digitisation*: essentially, when information is digitised it becomes readable and processable by electronic computers and this means data management and processing tasks that were previously undertaken manually can now be automated. The first types of information to be digitised were numerical but now all forms of information can be converted to digital formats and managed digitally including high resolution audiovisual content.

- *Connectivity*: When computers are connected by increasingly fast and reliable networks, digitised data can be shared across multiple systems leading to further efficiency gains this means. Connectivity occurs at many levels: person-to-person, person to machine, and machine to machine. One of the results of the smart phone revolution has been the 'personalisation' of computing nodes at the edge of the network. Smart phone is an intensely personal device and this means that the user experience can be personalised and optimised and that an enormous amount of data reference to individuals can be collected at low cost.

- *Accessibility*: accessibility arises from a combination of digitisation in connectivity. Access to digitised information over networks vastly decreases the cost of access and leads to further automation and new business models.

- *Automation*: automation is a core goal of the digital economy and, in addition to the examples described above, industry observers are now expecting a revolutionary era of automation in which increasingly sophisticated processes will be undertaken through extensive networks of cloud computing resources that are process using AI and machine learning techniques.

- *Efficiency*: Higher efficiency or productivity is ultimately directed to transforming scarce resources or inputs into products and services that consumers value. While greater efficiency clearly serves economic goals, it can also be a powerful contributor to the achievement of environmental sustainability.

So what is digital Transformation?

According to Gartner - the world's leading information technology research and consulting company, the definition of digital transformation is as follows: Digital transformation is the use of digital technologies to change business models, create new opportunities, revenue and value.

Microsoft believes that: Digital transformation is about rethinking how organizations bring together people, data, and processes to create new value.

From FPT's point of view, digital transformation in organizations and businesses is the process of changing from a traditional model to a digital enterprise by applying new technologies such as big data (Big Data), Internet of Things (IoT), cloud computing… changing operating methods, leadership, working processes, and company culture. Digital transformation brings many benefits such as cutting operating costs, reaching more customers in a longer time, leading to faster and more accurate decision making thanks to timely and transparent reporting system. Thereby, the operational efficiency and competitiveness of organizations and enterprises are improved[3].

The difference between digital transformation and digitization:

Digitization		***Digital transformation***
Data digitization	***Process digitization***	
Convert information from analog or physical form to digital form For example: Hard copies of documents are converted into soft files on the computer; Notes on paper imported into Excel spreadsheets or paper reports converted into PDF files file	Leverage digital data to simplify individual, organizational and corporate workflows. For example: Using CRM software, HRM… to optimize workflow; Use software to collect and analyze real-time data.	- The full integration of digital technologies into all areas of an enterprise, applying technologies to change the way of operation, business model and bring new values to customers. enterprise goods. - Digital transformation based on new technology applications (Big Data), Internet of Things (IoT), cloud computing (Cloud)…. To change the operating method, leadership, implementation process, and culture of the enterprise.
Manual process (Step 1)	Semi-automatic process (Step 2)	Automated process (Step 3)

The digital transformation process must inevitably produce:

(1) Big data: complete data about digital versions of entities.

(2) Means of collecting, storing and connecting big data: IoT, Cloud, Big data

(3) Big data processing engine: AI

(4) Appropriate policies for digital technology

(5) Human resources master digital technology

In the process of digital transformation, the construction and development of digital infrastructure is considered an extremely urgent requirement today and connection infrastructure is one of the core components of digital infrastructure.

According to the Report "Digital Infrastructure Policies and Regulations in the Asia-Pacific Region" of the international telecommunications union (ITU), *Digital infrastructure* is the key to enabling the benefits of the digital economy and society. Digital infrastructure is the physical hardware and associated software that enables end-to-end information and communications system to operate (ITU, 9/2019).

[3] https://ocd.vn/chuyen-doi-so-la-gi-ban-chat/

Digital infrastructure includes:

- Internet backbone including national and trans-oceanic fibre cables;

- Fixed broadband infrastructure such as analogue coaxial and optic fibre cable networks;

- Mobile communications infrastructure and networks including FWA, transmission towers, radio and optic fiber backhaul networks;

- Broadband communications satellites;

- Data and cloud computing facilities;

- End user equipment such as mobile handsets, PCs, modems and local Wi-Fi and Bluetooth networks;

- Software platforms including computer and mobile device operating systems as well as application programming interfaces; and

- Network edge devices such as sensors, robots, autonomous and semiautonomous vehicles, and other Internet of things facilitating devices and software.

According to the Digital Economy Report 2019, the components of digital infrastructure include: (1) ICT networks (the core digital infrastructure for connectivity); (2) data infrastructure (data centres, submarine cables and cloud infrastructure); (3) digital platforms; (4) digital devices and applications (United Nations, 2019).

Trends in emerging digital technologies include: (1) Blockchain technologies; (2) Three-dimensional printing; (3) Internet of things; (4) 5G mobile broadband; (5) Cloud computing; (6) Automation and robotics; (7) Artificial intelligence and data analytics (United Nations, 2019).

1.3. General theory of digital transformation in agriculture

Inevitability and benefits of digital transformation in agriculture:

Currently, the fourth industrial revolution is fundamentally changing the world's production. This revolution creates a driving force to promote in-depth development of manufacturing industries, reduce consumption of energy and raw materials, reduce harm to the environment, improve the quality of products and services, strongly promote the development of production. In particular, the fourth industrial revolution has comprehensively impacted all areas of production, including agricultural production; profound impact on all classes and strata in society, including farmers.

Agriculture is an important part of the national economy, is the main industry that creates jobs and income for farmers. For the agricultural sector, applying modern technological achievements of the 4.0 industrial revolution, especially digital technology, can help solve the challenges facing the industry: *Firstly*, production conditions production becomes more and more difficult (agricultural land area is shrinking due to the process of industrialization and urbanization taking place more and more strongly; the labor force in agriculture tends to decrease due to economic restructuring due to economic restructuring. and population aging; climate change makes traditional farming increasingly difficult and precarious…); *secondly*, the income level of consumers is increasing, so the demand for the quality of agricultural products is increasing, shifting from quantity to quality, diversity, abundance and friendliness with the living environment.

The rise of digital agriculture could be the most transformative and disruptive of all the industries, because digital agriculture not only will change how farmers farm their farms, but also will transform fundamentally every part of the agrifood value chain. Digital agriculture will affect the behaviour of farmers, and also affect the way that input providers, processing and retail companies market, price and sell their products. It can be applied to all aspects of agrifood systems and reflects a change in generalized management of resources towards highly optimized, individualized, intelligent and anticipatory management, in real time, hyperconnected and driven by data. For example, rather than treating all fields, crops and value chains uniformly, each could receive their own highly optimized management prescriptions and animals could be monitored and managed individually. Value chains could have traceability and coordination at the lowest level of granularity. The desired results of digital agriculture are systems of higher productivity, which are safe, anticipatory and adapted to the consequences of climate change, to offer greater food security, profitability and sustainability.

Therefore, in this report we classified digital technologies according to the following structure, based on the complexity and stage of penetration of these technologies in the agrifood sector: a) mobile devices and social media; b) precision agriculture and remote sensing technologies (IoT, GNSS, RTK, VRT, PLF, UAV and satellite imagery); c) Big Data, cloud, analytics and Cybersecurity; d) integration and coordination (blockchain, ERP, financing and insurance systems); e) intelligent systems (Deep Learning, Machine Learning and Artificial Intelligence and robotics and autonomous systems) (Food and Agriculture Organization of the United Nations, 2019)

According to The Digital technologies in agriculture and rural areas status report (2019) of Food and Agriculture Organization of the United Nations, *basic conditions for agricultural digital transformation include*:

Firstly, IT infrastructure and network in rural areas (Connectivity: mobile subscription and the access to broadband infrastructure; affordability: costs of ict tools as a precondition for adoption by rural population)

Secondly, Educational attainment, digital literacy and employment among rural communities (literacy rate and the gap between urban and rural areas; introduction of icts to the educational process; employment in the rural areas and agrifood sector;

Thirdly, Policies and programmes for enabling digital agriculture (institutional support and mechanisms include e-government services, e-agriculture services, doing agribusiness initiatives; policy regulation and frameworks; existing digital agriculture strategies)

Enablers for digital agriculture transformation include: (1) Use of digital technologies among rural population and farmers; (2) Digital skills among rural population (global trend on digital skills, digital skills gap between urban and rural areas); (3) Digital agripreneurial and innovation culture (Food and Agriculture Organization of the United Nations, 2019)

2. Method

In this article, the author uses secondary data to clarify the general theory of digital transformation and agricultural digital transformation; learn some typical digital village models in the world; analyzing the current situation of digital transformation of agriculture and rural areas in Vietnam in the context of the industrial revolution 4.0. Secondary data were obtained from government journals and websites.

3. Results

3.1. Typical agricultural and rural digital transformation models in the world

3.1.1. Digital Village model in EU

According to the European Rural Review No.26, smart villages will create 5 main drivers: *firstly*, responding to depopulation and demographic change; *secondly*, finding local solutions to public funding cuts and the centralisation of public services; *thirdly*, exploiting linkages with small towns and cities; *fourthly*, maximising the role of rural areas in the transition to a low-carbon, circular economy*; fifthly*, promoting the digital transformation of rural areas (European Network for Rural Development, 5/2018)

Since 2016, the European Commission has coordinated with the European Parliament to launch a pilot policy to build smart villages in the 2016-2020 period with the name "Europe acting for smart villages" in a number of countries and based on technology connected with indigenous values in order to preserve and develop European values, helping rural people have jobs and prosperous lives.

On the 11th of April 2017, the European Commission presented an “EU action for Smart Villages”, a document to launch reflections on villages of the future. It announces a series of initiatives within the EU rural development, regional development, research, transport, energy, and digital policies and funds. This Action Plan is a follow-up of the Cork Declaration of September 2016 in which one of the ten priorities is “investing in rural viability and vitality”. Smart Villages is a relatively new concept within the EU policy making. According to this EU action, Smart Villages refer to “rural areas and communities which build on their existing strengths and assets as well as on developing new areas.

The EU Action Plan presents 16 planned actions that will be implemented by 2020 to promote smart villages. The plan is a mix of actions, conferences or calls for proposals already scheduled before the Cork Declaration and some new actions more directly targeting the implementation of Smart Villages.

In April 2018, another declaration that was widely accepted in Europe was the Bled Declaration (Bled, Slovennia) titled “The Smarter Future of Rural Areas in the EU”. The Declaration calls for innovative and inclusive use of digital technologies; strengthened knowledge and entrepreneurship; and complementary support under EU funding instruments to boost the development of rural economies across the EU.

According to the Bled Declaration, the concept of a smart village should include: precision farming, various digital platforms (e-learning, e-health, e-administration, transport, gastronomy, social services, retail), shared economy, circular economy reducing waste and saving resources, bio-based economy, renewable energy, rural tourism, social innovations in rural services and entrepreneurship.

In the EU, the typical smart village models are the German Digital Village model. The German Digital Village project, implemented from 2015 to 2019 with a funding budget of about 4.5 million Euros. The main purposes of the project are: 1) Innovation in the smart rural ecosystem; 2) Building interdisciplinary solutions; 3) Create a culture of collaboration between the people, the local government; 4) Building sustainable solutions; 5) Develop cost-effective digital solutions.

3.1.2. Digital Village model in India

The Government of India launched different schemes for making strong base for farmers so that farmers of India can get the benefit of digital world in their farming business. The rural India has various panchayat. It is important to provide high speed internet connectivity to all panchayat so that all rural areas of India can have high speed internet connectivity. The central and state government of India set up a Core ICT infrastructure and the objective is to taking the digital literacy to the remotest locations of the India. The Department of Telecom (DoT) has established Bharat Broadband Networks Ltd. (BBNL) to spread out the National Optical fiber Network (NOFN). BBNL spread the optic fibre cable terminating in each of the 2,50,000 gram panchayats. In this way all panchayats in the India can have high speed internet connectivity. This will provide digitalization and connectivity to the local institutes like panchayat office, schools, health centre etc. After connecting the local institutes of the rural India with the internet, now the requirement is making the rural India digital literate. National Institute of Electronics and Information Technology [NIELIT] has identified more than 5000 facilitation centers across India for training on courses which literate the rural India about basic online activities. Under the umbrella of Digital India scheme, Department of Electronics and Information Technology [DeitY] launched Mobile seva through which government departments/agencies deliver public services to the people through mobile only (Jain, 2019)

Akodara village is located in Sabarkantha district of Gujarat. This village is known as “Digital Village” on 2, January, 2015. Akodara village was adopted by ICICI Bank under the Digital Village schemes in 2015. Akodara is known as Digital village and Cashless village. This village is known as the first Digital village of India. All mobile banking activities are done in Hindi, English and Gujarati languages. ICICI bank also provides training to the villagers about the processing of financial activities over the internet. The majority of the villagers are using electronic payment methods or digital methods for making payments. The majority of payments are done through SMS only and the payments are directly goes to the shopkeeper‟s accounts. The gram panchayat rented out the premises of village to ICICI Bank‟s rural branch. People in Akodara are using mobile phone for making payments of their different purchases. The village has their own website (http://akodara-digitalvillage.in) and people are using this website for different purpose. This village has wi-fi facility and people are using wi-fi for different online activities (Sonia Bhatt, 2020).

3.1.3. Model of information network village in Korea

Korea has attracted special attention from the world through the Information Network Village (INVIL) project. The main objective of the project is to close the gap between rural and urban areas, through increasing the availability of e-government services, and to raise people's living standards by promoting e-commerce. The project is expected to raise awareness of the local community in the application of information and communication technology to promote the regional economy through e-commerce transactions, education and public information. INVIL villages often create an environment using the Internet that provides residents with information, training them and guiding them to access various types of information closely related to daily life and business activities. livelihoods of residents, and more importantly, facilitate the formation of local communities and bring them together.

The INVIL project is a partnership between the Ministry of Public Affairs and Security of Korea (MOPAS) with local governments and each INVIL. MOPAS provides information infrastructure such as high-speed Internet connection, PC.... MOPAS is the governing body that establishes plans, budgets, legislation, and supports the network of cooperation between the organizations involved and promotes the project. The local government establishes and manages the information environment in each village, develops local content and centralizes administrative support and practical content, such as computer training, Internet applications, manage the site for local people especially in winter, when the crops are idle in 7 languages. Each INVIL organizes activity committees, manages village centers and develops profit models using the INVIL shopping website and INVIL experience for local people to participate and contribute to the activity sustainability of information networked villages.

The information villages of Korea are built as follows:

- Regarding communication infrastructure: Villages participating in INVIL must be located in locations where high-speed, low-cost Internet infrastructure can be built;

- INVIL Center in the Village: The INVIL Center in the village is built and equipped with facilities for training, as well as providing online public services to residents;

- Developing information content: In order to encourage the participation of residents, INVIL has organized and developed online education and training programs on IT application, exploitation and operation of e-commerce website, tourism. ecology… (including for people with disabilities, the elderly, leaders of villages and communes, etc.).

For farmers, the INVIL project also offers ways to increase people's income in a sustainable way, providing information platforms about crops, prices, farming methods, weather conditions, as well as a market information platform, connecting supply and demand of farmers' products, remote consulting services, medical information...

In addition, the project also encourages local residents to contribute to promoting their communities by posting local news on the website (new.invil.org) and forming clubs (community.invil.org).) on the Internet. By doing so, INVIL has enabled farmers to actively find their own way to manage their villages, develop a business model and seek sustainable development plans.

The successful experiences of the information network village model in Korea:

With these results, in 2011, the INVIL project became the first Korean public policy program to win the first prize of the United Nations Award for Public Service, in the category of "Promoting Participation in Public Services". policy making through innovative mechanisms”. The successful case of INVIL can be drawn through the following experiences:

Firstly, the village community is the center of development projects. The active participation of the people is a key factor in ensuring success. For projects applying information and communication technology, as well as digital transformation, training people to become digital citizens is a prerequisite solution.

Secondly, the application of information and communication technology, digital transformation is not a one-time infrastructure investment project, but must be continuously maintained, ensuring the sustainable development of the project. Even the criteria of the project must be continuously reviewed, updated and redesigned to match the realities of life.

Thirdly, the sharing of information and knowledge in implementation, not only between state agencies and enterprises, but also within the population community must also be focused.

Fourthly, applying information and communication technology, digital transformation is not only a solution to socio-economic problems in the short term, but also shapes a community and a country in the future. Therefore, the approach needs to be flexible, both according to a systematic design mechanism, as well as with inter-sectoral and inter-agency coordination, between localities and the central government, and between localities.

3.1.4. E-commerce for poverty alleviation in rural china (Taobao villages)

China's rapid development of e-commerce has begun to reshape production and consumption patterns as well as change people's daily lives. In 2014, the Alibaba Group, in collaboration with the government, launched the Rural Taobao Programme to help give rural residents greater access to a broader variety of goods and services and help farmers earn more by selling agricultural products directly to urban consumers in online platforms.

The programme has four main activities: 1) Setting up an e-commerce service network in counties and villages; 2) Improving logistical connections for villages through "two-stage delivery" shipping packages from county centres to villages; 3) Providing training in e-commerce and promoting entrepreneurship; and 4) Developing rural financial services through the AntFinancial subsidiary of Alibaba.

The Rural Taobao Programme has expanded rapidly, from 212 villages in 12 counties in 2014 to more than 30 000 villages in 1000 counties in 2018, spreading from the coast to inland. While over 95 percent of the Taobao Villages cluster in the eastern region, particularly in Zhejiang, Guangdong, and Jiangsu, they have started to spread to the inland region, going from four shops in 2014 to over 100 in 2018.

The formation of Taobao Villages broadly proceeded through three stages: 1) Version 1.0 was mainly about grassroots development: Villagers, often returned migrants with distinct entrepreneurial skills, led the establishment of online businesses and created models for other villagers to follow. Examples include the early Taobao Villages, such as Shaji in Jiangsu province. 2) As e-commerce developed and more Taobao Villages prospered, version 2.0 was accompanied by government support: Local governments provided direct support for infrastructure, e-commerce training, and finance. Examples include Jieyang in Guangdong province. 3) In recent years, as more Taobao Villages formed, the platform-ecosystem version 3.0 has emerged: Local governments are providing support through subsidies for specialized e-commerce service providers and firms to build an e-commerce ecosystem with e-platform companies. Tailored support to villagers includes training and developing suitable local online products and branding. This process is typical of Taobao Villages in locations where the industrial base is weak and human capital (entrepreneurship and skills) more limited. Examples include Xifeng in Guizhou province.

Its main activities consist of establishing and improving rural e-commerce public service, fostering rural e-commerce supply chains, promoting connectivity between agriculture and commerce, and enhancing e-commerce training. The programme grew quickly and by 2018 had supported 1016 demonstration counties, covering 737 poverty-stricken counties (89 percent of the total), including 137 counties with extreme poverty (41 percent of the total). The share of poverty-stricken counties among demonstration counties increased from 27 percent in 2014 to 45 percent in 2015 and 65 percent in 2016, while in 2017 and 2018, more than 90 percent were poverty-stricken counties, with the rest underdeveloped.

While further research is needed to clarify and quantify the relationship between e-commerce participation and household welfare improvement, numerous anecdotal cases show that people gain wealth and have better lives after participating in e-commerce. Women in particular seem to benefit and account for a large share of e-commerce entrepreneurs. The ratio of women to men entrepreneurs in e-commerce is at or near parity, compared to a ratio of 1:3 in traditional businesses. The average age of female entrepreneurs in traditional businesses is 47.6 while the online counterparts tend to be younger, with those aged 25-29 accounting for 30 percent and those aged 18–24 nearly 30 percent on the Taobao platform. The average age of online female entrepreneurs is 31.4.

Success stories in Taobao Villages suggest that digital technologies can contribute to inclusive growth in rural China. They can lower the required skill threshold allowing individuals, including the less educated, to participate in e-commerce and earn more. The experience in Taobao Villages has sparked strong interest among researchers, policy-makers and the private sector to explore the use of e-commerce as a tool for poverty alleviation and rural vitalization (Food and Agriculture Organization of the United Nations, 2019)

3.2. The reality of Vietnam's agricultural digital transformation in the context of the 4.0 industrial revolution

Vietnam is currently an agricultural country with rural areas accounting for 63% of the population, 66% of households, and 68% of working people; Agriculture accounts for 13.96% of GDP. The small, inefficient production model and lack of value chain linkages have always been a "serious disease" of Vietnam's agriculture.

In the context of industrial revolution 4.0, agricultural production in Vietnam is facing many challenges: Due to the increasing population, the demand for food is constantly increasing; agricultural land area is shrinking due to urbanization, so it is necessary to increase agricultural productivity to meet food security; Climate change is taking place strongly, creating great pressure on our country's agriculture; The process of international integration requires higher quality agricultural products. In addition, due to the impact of the Covid-19 pandemic, Vietnam's agricultural exports were at a standstill, the major export markets of China, the EU, and the US froze, plus the double impact of drought, saltwater intrusion and Floods and storms, Vietnam's agriculture witnessed the loss of crops, bankruptcies of businesses and a series of immediate difficulties. Therefore, agricultural digital transformation is an inevitable trend to develop a modern and sustainable Vietnamese agriculture.

To adapt to the new situation and take advantage of the opportunities brought by the industrial revolution 4.0, Vietnam has issued Resolution No. 52-NQ/TW (September 27, 2019) on a number of undertakings and policies to actively participate in the fourth industrial revolution, which emphasizes the urgent need to accelerate the digital transformation process. On that basis, the Prime Minister signed Decision No. 2289/QD-TT (December 31, 2020) promulgating the National Strategy on the fourth industrial revolution to 2030; Decision No.749/QD-TTg (June 3, 2020) approving the national digital transformation program to 2025, with orientation to 2030.

The Digital Transformation Program in Vietnam has three main pillars: digital government, digital economy and digital society. The basics of this program include: 1) Awareness plays a decisive role in digital transformation; 2) People are at the heart of digital transformation; 3) Institutions and technology are the drivers of digital transformation; 4) Developing a digital platform is a breakthrough solution to promote faster digital transformation, reduce costs, and increase efficiency; 5) Ensuring network safety and security is the key to successful and sustainable digital transformation, and at the same time is an integral and integral part of digital transformation; 6) The participation of the whole political system, synchronous action at all levels and the participation of the whole people are factors to ensure the success of digital transformation.

The National Digital Transformation Program has introduced many important solutions to support the digital transformation of agriculture, farmers and rural areas towards the goal of building a new countryside to improve the material and spiritual life of the people. citizen; have appropriate socio-economic infrastructure; economic structure and forms of production organization rationally, linking agricultural development with industry and service; linking rural development with urban areas; a democratic, equal and stable rural society, rich in national cultural identity; ecological environment is protected; national defense and security, order is maintained.

In recent years, the agricultural industry has begun to pay more attention to many digital transformation solutions and applications in almost all fields.

In farming, IoT and Big Data technologies have begun to be applied through digital technology products such as software that allows analysis of data on the environment, plant types and growth stages, and consumers. can retrieve and monitor these parameters in real time…

IOT technology, Blockchain, biotechnology are widely applied in large-scale livestock farms. The dairy industry applies digital technology the most, with the prominent models being the modern farms of TH TrueMilk Group and Vinamilk Company.

In forestry, applying DND technology in the management of forest varieties and forest products; GIS technology and remote sensing images to build software for early detection and warning of forest fires from satellite images, monitoring and early detection software for deforestation, forest degradation...

In fisheries, digital transformation is also strong such as the use of ultrasonic fish detectors, flow meters, satellite phones; seine receiver (standing); capture and drop net capture system, GIS technology and global positioning system (GPS) to help manage offshore fishing fleet. Applying biotechnology selectively, breeding varieties with high yield, quality, disease resistance, good tolerance to the environment, circulating aquaculture technology (RAS), biofloc technology, technology nanotechnology, marine cage culture technology, cold water fish farming technology.

Artificial intelligence technology has been used in shrimp farming to analyze water quality data; feed management and health of farmed shrimp. Automation technology has been widely applied in seafood processing from sorting, steaming, packaging, production lines..., helping to reduce production costs and ensure the quality of seafood products. ...

In the context of industrial revolution 4.0, Vietnam has researched and learned from typical smart village models in the world (EU, India, Korea, China...). Vietnam is also making efforts to implement "smart villages, connected communes" projects with Vietnamese identity, in order to bridge the gap between urban and rural areas, and improve the lives of rural residents.

In September 2020, the Ministry of Agriculture and Rural Development coordinated with the Ministry of Information and Communications to organize a seminar on digital transformation and smart new rural orientation for the period 2021 - 2025. Experts from the Digital Agriculture Cooperative at the Workshop, the "smart village, connected commune" model in Vietnam is a community of hamlets, villages and communes in rural areas using innovative solutions based on local strengths and opportunities, on a participatory, shared approach to developing and implementing economic and social strategies to improve economic, social and environmental conditions, especially differentiated by mobilizing digital technology solutions. The model of "smart village, connected commune" promises to form truly civilized and modern rural areas while still preserving the cultural identity of traditional villages.

The Ministry of Agriculture and Rural Development and the Ministry of Information and Communications jointly have an idea to submit to the Government to develop a project to bring information technology and digital transformation into one of the criteria for building a new countryside in the 2021 period. - 2025. Specifically, digital transformation infrastructure will be essential infrastructure, including broadband connection infrastructure with fiber optic cable covering rural areas, followed by 4G connection infrastructure, then 5G. How can every citizen have access to internet connection through basic connection systems at reasonable costs….

Experts and researchers believe that the construction of smart villages and connected communes in Vietnam needs to start from people, take people as the object of service, build the most direct connections, save money. as complete as possible. Accordingly, smart villages and connected communes will include components of smart institutions, smart people (trained and professional), smart government and smart agriculture.

4. Discussion and Conclusion

4.1. Basic solutions to digital transformation of agriculture in Viet Nam

Basic solutions to digital transformation of agriculture in Vietnam include:

Firstly, develop hi-tech agriculture in the direction of focusing on smart agriculture and precision agriculture, increasing the proportion of digital agriculture in the economy. Implementing digital transformation in agriculture must be based on data. Focus on building big data systems of the industry such as land, crops, livestock and fisheries. Building an integrated observation and monitoring network in the air and on the ground for agricultural activities. Promote the provision of information on the environment, weather, and land quality for farmers to improve productivity and crop quality, and support the sharing of agricultural equipment through digital platforms.

Secondly, apply digital technology to automate production and business processes; managing and monitoring the origin and supply chain of products, ensuring fast, transparent, accurate, safe, and food hygiene. Consider piloting the implementation of the initiative "Each farmer is a trader, each cooperative is an enterprise applying digital technology" with the goal that each farmer will be oriented and trained in digital technology application in the future. produce, supply, distribute, forecast (price, season, ...) agricultural products, promote the development of e-commerce in agriculture.

Thirdly, implement strong digital transformation in management to have timely policies and administration for agricultural development such as forecasting, market warning, planning management.

4.2. Conclusion

In summary, in the context of the industrial revolution 4.0, digital transformation is a global trend and a top concern of countries, including Viet Nam. Vietnam is currently an agricultural country with rural areas accounting for 63% of the population. Agriculture and rural digital transformation in Vietnam is of particular importance to overcome the challenges facing the agricultural sector, to close the gap between rural and urban areas and to improve the living standards of farmers.

Abstract

Facebook is the leading medium which is used for communication during the COVID-19 pandemic in Vietnam. Due to social distancing by this pandemic, the way college admissions counseling must also change by remote consultation. This paper examines the impact of facebook usage on students' career selection. In addition, it also analyse the effectiveness of career selection through college admission advisory based on facebook. Empirical data was collected from 6.404 freshmans using questionnaire survey at National Economics University, Vietnam. The obtained results show that high school students often search for admission information via Facebook and then the university's website.

Key words: *Admission; Facebook; Freshman; Recruitment*

1. Introduction

Nowadays, it can be recognized that students are as digital members of the Net Generation because they were born in the digital age and digital technology has affected them from an early age (Prensky, 2010; Thompson, 2013; Laura, Genevieve, Beth, & Matthew, 2020; Arteaga, Cortijo, Javed, 2014; Aiman, Adrienne, Cathy, Nijina, Maria, 2021). This Generation is considered as groups of young people who live in a computer-based environment. This has brought a completely new approach of learning, thinking and sharing. In today's world, one of the most effective mechanisms of communication is social media. There were 4.2 billion active social media users and 4.66 billion active internet users by January 2021. 4.2 billion active social media users show the penetration of social media.

The most popular social media worldwide is Facebook with more than 2.6 billion monthly active users (Statista, 2021). It has become unprecedent popularity among college students both in their academic and social life. The distribution of facebook users aged 18-24 by gender worldwide as of January 2021 was 9.6% for women and 14.2% for men, respectively (Statista, 2021). Thompson and Lougheed (2012) found that 80.24% of college students suppose that using Facebook is an important factor in college social culture.

Recently, a study (Kayla, H., 2018) that detailed recruitment information from a large online study of family caregivers aimed to develop a method to assess how family caregivers control stress day-by-day. Twitter and Facebook was used for these recruiting strategies. Here, Facebook was the most effective to target family caregivers with 86% of the sample. This research also points out that the use of social media recruitment methods should be very attractive because of cheap price, simplicity, and efficient methods for large samples.

A lot of features for users such as posting photos, updating status, livestreaming video, updating wall, reading news feed, giving comments, giving likes, messaging, forming groups, managing fanpage, playing games, creating events, online marketing, taking notes and chatting in the groups are provided by facebook (Ryan & Xenos, 2011; Silvia, Giulia, 2018). A number of advantages have been shown when using Facebook, such as generating new ideas, a chance to make new friends, getting someone to do things (Dholakia, Bagozzi & Pearo, 2004), higher-level of life satisfaction (Valenzuela, Park, & Kee, 2009), the need for admiration and to belong (Silvia, Giulia, 2018), knowledge sharing, information distribution, quick feedback (Seo, Kim, & Yang, 2016), making social circle strong, learning new ideas, and information-seeking (Syed, Wasim, Nida, Muhammad, Shahzad, 2020), and bridging and bonding social capital (Phua, Jin, & Kim, 2017).

Although students have considered Facebook as a social technology rather than a formal teaching tool (Madge et al., 2009; Shihui, Yip, Lai, Liaquat, 2019; Mazman & Usluel, 2009; Reynol, 2012; Selwyn, 2009; Hong et al., 2014), students' performance could be impacted significantly by Facebook. Recently, the potential of social media platforms, such as Facebook, WhatsApp, Twitter, and Instagram, were also explored to use for enhancing students' active learning (Isaiah, Mark, Tijana, 2019; Stone and Logan, 2018).

Vietnam is among one of the Asian countries which lie in Southeast Asia. The total population of Vietnam is 98,168,833 in the year 2021 (internetworldstats, 2021). Statitics reveal that Vietnam is among the top seven countries in terms of number of Facebook users with more than 68 millions accounts in the first quarter of 2021 (Statista, 2021).

If we, as educators, wish to make strong connections with our future students and engage them with the admission documents we want them to consider choosing, we need to fit our approach strategies to their lifestyles. It is necessary to move from a traditional admissions counseling to digital one, especially in COVID-19 pandemics.

2. Literature review

2.1. Employer branding, and Social media

The Internet completely assists recruitment at the same time for recruiters and those being recruited (Carrillat et al., 2014). Social network platforms are a main source of future talent who are availble to recruit at a low cost and very easily. These social networks futher reveal valuable information that was previously unreachable to recruiters. For that reason, implicit employers exert to expand their digital presence, attractiveness, and reputation, which are important to their ability to attract talented employees. Recruiters hold on their own profiles, design their pages for business, animate their blogs, send their newsletters, and enter into professional communities. Social networks are also used to check and add the information supplied by their implicit employees. Besides, automated tools are constantly used to scan social networks in search of the rare pearl (Faliagka et al., 2012). However, these social networks are creating a risen pressure in recruiters to work faster and occlude more diversified and much bigger information flows to search the suitable candidates for their jobs.

Recruitment based on social media through 4 different ways: (1) as a connector, it allows quick and direct contact between job seekers and employers, (2) along with the growth of the employer‘s reputation, it contributes to the brand, the visibility and the attractiveness of the business and motivates the candidate to contact, (3) together with transparency relationships, it contributes to increased trust, richer and more humane exchanges, far from job interviews, and (4) identifying specifically the proposed job data, which conducts to a gradual ranking of candidates according to individual and fair criteria. On the other hand, social networks also create a form of snatching and uncertainty that makes it hard to follow and master the flows of talent (Kumar et al., 2018; Mas and Gómez, 2020).

The attracting employees are the target of employer branding through cultivating unique and compelling perceptions of a company in the potential candidates' minds (Mandhanya & Maitri, 2010). Some authors (Michaels et al., 2001, p. 1) show the "war for talent," in which battles between companies are to recruit skilled candidates. Now, the trend of candidates who often switch jobs during their careers makes this war seriously (Verma & Ahmad, 2016). This tendency could lead to a situation in which battle for the best candidates will be as intense as that for clients (Sehgal & Malati, 2013).

To cope with the challenges of attracting a limited number of talented employees, companies need to conduct employment marketing activities in multichannel systems. Social media is one of the most effective and newest channels for employment marketing (Simon, Anne, Robbert, Mariët, 2021); Dimitri, Jan, 2019; Kayla, Jaclene, Kate, 2018; Kaur, Sharma, Kaur, & Sharma, 2015).

An electronic recruitment flyer was made with appropriate study information consisting of the study's purpose, eligibility criteria, expected timetable, and contact information before either social media profile was created. The study flyer was posted on Facebook and Twitter. A link to the Qualtrics survey from social media platforms such as Facebook and Twitter was clicked by potential candidates. After that, they were prompted to reply eligibility questions. If the latent candidates are suitable for the criteria, they were then automatically forwarded to the online approval form (Kayla, Jaclene, Kate, 2018).

A recruitment strategy for research used the social media is a new recruitment approach because social media is a new technological environment. Some authors have successfully applied these media as a recruitment tool in caregivers of persons with cancer (Pohlig et al., 2017; Gage-Bouchard et al., 2017), diabetes (Scarton et al., 2017), dementia disorders (Bateman & Brady, 2017; Dam, Van Boxtel, Rozendaal, Verhey, & Vugt, 2017) as well as family caregivers (Kayla, Jaclene, Kate, 2018).

2.1. Recruitment of high quality students

Freshman recruitment for all universities in the world is a very important topic. This recruitment process includes those activities and practices conducted by the universities or independent organization. Its main target is attracting potential candidates (Winter & Melloy, 2005). The international student recruitment management was studied elsewhere. The international student recruitment was investigated from considered institutional elements and an institutional perspective that can have an effect on recruitment (Ross, Heaney, and Cooper, 2007). The global trend was studied in recruiting engineering and technology freshman (Islam, 2003). This study‘s purpose is to persuade and entrain best students to enter on technology and engineering specialities. The related target areas have been identified such as: to have an effect on the candidates to technology and engineering vocation in the K-12 level, to modify the admission standards, to investigate the global accreditation need of technology and engineering programs, to kick off special drive to be attractive for underrepresented groups as well as solving employment opportunities and social status. The recruitment of undergraduate Geographers was studied in Enland and Wales (Croot and Chalkley, 1999). Besides a national-level evaluation, the streams of applications and enrolments between localities were also identified and discussed in this study. Some important components was found such as interested subject, prestigious course, job opportunities, teacher advice and etc that is very important for students in making decision concerning on selection of courses or university (Maringe, 2006).

3. Method

3.1. Data sample and measures

To analyze the effectiveness of the recruitment marketing process on Facebook, we selected a survey of freshmans of the National Economics University, Vietnam. We chose this university because it is a top famous university in Vietnam specializing in the fields of economics, management and business administration. The study was conducted online from

October 8th, 2020 to November 14th, 2020. This study period was the first time that freshman learnt offline at university after entrance admission. This investigation aimed to explore the students' decision-making regarding collecting recruitment marketing process on Facebook. The covering criteria of the study were measured by self-report.

3.2. Survey instrument

A self-completed, cross-sectional, nameless online survey was designed in the google form. Freshman entered the survey through scanning QR code or a direct link to the google form included on a formal Fanpage designed for the study. The Member Information Declaration became visible in the first line of survey before any survey questions were seen, and notified contributors that fulfillment of the questionnaire was considered as agreement to join. In addition, this declaration strenthened that this survey was nameless as well as did not collect any identifying data.

3.3. Data collection and analysis

The data were directly downloaded as an Excel file from Goole form data. The obtained data were preliminarily processed through Microsoft Excel. After that, secondary data were run on SPSS 22.0 software. The demographic characteristics of the sample and their use of Facebook were illustrated by descriptive statistics.

4. Results

Among all participants, the number of female students accounted for more than 70%. This is a fact that most female students prefer to study economics, management and business administration. The survey results show that the majority of freshmen have a birth year of 2002 (95.60%), which means they have just graduated from high school. There are 11 students going to school before their required age, accounting for 0.17%. The rest are students born in 2001 or earlier (table 1). The results in table 1 also showed that the number of students from towns accounted for the largest proportion with 33.55%. After that, students from rural areas took second place with 29.28%. The third place belongs to students from big cities with 25.25%. The rest are students from other regions.

There are 4021 (76.2%) students responding that the major they are studying is right for their interest. In contrast, 1446 (23.8%) respondents said that the current major is not their original interest.

Table 1. Sample demographics

		Frequency	Valid Percent	Cumulative Percent

	Mountainous area	643	10.04	98.14
	High mountainous area	90	1.41	99.55
	Border area	9	0.14	99.69
	Island	20	0.31	100
	Total	6404	100	

Since the Covid-19 pandemic broke out in Vietnam in early 2020, students in localities have been converted to e-learning. Therefore, students are facilitated to have access to the internet through different forms.

With the results of using the devices for entering the internet, the internet connection service also includes 4 main types. Wifi connection is the highest with 5596 options to use (87.33%); followed by 3G/4G networks with 618 options to use (9.64%); the wired network and Bluetooth are the rest.

In table 2, the device used accessing the Internet typically consists of 4 types including desktops, tablets, laptops, and smart phones. In which, smartphones are used frequently and with the greatest frequency. The number of respondents to the question of using smartphones is also the highest with 6269 students. 52.52% of respondents say that they have used smartphones very often. Besides, 40.48% of respondents say that they have often used smartphones to access the Internet. Using laptops seems to be less with 12.34% of respondents saying that they always use laptops to access the internet. The percentage of respondents who regularly and occasionally use laptops accounted for 35.49% and 36.49%, respectively. Meanwhile, the percentage of respondents who never and rarely use the desktop is 23.17% and 34.33%, respectively. This figure is higher with tablet usage rate of 43.30% and 27.95% respectively for never and rarely used. This shows that, in the era of rapidly developing technology, smartphones and laptops are two devices that are applied a lot to serve the work daily activities of individuals. Today, desktops and tablets are no longer common. Desktops do not have many conveniences such as not being able to carry them to work, bulky size, etc. Tablets are also inconvenient during use, although their functionality is not much different from smartphones and laptops. According to this result, during the COVID-19 pandemic, smartphones are mainly used by students for e-learning as well as Internet access due to low price, their popularity and easier internet connection. This is consistent with the results of using e-learning devices, smartphones and laptops, mainly using wifi and 3G/ 4G connection services. In addition, wifi is used more generally because of their convenience such as high capacity, high-speed lines and cheap prices, while 3G / 4G networks have higher usage fees and they are often limited in the capacity of internet connection per day. Besides, desktops use wired networks. Although internet connection used a wired network is faster, easier and more stable, it is not possible for students to install this system during the unexpected COVID-19 outbreak and it is also inconvenient to carry. The wifi network is considered to be a slower Internet connection than a wired network, but the flexibility of wifi allows students to access the internet from neighbors to serve their studies without having to install the cable.

Table 2. Devices employed for accessing the internet

		Frequency	**Percent**	**Valid Percent**	**Cumulative Percent**
Valid	Wifi	5596	87.38	89.26	89.26

Total		6404	100		

Related to the obtained results, 20.39% and 33.87% of the sample is the percentage of students accessing Facebook for 1 hour and 2 hours per day, respectively (see Table 3). Meanwhile, 23.18% of the sample spends an average of 3 hours on Facebook. Furthermore, the percentage of students who are on Facebook for more than 4 hours accounts for 16.79%. Only 5.77% of students are on Facebook for less than 30 minutes a day. This result shows that the daily rate of students accessing Facebook for 1 hour or more is very high, accounting for 94.23%. Students reported spending a mean of 3.25 hours (SD 1.130) per day for accessing the Facebook. This is less than 4.5 hours per day that Taiwanese university students are on Facebook (Hong et al., 2014). However, related to the study by Thompson and Lougheed (2012), which set the indicator of Facebook addiction at usage of more than one hour, this would indicate that nearly 80% of university students have reached the behavioral standard for Facebook addiction.

Table 3. Time spent on Facebook

		Frequency	**Percent**	**Valid Percent**	**Cumulative Percent**
Valid	<=30 minutes	363	5.67	5.77	5.77
	1 hour	1283	20.03	20.39	26.16
	2 hours	2131	33.28	33.87	60.04
	3 hours	1458	22.77	23.18	83.21
	>=4 hours	1056	16.49	16.79	100
	Total	6291	98.24	100	
Missing		113	1.76		
Total		6404	100		

According to the data in Table 4, 50.85% of the respondents chose the field of study according to their hobby. Meanwhile, up to 32.42% of respondents said that they chose their current major because they did not have enough points to enter the desired major. Only 6.91% and 3.20% of the respondents answered that their current major is advised by family members and teachers or friends, respectively. Furthermore, 6.63% of the respondents enrolled in their current major by chance. This is a fact because National Economics University (NEU) is a leading university in economics, management and business administration in Vietnam, so the annual entry points of students are often very high and are not the same between different majors. In addition, high school students can be enrolled in many different subjects at the same time for admissions department of NEU to consider.

Table 4. Reasons for choosing a major

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Hobby	3151	49.17	50.85	50.85
	Not enough points to enter the desired major	2009	31.35	32.42	83.27

	Total	6197	96.71	100	
Missing		211	3.29		
Total		6408	100		

As the leading university in Vietnam training in economics, management and business administration, this criterion plays the most decisive role in the students' choice (82.37%). Followed by the long tradition and reputation of NEU, the second decision comes to the student's choice (69.71%). Successful alumni network determines 51.05% of students' intention to choose a University. Other factors such as having many majors, easy to find a job, and the opportunity to have a high income only partly determine the tendency of students to choose a university with rates of 45.24%, 45.18% and 28.42%, respectively.

Table 5. Statistical data on the reasons for choosing NEU

Reasons for choosing NEU	Frequency	Percent (%)
Long tradition and reputation	4467	69.71
Successful alumni network	3271	51.05
Many majors	2899	45.24
Easy to find a job	2895	45.18

Total	6404	100

Students' awareness of admissions information was assessed using a five-point Likert scale: strongly disagree, disagree, neither agree nor disagree, agree or strongly agree (Table 6). This study found that university students had the most access to NEU admissions information via Facebook with an average value of 4.33, followed by website of NEU and internet, with an average of 3.58 and 3.56, respectively. Besides, the average value of NEU-tour, In-person counseling sessions are held locally by NEU, leaflets, radio stations are all lower than 2.

Increased introduction of students' internship activities	6206	1	5	1.72	.010	.772	1.059	.031	1.495	.062
Valid N (listwise)	5963									

Evaluation of students related to the importance of admission counseling via Facebook was rated using a five-point Likert scale: strongly agree, agree, neither agree nor disagree, disagree or strongly disagree (Table 7). We inverted the scale of the question in this table from the questions in table 6 to make sure that students read the question carefully before answering. All items have an average mean of less than 2.7. In which, the items with average value below 2.0 are Strengthen news, introduction to the field of study, Increase direct reply on enrollment news, Increase news and articles on job opportunities after graduation, Increased introduction of students' internship activities, Increase news on NEU activities, Increase enrollment information sharing, Enhance the introduction of arts, sports and extracurricular activities and Increased introduction of scientific research activities. Strengthen news, introduction to the field of study and Increase direct reply on enrollment news are the two items rated as the most important by students with values of 1.59 and 1.61, respectively. This shows that students want to find more information about their majors as well as receive direct answers from the admissions department on the Facebook platform.

4. Conclusion

In the current period, the young generation in Vietnam is regularly using social networks, typically Facebook. The average time they spend on Facebook 3.25 hours (SD 1,130) per day. Therefore, educators or those who work in the admissions department of universities should pay more attention to the issue of enrollment counseling through this social network in order to recruit best students. In addition, those who work as administrators of University's fanpage need to research and enhance the information that students are most interested in, in order to be able to meet the requirements of students.

Abstract

The prevalence of science and technology and its application in life has attracted the attention of academia over the years in technology applications. However, there is still no research on the impact of mobile applications on the destination choice behavior of tourists. This study aims to find out the impact of travel apps on tourist destination choice behavior in Ho Chi Minh City. The results show that 5 factors: perceived ease of use, perceived usefulness, perceived flexibility, subjective standards and diversity of mobile applications have a positive impact on the decision to choose a tourism application affects the intention to visit the tourist destination. The study shows that the efforts of technology companies and leaders to raise people's awareness about the application of technology for tourism will contribute to the intention to choose a destination in the future.

Keywords: *Mobile application, Perceived ease of use, Subjective standards, Tourist destination, Tourism support application.*

1. Introduction

1.1. Introduction

Currently, there are still many difficulties for tourists when deciding on a tourist destination. Inconvenience for even the most basic and essential needs such as choosing a destination, motel, restaurant, etc. For example, it is very difficult to carry a backpack to China because of the language barrier, in addition to that, people here cannot use popular search engines, namely Google, Youtube, etc. The rapid development of mobile applications (technology applications) has helped users, especially tourists easily search information to travel. Therefore, it is more necessary than ever to bring technology applications to social launch on mobile devices to support the travel needs of tourists.

As society becomes more easily connected, the internet becomes more popular through the use of mobile devices, the basic activities of today's society are being transformed by the emergence of mobile applications. The use of technology and the tourism sector is no exception to that change. Nowadays, mobile phones have become extremely popular among all social. Mobile devices generally refer to mobile phones, smartphones, or tablets. Depending on the context, the term may include laptops or other portable electronic products.

1.2. Literature Review

Previous studies have shown a number of important factors affecting the intention to use mobile applications, thereby affecting the intention to visit the destination of tourists such as:eWOM, environment, etc. E - Servicescape (Kuo et al., 2019) ; Perceived usefulness (PU), perceived ease of use (PEU) (Kim et al., 2017; Chung & Koo, 2015; Kuo et al., 2019); Social norms (SN) (Oanh & Uyen, 2017). However, studies often focus on only one or two influencing factors according to the theoretical technology acceptance model (TAM) - focusing on attitude or satisfaction leading to intention. This paper combines both the theory of the TPB Planned Behavior Model and the theory of tourist destination choice. Technology acceptance model (TAM) to further analyze the influencing factors of mobile applications for tourism, thereby influencing tourists to choose destinations, and at the same time exploiting new influencing factors to perfecting the scale.

1.3. Definitions of Construct

Mobile applications: According to Islam & Mazumder (2010) mobile applications consist of software/set of programs that run on mobile devices and perform certain tasks for the user. Mobile Application is a new and rapidly growing Segment of Global Information and Communication Technology. The mobile app is easy to use, user-friendly, inexpensive, downloadable, and can run on most mobile phones including entry and entry-level phones. The mobile application has many functions for its wide operating area such as calling, messaging, web browsing, chatting, social networking, audio, video, games, etc.

Tourism Destinations: According to Beirman (2003), a tourist destination is a city, town, or other areas that depend to a substantial extent on revenue from tourism, or "a country, state, region, city or town is sold or marketed as a place for tourists to visit.

The tourist destination is a place for tourists to visit and stay, be it a country, state, region, or city - often due to cultural values or its natural (Piechotka et al., 2017). It is a place or area that offers a collection of tourism-related products and attractions, providing a travel experience for individuals or groups traveling away from home or their place (Jalis, 2019).

1.4. Definition Of Theories

Theory of Planned Behavior (TPB): Theory of Planned Behavior (TPB) (Ajzen, 1985, 1991) is an extension of the theory of reasoned action (TRA) (Ajzen & Fishbein, 1980), made necessary by the latter model's inability to deal with behaviors over which individuals have incomplete volitional control. According to TPB, an individual's performance of a certain behavior is determined by his or her intent to perform that behavior. For TPB, attitude towards the target behavior, subjective norms about engaging in the behavior, and perceived behavior control are thought to influence intention and internet purchasing behavior (George, 2002; Jarvenpaa & Todd, 1997; Khalifa & Limayem, 2003; etc)

Technology Acceptance Model (TAM) (Davis, 1989) or TAM proposes specifically to explain the determinants of information technology enduser's behavior towards information technology (Saade et al., 2007). In TAM, (Davis, 1989) proposes that the influence of external variables on intention is mediated by perceived ease of use (PEU) and perceived usefulness (PU). TAM also suggests that intention is directly related to actual usage behavior (Davis et al., 1989). TAM acknowledged that the acceptance using the product or service information is determined by the intended use (BI) and BI is determined by the attitude towards the use (Attitude - A) under the influence of two factors: perceived usefulness (PU) and perceived ease of use (PEU). The service how is dependent on external factors (such as system quality, installation service, training service, or various concepts in the system used) as a worldview that influences the person's perception.

1.5. Some Previous Research

The research ***Adoption of mobile applications for identifying tourism destinations by travellers: an integrative approach*** (Chung & Koo, 2015) is to provide an assessment of both how consumers adopt mobile tourism apps and how consumers use those apps to orient customer intentions to visit tourism destinations. Perceived ease of use and perceived usefulness tend to be moderators of the effects of the e-servicescape environment and e-word-of-mouth communication on attitudes towards using apps. The results may be important references to conduct further validations, and critical for marketing managers when designing specific criteria to enhance mobile apps and their adoption.

The research ***The impact of mobile tour information services on destination travel intention*** (Kim et al., 2017) is to provide functions of mobile tour information services are important and how mobile tour information services affects tourists' intention to travel to a destination. According to the results of the analysis, system quality, history and cultural knowledge quality, and interface design quality, which are major functions affecting mobile tour information services, had significant effects on tourists' continuance intention to a travel destination. In addition, this study empirically showed that as tourists' expectations of the performance of these functions are confirmed, they form perceived usefulness and satisfaction with mobile tour information services in forming continuance intention to a travel destination.

The research ***Factors influencing the intention to use mobile commerce services of consumers in An Giang province*** (Oanh & Uyen, 2017) aims to measure factors influencing the intention to use mobile commerce services of consumers in An Giang province. The research result shows five factors affecting the intention to use mobile commerce services of consumers in An Giang province namely (1) Mobility, (2) Variety of services, (3) Perceived usefulness, (4) Perceived trust, and (5) Perceived ease of use. In particular, Mobility is the most influential factor towards consumers' intention to use mobile commerce services. Mobility is the most influential factor towards consumers' intention to use mobile commerce services. This research has contributed and improved the measurement of consumers' intention to use mobile commerce services in Vietnam. It also confirms the necessity to extend the traditional Theory of Reasoned Action and Technology Acceptance Model. In addition, this research provides some managerial implications for telecommunications companies, mobile commerce companies and marketers to shape their marketing strategies and improve their mobile commerce services.

1.6. Theoretical Model And Hypothesis Development

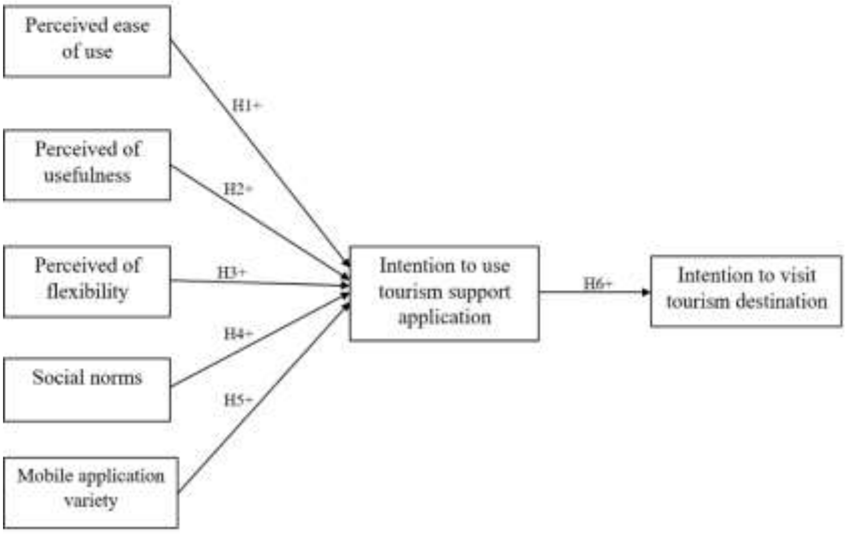

Figure 2: Conceptual model

Hypothesis Development:

Perceived Ease of Use (PEU): Perceived ease of use (PEU) has been identified as an important external factor that can influence a users' intention to adopt technology (Davis, 1989). PEU refers to "individuals" who believe that using a particular product/service will make an effort (Davis, 1989)**.** Applying the same concept in the context of Application technology, PEU is understood as the extent to which users perceive the ease of interaction with the Application allowing them to receive relevant and useful information they need.

H1: Perceived ease of use (PEU) will have a positive effect on intention to travel-enabled apps.

Perceived Usefulness (PU): Perceived usefulness (PU) relates to the degree to which a person believes that using a particular system will enhance their job performance (Davis et al., 1989). Research by Kim; Park; Morrison (2008) applied the TAM technology acceptance model and showed that perceived usefulness (PU) affects the intention to use mobile devices in the travel context. Applied in mobile commerce, research by Oanh & Uyen

(2017) also proves that the higher the perceived usefulness (PU), the higher the intention to use mobile commerce services.

H2: The perceived usefulness (PU) has a positive effect on the intention to use tourism support applications (IU).

Perceived of Flexibility (PF): Consumers can now connect to the WWW on their mobile phones through a standalone piece of software commonly known as mobile applications (Hoehle & Venkatesh, 2015). Mobile apps lead to a higher level of convenience, as consumers can use the software to compare prices, get discounts, perform specialized research on products and services, and locate store location, access timeline information, restaurants, traffic, local activities and share information on social networks (H.-Y. Wang & Wang, 2010). According to Kalinić & Marinković, 2016, as technologies on mobile devices increasingly meet the needs of flexible mobility in consumers' lives, the independent use of time and space is increasingly become important to both consumers and service providers.

H3: The perceived of flexibility (PF) has a positive effect on intention to use tourism support applications (IU).

Social Norms (SN)/ Social influence: Social norms (SN) or social influence is a person's perception of social pressure to perform or not to exhibit behavior (Fishbein & Ajzen, 1975). Social influence can be understood as the influence of an individual's social or environmental circle including reference groups, family, friends, and colleagues on their intention to adopt applications. tourism support applications on smartphones (Zhou et al., 2010). Similarly, social influence was found to be a significant predictor of behavioral intentions in different contexts including: mobile payments (Oliveira et al., 2016), intention to use mobile apps (Hew et al., 2015), mobile wallets (Madan & Yadav, 2016), mobile banking (Sok Foon & Yin-Fah, 2011) and mobile applications in tourism (Tan et al., 2017), etc.

H4: Social norms (SN)/ social influence has a positive effect on the intention to use tourism support applications (IU).

Mobile application variety (MAV): Research (Chong et al., 2012) indicates that e-commerce services provided to consumers today still have many limitations aspects compared to e-commerce. Mobile commerce provides custom-designed service apps that bring a lot of different benefits such as social media, listening to music, watching videos, and games, but providing "increased" values like e-banking. , mobile shopping is limited (Wang et al., 2006). In addition, (Kurgun et al., 2018), pointed out that the use of internet technology applications to advertise a destination is seen as an important motivation to go to that destination.

H5: The mobile application variety (MAV) has a positive effect on the intention to use tourism support applications (IU).

Intention to use tourism support applications (IU): According to Tran & Thanh (2017), intention to use (IU) is an individual conscious plan to make an effort to purchase a product of a brand. Intention to use (IU) is an important indicator of consumer behavior, representing the degree or likelihood that consumers will be willing to use it. In the field of tourism, information technology applications are successful and highly effective in identifying consumers and their intentions to visit destinations through tourism support applications.

H6: Intention to use tourism support applications (IU) has a positive effect on intention to visit tourism destination (IV).

2. Method

The data collection for this study aims to research and propose valuable solutions in determining the influence of technology applications on tourists' destination choice behavior, thereby helping tourism businesses business in Vietnam can improve service quality adapting with the current trends to attract tourists through media promotion on tourism applications

Data collection lasted from January 2021 to May 2021. Including 600 (Including 200 paper surveys and 400 online surveys). After eliminating inappropriate answer sheets such as respondents who participated in a number of similar surveys about tourisml apps within the past 3 months or there are family members who work in some professions related to the company or tourism organizations, or work related to the field of journalism, market research companies, etc., The number of samples remaining for analysis was 500.

Official research is carried out by a quantitative research method, conducted through the survey. The research sample is carried out through the convenience sample method (non-probability).

The research focuses on Vietnamese people and international tourists to Vietnam. The obtained results show that the majority of respondents aged 18-22 years old (49%), most of the respondents are students (42.4%), and the income level below 5 million also accounts for the largest part, 32.6%), and most of the respondents are of Vietnamese nationality (84.6%).

The results from this sample can be applied since most of young people aged 18-22 have a higher demand for tourism-entertainment at present. However, with a low budget, it is very useful for them to refer to tourism destinations or other information such as hotels, means of transport, etc on mobile applications.

The obtained data were coded and quantitatively analyzed to test the scale by Cronbach's Alpha analysis, Exploratory Factor Analysis (EFA), Model Compatibility, hypothesis testing, and evaluate impact assessment by running a Structural Equation Modeling (SEM).

3. Results

The reliability of the scale is assessed by Cronbach's Alpha analysis (Table 1) on the preliminary survey sample and the overall Cronbach's alpha coefficient is 0.890 and the Cronbach's alpha if item deleted coefficient is between 0.565 and 0.778. The final results show that the value scales of the groups of factors are reliable and the data correlation is consistent with the built scales, satisfying the criteria and can be used for EFA which helps to assess the convergence and distinguish the value of the scale. The KMO and Bartlett test in the 1st EFA testing show that the hypothesis of correlation between variables can be rejected (Sig.= 0.000). The KMO coefficient = 0.936 (> 0.5) indicates that EFA can be used.

Analyzing factors according to Principal components with Promax rotation. The results showed that 31 observed variables were initially grouped into 5 groups. Total value of variance extracted = 61.863% > 50%: passed; then it can be said that these 5 factors explain 61.863% of the variability of the data. The Eigenvalues of the factors are all high (>1), the fifth factor has the lowest Eigenvalues of 1,956 > 1.

After removing 3 factors with factor loading less than 0.5. The results show that 29 observed variables are grouped into 05 groups. Total value of variance extracted = 60.751% > 50%: satisfactory. This proves that 60.751% of the variation of the data is explained by 5 factors. The Eigenvalues of all factors are high (>1), the 5th factor has the lowest Eigenvalues of 1,799 > 1. The factor loading coefficients of 29 observed variables are all greater than 0.5 and there is not any variable that uploads both factors at the same time with a load factor close to each other, so the factors are guaranteed to have convergent values and differentiated in EFA analysis.

Table 4: Table to check the reliability of the scale

Factors	Cronbach's Alpha	Correlation Coefficient	Variable type
Perceived easy of use (PEU)	0,867	0,725-0,738	0/5
Perceived of Usefulness (PU)	0,911	0,722-0,777	0/6
Perceived of flexibility (PF)	0,928	0,652-0,778	0/9
Social Norms (SN)	0,864	0,647-0,688	0/5
Mobile application variety (MAV)	0,891	0,666-0,731	0/6
Intention of using (IU)	0,821	0,626-0,715	0/3
Intention of visiting (IV)	0,778	0,565-0,641	0/3

Bartlett's test is significant (Sig. < 0.05), and it can be used for Confirmatory Factor Analysis (CFA). The research team obtained the results after analyzing CFA illustrated with the Table 2 below:

Table 5: Model Fit Rating Index

	Index	Rate
Chi-square/df (CMIN/DF)	1,594	Acceptable (<2)
RMSEA	0,034	Good (<0,06)
CFI	0,969	Good (>0,9)
GFI	0,912	Very good (>0,9)
PCLOSE	1,0000	Good (>0,05)

The results show that Chi square/df= 1.594 (< 2) is good; TLI = 0.966; CFI = 0.969, GFI = 0.912; RMSEA= 0.034 (<0.06). It can be said that the model is appropriate to the research data. The authors execute the analysis of Structural Equation Modeling (SEM) to analyze multidimensional relationship between dependent and independent variables in the model, the obtained result are show in Figure (2) and Table (3).

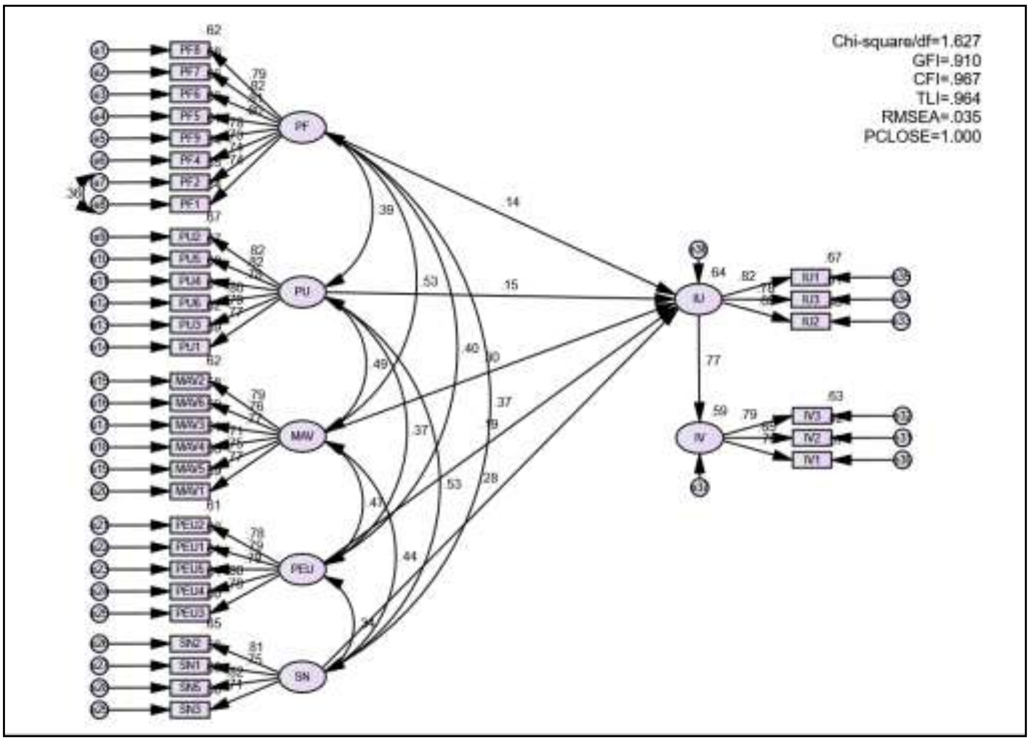

Figure 3: Final Standardized SEM Model

The factors "Perceived Ease of Use"; "Perceived Usefulness"; "Perceived of Flexibility"; "Social Norms"; "Mobile Application Variety" positively affects the factor "Intention of using"; The factor "Intention of using" has a positive influence on the factor "Intention of visiting". All relationships have p<0.05.

Thus, it can be concluded that the above relationships are statistically significant, or accepted at the 95% statistical reliability.

Table 6: Summary of Test Results

Hypo thesis		Estimate	P-Value (Sig)	Result
H3	Intention of using <--- Perceived of Flexibility	0,100	0,002	Accept
H2	Intention of using <--- Perceived of Usefulness	0,107	0,002	Accept
H5	Intention of using <--- Mobile application variety	0,221	0,000	Accept
H1	Intention of using <--- Perceived Ease of Use	0,148	0,000	Accept
H4	Intention of using <--- Social Norms	0,193	0,000	Accept
H6	Intention of visiting <--- Intention of using	0,851	0,000	Accept

The independent variable “Mobile application variety” (MAV) has the strongest impact on the dependent variable, followed by the independent variable “Social Norms” (SN) and finally the variable “Perceived Ease of Use” (PEU). In fact, it is only those who have the need to visit tourist attractions that they intend to find and use mobile applications. Research results show that it is necessary to propose more solutions to help mobile applications meet more needs. The role of mobile applications affects a significant part of tourists' decision to choose a destination, so there need to be many improved solutions for businesses operating mobile applications to attract tourists. People intend to visit more tourist attractions. And reach people who intend to visit at tourist sites through mobile applications.

The R2 value of the dependent variable IU, executed based on SEM analysis, is 0.639. Thus, the independent variables explain 63.9% of the variation of the IU variable. The R2 value of the dependent variable IV is 0.587. Thus, the independent variable IU explains 58.7% of the variation of variable IV.

4. Discussion and Conclusion

Combined model of TPB and TAM (Taylor & Todd, 1995), the authors propose a model of six influencing factors of tourism support applications to tourists' behavior of visting destination: Perceived Ease of Use (PEU); Perceived Usefulness (PU); Perceived of Flexibility (PF); Social Norms (SN); Mobile Application Variety (MAV) and Intention to Use tourism support application (IU).

According to the analysis results from the SEM model, the factor "Mobile Application Variety (MAV)" is the factor having the strongest impact on the Intention of Using tourism support applications (IU) to select destinations. come. At the same time, the results also test the influence of the factors on the Intention to Visit tourism destinations (IV) according to the equation below:

$$\mathbf{IV = 0.851IU + 0.193SN + 0.148PEU + 0.221MAV + 0.107PU + 0.100PF}$$

From there, the authors make four priority recommendations as below:

Firstly, mobile-commerce companies should regularly update new versions for tourism applications. In addition, in order to catch up with the current trend, mobile commerce companies should apply more diverse and intelligent technologies to technology applications.

Secondly, the enterprises should pay more attention to the user's feelings in the journey of using mobile applications, regularly have customer loyalty programs, remind customers about the application.

Thirdly, the enterprises that need to design a website and mobile application interface for tourism that is friendly, easy to understand, and easy to use for users.

Last, the enterprises should promote the promotion of outstanding features of tourism applications for consumers such as helping customers save their time, convenience for booking hotel, train tickets, air tickets. At the same time, special attention should be paid to compatibility so that the application can operate smoothly on different mobile devices.

When the Covid-19 pandemic is strictly controlled, the authors expect to expand the survey objects, especially foreign tourists and continue to develop and research complementary topics such as "Factors affecting tourists' intention to visit destinations in Vietnam", to correct shortcomings or points that the group's main topic has not explored. The authors hope that the results of this study will be applied in practice, as a reference for other topics in the future, and contribute to the development and launch of tourism support applications in the future.

Abstract

This paper examines the Fear of Missing Out (FOMO) and its influences on purchase intention of Hanoi undergraduates during sales promotional events on E-commerce platforms. The research findings show that FOMO is determined by anticipated elation, anticipated envy, comforting rationalization and herd behavior. The research also finds the positive impact of FOMO on consumers' purchase intent. Thereby, implications are given to marketers in order to take full advantage of FOMO marketing appeals when it comes to applying on sales promotional events.

Keywords: *E-commerce, Fear of Missing Out, FOMO, purchase intention, sales promotion.*

1. Introduction

As Vietnam adapts to the “new normal”, consumers have steadily altered their buying patterns from face-to-face transactions to online purchases via e-commerce platforms. This trading platform, which has become a major way of supporting social life, is one of the digital economy's pioneering industries, adding to corporate competitiveness (VECOM, 2020). Given this scenario, firms operating on e-commerce platforms must constantly have unique plans in place to build and strengthen trade promotion activities that will help them establish competitive advantages for their products. The most common method is for firms to provide consumers with particular perks when they purchase their items - this is known as promotional activities (Truong Hoang Len, 2018). Currently, promotional events on special occasions such as 11/11 or Black Friday are among the most successful ways to boost sales and attract consumers. As a result, businesses must upgrade their conventional marketing strategies and, in particular, utilize psychological effects to meet Industry 4.0 in order to trigger clients' purchase requirements right at the moment of visiting the boot, among which FOMO (Fear of Missing Out) is one psychological effect that can be made use of. In the scope of this research, FOMO is identified as a factor that boosts customers' purchasing intent. The effective use of FOMO in promotional events has been proved to result in a significant increase in revenue. Furthermore, as the Internet has grown in popularity, individuals have begun to check their mobile devices on a daily basis to ensure that they do not miss any important information or events taking place around them. The utilization of social media utilities has made it simpler than ever to learn about the variety of online and offline social activities one may participate in, which has increased the Fear of Missing Out, particularly among millenials (Przybylski et al, 2013). Despite the fact that FOMO is a well-known phenomena in modern society and the popular press throughout the world, it hasn't been fully explored, leveraged and exploited in Vietnam. As a result, the goal of this study was to conduct an in-depth research on FOMO in the context of Vietnam in order to provide a deeper understanding of this psychological effect. Based on the process of assessing and synthesizing prior studies, this research focuses on analyzing and demonstrating the factors affecting consumers' Fear of Missing Out, as well as the impact of FOMO on purchase intention. Implications, thereby, are given in order for marketers to fully exploit FOMO marketing appeals when it comes to applying on sales promotional events.

2. Literature Review

2.1. Previous studies

Many different studies regarding FOMO and the effects of FOMO on human intentions and behavior in numerous aspects have been conducted up till 2020. Those studies, on the other hand, have mostly concentrated on understanding the mechanism of formation and development of a FOMO scale depending, for example, people attending events, concerts, and addiction to cell phones and social media. The association between FOMO and purchase intention or behavior has mostly been described in terms of luxury products or services. Przybylski et al (2013) published "Motivational, emotional, and behavioral correlates of fear of missing out," which effectively developed 10 scales for FOMO and demonstrated the relation between FOMO and emotional, behavioral, and demographic aspects. However, there has not been much research on the impact of FOMO on purchase intent in the context of common-goods at promotional events. Moreover, up to now, few studies relating to the influence of FOMO on purchases on e-commerce platforms are found, which are currently prominent issues.

As far as the authors know, there is presently no formal research on FOMO in

Vietnam. The majority of them are brief or superficial articles published in newspapers, magazines, or personal blogs, whose theories are mostly translated from foreign research and secondary data sources drawn from those studies. As a result, the writers have a strong incentive to do the research.

2.2. Literature review

In this article, the term FOMO refers to an individual's anxiety about missing out on purchase opportunities during sales promotional events on an e-commerce platform that other people are taking part in. An in-depth analysis of the definition of FOMO shows three main stages of FOMO: Stage One – Awareness of Opportunities (major promotional event); Stage Two – Arousal of emotions (excitement, fear of missing out); Stage Three – Alleviating the negative tension (by forming purchase intention and then purchase behavior) (Zi Cheng Wesley Lim, 2016).

In the case of online shopping, a sales promotion is a form of substantial discount provided for a short period on e-commerce websites for certain items (Kaaviya R, n.d). An online flash sale, for example, is a mix of the following four principles: (1) Well-known brands at deeply discounted prices, (2) a limited number of products, (3) for a limited time, and (4) making exclusive offers to website members (Ayadi et al, 2013). As a result, the tendency of FOMO of consumers is examined in this study in light of two different scarcity messages: limited supply scarcity and limited time scarcity.

Purchase intention is indicated as a measure of customer's willingness to purchase a product (Ajzen, 1991) or defined as what a person thinks they will buy (Tirtiroglu & Elbeck, 2008). According to Javadi et al (2012), the intention of making an online purchase is based on external factors from which consumers synthesize, evaluate, choose and decide whether or not to buy such products from sellers on the Internet (electronics stores). This paper focuses on purchase intent during significant promotional events on e-commerce platforms. Accordingly, purchase intent is defined as a state of awareness about promotional events and the desire to make a purchase at these events due to the impact of FOMO.

This paper determines and assesses four factors affecting customers' fear of missing out: (1) Anticipated Elation (AE), (2) Anticipated Envy (AEnvy), (3) Comforting Rationalization (ComRat), and (4) Herd Behavior (HB), and examines the link between FOMO and purchase intention. In specific, anticipated elation, anticipated envy and herd behavior are believed to positively influence FOMO, whereas comforting rationalization is believed to negatively influence FOMO. In addition, both FOMO and herd behaviour have a positive influence on the purchasing intention of consumers in big promotional events on e-commerce platforms.

(i) Anticipated Elation (AE)

Anticipated elation is a euphoric emotion associated with assessment of the value of an imaginary transaction (Brandstatter & Kriz, 2001). In this case, anticipated action might stimulate excitement in the next event (e.g., purchasing things at a discounted price during a large promotional event) (Mandel & Nowlis, 2008). Similarly, an invitation with the implication of a FOMO-laden appeal creates positive expectations about experiencing an event while simultaneously suggesting the possibility of missing out on that event, which will cause anxiety regarding FOMO and other states to consumers (Mandel & Nowlis, 2008). Accordingly, in this study, the fact that an individual feels excited about the promotional event on an e-commerce platform will likely increase the fear of missing out on attractive discounts.

(ii) Anticipated Envy (AEnvy)

Subjective conjecture in interpersonal relationships leads to envy, which manifests as worry, fear, grief, and acute anxiety (Baker et al. 2016; Elhai et al. 2016). FOMO is a syndrome characterized by feelings of envy, worry, self-doubt, and a gnawing sensation of inadequacy (Tomczyk and SelmanagicLizde 2018). In addition, consumers make decisions in order to maximize benefits or boost their self-esteem (Yen et al., 2013). Therefore, "envy" from others is one of the significant aspects in helping customers fulfil that demand of benefit optimization and increase in self-esteem (Good & Hyman, 2020). Inducing envy in others, such as through consumption, may also promote purchase intent (Hyman et al., 2002; Van de Ven et al., 2011). Anticipating the envy from others or jealousy of others' accomplishments can increase FOMO when consumers consider buying during the big promotional event in which a lot of people are participating at that moment. Based on the research model of Megan C. Good and Michael R. Hyman (2020), the authors propose that FOMO will increase when customers believe they will be envied by others whenever considering purchasing at a big promotional event attended by a large number of people.

(iii) Comforting Rationalization (ComRat)

Comforting rationalization is comforting arguments that refer to "events and experiences you are afraid to miss out on that don't really matter." Comforting rationalization in the context of FOMO entails adopting a pessimistic attitude and doing a cost-benefit analysis in order to minimize enjoyment while accepting other alternatives in order to obtain satisfaction (Megan C. Good & Michael R. Hyman, 2020).

(iv) Herd Behaviour (HB)

In this study, herd behavior is examined on two aspects: Normative Herd Behavior and Informational Herd Behavior (Inwon Kang et al., 2020). Consumers are positively impacted by others' interests and behaviors in terms of obtaining information, comprehending reality, maintaining relationships, and developing their own values (Wood & Hayes, 2012). Furthermore, Zi Cheng Wesley Lim (2016) outlined the moderating function of the two components "informational" and "normative" in consumer susceptibility to interpersonal influence (also referred to as herd behavior) when validating the relationship between tendency towards FOMO and purchase intention. The research also found that one's purchase intention and behavior or brand preference are influenced by purchase decisions from those around him/her.

3. Method

The study employs qualitative and quantitative methods to accomplish the research objectives. While the qualitative method is used to explain the feasibility of applying the research model in Vietnam, the quantitative method is used to test the research hypotheses. Primary and secondary data are both used in this study.

3.1. Research model and hypotheses

Based on the research model of Megan C. Good & Michael R Hyman (2020) together with the theoretical synthesis of related previous studies, as well as the consultation of experts conducted by qualitative interviews, the research model and hypotheses are proposed

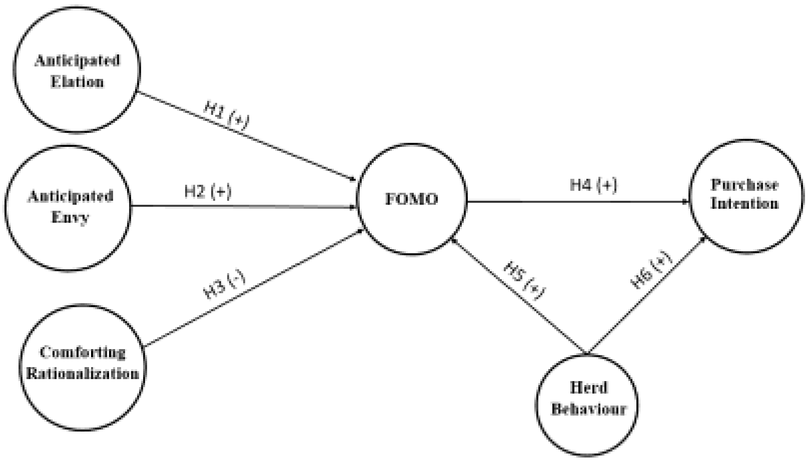

Figure 3.4 - Proposed research model

Source: Authors, 2021

as follows:

The impacts on FOMO in the context of big promotional events on e-commerce platforms:

H1: Anticipated elation has a positive effect on FOMO when customers make online purchases during big promotional events on e-commerce platforms.

H2: Anticipated envy has a positive effect on FOMO when customers make online purchases during big promotional events on e-commerce platforms.

H3: Comforting rationalization has a negative effect on FOMO when customers make online purchases during big promotional events on e-commerce platforms.

H4: Herd behavior has a positive effect on FOMO when customers make online purchases during big promotional events on e-commerce platforms.

The impacts on purchase intention in the context of big promotional events on e-commerce platforms:

H5: FOMO has a positive effect on purchase intention when customers make online purchases during big promotional events on e-commerce platforms.

H6: Herd behavior has a positive effect on purchase intention when customers make online purchases during big promotional events on e-commerce platforms.

3.2. Procedures

First, the authors carried out a qualitative research through two interviews: (1) interviewing marketing experts and e-commerce experts in person by giving related questions which helped show the rationality of the variables and develop the research hypotheses; (2) in-depth group interviews about the direct research subjects related to 06 topics with the goal to assess the relevance of the research variables and scales.

Next, the authors conducted quantitative research by collecting primary data through an online questionnaire survey with the interviewees who are the undergraduates at universities in Hanoi. After 17 days (from February 18 to March 6, 2021), the authors collected 503 online responses with 472 qualified responses for further analysis. The objective of the quantitative research is to test the research model and hypotheses as well as determine the reliability of the variables that are measured.

3.3. Data collection and analysis

Secondary data for the study were collected from research papers, academic theses, and journals officially published nationally and internationally. Based on these materials, the authors analyzed, researched, compared and synthesized to establish the proposed research model and the scale for the variables.

Primary data were collected from both qualitative and quantitative research with the aim of identifying variables and testing the model. Due to the impact of the COVID-19 pandemic, primary data collection was mainly done through online questionnaire surveys on social networking platforms such as Facebook and Zalo. The authors also sent the questionnaire surveys to experts and posted them on forums in which there were potential candidates from a number of universities in Hanoi. Then, the collected data were processed using SPSS 22.0 and SmartPLS 3.0. Cronbach's Alpha reliability test, exploratory factor analysis, SEM analysis techniques were used to test the data, determine how the variables are measured and the relevance of the research model and hypotheses.

4. Results

Cronbach's Alpha Reliability Test

Analysis results of internal consistency is presented in Table 4.1. Values of Cronbach's Alpha range from .817 to .893, meaning that the internal consistency is good. In other words, indicators in each variable reflect the same underlying entity.

Table 4.1 Analysis of Internal Consistency

Variables	Cronbach's Alpha	Number of items
Anticipated Elation (AE)	0,856	5
Anticipated Envy (AEnvy)	0,861	3
Comforting Rationalizations (ComRat)	0,893	4
Fear of Missing Out (FOMO)	0,872	5
Herd Behavior (HB)	0,817	4
Purchase Intention (PI)	0,822	3

Source: Authors, 2021

Exploratory Factor Analysis

The results of exploratory factor analysis (EFA) stop at the first rotation. The analysis results show that the factor loading of all factors are greater than 0.5. Kaiser-Meyer-Olkin measure of sampling adequacy is 0.898. P-value of Bartlett's test of Sphericity is 0.000. Total variance extracted is 62.536%. Therefore, all variables are kept and qualified for further analysis.

Table 4.2 KMO and Bartlett's Test of Sphericity

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.898
Bartlett's Test of Sphericity	**Approx. Chi-Square**	5953.975
	df	276
	Sig.	.000

Source: Authors, 2021

Structural Equation Modeling

Test of measurement model shows that composite reliability coefficients (CR) are greater than 0.7 and the average variance extracted (AVE) is greater than 0.5 with anticipated elation (AE) having the least value of 0.638. The VIF values are less than 5 in the collinearity test with the greatest value of 2.692. Test of structural model shows that Chi-square coefficient is 895.448 and the p-value is 0.000. Moreover, according to Hulland (1999), the model is regarded to be in agreement with the data if SRMR is less than 0.1. As a result, the research model is found to be acceptable for the study area in Hanoi, with SRMR of 0.061.

Regression test 1: the influence of Anticipated Elation (AE), Anticipated Envy (AEnvy), Comforting Rationalizations (Comrat) and Herd Behavior (HB) on Fear of Missing out (FOMO).

Table 4.3 Model Summary of regression test 1

Model	**R Square**	**Adjusted R Square**
	0.467	0.462

Source: Authors, 2021

Table 4.4 Coefficients of regression test 1

Model	**Unstandardized Coefficients**		**t**	**Sig.**
	Beta	**Standard Deviation (STDEV)**		
AE → FOMO	0.349	0.046	7.494	.000
AEnvy → FOMO	0.171	0.040	4.357	.000
ComRat → FOMO	-0.290	0.036	7.668	.000
HB → FOMO	0.272	0.044	6.326	.000

Source: Authors, 2021

The results of hypothesis test through SEM analysis show that R-square is 0.467, indicating that the factors in the study account for 46.7% to the change of FOMO. The Beta coefficients of AE, AEnvy, Comrat and HB to FOMO are 0.349, 0.171, -0.290 and 0.272 respectively with independent variables in the study model statistically significant at the level of 5%.

Regression test 2: the influence of Fear of Missing out (FOMO) and Herd Behavior (HB) on Purchase Intention (PI).

Table 4.5 Model Summary of regression test 2

Model	**R Square**	**Adjusted R Square**
	0.342	0.339

Source: Authors, 2021

Table 4.6 Coefficients of regression test 2

Model	Unstandardized Coefficients		t	Sig.
	Beta	Standard Deviation (STDEV)		
FOMO → PI	0.460	0.041	11.337	.000
HB → PI	0.210	0.054	3.495	.000

Source: Authors, 2021

The results of hypothesis test through SEM analysis show that R-square is 0.342, indicating that the factors in the study account for 34.2% to the change of PI. The Beta coefficients of FOMO and HB to PI are 0.460 and 0.210 respectively with independent variables in the study model statistically significant at the level of 5%.

In summary, results of regression analysis are shown in **table 4.7.**

Table 4.7 Summary of overall findings

Hypothesis		Unstandardized Coefficients	t-test	P-value	R-quare	Results
H1	AE → FOMO	0,349	7,578	0,000	46.7%	Supported
H2	AEnvy → FOMO	0,171	4,269	0,000		Supported
H3	ComRat → FOMO	-0,290	7,977	0,000		Supported
H4	HB → FOMO	0,272	6,159	0,000		Supported
H5	FOMO → PI	0,460	11,252	0,000	34.2%	Supported
H6	HB → PI	0,210	3,905	0,000		Supported

Source: Authors, 2021

Based on the finding analysis, the authors are able to prove (1) Anticipated elation has a positive effect on FOMO when customers make online purchases during big promotional events on e-commerce platforms; (2) Anticipated envy has a positive effect on FOMO when customers make online purchases during big promotional events on e-commerce platforms; (3) Comforting rationalization has a negative effect on FOMO when customers make online purchases during big promotional events on e-commerce platforms; (4) Herd behavior has a positive effect on FOMO when customers make online purchases during big promotional events on e-commerce platforms; (5) FOMO has a positive effect on purchase intention when customers make online purchases during big promotional events on e-commerce platforms; and (6) Herd behavior has a positive effect on purchase intention when customers make online purchases during big promotional events on e-commerce platforms.

5. Discussion and Conclusion

The researchers introduced a framework that shows the impact of FOMO on purchase intention of discounted items on e-commerce platforms in Vietnam. The implementation of the research review and the actual survey of the author's team has shown and proved (1) Anticipated elation, anticipated envy, comforting rationalization, and herd behavior have positive/negative impacts on Fear of Missing Out; and (2) Fear of Missing Out and herd behavior have positive influences on purchase intention.

This paper will go through two groups of hypotheses in the study as follows.

Group 1: The relationship between Anticipated elation, Anticipated envy, Comforting rationalization, Herd behavior and FOMO.

The research findings show that anticipated elation, anticipated envy, and herd behavior have multiple regression results on FOMO of 0.349, 0.171, and 0.272 respectively. These findings prove that the three factors have positive and significant impacts on FOMO. Comforting rationalization, on the other hand, has the multiple regression result on FOMO of -0.290. This finding prove that this factor has a negative and significant impact on FOMO.

Anticipated elation, as the most direct factor influencing FOMO according to this research's findings, can be properly understood and leveraged by marketers by: (1) promoting the enjoyment of the experience rather than the products themselves; (2) creating striking images and messages; and (3) convincing customers to predict positive future consumption outcomes.

Although anticipated envy is the lowest among the four factors affecting FOMO ($\beta = 0.171$), that consumers predict themselves will make others jealous when owning a product at an affordable price with accompanied gifts also urges them not to miss out the opportunity to purchase the product. Marketers can (1) arouse consumers' competitiveness and self-expression, (2) publish a specific number of people who have won the opportunity to buy a good product at a good price, or the number of people who have a desire to own that product, (3) encourage customers to share the "results" they have obtained in each promotional event on their personal social networks.

According to the findings, comforting rationalization, with the coefficient of -0.290, reducing the effect of fear of missing out. Although this factor can be harmful to businesses when using FOMO marketing strategies, if marketers know how to use them effectively and control them appropriately, they can still elicit purchase intentions from customers by (1) reducing alternatives and (2) emphasizing the value that customers can receive when they participate in the promotional event.

Group 2: The relationship between FOMO, Herd behavior and Purchase intention.

The research findings show that FOMO and herd behavior have multiple regression results on purchase intention of 0,460 and 0,210 respectively. These findings prove that the two factors have positive and significant impacts on purchase intention.

The research shows that FOMO positively influences Purchase intention, which coincides to the findings of the previous studies (Zi Cheng Wesley Lim, 2016; Good &

Hyman, 2020). The authors, however, are able to prove the direct impact of FOMO to purchase intention.

The results showing the impact of herd behavior on purchase intent do not demonstrate a strong influence purchase intention as compared to the other factors. This may be because when asking others about a product, individuals will have more knowledge about it. However, this does not necessarily lead to the customer's purchase intention because information about the product can be either positive or negative.

Thereby, based on FOMO, marketers can (1) convey scarce messages about time and product availability, (2) emphasize what customers are about to miss, and (3) design an e-commerce website as a social network. Based on herd behavior, marketers can (1) encourage customers to comment or recommend the purchased products, (2) build functions on the e-commerce platform to inform about purchasing status of customers' friends, however, when taking this measure, businesses need to be careful in using consumers' private information, and (3) ncrease the credibility of herd behavior by ensuring product quality, which means product quality must coincide to the advertisement.

Further research can expand the scope of the study to include other types of customers so that differences in psychology and in the relationship between FOMO and purchase intent, if any, can be easily compared. Future research should also focus on specific industries, such as luxury goods, or broaden the scope of the study beyond the commercial context. Furthermore, herd behavior should be taken into account and measured as a moderating variable that influences the relationship between FOMO and purchase intent.

Abstract

HRM (Human Resource Management) is the human resource management software in enterprises. HRM is considered an important and necessary tool for integration, but so far, the use of this software in Vietnamese insurance enterprises is still very low. With 170 valid questionnaires, the author conducted Cronbach's Alpha analysis for the scale. The results of multivariate regression and ANOVA show that all four components: Trust, perceived usefulness, perceived ease of use, and implementation cost affect the intention to use HRM software in Vietnamese insurance enterprises. The research team has also determined that these factors have a positive impact on the intention to use HRM in enterprises at different levels. The analysis results have served as a basis for proposing recommendations such as raising awareness about HRM software, changing the mindset of the leadership, or focusing on training human resources to use software that should be given top priority.

Keywords: *Insurance enterprises, intention, HRM, Vietnam,*

1. Introduction

Management and development of high-quality human resources in insurance enterprises are facing two difficulties: shortage of qualified human resources, and ineffective talent retention policies and methods. The recruitment of non-professional human resources, in addition to incurring many costs such as knowledge training cost and soft skills development cost, has a lower attachment likelihood of employees who work in different fields than their majors compared to those who work in the fields similar to their majors.

The situation in which qualified and highly appreciated human resources in insurance enterprises change their jobs after a period of attachment is quite common nowadays. Development of a fair remuneration and capacity assessment mechanism for human resources is one of the effective measures in management and also an urgent issue that needs to be implemented in enterprises. Human resource management (HRM) software applies technology that helps enterprises manage their human resources comprehensively and professionally, from building organizational structure, managing HR records, recruiting, training, to assessing human resources through KPIs… HR information is shown specifically through specific reports to help HR departments and enterprise owners have appropriate strategies for their enterprises. Although HRM brings many benefits in human resource management, so far, many insurance enterprises have not yet put this support tool into serving human resource management at their enterprises. So, what factors affect the application of HRM software in Vietnamese insurance enterprises today?

2. Literature Review

2.1. Theoretical foundations

Today, the role of human resource management is increasingly important because of the fierce competition and the increasing skills level of employees. Gray matter, knowledge, and experience of these employees will be a decisive factor for the competitiveness of enterprises and also a challenge for managers to create favorable conditions and environment for this team to develope and devote. Along with the development of information technology, HRM software was born to better support enterprises in managing enterprise resources. HRM provides basic functions such as developing human resource strategy, recruiting the right people, for the right positions, managing, evaluating and rating employees, building, developing and retaining talented people, complying with labor laws and handling labor disputes. Recognizing the advantages of HRM software, many Vietnamese enterprises have applied and achieved many positive results. Although the benefits of using a HRM software solution have been proven in many enterprises, the implementation of HRM software depends on many factors. In addition to the implementation costs such as operation and user training, the application degree of enterprises also greatly affects the royalty fee. Furthermore, there is an influence of the users themselves, for example, they do not want to absorb new applications or have not attached great importance to the development of information technology.

In 1989, Davis introduced the Technology Acceptance Model (TAM) under the influence of perceived ease of use and perceived usefulness of technology on attitudes towards technology use. TAM is based on the Theory of Reasoned Action (TRA) described by Fishbien & Ajzen (1975) and the Theory of Planned Behavior (TPB) proposed by Ajzen (1991). To apply the technology acceptance model in research, we need to consider whether the components are suitable or not. According to Davis, perceived usefulness is the degree to which a person believes that using a particular technology would enhance his/her job performance. Accordingly, he also divided these statements into three groups: efficiency, productivity, and the importance of system to job. Next, the perceived ease of use factor is defined as the degree to which a person believes that using a particular technology would be free from effort, and he also identified it through three groups of factors including physical effort, mental effort, and expectation about personal experience that enables ease of use of the system.

HRM system is a kind of management software solution and an electronic technology product. Therefore, it is appropriate to apply TAM to study the factors affecting the application of HRM software in Vietnamese insurance enterprises. According to Davis, the intention that shapes the use of a technology product is based on trust, perceived usefulness, and perceived ease of use. The degrees of impact and proposed hypotheses are as follows:

Impact of trust. According to Yousafzai et al. (2003) in their study of e-trust model, the higher the trust, the lower the perceived risk, and users will have a positive view of the electronic system. If users does not have the trust, the use of HRM software will not occur. The first hypothesis (H1) is proposed as follows: When trust is assessed to increase or decrease, the intention to use HRM software in Vietnamese insurance enterprises will increase and decrease correspondingly.

Impact of perceived usefulness. Davis argues that perceived usefulness is the degree to which a person believes that using a particular technology would enhance his/her job performance. The second hypothesis (H2) is proposed as follows: When perceived usefulness is assessed to increase or decrease, the intention to use HRM software in Vietnamese insurance enterprises will increase and decrease correspondingly.

Impact of perceived ease of use. According to Davis, perceived ease of use is the degree to which a person believes that using a particular technology would be free from effort. The third hypothesis (H3) is proposed as follows: When perceived ease of use is assessed to increase or decrease, the intention to use HRM software in Vietnamese insurance enterprises will increase and decrease correspondingly.

In addition, the author proposes one more hypothesis, which is the implementation cost. The major problem that still exists in enterprises today is the funding problem. The implementation of HRM software, in addition to large funds, requires enterprises to have appropriately trained human resources. All of these factors require funding. The fourth hypothesis (H4) is proposed as follows: When the implementation cost is assessed to increase or decrease, the intention to use HRM software in Vietnamese insurance enterprises will increase and decrease correspondingly.

2.2. Scale development

Based on the Technology Acceptance Model (TAM) and additional hypothesis, the author has designed a survey questionnaire to assess the impact of the four factors: trust, perceived usefulness, perceived ease of use, and implementation cost on the intention to use HRM software in Vietnamese insurance enterprises. The scale, after being adjusted according to professional advice of experts implementing HRM software and opinions of surveyed enterprises, includes 16 observed variables. The scale uses 5-point likert with 5 being completely agree, and 1 being completely disagree. The symbol and content of each variable are synthesized by the research team and shown in Table 2.1.

Table 2.1: Observed variables of factors affecting the application of HRM software in Vietnamese insurance enterprises

Scale and symbol	Observed variable name
Trust (TT)	
TT1	HRM is a software that has good security and users do not have to worry about business data leaks
TT2	Using HRM software brings better efficiency in human resource management of enterprises
TT3	HRM helps enterprises develop sustainably
Perceived usefulness (NTHI)	
NTHI1	HRM software helps enterprises manage all human resource operations
NTHI2	HRM software helps enterprises arrange human resources in the most efficient way
NTHI3	Using HRM software helps increase operational efficiency of enterprises
Perceived ease of use (DSD)	
DSD1	Employees can learn how to use HRM software easily
DSD2	Modules on HRM are clear and easy to understand
DSD3	Departmental employees can quickly master functional components of HRM
DSD4	Employees can master the use of HRM software when they see others using it
Implementation cost (KP)	
KP1	Enterprises focus on investing in quality management of human resources
KP2	Enterprises always prioritize funding to implement enterprise human resource management software
KP3	Do you think that the funding for information technology development in enterprises ensures these activities
Intention to use (YD)	

YD1	HRM software meets the requirements of enterprises' human resource management
YD2	I will use HRM software in enterprise human resource management
YD3	I will recommend HRM software to other enterprises

Source: Construction research team

3. Method

3.1. Data collection methods

Survey samples are taken by convenience method. Primary data is mainly collected by survey method, in which the first part is personal information that will be kept confidential during synthesis and processing, the second part is evaluation and scoring questions, and the last part is open-ended questions for enterprises participating in the survey about ideas to help enterprises apply HRM software. The questions are adjusted to accommodate the content of the study. In parallel with collecting primary data, in order to assess the difficulties and shortcomings in the implementation of HRM software in Vietnamese insurance enterprises, the research team also combines the secondary data collection method. The main sources of information are obtained from the enterprises' website about the application of software in business management.

3.2. Methods of analyzing collected data

Literature review method: Theoretical contents are selectively inherited from research results of published scientific works on contents related to the Technology Acceptance Model (TAM) and human resource management software in HRM enterprises.

Method of analysis and synthesis: The author analyzes and synthesizes data collected from primary and secondary data sources. The article applies quantitative research method. To test the theoretical foundations stated, the study conducted a survey of Vietnamese insurance enterprises. The study used descriptive statistical analysis software SPSS 22.0 to process the collected information.

Scale reliability testing: Based on the Cronbach's Alpha coefficient to detect unreliable indicators in the research process.

Exploratory factor analysis (EFA) aims to dissect and arrange indicators measuring latent concepts and variables.

Multivariate regression analysis and ANOVA aim to evaluate the role of each component in the model.

Processing of data calculating relative numerical indicators aims to specify the factors affecting the application of HRM software in Vietnamese insurance enterprises.

4. Results

4.1. Current status of application of human resource management (HRM) software in Vietnamese insurance enterprises

Currently, on the commercial insurance market nationwide, as of December 31, 2019, there are 66 insurance enterprises (including 30 non-life insurance enterprises, 18 Vietnamese insurance enterprises, 02 reinsurance enterprises and 16 insurance brokerage enterprises) and 01 branch of a foreign non-life insurance enterprise. Insurance is an industry with a high growth rate compared to other industries, with the average growth rate of the non-life and life sectors of about 15%/year and 20%/year, respectively (According to statistics of the Insurance Association of Vietnam). In addition to the inevitable development due to the stable income of the people and the increasing demand for protection, the development of insurance industry is resulted from the increase of economic, environmental and epidemic instability. Because of the increasing development trend of the market, the problem of human resources working in the fields similar to their majors has not yet been solved, which is becoming increasingly difficult. There is a shortage of qualified and skilled human resources in insurance enterprises more than ever. Technology application in human resource management is an inevitable trend for integration, especially in the era of industrial revolution 4.0. The enterprises that have used HRM in Vietnam are mainly large enterprises and joint ventures or 100% foreign-owned enterprises. The application of HRM software in human resource management is considered an important and necessary tool for sustainable development, but it is still not properly understood and appreciated in insurance enterprises. According to the survey questionnaire results, less than 10% of insurance enterprises use HRM software. The research results presented below will show the impact of each factor on the intention to use HRM software in Vietnamese insurance enterprises.

4.2. Research results

4.2.1. Scale reliability testing

Cronbach's alpha reliability testing is the first step to carry out exploratory factor analysis (EFA). Through processing the survey data, the author synthesized and made a table of scale reliability coefficient testing results. The data in Table 4.1 show that the minimum total variable correlation of the components of the scale ensures the level >0.5 which is suitable for the research purpose. Data on Cronbach's alpha coefficient, if eliminating (the largest) variable, is smaller than the Cronbach's alpha coefficient, ensuring concurrently satisfying both conditions for keeping the observed variables for the following analyses. With the data satisfying the requirements of the above reliability analysis, all variables included in the Cronbach's alpha analysis are kept for the following analyses.

Table 4.1. Scale reliability coefficient testing results

No.	Scale	Initial observed variable	Cronbach's Alpha	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted	Remaining observed variable
1	TT	3	0.909	0.798	0.891	3
2	NTSHI	3	0.929	0.815	0.927	3
3	DSD	4	0.876	0.676	0.862	4
4	KP	3	0.777	0.577	0.740	3
5	YD	3	0.903	0.799	0.869	3

Source: Survey data processing results

4.2.2. Exploratory factor analysis (EFA)

The author performed exploratory factor analysis for each component scale. Table 4.2 Synthesized results of exploratory factor analysis (EFA) for each scale show that the KMO (Kaiser-Meyer-Olkin) coefficient is >0.5 for all scales. Next, we can see the value Sig is < 0.05, which ensures the standard for all the scales of the independent variable components, the total variance explained is greater than 50% as prescribed and all converge on a single common factor, with all factor loadings being greater than 0.5. After completion of step one of the exploratory factor analysis, we obtain all the observed variables that are eligible to be included in the exploratory factor analysis.

Table 4.2. Synthesized results of exploratory factor analysis (EFA) for each scale

Scale	KMO coefficient	Sig	Total variance explained	Number of factors eliminated	Number of converging factors
TT	0.752	0.000	85.069	0	1
NTSHI	0.753	0.000	87.512	0	1
DSD	0.759	0.000	72.857	0	1
KP	0.696	0.000	69.264	0	1
YD	0.754	0.000	83.806	0	1

Source: Survey data processing results

The research has conducted factor rotation, showing that 13 observed variables of the independent variable converge on 4 factors including trust, perceived usefulness, perceived ease of use, and implementation cost. The dependent variable is the intention to use HRM software in Vietnamese insurance enterprises with all factor loadings being greater than 0.5.

4.2.3. Research model and hypothesis testing

To evaluate the connection and impact direction of the group of components including trust, perceived usefulness, perceived ease of use, and implementation cost, the study uses regression analysis method supported by SPSS software. The equation used in this study is a multivariable regression equation, aiming to determine the important role of each component in assessing the relationship between factors and the intention to use HRM software in Vietnamese insurance enterprises.

Table 4.3. Linear regression results

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	.780[a]	.609	.600	.65899	.609	64.248	4	165	.000

a. Predictors: (Constant), KP, TT, NTHI, DSD

b. Dependent Variable: YD

Source: Survey data processing results

Based on the linear regression results in Table 4.3, Adjusted R square = 0.6 (>0.5) shows that 4 components have an impact on the intention to use HRM software in Vietnamese insurance enterprises. Looking at the regression analysis results, we see that the preconditions for the regression analysis are satisfied. Thus, we can consider the regression analysis results to be reliable. However, this goodness of fit is only true for the sample data. To test whether the model can be inferred for the real population, we must test the model's goodness of fit:

Table 4.4: ANOVA testing

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	111.604	4	27.901	64.248	.000[b]
	Residual	71.655	165	.434		
	Total	183.258	169			

a. Dependent Variable: YD

b. Predictors: (Constant), KP, TT, NTHI, DSD

Source: Survey data processing results

The ANOVA testing results show that the F-test value reaches 64.248 at the significance level sig = 0.000 < α = 0.1. Thus, we reject hypothesis H0, accept hypothesis H1, that is, 4 components of independent variable including TT, NTSHI, DSD, KP, and dependent variable YD have relationship with each other. Therefore, the model fits the data set and can be generalized to the population.

Table 4.5: Results of multivariate regression model

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	.177	.244		.727	.468		
	TT	.169	.071	.149	2.382	.018	.606	1.649
	NTHI	.369	.063	.399	5.902	.000	.518	1.930
	DSD	.238	.077	.211	3.101	.002	.513	1.949
	KP	.248	.069	.203	3.615	.000	.749	1.334

a. Dependent Variable: YD

Source: Survey data processing results

The table of regression results shows that the regression coefficients of the factors TT, NTHI, TDSD, and KP all have positive signs and R = 0.780> 0 showing that the components including trust, perceived usefulness, perceived ease of use, and implementation cost have a positive impact on the intention to use HRM software in Vietnamese insurance enterprises. At the same time, the table of regression results also shows that the variance inflation factor VIF is <2, which meets the best conditions, proving that we do not have the problem of multicollinearity in this study. Thus, the regression equation for standardized Beta coefficients is as follows:

$$YD = 0.149TT + 0.399NTSHI + 0.211DSD + 0.203KP \quad (1)$$

Based on the equation (1), we see that the intention to use HRM software of Vietnamese insurance enterprises depends on four factors: trust, perceived usefulness, perceived ease of use, and implementation cost. The results also show that the biggest influencing factor is perceived usefulness. Perceived usefulness increases by 1, then the intention to use increases by 0.399. The second biggest factor influencing the intention to use HRM software is perceived ease of use with a beta coefficient of 0.211. Implementation cost ranks third with a beta coefficient of 0.203, and the last is trust with a beta coefficient of 0.149.

5. Discussion and Conclusion

The development of information technology is pushing enterprises that want to stand firm to constantly enhance the quality of management and improve the production process. HRM is the most comprehensive human resource management tool and solution available today. Therefore, the implementation of HRM in Vietnamese insurance enterprises is absolutely necessary. Based on the survey data results and the assessment of the impact of each factor on the intention to use HRM software in Vietnamese insurance enterprises, the author proposes some recommendations as follows:

First, enterprises providing and consulting HRM need to promote their consultation and introduction to raise awareness and understanding of the HRM system for enterprise leaders and users, helping them understand the benefits of the application of HRM in human resource management. The results from the multivariate regression model also show that the component that has the greatest impact on the intention to use HRM software in enterprises is perceived usefulness. It can be seen that the survey respondents all said that HRM software has not brought many benefits to enterprises, or in other words, the implementation cost does not bring commensurate efficiency. When enterprises provide software that helps customers realize the real benefits of the application, the intention to use HRM software in Vietnamese insurance enterprises will increase significantly.

Second, it is necessary to change the mindset of enterprise leaders. Due to the short establishment and development time, Vietnamese insurance enterprises lack a lot of things from finance, technology to people. It is these things that make enterprises not choose to invest in information technology first, even though it brings many benefits to enterprises. Currently, these enterprises mainly follow the traditional direction with each department having different software. Therefore, to solve this problem, it needs the determination of the business leadership team. By applying methods such as organizing exchanges on business forums or directly visiting enterprises that have successfully applied HRM software, it will help the leadership team of Vietnamese insurance enterprises have new awareness and thinking about the application of HRM software in management.

Third, it is necessary to train human resources to use HRM proficiently. User training is the most important factor affecting the successful implementation of HRM system in Vietnamese insurance enterprises. Typically, for most software projects, user training is often the last thing to be considered and often one of the first items to be cut down when a project starts to fall behind schedule; however, for HRM projects, enterprises need to avoid this. All users must be trained to take full advantage of the system's capabilities. It is important that users receive training early and regularly throughout the project. If possible, users should also participate in the HRM system commissioning

Fourth, implementation cost. Although this factor does not have a great impact on the intention to use HRM software in Vietnamese insurance enterprises today, it is also a positive factor. Therefore, the cost-benefit optimization should also be considered. Enterprises need to clearly define the necessary modules when surveying and implementing HRM in enterprises. Accordingly, implementing enterprises should choose a suitable HRM provider that can provide a HRM system with maximum flexibility and ease of customization. In such cases, time and costs can be minimized.

Abstract

The study aims to apply the supervised machine learning method to the classification of product review content in online customer comment mining. The entire study was conducted automatic data collection with 2,241 customer reviews on products on Lazada.vn, then trained with Supervised Machine Learning models to find the most suitable model with the training dataset and apply this model to predict the reviews content for the dataset. The results show that the machine learning methods, those are Support Vector Machines (SVM), Decision Tree (DT) and Neural Network (NN) have the best performance with classifying customer comments in Vietnamese. The research results have reference value for applications of comment mining in the field of online business.

Keywords: *Content classification, Comment classification, Using supervised machine learning.*

1. Introduction

With the advancement of information technology has changed the way communication makes it easy for customers to access information and exchange content about products and services on a large scale in real time. The advent of social networks and e-commerce websites allows customers to evaluate products online through comments, such as: Lazada.vn, shopee.vn, tiki.vn, etc (Ochilbek Rakhmanov, 2020). With the explosion of Big Data, the comment of the online community needs to be collected and exploited automatically, allowing merchants to track shopping customer behavior, detect customer preferences and support customers to buy products and services in the best way (MehdiGolzadeh & et al, 2021).

Content classification is an important step in machine learning to research and exploit online customer comments. Currently, there are many authors who have studied the method of content classification at different levels. From results of domestic and foreign studies, the author finds that there are two approaches to classifying online comment contents by machine learning method: (1) Supervised Machine Learning and (2) Unsupervised Machine Learning (Sun & et al, 2017). Research direction, the method of exploiting customer comment contents is not newest, however, each method has its own advantages and disadvantages, no method is considered to be absolutely accurate. This study applies a supervised machine learning method to classify online customer comment contents with automatically collected data sources, including 2,241 customer comments about products on the Lazada.vn website.

2. Literature Review

2.1. Exploit the customer comments

Exploiting customer comments is a field of research to analyze and evaluate customers' opinions on objects such as products, services, organizations, individuals, events, topics and their properties (Pang & Lee, 2008; Liu, 2012). A customer comment mining process typically consists of three main steps: (1) Comment Retrieval, (2) Content Classification, and (3) Comment Summarization (K.M. Kavitha & et al, 2020; Kumar & Reddy, 2016). In which, content classification is considered as the most important step for the purpose of classifying comment according to the following levels: Positive; Negative; and Neutral. According to Liu (2012), customer comments mining is divided into three levels: (1) Document Level, at this mining level, it is assumed that each document represents the comment content about a single entity. Therefore, the analysis will not be applicable to documents that cover many subjects; (2) Sentence Level, at this mining level, it is assumed that each sentence represents the content of an object, however, the analysis will ignore the sentences with many clauses, each of which represents comments on different subjects; and (3) the entity/aspect level, instead of exploiting the comment according to the linguistic structure (document, sentence, clause...), this level of analysis looks at the content in target, the target of the comment can be an object or an aspect (attribute) of the object. Today, with the explosion of Big Data, the exploitation of customer comments has become a great concern of businesses, especially companies with websites that allow users to respond on the internet. Customer comments mining can also be added to Recommender Systems to recommend products with positive comment and not recommend product categories that receive a lot of negative comment (Özlem & Tutku, 2021; Pang & Lee, 2008).

2.2. Customer comment contents classification using Supervised Machine Learning

Supervised Lachine Learning is a Computer Science technique for constructing a function from training data. The training data consists of pairs of input objects (usually vectors), and desired outputs. The output of a function is to predict a label for an object (Reynaldo & et al, 2019).

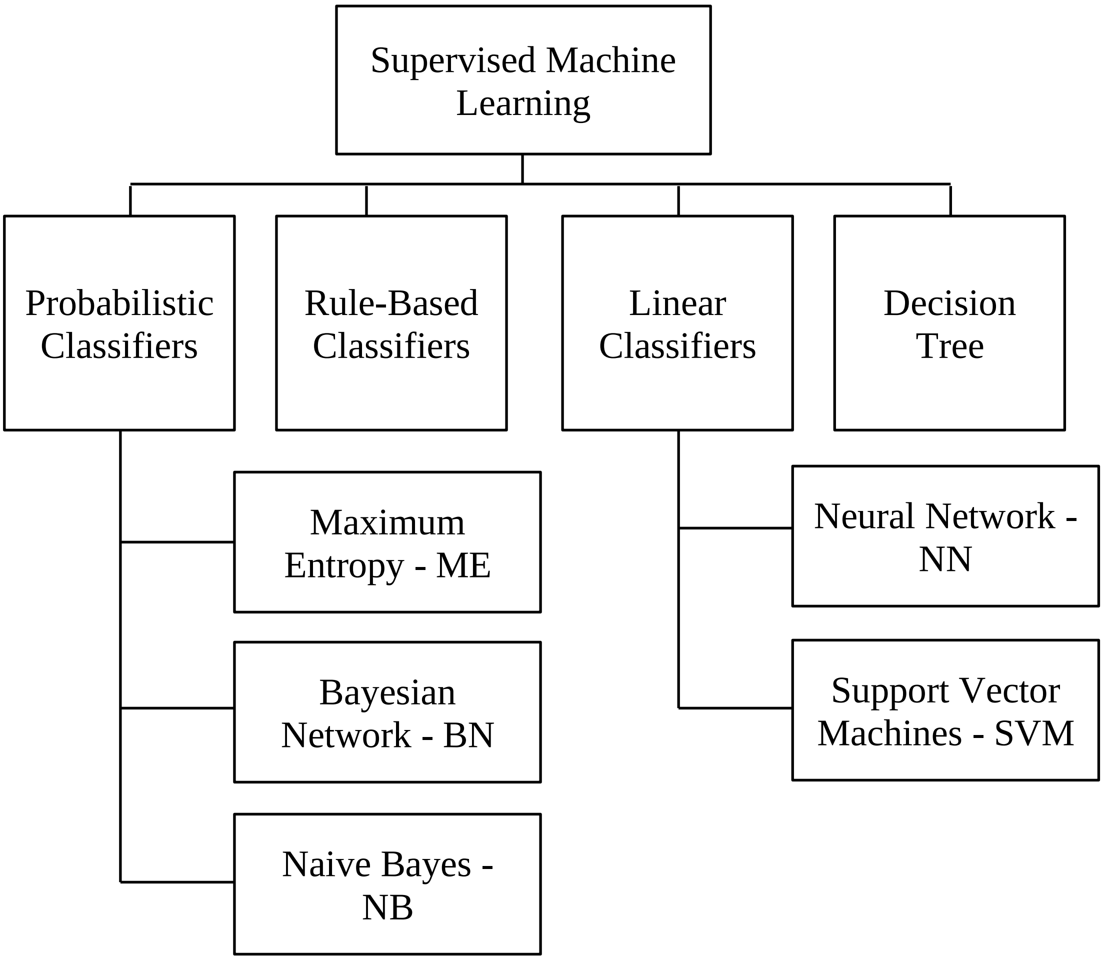

Figure 1: ***Customer comment contents classification using Supervised Machine Learning***

2.3. Some tools to support classification

No.	**Tool name**	**Uses**	**Reference resource**
1	Natural Language Toolkit (NLTK)	For text processing, coding classification, Stemming, tagging, parsing, and easy-to-use interface with more than 50 word and content resources vocabulary.	http://www.nltk.org/
2	GATE	Useful in developing a pipeline. Language analysis modules for different languages are contributed by developers. They are available to be used integrated into the pipeline.	https://gate.ac.uk/

3	CoreNLP	Perform the most common natural language processing tasks, such as: Part-of-Speech Tagging, Named Entity Extraction, Chunking and Co-Reference.	http://nlp.stanford.edu/software/ corenlp.html
4	OpenNLP	This is a JAVA library for natural language processing, supporting common tasks, including: encoding, sentence decomposition, word type labeling, object recognition, parsing.	https://opennlp.apache.org
5	WEKA	Algorithms data mining, data preprocessing, classification, clustering, regression, association rules, visualization.	http://www.cs.waikato.ac.nz/ml/weka/
6	VnTokenizer	This is a specialized tool to separate words, assign word categories to Vietnamese, developed by Le et al (2008). VnTokenizer is written in JAVA, can be used as Tools Command Line or Programming.	http://mim.hus.vnu.edu.vn/ phuonglh/softwares/vnTokenizer
7	Underthesea - Vietnamese NLP Toolkit	An open source set of Python modules, datasets and tutorials that support research and development in Vietnamese Natural Language Processing.	https://underthesea.readthedocs.io

3. Method

This study was conducted according to the method of knowledge mining from Knowledge Discovery in Databases - KDD. The steps in the research process are carried out as shown in Figure 2. The experimental environment is installed in Python programming language with the support of Python Vietnamese Toolkit (for Vietnamese language) and other tools available library.

Step 1. Data collection and preprocessing

The study was conducted to collect data by an automatic program, the data was taken from Lazada.vn website. This is a method of automatically collecting content from HTML pages of any internet resource by special programs or scripts. With the object and scope of the research aimed at the Vietnamese language, the data only uses customer comment in Vietnamese. Next, the study carried out data preprocessing by removing the missing data, the responses do not contain the necessary information to proceed to the next processing step.

Step 2. Data Labeling

This step is to prepare a labeled (or classified) dataset large enough to be used as a training data set. Usually for studies applying machine learning methods, this dataset will be built manually. However, in this study, after randomly reviewing the content of the collected comment dataset and based on the results of the rating scores (the rating field in the dataset), this study found that the comment with rating score less than 7.0 has negative meaning (Negative), and conversely, comment with rating score greater than 7.0 has positive meaning (Positive). Therefore, the training dataset was determined to have 2,241 comments, of which 81 were negative (labelled 0) and 2,160 comments were positive (labelled 1).

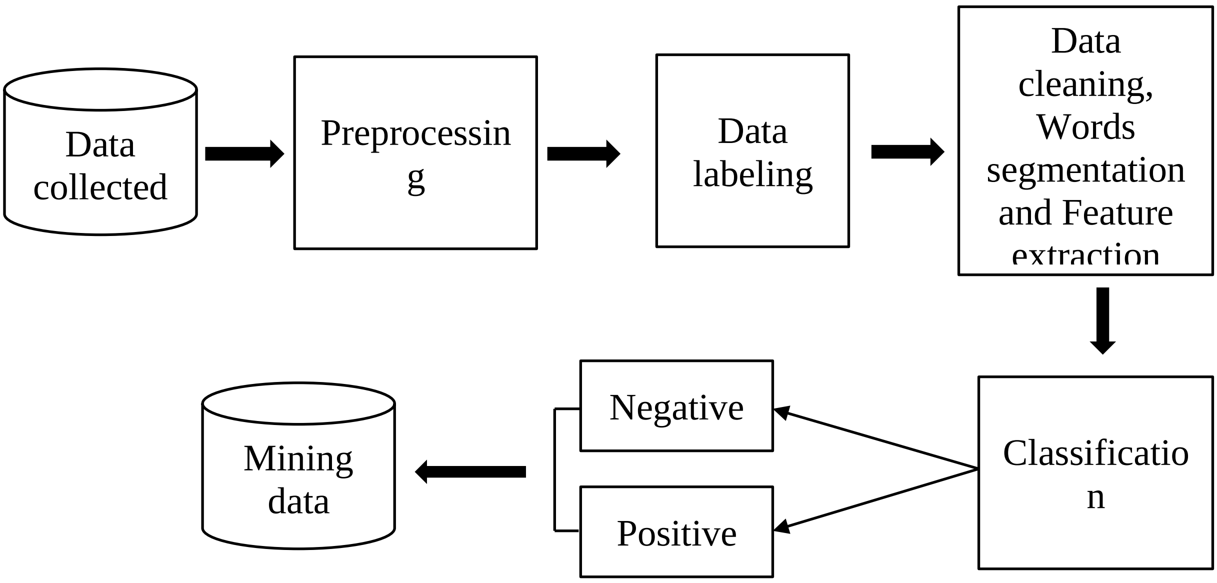

Figure 2: Research process

Step 3. Data cleaning, Words segmentation and Feature extraction

Data Cleaning: This step conducts data cleaning before starting processing on the dataset, including some natural language processing steps such as removing stop words, or checking spelling, etc.

Words Segmentation: This step is very important in natural language processing, and especially for Vietnamese language because there are many compound words, separating words in different ways can cause semantic ambiguity. This study inherits the separated library from Python Vietnamese Toolkit.

Feature Extraction: This step will select the typical features (keywords) that are representative of the data set as input for the classification algorithm. This study selects keywords according to TF-IDF method (Term Frequency/Inverse Document Frequency), the TF-IDF value of a keyword is a number obtained through statistics showing the importance of this keyword in a comment. The TF-IDF of the keyword w_i in the response d is calculated using the following formula:

$$if\_idf_{id} = f_{id} \times log\frac{N}{n_i}$$

With f_{id}: The frequency of occurrence of the keyword w_i in the comment d

N: Total number of the comment

n_i: Number of the comment where the keyword w_i appears

Comment classifier model training: This phase aims to determine whether a customer comment is Positive or Negative. This study applies the classification algorithms belonging to the group of supervised machine learning which is considered to be the best, they are Naive Bayes, Support Vector Machines, Neural Network and Decision Tree algorithms. Based on the combined results from previous studies related to the topic, to find the most suitable model for the dataset, which is the classified comments, and then to make predictions for the data unclassified comments or new comments data generated without retraining. The training process is carried out by the K-fold method, randomly dividing the data into K non-intersecting subsets. For each experiment (out of K times), one subset is used as the test data, and (K-1) the remaining subset is used as the training data. This study was conducted with K=5.

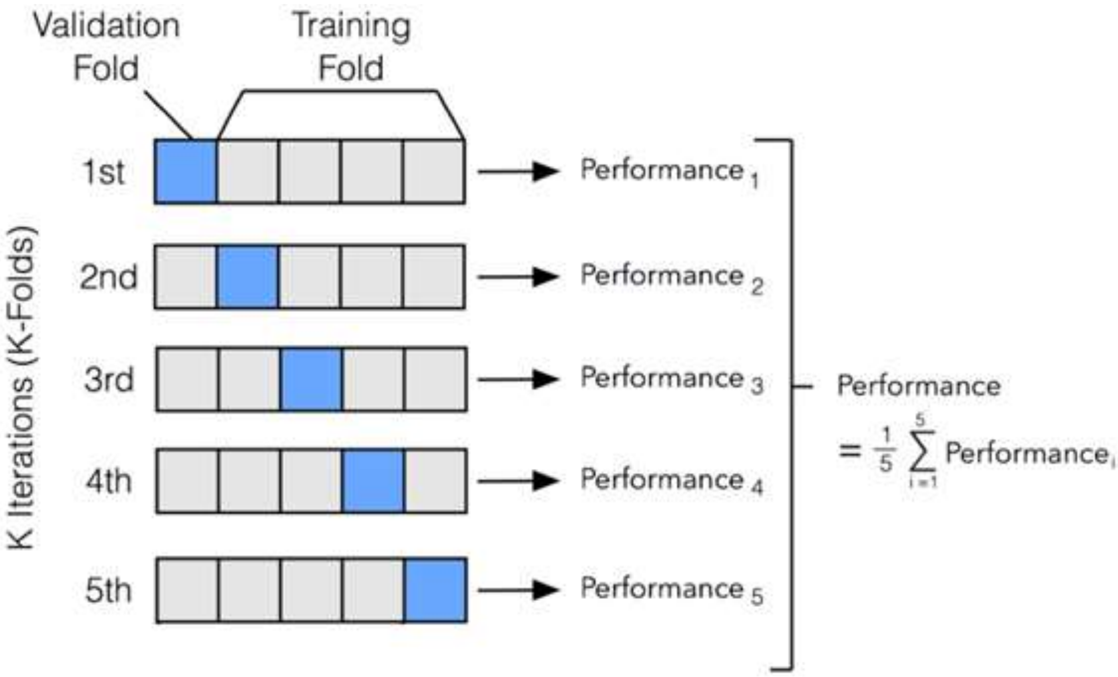

Figure 3: K-Fold method

With Performance: An average performance of 5 experiments

K Iterations: To repeat K times

Validation Fold: The dataset is used for testing

Training Fold: The dataset is used for training

Step 4. Evaluation of classification efficiency

The study used the method of evaluating the classification model which is based on the calculated indexes in the Confusion Matrix as Table 1.

Table 1: Confusion Matrix

	Reality: Positive	**Reality: Negative**
Predict: Positive	True Positive (TP)	False Negative (FN)
Predict: Negative	False Positive (FP)	True Negative (TN)

The effectiveness of the comment classification model is evaluated based on 4 indicators: Accuracy, Precision, Recall, and Average value of harmonics (F1). In addition, this study also considers the training time factor (Time) of each model.

With in:

$$Accuracy = \frac{TN + TP}{TN + TP + FP + FN}$$

$$Precision = \frac{TP}{TP + FP}$$

$$Recall = \frac{TP}{TP + FN}$$

$$F1 = \frac{2 \times Precision \times Recall}{Precision \times Recall}$$

4. Results

4.1. Results of data collection and preprocessing

The results of data collection were 2,241 customer comments on products in Vietnamese of 15 items across 5 stores. The data is distributed as shown in Table 2.

Table 2: Results of data collection and preprocessing

No.	Products	Amount	Number of comments	Medium
1.	Television	14	173	12.4
2.	Fridge	6	93	15.5
3.	Air conditioning	9	196	21.8
4.	Jeans	3	12	4.0
5.	T-shirt	4	54	13.5
6.	Man swimwear	3	45	15.0
7.	Iphone 12	2	246	123.0
8.	Iphone 11 pro max	2	198	99.0
9.	Iphone 10	4	74	18.5
10.	Samsung Galaxy A32	3	297	99.0
11.	Samsung A52	3	157	52.3
12.	Samsung A72	2	65	32.5
13.	OPPO Watch	5	289	57.8
14.	OPPO Reno5	4	32	8.0
15.	OPPO A53	4	310	77.5
Total		68	2.241	

Table 3: Training results by K-Fold (K=5)

No.	Method name	Average accuracy	Standard deviation	Training time (seconds)
1	Naive Bayes (NB)	0.48	0.05	16.02
2	Support Vector Machines (SVM)	0.80	0.02	4.33
3	Neural Network (NN)	0.79	0.03	312.29
4	Decision Tree (DT)	0.70	0.03	315.56

The training results showed that the SVM, NN and DT models have the best accuracy (0.80, 0.79 and 0.70). Meaning these models were relatively suitable for the training dataset. However, if considering the factor of training time, only the NB and SVM models were the best. Therefore, subsequent applications could use two these models as a tool to classify comments for unclassified comment data or newly generated comment data without retraining. The results of this study helped determine the appropriate method and tool for classifying comments.

5. Conclusion

This study has conducted a review of the theoretical basis of the comment classification method and proposed the application of a supervised machine learning method for automatic comment content mining. Experimental results show that Neural Network, Decision Tree and Support Vector Machines methods are the best in training methods. This study has a reference value for applications of comment mining in the field of online sales. Online businesses can use the results to automatically assess which items are the best rated by many customers, thereby increasing the number of items in stock, increasing the frequency of suggestions and marketing that product to prospective customers for increasing sales. And the items that have many negative customer reviews are an opportunity for businesses to consider what factors inside the company or outside lead to that. If the product is not good, the enterprise considers reducing the number of such items. However, this study still has many limitations, which can be continued in the future or in future studies: Firstly, in terms of data collection, this study only collects data that is the customer comment on items on Lazada.vn website. The study can extend to collecting customer comment on any products or services on e-commerce websites or social networking sites; Secondly, about the scale, this study only classifies customer comment on a scale of 2 levels: Positive, and Negative. The next research direction can use a scale of more levels (for examples, a 5-level Likert scale); Third, about the comment content classification technique, this study only uses the supervised machine learning method, if combined with the semantic-based lexical method, it may give better results.

Abstract

Digital transformation has led to the significant changes in many of sectors in Vietnam in recent years including monetary control. Under the context of digital economy, Vietnam's monetary regulation is affected by fintech development, the available of cashless payment services and financial openness. Based on applying VAR model for monthly data for 1/2013 to 1/2020, this paper examined the impact of factors representing the digital economy on the transmission channel of monetary policy. We found that digital economy in general and cashless economy transformation in particular having resulted in positive effects to monetary control and reduced the lag of monetary policy immediately.

Key words: *digital economy, monetary policy.*

1. Introduction

In Vietnam, The Law on the State Bank in 2010 stipulates: "National monetary policy is the monetary decision making at the state level by the competent state agency, such as stabilizing the value of the domestic currency expressed by the inflation target, determining the use of tools and measures to achieve the planned goals". The ultimate goal of monetary policy is to control inflation, stabilize the exchange rate, supporting the economic growth, reducing the unemployment rate…The main channels of Vietnam's monetary transmission include interest rates, exchange rates and credit channels. The interest and credit transmission channel are the focus of monetary policy, related to reducing interest rates through increasing money supply or promoting credit growth also through increasing money supply. The exchange rate transmission channel involves an increase in the volume of the money supply leading to a devaluation of the VND. A depreciation of the local currency is expected to increase net exports and thereby increase the real GDP of the economy. Vietnam's economic growth therefore depends a lot on exports, so like the interest rate channel, the exchange rate channel also plays a very important role.

The term "digital economy" was previously mentioned prior to the concept of

Industrial Revolution 4.0. However, only when Industry 4.0 appears, the digital economy will be mentioned more and become a development trend, because of its link with modern technologies such as artificial intelligence, big data, digital assets... Monetary regulation in the digital economy in Vietnam is significantly influenced by three factors such as (i) Fintech development, (ii) Development of electronic payment (also called cashless payment) and (iii) Financial openness and economic globalization.

The study examined the influence of factors on money management under the context of the digital economy. Particularly, our focused on assessing the impacts of technology and digitalization applied to financial services on the effectiveness of monetary management in Vietnam. Evaluating how electronic money (e-money) and electronic payments affect the replacement of cash in the economy. The efficiency of monetary policy depends on monetary policy transmission mechanism which connects policy tools and policy outcomes. Therefore, the study also analyzes the implications for the transmission mechanism and effectiveness of monetary management. This study understood that electronic payment (e-Payment) is a type of payment carried out electronically by financial intermediaries, both financial and non-financial institutions. Electronic money is a digital alternative to cash which allows users to make cashless payments with money stored on card or a phone or over the internet (EC, 2009).

2. Literature Review

Factors affecting monetary management under the context of the digital economy

Currently, the number of quantitative studies evaluating the impact of digital economy such as digital currencies and/or new payment use on money control focuses on cash substitution effect or effect of electronic payments on money demand. Money growth is usually based on analysis of the money demand function. Understanding this issue will allow policymakers to develop an appropriate monetary policy and adjust the equivalent increase in the money supply. The stability of money demand will provide a key link in the monetary policy transmission mechanism through the interest rate channel. This is an important basis for effective monetary policy implementation (Laumas, 1978), (Mohsen Bahmani-Oskooee & Yongqing Wang, 2007). Foreign studies showed that there was not constant finding of the relationship between electronic payments and cash demand. (Amromin, G., and S. Chakravorti, 2007) found their negative relation. Using panel estimation techniques to analyze the change in transaction demand for cash resulting from greater usage of debit cards in 13 countries from 1988 to 2003, this research found that both consumers and merchants generally prefer debit cards over other payment alternatives. By grouping cash into three denomination categories, they also found that electronic alternatives to cash will reduce the demand for cash of certain denominations. Clearly, demand for low-denomination notes and coins decline as debit card usage increases, but demand for high-denomination coins is generally less affected. Additionally, the general demand for cash will continue to grow strongly in the future because of cash's anonymity and store of value. (STIX, 2004) analyzed the withdrawal behavior of Austrian individuals based on surveys from 2003 and 2004 to assess how EFT-POS payments and ATM withdrawals affect purse cash demand. The results revealed that purse cash demand was significantly affected by debit card usage and that there were significant differences in cash demand for individuals with different debit card usage frequencies. The study of (Anderson-Reid, 2008) uses an error correction model (ECM) to estimate the impact of the use of these alternative means of payment on the demand for currency in Jamaica during the period April 2003 to June 2008. The results suggested that the volume of ATM transactions increases the currency stock while both the volume of EFTPOS transactions and the number of cards negatively influence the demand for currency. As a consequence, payments media such as EFPOS machines are not readily available in some areas of the country and where they are available some consumers might still chose not to use them given the associated charges.

Unlike the above studies, (Bech, M., Faruqui U., Ougaard F., and Picillo C., 2018); (Kartika V. and Nugroho A., 2015) showed that the demand for cash remains high despite the growing use of electronic payments worldwide. These studies covered developed and emerging economies. They focused on three motives of holding cash: transaction, precautionary and speculative (or portfolio). The results after conducting the panel data regression showed that developed countries saw an increasing demand for cash after the global financial crisis of 2008-2009 due to a lack of confidence in the payment system and low cost of cash holdings. Reports of the death of cash were greatly exaggerated. In fact, cash in circulation has not decreased for most countries, only few countries were considered cashless or less cash economies. Demand for cash is particularly noticeable in advanced economies and may be driven by store-of-value motives rather than payment needs. The expansion of large and small denominations suggests that cash is increasingly used as a store of value rather than for payment motives. Over the decades, the demand for large denomination notes has exceeded the demand for smaller denominations. In fact, some countries (such as Korea and Russia) have seen the decline in demand for smaller denominations and the increase in demand for larger denominations. By examining the impact of modern technology on money demand, Tehranchian et. al, (2012) examines the impact of modern technology including credit cards, ATM and electronic funds of transfer at the Point-Of-Sale (POS) on money demand for Iran. Using seasonal data over the period of 2001-2008, this study showed that the long-run impact of modern technology on demand for money is strongly greater than short-run in Iran. They used cross-sectional data and autoregressive distributive lag model in their analysis in which they found that by increasing the number of ATMs and credit cards, the demand for currency increased in both short and long runs. The long-run impact of modern technology on demand for money is strongly greater than short-run.

In addition to studies assessing the alternative effects of new payment services, many of studies evaluated the influence of electronic payments and digital money on monetary policy. (Thitima Chucherd, Thosapon Tonghui, Acharawat Srisongkram, Natta Piyakarnchana, 2018) used GMM and Factor VAR models to study impacts of digitalization in financial services for monetary policy in Thailand by investigating whether the widespread use of e-Payment has contributed to a decelerating trend of cash in circulation in the Thai economy. Cash in circulation (CIC) was a dependent variable to represent money demand. They indicated e-Payment usage including total retail e-Payment, card payment, internet and mobile banking (called e-Money). The period of study covers data from 2010 to 2018. Their model found that e-Payment in Thailand significantly substitutes cash especially card payment as well as internet and mobile banking. This paper also conducted the empirical study of monetary policy transmission mechanism due to employing the Factor VAR model. The empirical study showed that e-Payment supports monetary policy transmission in several channels. (1) The interest rate channel has no impact. This is partly because adjustment in the interest rate channel also depends on other factors, such as commercial banks' financial structure, sensitivity of deposit and loan amounts to policy rate adjustment, and competition in banking industry. (2) The credit channel is slightly more effective partly owing to more loans extension with better loan pricing strategies based on risk profiles of each borrower. (3) The asset price channel is more effective. People can easily reallocate assets due to lower transaction costs that could consequently impact their wealth. The estimation also find that money demand depends on economic growth, short-run interest rates, stock market index, and e-Payment usage. (4) The exchange rate channel is expected to be more effective as e-Payment could reduce cross-border transaction costs, partly shown by a large volume of capital flows especially in the capital market. However, there is no apparent impact on the exchange rate. According to (Al Laham M., Abdallat N., Al Tarawneh H., 2009), the impact of electronic currency on monetary policy could mostly be expected in the following aspects: (i) Reduced the Central bank's control over the money supply. The extent to which the central bank's control over the money supply would be reduced according to the substitution of money in circulation for e_money. This would result in difficulties in measuring and regulating the money supply by the Central Bank. (ii) Increase the velocity of money. With the use of e-money, transactions are relatively cheaper and convenient because transactions will take place in real time across thousands of miles. Theses lead to increase the number of transactions and increase the speed of money. Generally, it will be useful in the case that the central bank can control or measure monetary aggregates. (iii) Exchange rate fluctuations. Due to the ease of transfer of these funds, electronic money denominated in a stronger currency could be preferred and therefore would cause “exchange rate instability, not only giving rise to instability in the financial system but also working as a factor limiting the influence of monetary policy. Electronic money breaks down the barriers between countries and could one day lead to a universal currency backed by a commodity based basket of goods and services with universal price set in an auction market. Decreased ability to control cross country currency exchanges lowers the central bank’s control of the money supply. (iv) The change in the currency multiplier is an important indicator. The money multiplier is directly affected by the increased use of electronic money as a replacement for conventional currency. When electronic money is introduced, currency decreases and deposit money increases as the private propensity to retain cash goes down. Therefore, the currency ratio is reduced, the money multiplier becomes larger, and the volume of money supply created from the supply of fix reserve money is amplified. This shows that electronic money will directly affect the money multiplier through the currency ratio.

3. Method

Empirical method

In the next section, the study analyzed the influence of some factors representing the digital economy on (i) the effectiveness of money management represented by the target inflation (measured by consumer price index) and (ii) monetary policy transmission mechanism. Based on the studies of B. Bernanke, ECB (2002), Sarno and Taylor (2001), Frederic S. Mishkin (1996), Aleem (2010)…This study examined the impact of factors representing the digital economy on the transmission channel of monetary policy through credit and money supply _ M2 (called broad money, the sum of M1 and time and savings deposits), interest rate and the exchange rate. The factors related to the monetary policy transmission channel could be divided into two groups: domestic factors and foreign factors. Domestic factors including credit, prices, money supply, short-term interest rates, exchange rates represent transmission channels of monetary policy and variables representing digital economy. World oil prices and US interest rates represent the foreign factors.

We applied VAR (Vector Auto Regression) model according to the studies of Starr (2005), Hericourt (2005), Mohanty and Turner (2008)…to test the above relation. The VAR model is useful for identifying economic shocks and the interaction of factors arising from these shocks, especially existing co-coordinated relationship among variables. VAR not only identifies monetary policy shocks but also measures the influence. Furthermore, VAR can also reduce the severity of endogeneity that can make the results less reliable. With the VAR model, the model has the form as follow:

$$Y_t = AY_{t-1} + BX_t + v_t$$

Where: Y_t is the vector of endogenous variables, X_t is the vector of the exogenous variables, and v_t is the vector of error. The A matrix is the coefficient matrix representing the relationship among the endogenous variables. The B matrix including parameters represents the relationship between endogenous variables and exogenous variables.

Data

We used monthly data for 1/2013 to 1/2020. Data are taken from the General Statistic Office of Vietnam, the International Monetary Fund's International Financial Statistics (IFS), and the State Bank of Vietnam. Details of data sources and variable definitions are given in the following table:

Table 1: List of variables expected to be used in the model

Groups of Variables	Name of variables	Notation	Description
Domestic endogenous variables	Logarithm of the CPI	Cpi	Log of price index
	Growth of credit	Credit_growth	Credit growth rate
	Growth of M2	M2_growth	M2 growth rate
	Short-term interest rate (%)	R	Overnight lending rates on the interbank market
	Logarithm of the exchange rate	Ex	Log of average interbank exchange rate at the end of the quarter
Foreign exogenous variables	Logarithm of world oil price	Oil	Log of world oil prices
	Federal Funds rate (%)	R_US	Overnight lending rates on the US interbank market
Domestic endogenous variables representing the digital economy's characteristics	Logarithm of the number of ATMs, POS/EFTPOS/EDC	ATM_POS	Log of the number of ATM, POS/EFTPOS/EDC
	Logarithm of the number of accounts	Account	Log of the number of payment deposit accounts
Foreign exogenous variables representing the digital economy's characteristics	Logarithm of the transaction value through ATM, POS/EFTPOS/EDC	ATM_POS_amount	Log of transaction value through ATM, POS/EFTPOS/EDC
	Logarithm of the average account balance	account_amount	Log of average balance in demand deposit account

The two variables including the world price of oil and the overnight interest rate in the U.S interbank market (U.S Federal Fund Rate) represent foreign shocks (mentioned by S.Kim, N.Roubini, 2000). The U.S has been one of the Vietnam's strategic partners and Vietnam's important export market. Therefore, the volatility in the U.S market results in a profound effect on Vietnam. Besides, fluctuations in oil prices also lead a great influence on the Vietnam's economy where is a crude oil exporter and importer of petroleum as well. Gasoline is also an important input to production. Fluctuations in world prices of oil affects both consumers and producers. Besides, world oil prices also was considered to affect inflation expectations.

Unlike previous studies on monetary policy transmission channels, the study added a group of variables representing the digital economy related to technological innovation, the digital transformation such as the number of ATMs and POS/EFTPOS/EDC, the number of payment deposit accounts, the transaction value through these channels and the average demand deposit account balance.

4. Results

Data description

In order to gain reliable results, we removed seasonal effects from the time series data and conducted stationary test prior to modelling. The data series being used here was the monthly series so it might contain 12-month trends in a year. After testing for seasonality, the results identified that credit_growth and M2_growth data repeat every months. For the two variables showing the monthly trend, we adjusted these variables and received the variables after the seasonal adjustment including creditgrowth_adj and M2growth_adj. To test the stationarity of the variables, the study used the Augmented Dickey-Fuller Test.. Among the above group of variables, only three variables were stationary at the original value and the remaining 8 variables were stationary at the first difference.

Variables correlation

CPI is highly correlated with Ex, ATM_POS, Account, ATM_POS_amount, account_amount, R_US. CPI and oil price carried a low negative correlation. CPI and R_US carried zero correlation (no statistical significance at the 10% level). The credit_growth carried a high positive correlation with the ATM_POS, Account, account_amount and a high negative correlation with the oil price. M2 growth had a low correlation with the rest of variables and was mostly negative. The Ex had a high positive correlation with R, R_US, ATM_POS, Account, account_amount, ATM_POS_amount and negatively correlated with the oil price. Existing a low correlation between R and remaining variables and a positive correlation between ATM_POS_amount and R_US.

Testing for cointegration using the Johansen methodology

According to Johansen test using to test cointegrating relationships, there are no cointegration. Therefore, the VAR model is a suitable model.

Optimal lag selection

The result of optimal lag selection show that the lag (p=1) is selected by three criteria. However, when the serial autocorrelation test (LM test) for VAR(1) is performed, the result shows the autocorrelation at the lag 1 and 3 (months). To address the autocorrelation, the lags 1 and 3 are included in the VAR model. The serial autocorrelation test for the model VAR(1,3) show the result of accepting Ho (no autocorrelation). The result of the lag exclusion test agrees that the lags 1 and 3 are significant in all equations (with p-value < 0.05) except in the equations of creditgrowth_adj and ex. Hence, the lags of 1 month and 3 months are chosen. This is also of economic meanings that the interactions between economic variables have a lag of 1 month and 1 quarter.

Estimation results of VAR (1,3)

The stability test shows that the model satisfies the stability requirement with all eigenvalues inside the unit circle. Then, to check the significance of the variables representing the digital economic conditions such as Account, ATM_POS, account_amount, ATM_POS_amount in the model, the study uses Wald test for each variable. According to the results, all these exogenous variables are significant. Next, the Granger causality test checks whether one variable can be used to improve the prediction for another variable. In the Granger test, the hypothesis H0 is no relationship.

According to the test results, the growth rate of accounts d.Account and interest rate R are the causes of the change in inflation d.cpi at 5% significance level (dX is the first difference of X). In the equation of credit growth, the percentage change in the exchange rate d.Ex and interest rate are significant in explaining the change in credit growth. For the growth of money supply M2growth_adj, there are many factors explaining the fluctuation of this variable including: inflation (d.cpi), credit growth (d.creditgrowth_adj), interest rate (R), the number of ATMs and POSs (ATM_POS). For exchange rate, only inflation (d.cpi) is significant in explaining changes. Interest rate is influenced by credit growth. Meanwhile, the number of ATM_POS is influenced by the growth of money supply M2growth_adj.

Impulse Response Functions (IRF) and Forecast Error Variance Decomposition (FVD)

The general VAR(p) model has many parameters, and they may be difficult to interpret due to complex interactions and feedback between the variables in the model. As a result, the dynamic properties of a VAR(p) are often summarized using various types of structural analysis. The two main types of structural analysis summaries are (1) impulse response functions (IRF); and (2) forecast error variance decompositions (FVD). Main purpose of IRF is to describe the evolution of a model's variables in reaction to a shock in one or more variables along a specified time horizon in VAR model. Predictive variance decomposition, often referred to as variance decomposition, is another way to describe the dynamics of a VAR model. While the IRF determines the effect of one shock on other endogenous variables, the VDF separates the variability of an endogenous variable according to the different shocks in the VAR model. Thus, the VDF allows us to assess the relative time importance of each shock to the variability of the variables in the model. The results of the analysis of the response function and the decomposition of variance will be analyzed in the following sections.

Impulse Response Function (IRF)

The results of the IRFs of the endogenous variables to a one standard deviation shock on the number of ATM_POS. The results show that the marginal response of endogenous variables to the shock increases to the peak and then decrease gradually over time. The strongest impact is seen in the first 5 months (reaching peak after 2 or 3 months). Among the variables of monetary policy, the shock to the number of ATMs and POSs has the strongest positive impact on the money supply growth M2_growth. The impact of the shock peaks after 3 months and then decreases. After 5 months, the impact is no longer statistically significant. The cumulative effect over time of the shock is in positive and statistically significant. This can be explained through money multiplier. An increase in the number of ATMs and POS represents the growth of cashless payment. A decrease in the demand for cash increases money multiplier and then increase the money supply for the economy. For exchange rate and credit growth variables, the shock from ATM_POS has a positive impact on these two variables in the first two months, but these effects are not statistically significant at the 5% level. In contrast, with inflation, the shock has an opposite effect, but this effect is also not significant at 5% level.

The results of the response of endogenous variables to a one-standard deviation shock on the growth of the number of account d.Accounts. The shock to the growth of the number of checking accounts has a negative and statistically significant effect on inflation after 1 month and 2 months at a 5% significant level. For other variables, the impact from the shock is not statistically significant. The explanation for this relationship comes from the fact that when an increase in the number of accounts represents the gradual shift of habits from using cash to using cashless payment methods. This helps the regulator to control the money supply as well as to better predict the impact of monetary intervention, helping policymakers come up with appropriate monetary policies. In other words, an increase in the opening and use of current accounts helps monetary management become more efficient and then realize the ultimate goal of monetary policy, which is to control inflation.

Forecast Error Variance Decomposition (FVD)

Appendix below shows the variance decomposition of the impact of shock on ATM_POS and d.Account on other endogenous variables of the model. The results shows that up to 10% of the variation in the error of the variable M2growth_adj is explained by the shock to ATM_POS. The explanatory power of shock to d.Account for the variation of errors of other endogenous variables is not significant.

The impacts of exogenous variables representing the digital economy

According to the VAR model estimation results, when the average account balance d.account_amount increases, the d.Ex exchange rate decreases. This effect is statistically significant at the 10% level. This can be because when the balance of the current account increases, people more believe in the financial system and the value of VND. Furthermore, maintaining higher current account balance represents a shift in payment behavior from cash to non-cash forms. This helps the monetary authorities better manage the financial sector, increase efficiency, reduce the delay of monetary policies, enhance macroeconomic stability and thus increase the value of VND.

Current deposit balance also has a negative effect on short-term interest rate and this effect is statistically significant at 5% significance level. As the account balance increases, short-term interest rates tend to decrease. This can be explained by increasing average balance of account combined with money multiplier, which increases the money supply and reduces short-term interest rates accordingly. This effect is periodical and immediate.

The average transaction value through ATM and POS (d.ATM_POS_amount) has a positive effect in the same period on short-term interest rates and this effect is statistically significant at 5% significance level. This comes from the fact that nowadays ATM transactions are mainly cash withdrawal transactions. The number of ATMs increase and the coverage is large, creating convenience for people to withdraw spendable cash. Then cashflows out of the banking system affect the money supply (in a downward direction) as well as the efficiency of money management, leading to an increase in short-term interest rates.

5. Discussion and Conclusion

Under the context of digital economy in general and cashless economy transformation in particular has resulted in positive effects to monetary control and reduced the lag of monetary policy (immediate impact or peaking quickly within a quarter). This situation led to the decline in inflation and stabilization of the value of the local currency. In Vietnam, develop and diversify non-cash payment services, especially through mobile devices; encouraging entities in the open economy, maintaining balance and making payment transactions to purchase goods and services, etc. through demand accounts is not only the direction chosen and is being implemented by the government. It is also an important solution to maintain transactions and promote business activities under the context of social distancing due to the Covid-19 pandemic.

Based on the results of the above model combined with the actual context of Vietnam, the study makes some recommendations to promote the positive impact of the digital economy, specifically in this study, payment. not using cash to effectively manage money in the near future. (i) *Regarding the legal regulation*: develop criteria measuring the rate of using non-cash payment means; promulgate regulations on management of financial technology (fintech) companies, e-wallets, mobile money; complete and update the national scheme on non-cash payment (with a mechanism to encourage and enforce non-cash payments, ...). In addition, it is necessary to have regulations on information and data sharing; mechanism to recognize the results of appraisal and mutual authentication among credit institutions, to build a national database of personal identification; the study of digital banking licensing…(ii) *Regarding the population's habit of using cash*: organizing demand-stimulating programs, refunding money on electronic transactions, freeing small transactions; building an integrated electronic tax system e_tax; building a prompt Pay money transfer system that allows you to use no bank account but a national identification code and mobile phone number...At the same time, service providers need to actively propagate, create attractive products and services for people to increase transactions over the Internet. (iii) *About safety and security:* Payment service providers need to increase investment in security infrastructure, ensure the smoothness of payment activities of banks and simplify registration procedures and processes. Specifically, developing and perfecting the Tokenization system (a secure process that automatically encodes the customer's card number) and the mobile payment switching infrastructure; develop security systems, fix security holes...
