HOW DO CONSUMERS TRUST THE SIGNALS IN E-COMMERCE MARKET - THE CASE OF COSMETICS PRODUCTS

Abstract

Consumer trust is an important factor in consumer decision, especially in the market of credence good – the good that sellers know about its quality, but buyers do not. If the good is traded in E-commerce market, that information asymmetry can be even more amplified. This paper empirically studies how young consumers trust the signals provided by sellers (with a purpose of reducing the asymmetry) in the e-commerce market with the case of cosmetics. Cosmetics are the item chosen as a research object because it is a typical good for the group of goods – the group of goods that consumers can hardly distinguish the quality even after being used. In summary, we use a Rank Ordered Logit model for the surveyed data set to rank the importance of signals in customers' online cosmetic consumption decisions in conditions of asymmetric information of both markets and products. The signals include product quality signals, service signals, and operation signals. After controlling factors about customer characteristics, the authors find that signals such as "The store is a genuine agent", "the store is a booth on Shopee Mall", and "famous Beauty Bloggers review the store" receive the most trust from the customers. In addition, these signals also play an essential role in customer purchase intention. In contrast, stores respond to customers quickly and allow consumers to track orders as signals that are not so important to customers. Moreover, the higher the convenience of the rated site, the higher the level of trust in the signals will be. This result can be applied in categories including medicine, old electronics, and organic food.

Keywords: *Credence goods, E-commerce, ROL model*

1. Introduction and literature review

In the past few years, the e-commerce market has been increasingly active. Along with that, asymmetry in the e-commerce market in general and some items themselves have contained asymmetries, such as cosmetics, particularly a hot issue that receives the attention of both consumers and businesses. Because of the difference in information capture between consumers and businesses due to the "late" nature of transactions, inferior quality products and false signals are rampant in the market and even more alarming when they are processed more and more sophisticatedly. This asymmetry makes it almost impossible for consumers to distinguish between products and reliable signals from counterfeits. Therefore, this market also gradually gives customers a less sympathetic view and they remain loyal to the traditional shopping style even though online shopping brings many utilities.

The theory of information asymmetry between buyers and sellers was first mentioned by Akerlof [1]. He took into consideration the informational asymmetry in the product. Specifically, in the used car trading market, buyers are entirely disadvantaged compared to sellers when it is impossible to know in advance the quality of cars they bought before using them. The theory also points out that information asymmetry will direct the market away from its optimal level, and even extreme asymmetry can lead to the collapse of the market.

One theory developed from Akerlof's asymmetric information theory is the theory of signaling proposed by Spence. In asymmetric information, the theory is that suppliers of high-quality products must provide signals to consumers to help them distinguish their products from low-quality products. Signals can be in different forms, such as labeling, packaging and pricing.

Applying these two foundational theories to items containing asymmetric information, Stiglitz and his associates [3] studied asymmetry in the insurance market. In this market, customers or insurance buyers have more information than the sellers - the insurance companies. Insurers will categorize their customers by risk type by offering a wide range of insurance products to everyone and for customers to choose for themselves. For example, a low-premium, high-deductible health insurance policy will attract healthy customers while less attractive to customers with multiple health problems. Unhealthy customers are more likely to buy premium, low-discount policies. In this way, the market will lead to what the authors call a "Separating equilibrium" state, in another word, the market in which people's risk portfolios are determined by the type of insurance they have purchased. Stiglitz and Rothschild also point to certain conditions under which there will be no balance, and the market simply does not exist. In addition, he pointed out that asymmetric information and economic motivations are not merely academic abstractions but specific phenomena of far-reaching explanation in the analysis of institutions and market conditions in other developing economies.

Also, based on asymmetric theory (Akerlof) and signaling (Spence), some recent studies consider asymmetry and consumer confidence in the e-commerce market - an emerging and potential market.

In particular, the trim studies have reached certain conclusions. Z.liu [4] research on an online shopping app – Alibaba has discovered information asymmetry in e-commerce because of the difference between the time, space, and location of transactions. He has carried out the operational analysis, characteristics, and factors that influence the information asymmetry between buyers and sellers in the e-commerce market. Accordingly, during the transaction of the e-commerce market, the seller owns all the information about the store and the goods sold. However, because the seller pursues his interests, it maximizes the non-disclosure of its non-positive information or goods; information shared by both parties is unevenly distributed, causing problems of unfavorable selection and moral risks. Since then, Z.liu has analyzed the "game" made against the strategic choices of buyers and sellers in conditions of incomplete information. Finally, the study makes practical policies or proposals for analytical results, which reduces the level of information asymmetry in e-commerce so that Alibaba and other e-commerce platforms can achieve better development.

Another research trend that delivers more well-founded results is dosing studies, primarily using quantities of economic models and Machine Learning. Mavlanova and her associates' research uses a combination of Content analysis and K-means to compare signaling methods of online drug-selling websites. The study takes into account signaling in three aspects: the cost of signal s falsity, the ease of verification of the signal, and the time of signaling (before purchase, during purchase, and after purchase). Research shows that low-quality sellers display fewer signals than high-quality sellers, as well as low-cost and easy-to-verify signals such as "addresses," "communications." Meanwhile, signals such as "have a genuine agent", "have a seal from a third party" or "have a warehouse address" are high-cost and easy-to-verify signals that are only used by high-quality sellers. High-cost signals are not always profitable for low-quality sellers due to their initial cost because they often enter and exit the market quickly and re-appear with new domains. In contrast, high-quality sellers remain on the market and therefore benefit from the display of high-cost signals. Alternatively, research by Moriuchi [6] in Japan has pointed to the relationship between signaling and consumer trust. Research shows that their people are not willing to ignore product quality in exchange for discounted items or convenience in the online market. Instead, they are only willing to consume in the online market when they have confidence in product quality. For Japanese people, the trust when buying their goods comes from the belief in the product quality of the online shop, the supplier' coverage (for example, through advertising), fewer promotions, and finally, positive reviews of former consumers. These statements are concluded by analyzing the element - analyzing the original composition

(PCA) based on the data set surveyed by NTTCom Online Marketing Solutions Corporation (NTTCom) from customers who regularly shop online.

Studies of asymmetry in the e-commerce market combined with the asymmetry of credit items in Vietnam are pretty scarce, mainly dosing studies, or there is no combination of both issues. For example, Tran Ha Anh Quan and Tran Huy Anh Duc [7] study factors affecting customer trust in the e-commerce market. Although this study has found some specific factors that affect customer trust, it has not been intensely exploited in the asymmetry of markets and goods.

Summing up, studies show that, with items in the e-commerce market in general and credit items in particular, consumers often cannot evaluate the quality of products themselves before deciding to order and consume. Therefore, they must rely upon the signals given by businesses. In these signals, in addition to genuine and complex signals such as "genuine agents", "stores on Shopee Mall", ..., there are still unfounded and easily created signals such as "address", "communication method", "commitment to return", ... The above signals in Vietnam may not be reliable because the management mechanism is not as tight as in developing countries, so assessing the role of these signals for the Vietnamese market is essential and useful for both businesses and consumers. This will limit the information asymmetry between buyers and sellers when the buyer passively absorbs the business's signals. The results make consumer confidence in the e-commerce market decreasing and gradually shifting with traditional shopping. Therefore, to develop this market and build consumer trust, it is vital to stand as the underlying party for the accuracy of signals from state management agencies. In this study, we will be primarily interested in evaluating signals on the part of customers, namely the study of consumer confidence. In the situation that consumers cannot verify the quality of products before deciding to buy online, and even after receiving goods for typical items such as cosmetics, what signals will they rely on? It is the issue of top concern in this article, from which it is possible to make some recommendations for businesses, the state, and consumers. The selection of cosmetic items for research is based on two main reasons: Firstly, it is possible consider both asymmetry in the market and like the item – a combination that almost no research has mentioned; Secondly, cosmetics are an increasingly popular item for today's youth.

2. Method

Rank Ordered Logit (ROL) regression model.

To prove the quality of their products and prestige, or in other words, to minimize the asymmetry between buyers and cosmetic sellers, businesses need to give signals to attract consumer trust. However, besides the genuine signals, difficult to fake or need significant costs such as genuine agent certification, is the booth on Shopee Mall, ... then there are very easy to fake signals with the low cost such as communication methods and return commitments, ... So, what signals do consumers believe? Therefore, this section will evaluate what signals are important to consumers when they decide to buy cosmetics online, thereby showing the feasibility of the signaling policies of the business.

In the questionnaire, consumers will perform a rating of 9 signals of the business given according to the degree of importance gradually increasing from 1 to 9. Since dependent variables are rating variables, the appropriate resumable model is Rank Ordered Logit. The model was first introduced by Beggs [10]. The model can be concisely explained as follows:

For signal set from enterprises including J items; Random signals rated J by individual i (Ui), defined as:

$$U_{ij} = v_{ij} + \epsilon_{ij}$$

The defining part of v_{ij} the signal, which is the random component of ϵ_{ij} the signal, is assumed to be independent and follows the distribution of extreme values. As long as the random variables are independent and distributed identically, we have the following formula (Beggs and associates, 1981):

$$P\left(U_{i1} > U_{i2} > \cdots > U_{ij}\right) = P\left(U_{i1} > U_{ij} \mid j \geq 2\right) \ldots P\left(U_{i(j-1)} > U\left(r_{ij}\right) \mid j \geq j\right)$$
$$= \prod_{J=1}^{J} \frac{e^{v_{ij}}}{\sum_{k=1}^{J} \delta_{ijk} e^{v_{ik}}}$$

Therefore, the probability that the I rating signal 1 first, ..., the final J signal will be:

$$\mathrm{P}\left(\mathrm{U}_{\mathrm{i}1} > \cdots > \mathrm{U}_{\mathrm{ij}}\right) = \prod_{J=1}^{J} \frac{e^{v_{ij}}}{\sum_{k=1}^{J} \delta_{ijk} e^{v_{ik}}} \quad (1)$$

Moreover, it can be in which it can be in which: v_{ij}

$$\mathrm{v}_{\mathrm{ij}} = \mathrm{a}_{\mathrm{j}} + \sum_{i=1}^{J} \beta_j x_i \quad (2)$$

The indicators i sign the second person, and j are the corresponding signals; is a vector of the characteristics of the answer; x_iα, β are the numbers to estimate.

From (1) and (2), the probability function will be:

$$\mathrm{L}(\alpha, \beta) = \prod_{i=1}^{N} \prod_{j=1}^{J} \frac{e^{a_j + \sum_{i=1}^{N} \beta_j x_i}}{\sum_{k=1}^{J} \delta_{ijk} e^{a_k + \sum_{i=1}^{N} \beta_j x_i}} \quad (3)$$

According to Beggs and his partner (1981), the ability function to concave co-variables, so the first-tier condition is also eligible for the highest function. Therefore, the parameters (α, β) can be estimated by explained to the first-degree condition for the function (3).

Data

Research items are cosmetics – favorite items of young people. Therefore, the study carried out a randomized investigation from students of the National Economics University. The data collection is done as follows: The author's group goes to several random classes, gives questionnaires and funding to all students in the class, and collects questionnaires soon after. The questions are based on previous studies and after examining samples on 20 consumers and eliminating inappropriate factors. The result received a questionnaire of 15 questions/group of questions. The questionnaire was then investigated for the second time by 30 other random consumers to ensure the words used in the questionnaire were easy to understand and clear. The survey received 305 responses, of which 42 responses that had never used cosmetics were removed from the list, the set of data used for calculation and analysis in the remaining study of 263 responses.

Table 1. Basis statistics for demographic variables

Variable		In template (Person)	Percent (%)
Gender	south	120	39.47
	female	184	60.53
Age	2000	92	30.26
	2001	137	45.07
	2002	59	19.41
	1999	16	5.27
Area	rural	124	40.79
	urban	180	59.21

The data collected is exceptionally even in terms of gender as well as hometown. Meanwhile, students born in 2001 accounted for half of all observations in the sample.

According to the survey, 86.18% of respondents used to buy cosmetics online. Over 74% of consumers used cosmetics from mid-range to high-end brands, and 89% believed that the products received were of the right quality as advertised when buying online. The above figures show that consumers also have a certain confidence in the online market. However, the number of people who believe in the quality of products when buying traditionally still reaches a higher percentage (96%). The figure is pretty close to reality because, besides the utilities of online shopping, consumers face more risks.

After studying the properties and effects of cosmetics. As well as gaps in online cosmetic consumption from previous research articles such as Kim [8]. Since then, the topic has carried out a review of the level of apprehensive of customers on a scale of liker 5 from very unbelievable (1) to very confident (5) about the risks that can be encountered as follows:

Health risks when using cosmetics online: Suffering from dangerous diseases such as lead poisoning, skin cancer,...; Premature skin aging; Allergenic when used; Causes end noisy disorders.

Service risks when buying cosmetics online: Addresses and phone numbers provided on the web are misused; Account number took advantage of; The store does not give returns as committed; Cannot contact the store when the product has a problem; Do not receive goods after paying online via app.

Below is a brief description of customers' risk aversion when using online cosmetics through the author's survey.

Level of fear of risks of customers when consuming cosmetics in the e-commerce market

Table 2. Level of risk apprehensive of customers (unit: % by line)

Risk	Very unbelievable	Unbelievable	Medium news	Pretty trusting	Very trusting
Dangerous diseases	3.42	14.83	33.46	27.76	20.53
Aging skin	3.42	23.57	31.94	23.95	17.11
Allergy	3.42	23.95	30.04	27.38	15.21
End noisy disorders	4.56	23.95	30.80	28.14	12.55
Address, phone number misused	3.04	20.53	39.92	28.90	7.60
Don't give back	6.08	28.14	31.56	29.66	4.56
No contact	7.98	25.86	34.98	26.62	4.56
Account number being taken advantage of	5.32	29.66	36.50	24.33	4.18
Do not receive goods after payment	15.59	31.94	36.12	15.21	1.14

The majority of questioners were more concerned about health risks than service risks; the risk of dangerous diseases was the one that consumers were most concerned about (20.53%), followed by skin-related problems with 17.11% and endocrine disorders with 15.21%. In the survey, people were less interested in whether the account number was taken advantage of or did not receive the goods after paying online.

The e-commerce market in Vietnam is a new market with pretty a few loopholes in operation, which is why customers have a fairly high level of risk when trading in this market, especially with credit items such as cosmetics. Therefore, businesses need to send signals to attract and build trust with consumers.

Through previous research on consumer confidence such as Mavlanova [5], Morais [9], and through sample surveys about the signals that Vietnamese cosmetic consumers are interested in when buying cosmetics online. The authors' team has synthesized some of the following signals:

Signals to increase customer confidence in product quality: The store is a genuine agent; The store is a shop on Shopee Mall; Products reviewed by famous Beauty Bloggers; Stores regularly receive good customer feedback

Signals that show that the enterprise has a system that operates in a system and reliably: The store is a genuine dealer; The store is a store on Shopee Mall; Products are reviewed by famous Beauty Bloggers; The store often receives good feedback from customers

The following signals indicate that the enterprise has a system that operates systematically and responsibly: The store has a specific address; The store displays the contact method; The store responds to customers quickly; Stores allow consumers to track order; The store commits to return and exchange when detecting inferior quality products

So, do the signals given by businesses promote the effect of attracting and building trust with customers? This is a question that is always interested by brands because each signal requires certain costs.

Customer confidence in the signals issued by the business.

In the questionnaire, the answer will evaluate the above nine signals on a liker five scale from very unbelievable (1) to very confident (5).

Table 3. Consumer confidence in signals when shopping online (unit: % by column)

Trust level / signal	Very unbelievable	Unbelievable	Medium news	Pretty trusting	Very trusting
The store is a shop on Shopee Mall	0	2	29	40	30
The store is a genuine agent	0	1	25	47	27
Products reviewed by Beauty Blogger	1	10	40	36	14
Store with a specific address	0	6	47	40	6
Store receives good customer feedback	1	10	36	46	7
Store return commitments	1	13	36	41	9
Have communication methods displayed	0	14	52	30	4
Allow consumers to track orders	0	17	52	28	3
Store responds to customers quickly	3	19	57	20	2

In the above signals, considering the total percentage of customers who evaluate pretty confident, we find that the first 3 signals receive the most trust from customers with the percentage of trust: 70%; 74%; 50%. Realize that these 3 signals are official signals – certified and guaranteed information security help consumers have a basis for trusting the products they consume and the services they receive.

The signal group that receives a pretty high trust from customers is the 4th signal; 5; 6 according to table 3 with the percentage of customers trusting are 46%; 53%; 50%. Signals 5 and 6 have a fairly reliable and very trusting customer volume higher than signal 3. However, on the other hand, the number of customers is only half that of signal 3, so signal 3 is still more important. Considering that this signal group is intended to assert itself about the quality of its products, however, this information is difficult to verify, and no agency guarantees their accuracy.

The group that received the least customer trust was the last 3 signals with the corresponding percentage: 34%; 31%; 22%. These are signals about the service of the store and less correlation with the quality of the product.

So are the signals most trusted by customers important signals when consumers decide to buy cosmetics online? To answer this question, the authors continued to survey how important the signals are to respondents by ranking 9 signals on a scale of 1 to 9 with 1 being the least important and 9 as the most important. The results are as follows:

Ranked the top nine on a scale of 1 to 9.

From table 4, we consider the first signal (The store is a store on Shopee Mall) - this is the signal that many consumers rank highest when deciding to buy cosmetics online. For example, the number 47 in this line said 47% of the questioning people ranked this signal as the most important of the 9 indicators given.

Table 4. The importance of signals when consumers decide to buy online

(unit:% by line)

Signal \ Rank	1	2	3	4	5	6	7	8	9
The store is a shop on Shopee Mall	4	3	1	1	3	5	11	25	47
The store is a genuine agent	8	5	1	3	7	8	17	19	33
Products reviewed by Beauty Blogger	2	3	5	10	10	16	14	22	18
Store with a specific address	8	7	8	6	16	10	20	15	11
Store receives good customer feedback	6	6	9	10	16	14	19	12	9
Store return commitments	3	2	6	6	14	21	21	18	8
Have communication methods displayed	7	5	5	5	15	13	25	16	8
Allow consumers to track orders	5	8	10	8	16	16	19	13	6
Store responds to customers quickly	6	5	5	11	16	18	22	9	6

The ranking results from table 4 are pretty similar to table 3 in terms of reliability and importance of signals to customers. Accordingly, genuine signals such as the booth on Shopee Mall, which is a genuine agent and reviewed by the famous Beauty Blogger, are still the most important signals for customers and the most trusted signals for consumers.

Furthermore, customers are not too concerned about service signals such as order tracking and quick responses.

3. Results

The topic of performing a revoicing of 9 ranking signals of trust (Rank) to evaluate the contribution of each signal to trust. The signals include: Signal1 (Store with a specific address); Signal2 (Does the store leave a communication metho; Signal3 (The store is a genuine agent); Signal4 (The store is a shop on Shopee Mall); Signal5 (Products reviewed by famous Beauty Bloggers); Signal6 (Store responds to customers quickly); Signal7 (Stores regularly receive good feedback from customers); Signal8 (Stores that allow consumers to track orders); Signal9 (Store commits returning if the product has problems).

Control variables include: Risk_health (Level of health risk apprehensive); Risk_ser (Level of service risk apprehensive); Signal_health (Trust in product quality signals); Signal_ser (Trust in service signals); Conv (Feel the convenience of online shopping); Amount (Quantity of cosmetics purchased/year); Grow (The percentage of purchases increases as customers believe the product is of good quality).

In particular, Risk_health, Risk_ser, Signal_health, Signal_ser, Conv result from analyzing EFA factors of variables on the level of risk apprehension, trust in signals, and feeling convenience. This step is intended to avoid multi-line problems due to high correlated variables with each other. Moreover, variables like Amount, Grow are the quantities that the respondents answered with such numbers.

Scale model:

$$L(\alpha,\beta) = \prod_{i=1}^{N}\prod_{j=1}^{9}\frac{e^{\alpha_j + \sum_{i=1}^{N}\beta_j x_i}}{\sum_{k=1}^{9}\delta_{ijk}e^{\alpha_k + \sum_{i=1}^{N}\beta_k x_i}}$$

In which:

+ α_j is the blocking system

+ x_i vector of characteristic variables of the i person (including Risk_ser, Risk_health, Signal_ser, Signal_health, Conv, Amount, Grow)

+ β_j is the vector of the system corresponding to the j signal x_i

Table 5. ROL result

Var (1)	Coef. (2)	Std. Err (3)	z -value (4)	Pr(>|z|) (5)	Var (6)	Coef. (7)	Std. Err (8)	z - value (9)	Pr(>|z|) (10)
Intercept					Signal: Signal_health				
Signal2	-0.81	0.14	0.43	0.664	Signal2	-1.75	0.16	-11.05	0.000

Signal9	0,29	0,14	2,04	0,041	Signal9	-0,04	0,02	-2,23	0,026
Signal: Signal_ser					Signal: Grow				
Signal2	1.32	0.15	8.54	0.000	Signal2	0,01	0,02	0,59	0,556
Signal3	-0.16	0.17	-0.94	0.347	Signal3	0,03	0,02	1,45	0,146
Signal4	-0.51	0.17	-2.96	0.003	Signal4	0,00	.	.	.
Signal5	-0.27	0.17	-1.6	0.109	Signal5	-0,04	0,02	-2,19	0,029
Signal6	0.92	.	.	.	Signal6	-0,07	0,02	-3,3	0,001
Signal7	-0.03	0.17	-0.19	0.849	Signal7	-0,06	0,02	-2,45	0,014
Signal8	1.15	0.15	7.58	0.000	Signal8	-0,06	0,02	-2,86	0,004
Signal9	1.22	0.15	8.31	0.000	Signal9	-0,02	0,02	-1,02	0,307

From table 5 can explain the result as follows:

+ The above parameters compared to the reference category (Signal1 – store displays specific address).

+ Value - 0.81 in column 2, the first line shows the importance of signal 2 compared to signal 1 for customers. A few times, the respondents believed in signal 2 less than the 1-time $e^{0.81}$ signal. However, the corresponding P_value in the 4th column is 0.664, so this difference has no statistical significance.

+ Column 2 figures show that the difference between signal 3 (1.56) and signal 4 (1.47) is the largest, proving that these are the two most important signals for customers when buying cosmetics online. Moreover, signal 6 has the most negligible impact on consumer confidence (-1.48).

The following result is a difference in the ranking of how important the signals are to groups of customers who have a different level of trust in signals and varying degrees of risk apprehension. Again, the result of the number explained compared to the store shows the specific address.

After controlling variables such as trust in health and service signals as well as the level of fear of risks, convenience, ... we can see that trust in signals, level of risk apprehension, sense of convenience, the quantity of consumption, and growth of purchasing volume when ingesting different product quality affects the ranking of the importance of signals.

More specifically, first, we look at the group of customer service risk apprehensive levels (Risk_ser).

+ The above Risk_ser for Signal5, Signal6, Signal7 is not statistically significant. This implies that the percentage of customers who trust "products reviewed by well-known Beauty Bloggers", "stores that respond to customers quickly", "stores that receive good feedback from customers" compared to "stores that show specific addresses" is the same for those with different levels of service risk.

+ For Signal2, the Risk_ser-to-negative and statistically significant ratio demonstrates that the higher the level of risk apprehensive, the smaller the trust rate in the "store that displays the communication method" according to the "store that shows the specific address". In other words, those who are more afraid of service risks tend to believe in "specific addresses" than "communication methods."

+ Mathematically, the factor - 0.4 in signal2 implies that: When other factors are constant, if the level of fear of service risk increases by 1 unit, the ratio between customers believing to "store display communication method" compared to believe in "store showing specific address" decreases times.$e^{0.4}$

Similarly, we can explain the estimated values of the system to the group "level of apprehensive of product risks", "signals to help customers believe in service", "signals to help customers believe in product quality", "feel about convenience", ...

When controlled with the variable "sense of convenience" (Conv), the result is quite remarkable when the estimates are optimistic and almost statistically significant (column 7). This means improving the convenience of online shopping that can help increase the reliability of signals.

4. Discussion and Conclusion

This article evaluates the importance of the signals provided by businesses. The reason for the cosmetic products is chosen because these products inhibit information asymmetry at a high level. Furthermore, the market for the products is expanding rapidly.

Rank Ordered Logit results showed that the signals rated by consumers as the most important include: "The store is a genuine agent", "The store is a store on Shopee Mall", "The product is reviewed by the famous Beauty Blogger", "The store regularly receives good feedback from customers", and "The store has a commitment to return". Meanwhile, the least popular signals for customers include "Quick Customer Feedback Store", and "Store for Order Tracking".

Increasing the convenience of the website can increase consumer confidence in buying cosmetics online.

From here, the study makes some recommendations for businesses, the state, and consumers as follows:

+ Enterprises can set some policies to attract and increase customer trust such as publicity of business certificates and legal product quality certifications; legalization of return commitments; collaboration with famous Beauty Bloggers; actively ask for feedback from customers after use, to control and improve the quality of products and service quality of the company regularly.

+ Businesses need to regularly approach and update new utilities and features of online sales websites such as proposing items that are of frequent interest to customers; 3D product display makes it easier for customers to observe and evaluate products that minimize the information asymmetry of products, or in other words, increase customer trust in product quality; set up utility programs such as 2-hour delivery with customers in the same province/city as big websites (Shopee, Tiki) are implementing.

+ Signals that are not so important such as "Quick customer feedback" and "Let customers track orders" if they cost too much to operate, may consider not signaling.

+ On the stateside, to develop this market, the state needs to stand up to ensure the authenticity of the information provided by the store such as addresses, return commitments, certifications, ... make these information security factors a legal issue and provide appropriate penalties for fraud and information creation so that consumers have more basis to believe in the signals given by the business.

+ Customers can also rely on these signals to base their trust when deciding to buy cosmetics online because the people in our survey are all people who have bought cosmetics online and made an objective assessment.

Abstract

Consumers'perceived risk and consumers' trust are important in consumers' purchasing intention, especially in the market for credence good - the good of which qualitycannot be observed or assessed by consumers. This article empirically studies the role of trust and risk in consumers' intention of purchasing cosmetics online. Cosmetics are selected as the product is a typical credence good, which inhibits information asymmetry between the sellers and the buyers, that is the sellers know about the good quality but the buyers do not.. And the online- market may make the asymmetry even more serious. We apply K-means algorithm to segment customers and thenOrdered Logit regression models to evaluate the impact of consumer's trust in the signals, level of perceived risk , and behaviorsome other factors. The results show that all customer groups will increase consumption when the trust in the signals is high and the level of risk, aversion is low; Besides, we also find a positive impact of website convenience on customers' shopping behaviorintention. Another interesting result is that consumers who buy ordinary products have higher level of perceived risk than consumers who buy more pricey products..

Keywords: *Credence goods, E-commerce, K-means, Ordered Logit model*

1. Introduction and Literature Review

The rapid development of e-commerce recently results from the technological progress of the industrial revolution 4.0 and the spread of the covid 19 pandemics. However, this is a new market and contains high information asymmetry when suppliers and consumers do not directly trade with each other as in traditional markets. This asymmetry has created opportunities for some suppliers to launch fake signals and inferior quality products. On the consumer side, it is difficult for them to recognize the accuracy of the signal and the quality of the product before deciding to make a purchase. The asymmetric information is even more significant for credence items such as cosmetics, which used customers still cannot determine the quality of products. Therefore, the e-commerce market in Vietnam has not worked optimally when some parts of customers are afraid of the risks of this market but remain loyal to the traditional method of buying.

The "Theory of Reasoned Action - TRA" (1967) is one of the most well-known models in consumer behavior identification, revised since the early 1970s by Ajen and Fishbein (1980). Developed from TRA theory, TPB intended behavior theory was born to overcome the disadvantages of TRA by adding perceived behavioral control (PBC). In 1986, the TAM model proposed by Fed Davis was one of TRA's most optimal models, replacing many elements of TRA's attitudes with two elements that accept technology: Perceived Usefulness (PU) and Perceived Ease Of Use PEOU.

Based on these foundational theories, later studies have gone more profound in studying customer purchasing behavior. Including Shirin / Clara's research (2015) on customers' intention to shop for cosmetics online, using the TRA Reasonable Action Theory model and related research works, thereby giving research models and explaining the relationship between Trust, Risk Awareness, Shopping Interest, Website Design Quality to The Intention to Buy Cosmetics Online. The study results have explained that: variables including Trust, Risk Awareness, Shopping Pleasure, Website Design all affect the intention to buy online. In particular, three factors are Trust, Shopping Interest and Website Design that positively influence the intention to make an online purchase. Independent variable risk perception factors do not affect the intention to buy cosmetics online.

Another study by Abdullah Osman, Yi Jin Lim, Shahrul Nizam Salahuddin, Abdul Rahim Romle / Safizal Abdullah (2016) study of factors in impacting online shopping behavior - the intermediary role of shopping intention that gives a relationship between standards including Subjective Norm, Perceived Usefulness, Online Shopping Behavior, and intermediaries. This study uses the TPB model by Ajzen (1991), which has been modified to increase the likelihood of explanation, suitability and provide more details that form online shopping behavior. The study adds a Perceived Usefulness variable to the TPB model. The study results show that Subjective Standards and Useful Perceptions have a positive impact on Purchase Intention. However, Subjective Standards and Useful Perceptions have an inseparable effect (without negative trends) on shopping behavior. At the same time, shopping intention has a positive effect on online shopping behaviorbehavior.

Research by Nuno Fortes & Paulo Rita (September–December 2016) analyzes how internet privacy concerns affect consumers' online shopping. The research model developed shows that this impact occurs through its relationship with theories of trust and risk, TPB, TAM, TRA models. Previous studies have shown that concerns about the security of personal information in online purchases have a positive effect on risk Perceptions and a negative effect on trust in the intention and behavior of visual purchases online (Liu, Marchewka, Lu, & Yu, 2005; Eastlick et al., 2006; Van Dyke, Midha, & Nemati, 2007, Van Slyke, Shim, Johnson, & Jiang, 2006). The most potent direct impact on privacy concerns is the perception of behavioral control. Online shopping intention is positively influenced by useful awareness, awareness of behavioral control and online shopping attitudes. Confirm the results obtained in Lwin and Williams's (2003) and Pavlou (2003). The most potent factor in the intention to shop online is the attitude of online shopping.

Another study was conducted by Kai H. Lim (2014) while investigating how different trust-building strategies affect purchasing behavior in an online shopping environment, especially for first-time visitors to a nameless online store. The study is based on the Partial Least Squares Regression method, which hypothesized that both the link to well-known websites and customer satisfaction confirmation positively influenced customer trust, thereby increasing the level of willingness to make purchases and purchasing decisions for that store. Kai H. Lim and his partner have proven that customer satisfaction will increase consumer confidence in the store.

In Vietnam, there have also been some studies on consumer behavior such as Pham Ngoc Thai's master's thesis (2015) on factors in impacting customers' intention to use online services, this study was conducted with subjects between the ages of 22 and 50 living in Ho Chi Minh City. The study using Taylor and Todd's C-TAM-TPB combination model (1955). The results show that two factors: Subjectance (personal needs and customer attitude) and objective (price, product quality and trust in the website), all affect the intention to use online shopping services. In addition, the research by Author Re Thanh Xuan (2015) also gives factors affecting the intention of shopping through Facebook social network in Ho Chi Minh City, through TPB, TAM model and trust theory to build an online retail model through social networks. The results of the study point to 5 factors such as reliability, subjective standards, useful awareness, ease of use awareness and behavior control perception that have a substantial impact on the intention to make an online purchase through Facebook.

In summary, previous research has shown that factors such as trust, risk apprehensiveness, and the convenience of the site to customers' online shopping behavior are present mainly in the research articles. However, most of these studies are based on various methods, so the reliability of the results has not been high. In this study, the authors used both quantitation and quantities simultaneously to develop and develop a model to assess the impact of factors on online cosmetic shopping behavior in the event of information asymmetry present in both the item and the market. The selection of cosmetic items for research is based on two main reasons: Firstly, cosmetics are typical items for the group of goods, the new objective of the study is to take into account the asymmetry in the market and the breed of the item - a combination that almost no research has mentioned; Secondly, cosmetics are a potential item and are increasingly popular with young people today.

2. Method

Ordered Logit (OL) regression model.

Customers' intention to shop for cosmetics online is determined based on many different factors such as financial capacity, advantages of shopping online, age, gender, hometown,... and especially the factors of trust (and risk) of customers about online cosmetic consumption. Trust has a great impact on the intention to continue buying cosmetics online because cosmetics are used directly on the skin and by mouth, consumers only know cosmetics' quality after a long time when they are used, so they can face the beauty risks and health if they use poor quality products. Cosmetics shopping online also add to consumers' fear, when this form of shopping has many disadvantages. So does trust and risk really affect customers' cosmetic buying behavior?

In the survey questionnaire, the dependent variable: "Intent to buy cosmetics online in the next 6 months" is hierarchical, so in this article, an Ordered-Logit regression model is used to assess the impact of these factors, especially trust and risk on the intention to buy cosmetics in the next 6 months. The Ordered-Logit regression model has the form such as:

$$P(y=j)=\frac{\exp\,(X^T\beta-\mu_j)}{1+\exp\,(X^T\beta-\mu_j)}-\frac{\exp\left(X^T\beta-\mu_{j-1}\right)}{1+\exp\left(X^T\beta-\mu_{j-1}\right)}\text{ với } j\ =\ 1{,}2,\ldots\ \mathrm{N}-1 \qquad (1)$$

Where: $X^T{}_I$ là factors affecting consumers' intention to buy cosmetics online, u_j là sai số ngẫu nhiên, β the numbers to estimate..

Data

Research items are cosmetics – favorite items of young people. Therefore, the study carried out a randomized investigation from students of the National Economics University. The data collection is done as follows: The author's group goes to several random classes, gives questionnaires and funding to all students in the class, and collects questionnaires soon after. The questions are based on previous studies and after examining samples on 20 consumers and eliminating inappropriate factors. The result received a questionnaire of 15 questions/group of questions. The questionnaire was then investigated for the second time by 30 other random consumers to ensure the words used in the questionnaire were easy to understand and clear. The survey received 305 responses, of which 42 responses that had never used cosmetics were removed from the list, the set of data used for calculation and analysis in the remaining study of 263 responses.

Table 1. Basis statistics for demographic variables

Variable		In template (Person)	Percent (%)
Gender	south	120	39.47
	female	184	60.53
Age	2000	92	30.26
	2001	137	45.07
	2002	59	19.41
	1999	16	5.27
Area	rural	124	40.79
	urban	180	59.21

According to Table 1, It can be seen that the responders are mostly female (60.66%) and come from urban areas (59.02%). For the age, the majority of responders were born in 2001 (44.92%) and 2000 (30.16%).

As a result of the survey, 86.18% of respondents used to buy cosmetics online, of which 74% believed that buying cosmetics from above-average to high-end brands, and 89% of respondents believed that the products received after buying online were of the right quality as advertised. Thereby, we see that most young people now have a certain trust in online shopping. In addition, of those surveyed, 96% of them rated the products received when buying directly at a traditional store of the same quality as advertised. This shows that the majority of consumers still trust the products they buy directly at the store rather than when buying online. This is quite close to reality because when consuming products online, they always face many risks, especially cosmetic items - high asymmetry.

After studying the properties and effects of cosmetics. As well as gaps in online cosmetic consumption from previous research articles such as Kim [8]. Since then, the topic has carried out a review of the level of apprehensive of customers on a scale of liker 5 from very unbelievable (1) to very confident (5) about the risks that can be encountered as follows:

Health risks when using cosmetics online: Suffering from dangerous diseases such as lead poisoning, skin cancer,...; Premature skin aging; Allergenic when used; Causes end noisy disorders.

Service risks when buying cosmetics online: Addresses and phone numbers provided on the web are misused; Account number took advantage of; The store does not give returns as committed; Cannot contact the store when the product has a problem; Do not receive goods after paying online via app.

Below is a brief description of customers' risk aversion when using online cosmetics through the author's survey.

Level of fear of risks of customers when consuming cosmetics in the e-commerce market

Table 2. Level of risk apprehensive of customers (unit: % by line)

Risk	Very unbelievable	Unbelievable	Medium news	Pretty trusting	Very trusting
Dangerous diseases	3.42	14.83	33.46	27.76	20.53
Aging skin	3.42	23.57	31.94	23.95	17.11
Allergy	3.42	23.95	30.04	27.38	15.21
End noisy disorders	4.56	23.95	30.80	28.14	12.55
Address, phone number misused	3.04	20.53	39.92	28.90	7.60
Don't give back	6.08	28.14	31.56	29.66	4.56
No contact	7.98	25.86	34.98	26.62	4.56
Account number being taken advantage of	5.32	29.66	36.50	24.33	4.18
Do not receive goods after payment	15.59	31.94	36.12	15.21	1.14

The majority of questioners were more concerned about health risks than service risks; the risk of dangerous diseases was the one that consumers were most concerned about (20.53%), followed by skin-related problems with 17.11% and endocrine disorders with 15.21%. In the survey, people were less interested in whether the account number was taken advantage of or did not receive the goods after paying online.

The e-commerce market in Vietnam is a new market with pretty a few loopholes in operation, which is why customers have a fairly high level of risk when trading in this market, especially with credit items such as cosmetics. Therefore, businesses need to send signals to attract and build trust with consumers.

Through previous research on consumer confidence such as Mavlanova [5], Morais [9], and through sample surveys about the signals that Vietnamese cosmetic consumers are interested in when buying cosmetics online. The authors' team has synthesized some of the following signals:

Signals to increase customer confidence in product quality: The store is a genuine agent; The store is a shop on Shopee Mall; Products reviewed by famous Beauty Bloggers; Stores regularly receive good customer feedback

Signals that show that the enterprise has a system that operates in a system and reliably: The store is a genuine dealer; The store is a store on Shopee Mall; Products are reviewed by famous Beauty Bloggers; The store often receives good feedback from customers

The following signals indicate that the enterprise has a system that operates systematically and responsibly: The store has a specific address; The store displays the contact method; The store responds to customers quickly; Stores allow consumers to track order; The store commits to return and exchange when detecting inferior quality products

So, do the signals given by businesses promote the effect of attracting and building trust with customers? This is a question that is always interested by brands because each signal requires certain costs.

Customer confidence in the signals issued by the business.

In the questionnaire, the answer will evaluate the above nine signals on a liker five scale from very unbelievable (1) to very confident (5).

Table 3. Consumer confidence in signals when shopping online (unit: % by column)

Trust level / signal	Very unbelievable	Unbelievable	Medium news	Pretty trusting	Very trusting
The store is a shop on Shopee Mall	0	2	29	40	30
The store is a genuine agent	0	1	25	47	27
Products reviewed by Beauty Blogger	1	10	40	36	14
Store with a specific address	0	6	47	40	6
Store receives good customer feedback	1	10	36	46	7
Store return commitments	1	13	36	41	9
Have communication methods displayed	0	14	52	30	4
Allow consumers to track orders	0	17	52	28	3
Store responds to customers quickly	3	19	57	20	2

In the above signals, considering the total percentage of customers who evaluate pretty confident, we find that the first 3 signals receive the most trust from customers with the percentage of trust: 70%; 74%; 50%. Realize that these 3 signals are official signals – certified and guaranteed information security help consumers have a basis for trusting the products they consume and the services they receive.

The signal group that receives a pretty high trust from customers is the 4th signal; 5; 6 according to table 3 with the percentage of customers trusting are 46%; 53%; 50%. Signals 5 and 6 have a fairly reliable and very trusting customer volume higher than signal 3. However, on the other hand, the number of customers is only half that of signal 3, so signal 3 is still more important. Considering that this signal group is intended to assert itself about the quality of its products, however, this information is difficult to verify, and no agency guarantees their accuracy.

The group that received the least customer trust was the last 3 signals with the corresponding percentage: 34%; 31%; 22%. These are signals about the service of the store and less correlation with the quality of the product.

In addition to factors that frequently appear in previous studies such as trust and risk aversion, the study also considers several factors such as the convenience of online shopping, a brand of cosmetics ... also has a significant impact on the purchase intention of customers. The following are some descriptive statistics of other variables that the research team performed presented in Table 4:

Table 4: Descriptive statistics for some other variables

		Mean	Median	Mode	Std.dv
Believe in products purchased online		3.27	3.00	3.00	0.75
Believe in offline purchases		3.67	4.00	4.00	0.66
Convenience of buying online	Attract more than buy ofline	3.27	3.00	3.00	0.95
	Save time	3.94	4.00	4.00	0.81
	Easy to choose	3.65	4.00	4.00	1.02
	Cheaper than buying offline	3.87	4.00	4.00	0.88
	Feel comfortable buying online	3.37	3.00	3.00	0.92
Use a lot of cosmetics		3.03	3.00	3.00	0.90
Buy only famous cosmetics		2.67	3.00	3.00	0.57
Determine quality through appearance		2.55	3.00	2.00	0.77
Determine the quality as soon as you use it		3.30	3.00	4.00	0.80
Will buy online in the next 6 months		3.57	4.00	3.00	0.89
Will introduce relatives to buy online		3.41	3.00	3.00	0.84

The variables in table 2 are measured using a likert5 scale. On average, survey respondents are quite confident in products purchased online and offline (3.2~3.7), the frequency of cosmetic use as well as the intention to continue buying cosmetics online are quite high (3~ 3.6). And the answer also appreciated the convenience of buying cosmetics online (3.2~4).

3. Results

In fact, depending on the audience of customers, they have different product and service requirements, the audience of the item they are interested in, as well as the frequency of their purchase, is not the same, especially with high-level items such as cosmetics. Therefore, we have implemented customer clustering to understand the behavior in each customer group. The study conducted the customer segment based on the variables collected and some transformations such as the percentage of cosmetic purchases per total spend or the percentage of online cosmetic purchases on the total amount of cosmetic purchases and the average price of a cosmetic item using the K-mean algorithm.

Using the K-means algorithm to segment customers

After running clustering on the data set, the results result in 3 customer segments with characteristics that are performed through the following table:

Table 5: Some typical factors among the 3 customer segments

Variables / Clusters	Number of observations	FRED	AMOUNT	REXP	RONE	APRICE (VND)	GROW
1	175	2.98	11.71	0.32	0.59	600,366.5	6.71
2	26	4.46	30.00	0.29	0.73	644,348.8	6.23
3	62	2.56	6.23	0.26	0.397	472,043.1	18.95

From the characteristic elements obtained from table 5, we get the characteristics of each segment as follows:

Table 6. Clustering characteristics of each customer group

Cluster	Characteristics
1	Middle customers, high frequency of use and purchases
2	High-end customers, high frequency of use and purchases
3	Low-end customers, high frequency of use and purchases

After implementing the customer segment, the team carried out a recall of the intention to buy cosmetics online in the next 6 months according to the independent variables in the post.

So is the purchasing intention of each customer segment different and what factors affect the intention to buy cosmetics online on each customer group? Previous studies have all pointed to the impact of trust and the level of fear of the risk of customer procurement behavior. Whether to find the impact of these two factors on the intention to buy cosmetics online of young Vietnamese consumers. The team has revoked customers' intention to buy cosmetics online in the next 6 months according to variables found using the Ordered-Logit Revo recovery model.

However, the resulting variables have a fairly high correlation that easily leads to multi-line correlation when res on a scale. Therefore, the author's team conducted a discovery factor (CFA) analysis for variables of trust in signals,   level of risk apprehension, and sense of convenience before proceeding. The results obtained 5 main factors are trust in product quality signals (Trust_health), Trust in service signals (Trust_ser), Health risk apprehensiveness (Risk_health), Fear of service risks, and security(Risk_ser), and The convenience of buying cosmetics online (Conv).

Using Ordered Logit regression model to evaluate the impact of trust, risk and other factors on customers' intention to buy cosmetics in the next 6 months.

The study carried out regression of intention to buy cosmetics online according to independent variables such as:

Variables obtained from CFA factor analysis: Risk_health (Level of health risk apprehensive); Risk_ser (Level of service risk apprehensive); Trust_health (Trust in product quality signals); Trust_ser (Trust in service signals); Conv (Feel the convenience of online shopping)

Demographic variables: Female (Female gender), Urban (Urban).

Variables on customer consumption characteristics: Amount (Quantity of cosmetics purchased/year); Grow (The percentage of purchases increases as customers believe the product is of good quality), Amount spent on buying cosmetics online (Onlexp), Amount spent on buying cosmetics directly at the store (Offexp)

Regression results of intention to buy cosmetics online according to Ordered-Logit model are shown in table 7 below:

Table 7. Ordered Logit result

	Coef.	Std. Error	P-value
Signal_health	**0.46**	0.17	**1.12e-06*** **
Signal_health:cluster1	**0.26**	0.31	**0.00467** **
Signal_ser	**-0.05**	0.15	**0.104**
Signal_ser:cluster1	**0.61**	0.31	**1.88e-07*** **
Risk_health	-0.09	0.17	0.367
Risk_health:cluster1	**-0.96**	0.47	**2.00e-08*** **
Risk_ser	0.05	0.14	0.308
Risk_ser:cluster1	0.11	0.32	0.363
Conv	**0.94**	0.16	**1.00e-26*** **
Conv:cluster1	**0.37**	0.37	**0.00042*** **
Sex1	-0.23	0.31	0.25
Ht1	0.25	0.25	0.248
Onlexp	**0.2**	0.87	**0.084 .**
Offexp	**-0.3**	0.6	**0.093 .**
Grow	**-0.005**	0.03	**0.047***
Amount	**0.06**	0.05	**0.045***
Intercepts			

μ1|2	-7.56	1.21	
μ2|3	-4.802	0.96	
μ3|4	-1.53	0.9	
μ4|5	0.615	0.99	

The estimated results show that factors such as: Trust in product quality signals (Signal_health), Trust in service signals (Signal_ser), Feel the convenience of online shopping (Conv), Amount spent on buying cosmetics online (Onlexp), Amount spent on buying cosmetics directly at the store (Offexp) have an impact on purchase intention, in which the factors of trust in product quality, convenience of the site, amount spent on buying cosmetics online has a positive impact on customers' intention to buy cosmetics online.

In the group of "premium and mid-range customers" (cluster0), Signal_health, Signal_ser and Conv have a positive impact on consumer purchase intention and these three factors have a stronger impact than the group of "customers" low-end goods" (cluster1). In addition, level of health risk apprehensive only affects the intention to buy cosmetics online of low-end customers (cluster1).

4. Discussion and Conclusion

The article is interested in the influence of trust and risk on online purchase intention, focusing on cosmetic products. The research results show some results as follows:

+ Firstly, through the Ordered Logit regression model, the model shows that the trust factors about product quality, service and convenience affect the intention to buy cosmetics online, in which the factors trust in product quality, convenience has a positive impact on customers' intention to buy cosmetics online. Therefore, in order to attract more customers, businesses should strengthen the factors that affect customers' confidence in the quality of cosmetics, and improve the features of the sales website to help customers more convenient during online shopping. In addition, the state should stand to guarantee the information given from the business, making information falsification a legal issue so that customers have a basis to believe in the signals given. If the state does not tighten management, it is easy for businesses to fake information when the cost of forging information is lower than the cost of doing business honestly.

+ Second, in the middle and high-end customer groups, the factors of trust in product quality and convenience have a positive impact on consumers' intention to buy cosmetics online. In the low-end customer group, in addition to the impact of the two factors above, a negative impact of the level of health risk apprehensive was found. From the given results, businesses when approaching these customer segments need to focus on the trust factors about cosmetic quality, synthesize information that affects customer trust and especially Especially for low-end customer groups, specific information needs to be provided to reduce customers' risk aversion to the product.

SESSION 4:

RESOURCES, ENVIRONMENT AND CLIMATE CHANGE

CURRENT STATUS OF LIVELIHOOD ACTIVITIES, PRESSURES AND CHALLENGES TO ECOSYSTEM SERVICES IN THE BUFFER ZONE AT THANH PHU WETLAND NATURE RESERVE, BEN TRE PROVINCE

Dr. Ha Thi Thu Hue

hathithuhue2001@yahoo.com

Central Institute for Natural Resources and Environmental Studies, Vietnam National University, Ha Noi (VNU-CRES)

Abstract

Wetlands play an important role in many different ways for the lives of many people in Vietnam. One of the challenges that the Wetlands are facing is the livelihood activities of local people in the buffer zone. This paper examines the current situation of people's livelihood activities and the pressures on biodiversity conservation in Thanh Phu Wetland Nature Reserve (NR), Vietnam. The study was conducted in 3 communes in the buffer zone. 249 households were selected for interviewing, 03 group discussions, 10 in-depth interviews were conducted to collect both qualitative and quantitative data. The results show that, people living in the buffer zone of Thanh Phu Nature Reserve do not have diversity in livelihoods, they mainly work in aquaculture, agriculture and fishing in mangrove forests. 4 provisioning services, 5 regulating services and 3 supporting services are mainly ecosystem services that are highly appreciated by the people. In addition, the NR is also facing challenges in conserving biodiversity from both human and natural impacts, especially forest encroachment activities for aquaculture and fisheries activities. The harmony of interests between local people and the conservation. Therefore, the sustainable livelihood development for the community and biodiversity conservation requires integrated and multi-methodical efforts in addressing constraints in different areas such as aquaculture, contracting and forest protection policy.

Key words: *Ecosystem Services, Natural Resources, Thanh Phu, Wetland*

1. Introduction

Wetlands cover 5–10% of the Earth's land surface (Mitsch and Gosselink, 2007). As a transitional ecosystem between terrestrial and aquatic ecosystems, wetlands support high biodiversity (Keddy, 2009; Cohen-Shacham, 2015) and are essential to the health of both lower life forms water and land (Mitsch and Gosselink, 2007).

Wetlands are very important to human society (Mitsch and Gosselink, 2000; Ricaurte et al., 2014) because they provide a wide range of ecosystem services (RCS, 2007). In particular, the provision of food, drinking water and ensuring livelihoods for people living in and around them is widely recognized (Ricaurte et al, 2014; Schuyt, 2005; Rebelo et al., 2009). Their global economic value is estimated to be about 70 billion USD per year (Schuyt and Brander, 2004). However, wetlands are continuously degraded in many countries (Mitsch and Gosselink, 2007; Wei, 2015) although understanding of their values has been enhanced (MEA, 2005). Global wetland loss has been estimated to be around 50% since 1900 (OECD/ IUCN, 1992), leading to a significant impact on ecosystem services, biodiversity and human livelihoods (ICSU-UNESCO-UNU, 2008). In Asia alone, about 5,000 km^2 of wetlands are lost annually (McAllister et al., 2001).

The Millennium Ecosystem Assessment (MEA, 2005) demonstrated a strong link between ecosystem services and people's livelihoods and the decline of ecosystem services across biomas, leading to changes to people's livelihoods. On the contrary, people's livelihood activities are also reversed to put pressure on the ecosystem. We use the MEA framework as the basis for our research, where we look at changes in wetlands and consequential impacts on people. Specifically, we use the separation of ecosystem services into provision (products obtained from the ecosystem), moderation (benefits obtained from modifying ecosystem processes), (the non-material benefits people gain from the ecosystem through spiritual fostering, cognitive development, reflection, recreational and aesthetic experiences), and support (experiences required for the production of all other ecosystem services) (MEA, 2005).

Information on individual wetlands and their exploitation at the local level is very limited (Gopal, 2013). Accurate information is needed on the values and drivers of change for the conservation and sustainable use of wetlands (Balmford et al., 2011). Knowledge of wetland ecosystem services, dynamics of change and subsequent impacts specific to regions or areas of interest is essential to ensure proper, safe use, conservation and sustainable development (Mmopelwa, 2006; Ostrom, 2007; Adekola, 2011). Assessing wetland ecosystems at a time scale and particularly at the local level helps to track changes, providing important information for natural resource planning and management (Prasad, 2002). For conservation planning and management, there is a clear need for a more detailed understanding of the ecosystem services provided by wetlands and the threats they face (MEA, 2005).

The objective of the paper is to analyze livelihood activities of people in Thanh Phu Nature Reserve buffer zone and the pressures on biodiversity conservation activities.

2. Method

Study areas

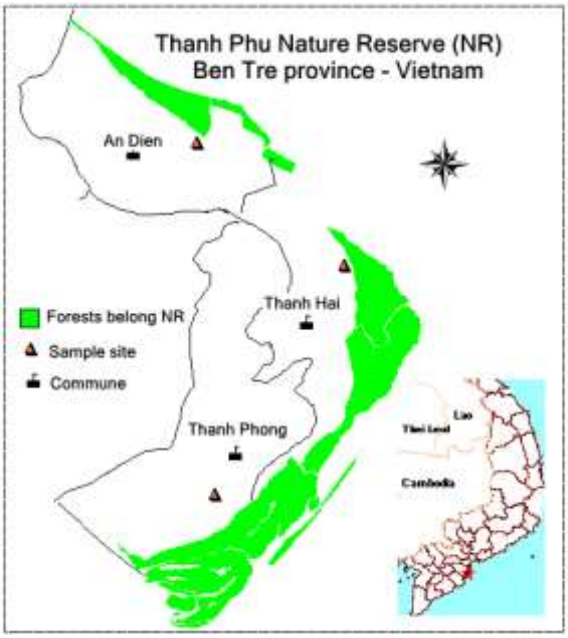

Fig.1. Location of Sampling

Thanh Phu Wetland Nature Reserve, Ben Tre Province: Ben Tre was established under Decision No. 1026 / QD-TTg dated November 13, 1998 of the Prime Minister with an area of 4,510 ha. Since the establishment of the Reserve, the area covered all forest and production forest land managed by Thanh Phu Forest Enterprise (971 ha), a state-owned enterprise assigned by the Provincial People's Committee. Many land areas of the Nature Reserve belongs to local people who have lived and cultivated before the NR was established. There are over 407 households with 1,385 people living and cultivating interwoven in the forest, but the locality has no land fund and financial resources to relocate. Therefore, under the pressure of production development, people always violate deforestation and illegal encroachment on forest land for aquaculture and agricultural production, thus creating a conflict between economic development and forest protection.

The study was conducted in three communes in the buffer zone of Thanh Phu NR: An Dien, Thanh Phong, and Thanh Hai (Figure 1).

Data collection

We used both qualitative and quantitative research methods to identify the livelihoods of people dependent on ecosystem services.

Household survey

Before conducting interviews with the households, the research team had a meeting with the Nature Reserve Management Board, local authorities in the district to find out an overview of the socio-economic background of the people living around the NR. In which, the research team has selected three communes in the buffer zone of Thanh Phu NR to be study sites to determine the household's dependence on wetland resources. Initial assessment shows that about 85% of all households directly depend on wetland resources. Of these households, about 10% were randomly selected for household survey. Using semi-structured questionnaires, a total of 249 households dependent on wetlands were surveyed in Thanh Phu NR. The questions focused on the ecosystem services, people's dependence on them, the dynamics of change and people's impact on ecosystem services.

Group discussion

The list of ecosystem services obtained from the household survey was confirmed during focus group discussions. Three focus group discussions were conducted at the commune level, with an average of 8–10 participants per group during the study. Group members were selected based on their livelihood strategy and dependence on wetlands. The different dynamics of change and people's dependence on wetlands have also been thoroughly discussed among the groups. The listed ecosystem services have also been ranked in discussions.

In-depth interview with key informants

Representatives of the NR Management Board, Thanh Phu Agriculture Department, Natural Resources Department, the leaders of the People's Committees of 3 communes, the heads of the hamlets, from October 2020 to January 2021. The main questions in interviews focused on livelihood strategies and the dynamics of change in wetlands. A total of 10 staff members were consulted as key informants during the study to help us understand change patterns and dynamics. The main criteria for selecting informants were their knowledge of wetland resources, and people's dependence on and participation in wetland management. The main topics of the in-depth interview were focused on the following areas: (a) what is the status of wetlands and the availability of ecosystem services, (b) ecosystem services. What are the key drivers of change that local communities are gaining, (c) changing trends in existing ecosystem services, (d) what are the main drivers of change, and (e) What management decisions are needed to manage well wetlands?

Data analysis

Quantitative data were analyzed using software (SPSS) 20.0 to determine the extent of local people's dependence and the impacts of different factors on wetland ecosystems. Qualitative data obtained from first-time interviews were coded and categorized into topics according to research questions (i.e. ecosystem services; dynamics of change, livelihood strategies, etc.) and similar coded topics are grouped together. Ecosystem service ratings are performed using participatory tools. Focus group discussion participants were asked to identify key ecosystems available from wetlands. After key ecosystem services were listed, participants were asked to rate the listed ecosystem services on a scale of 1 to 10 (1 with least priority and 10 with highest level). The overall rating is based on the total score for each ecosystem service divided by the number of respondents. Drivers of ecosystem change are identified through both qualitative analysis (focus group discussions) and also from the household questionnaire.

3. Results

Background information established from the survey of local household

Among 249 respondents, the number of respondents is male is 160, accounting for 64.3%, the rest are female. Women in the three communes participated in the interview very boldly, they not only take care of housework in the family but also know very well the business and economic situation in the family, they are the key people lock, keep money and take care of household payments, so the data is very reliable. The age of the interviewees ranged from 24 to 89 years with the median age, 48.5 years (Table 1). The largest age group represented was 41-50 years with 28.5% of the respondents. This implies that the respondents had experience on various issues relating to livelihood activities by themselves and in the community. Small family size (smaller than 4 people in the family) is dominant (66.3%). Most of the respondents are owners, therefore, they have a good understanding of their house livelihood as well as the disadvantage that their family is facing.

Table 7. Summary of socio-economic respondents based on the survey

Social-economic situation	Categories	Frequency (n)	Proportion (%)
Gender	Male	160	64.3
	Female	89	35.7
	21 – 30	16	6.4
	31 – 40	53	21.3
	41-50	71	28.5
	51-60	69	27.7
	Above 60	40	16.1
Number of persons in the family	≤ 4	165	66.3
	5 – 7	72	28.9
	≥ 8	12	4.8
Relationship of the respondent to family owner	Owner	167	67.1
	Wife	46	18.5

	Husband	5	2.0
	Other	31	12.4
Years of stay in the commune	Under 20	25	10.0
	21-30	31	12.4
	31-40	43	17.3
	41-50	47	18.9
	51-60	58	23.3
	Above 60	45	18.1

Ecosystem services, their uses and ratings

A total of 12 major ecosystem services have been identified through household surveys, in-depth interviews, focus group discussions, of which, 4 providing services, 5 regulating services and 3 supporting services (Table 2). Cultural services in Thanh Phu NR have not yet been available, a number of historical relics for tourism development have been removed from the NR, some spontaneous tourism activities such as restaurants, swimming by a number of private sectors, not belong to NR.

Table 2. List of ecosystem services at study site

Ecosystem service criteria	Ecosystem services were recorded at the study site	Note
Providing Services (4)	1. Wood 2. Firewood 3. Seafood (fish, ba khia, clam, shrimp) 4. Water for aquaculture	- Timber: More than 10 years ago, people lived in Thanh Phu used timber to build houses, however, now, the government prohibits them, they cannot cut the trees and they also use solid houses, however, there are still a few households living in the core zone of the NR that still need to take wood for house construction, the government suspended the construction of the house, but they do not agree. - Firewood: Previously, people went to the mangrove forest to get firewood to cook, now they use gas, no more firewood. - Seafood: In Thanh Phu NR, people go to the forest to

Ecosystem service criteria	Ecosystem services were recorded at the study site	Note
		catch fish and Ba Khia (*Sesarma mederi)*, which is a significant source of income for a part of the people dependent on the mangrove forest. - Water supply services, according to the people in the study site, water mainly for aquaculture.
Regulating Services (5)	1. Air regulating 2. Air purification 3. The cycle of nutrition 4. Carbon sequestration and storage 5. Control of floods, breakwaters	1. "The mangroves make the climate cool, too wonderful, the green lungs, especially in the summer, coming here (mangrove forest) is too cool. 2. "Mangrove forest" the air too good, making the air fresh" 3. The crab living in the forest make the soil soft. 4. "If you have trees, you will definitely absorb carbon, but we don't know if we can store them" 5. There are mangroves that support waves very much, if there is no forest, the inner dyke cannot support the waves at sea, this service is very clear.
Support services (3)	1. Regenerate soil nutrition 2. Agricultural production support 3. Spawning grounds, food supply, and breeding animals	1. Alluvial soil and deciduous branches contribute to soil nutrient regeneration (soils in mangrove forests). 2. Thanks to mangroves that prevent waves and saltwater, people can do agriculture. 3. "The Ba Khia, fish and shrimp live in it"

In focus group discussions with local communities, and household interviews, the top ranked services are aquaculture, fishing services, agricultural production (growing rice). These services were ranked based on their household use and / or the ability to sell them in the marketplace for an economic profit. The top 8 services with detailed information on local people's usage are given in Table 3

Table 3. Ecosystem services, local community uses and ratings (Lower number indicates higher preference)

Ecosystem services	Use	Ranking	Note
Aquaculture (Supporting service)	Food serve for their family and sell it	1	131 out of 249 households interviewed in Thanh Phu NR doing aquaclture, with average income (244.73 million VND/ha). Although, in recent years, farmers have lost many shrimp crops from diseases, but aquaculture is still a main sector that brings in significant income, many households raise intensive farming, many households do extensive farming or semi-extensive farming.
Fishing (Providing Service)	Food serve for their family and sell it	2	70/249 households interviewed in Thanh Phu NR participated in fishing in the forest, they went to catch Ba Khia in the forest, earning 70,000 VND/night.
Agricultural production (supporting services)	Mainly for home and sale	3	26/249 households interviewed in Thanh Phu NR cultivates rice. In addition to agricultural production, which is rice cultivation, local people also plant a number of fruit trees of high economic value in Thanh Phu NR (Tu Quy mango, water melon, Jícama) for a significant source of income.
Flood prevention, breakwater, coastal protection (Regulating service)	Protecting people and property for people	4	This service is highly appreciated by the local people. "Without forests, it is dangerous to prevent storms and strong winds to protect people and property for the people". People often give this service a 9-10 score
Habitat for Species (Supporting Service)	Habitat support for species	5	This service was scored by people around 7 points, they said that although some species reproduce in the sea, but then they went to the mangrove forest to live and develop.

Ecosystem services	Use	Ranking	Note
Climate regulation (Regulating service)	Health support for people and disease reduction	6	"It is very cool near the forest. Especially in the summer, I love mangrove forest very much, wherever I go, I want to quickly go back to my hometown, living here, the fresh climate is familiar". This service is also given 9-10 points by people.
Water supply for aquaculture (Supporting Service)	Serve for aquaculture households, especially extensive farming households	7	Now the water source is also polluted from agriculture and other sources, so shrimp and fish also die a lot, aquaculture is no longer the same as before.

(Source: Focus group discussions and household interviews in 2020 and 2021).

People's dependence on ecosystem services

In total, there are three main livelihoods of people in the study site. Approximately 84% of the respondents participated in fishing in the mangrove forest and combined with agriculture in Thanh Phu NR, which is understood as rice cultivation (Figure 3), and fruit crops such as Tu Quy mango, watermelon and Jícama. In addition, they also plant crops for food.

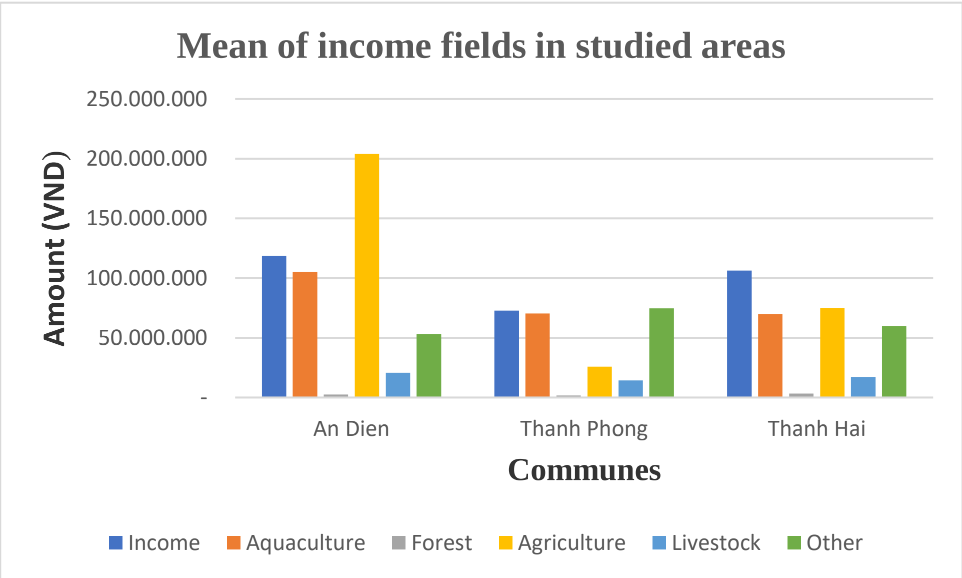

Figure 4. Average income from occupations of people in Thanh Phu NR

The average income per capita / month of the people in Thanh Phu NR is 1,700,000 VND/person/month. Summary of livelihood types associated with ecosystem services in Thanh Phu NR is described in Figure 4.

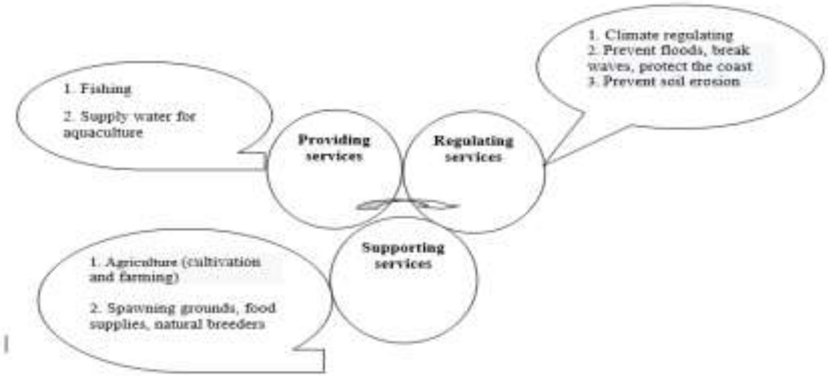

Figure 5. Types of livelihoods and their relationship with the ecosystem services of the study site

The challenges of livelihood activities on the conservation at study sites

Analysis of household surveys, group discussions and in – depth key informant interview, 5 direct drivers and 2 indirect drivers affects on ecosystem services. These forces of change are human and natural (Table 4). The reported market is the indirect driver of the change. The encroachment on forest land to expand aquaculture, the use of chemicals from agricultural production.

Table 4. Factors putting pressure on conservation in Thanh Phu NR

Factors that put pressure on conservation	Direct/ Indirect	Natural / human	Note
Market (purchasing all fish species, Ba Khia, small shrimp)	Indirect	Human	If there is a demand, there is a supply, people will catch everything they catch and sell for money
Management plan is not effective	Indirect	Human	The stakeholders have not yet had truly effective coordination activities.

Factors that put pressure on conservation	Direct/ Indirect	Natural / human	Note
Aquaculture	Direct	Human	The massive development of aquaculture, lack of planning, and lack of strict management and supervision have also lost some areas of mangroves. Not only that, the wastewater from the fins of the aquaculture lagoon has polluted the water sources of the rivers and tidal flats in the area, negatively affecting the food source of wildlife, causing the number and the quality of species has deteriorated.
Wastewater and water pollution. example: Use of pesticides in cultivation (rice)	Direct	Human	The rice farmers said that, at present, to facilitate cultivation, they use too many plant protection chemicals, pollute water sources, and affect the development of mangroves.
Lightning strikes	Direct	Nature	Much of the mangrove area died due to lightning strikes
People's dependence on forest resources	Direct	Human	The dependence of communities in and around the NR has put great pressure on the NR's resources, reducing the quantity and quality of natural resources in the area.
Overexploiting natural resources	Direct	Human	

4. Discuss and conclusion

The research team evaluated the ecosystem services of a wetland by examining the perceptions of communities based on their dependence on those services. We found 12 ecosystem services, reported to be important to the livelihoods of local people. Critical ecosystem services are identified by locals as providing services because they can be immediately profitable in cash or used. Human dependence on services provided is widely recognized, especially in developing countries, as people depend heavily on natural resources (Van Oort et al., 2015; Bhatta et al. , 2015).

Local people are said to be heavily dependent on the ecosystem services listed, the three main livelihoods in the study from the area are derived from ecosystem services provided by wetlands, suggesting that the high contribution of wetland ecosystem services to their livelihoods. High dependence of some local communities on wetland ecosystem services has been reported elsewhere, for example in the Koshi Tappu Wildlife Sanctuary in eastern Nepal (Chaudhary and et al, 2015; ICIMOD, 2014) and Kratie province of Cambodia (Persson et al., 2010). Declining trends in the availability or provision of these services, as previously reported elsewhere (Bhatta, 2015), threaten the livelihoods of local communities. Further deterioration of ecosystem services can negatively impact the livelihoods of wetland-dependent communities as they limit alternatives for livelihood diversification. The vulnerability of wetland communities to such rapid changes in the provision of ecosystem services is a major concern elsewhere, for example, Bhatta et al. (2015), who pointed out that similarly poor communities in the mountainous regions of Nepal are too poor to adapt their livelihoods to rapid climatic changes in ecosystem service provision. It is worth noting that the factors that cause climate change, climate change in mountainous communities and poor management and overuse of resources in wetlands are completely different. However, poor people are often less able to adapt to their livelihoods in the face of such changes leading to similar results. When interviewing people in Thanh Phu NR, some households said that if they relocate their livelihoods out of the core zone of the NR, they will not go unless the government creates new livelihoods for them, for many generations. They are used to living clinging to work near the forest.

In the assignment of forest protection contracts in Thanh Phu NR, they do not even remember how much money they received per year because that amount was too small, in contrast, they used 3/7 (3 parts of the surface area water, 7 parts of the forest) for extensive aquaculture, fishing (Ba Khia, fish) in the forest area they manage, however, leaves and branches of the forest fall and pollute the water, making it difficult for them to cultivate, their desire to increase the rate of cultured water surface to 4/6 or 5/5. In fact, forest violations at the study site in recent years have decreased significantly, only a few cases of deforestation have been handled, partly because of increased awareness of the people, partly because “ there is not much to get in the forest ”.

FACTORS AFFECTING OCCUPATIONAL MOBILITY IN THE CONTEXT OF CLIMATE CHANGE IN THE MEKONG RIVER DELTA

Hoang Thi Quyen
hoangquyenhv4@gmail.com
Faculty of Sociology and Development, Regional Academy of Politics 4

Abstract

The article focuses on analyzing the factors affecting occupational mobility in the context of climate change in the Mekong Delta. The paper show that: 1) The changes in the environment, climate as well as changes in science and technology in recent years have led to major changes in the structure of labor, employment and causing more people to change their jobs and occupation; 2) The size and trend of occupational mobility depends heavily on factors such as: type of employment, level of income, age, education level, professional qualification when having a first job; level of loss in production and life caused by unusual weather and climate events.

Keywords: *Climate Change; occupational mobility*

1. Introduction

The Mekong River Delta ranks as one of the geographic areas most affected by the likelihood of a natural disaster, with the highest ranking for flood risk; saltwater intrusion, storms, riverbank erosion, high tide, and fire. The existing potential impact of environmental and climate change on labor and employment is a topic that attracts the attention of many scholars, policymakers, and, more broadly, the public. Several studies showed the effects of climate change on employment and labor. However, there is very little research that can generally describe the process of redistribution of human resources and job prospects when workers move to new jobs. For a more in-depth understanding of this topic, the article describes the occupational mobility model while analyzing the factors that influence the size and orientation of individuals' occupational mobility. Research results have important implications in designing policies to help employees best prepare to adapt to career changes in new contexts.

2. Method

The data used in the article are taken from the quantitative survey on occupational mobility in Can Tho city in the Mekong River Delta -based sample of 784 individuals (age: 15-60 years). Questionnaires were used to collect information on current employment status, current or main occupation before job strain. Occupation groups are classified according to the General Statistics Office's classification of occupations. Based on 10 Occupation groups are listed in Vietnamese occupational billboards in 2009, the author classified into 4 main occupational groups: 1) Management leadership and high expertise; 2) Middle-level technical expertise and staff; 3) workers and Skilled labor; 4) Farmers and other simple labor.

The concept of occupational mobility in the article is used to refer to the change of job /change of position in the occupational stratification of individuals at different times (intra-generational occupational mobility). In which, changes in job that "not related to change of class" / without transition status in the occupational stratification system are defined as horizontal mobility or "horizontal mobility”[4]. (Horizontal mobility means workers often remain in the same occupation when they change jobs). "Vertical mobility" is used to refer to the transition of an individual's occupation status or social advancement or regression compared to the previous occupation status.

Linear regression was used to estimate associations of the number of times worker change thier job with individuals’ characteristics such as: age, sex, socioeconomic position and several risk caused by unusual changes in weather and climate. Multivariate regression models was used to to estimate associations of family factors/the origin of the individuals; Personal characteristics such as: age, sex, education level, skills, efforts, hobbies with occupational mobility trends.In addition, I compare net mobility/ exchange mobility to structural mobility to determine the impact of the conversion factor on occupational mobility.

3. Results

3.1. Factors affecting the degree of job change in the Mekong River Delta

Occupational mobility refers to the process of workers transitioning from one occupation to another in order to find earning jobs or meet labor needs. When conditions allow for high degrees of occupational labor mobility, it can help maintain strong employment and productivity levels. In an economy, if workers can easily switch jobs from one industry to another, it means that economy has a rapid transition (Adam Hayes, 2019)[5].

Over the past years, with the rapid change of the scientific and technological revolution; Climate and environmental changes are affecting each industry and profession, affecting each employee. In the new context, many people had to change their jobs; career and consequently change in occupational skills that have followed them throughout their life. (*Chart 1*).

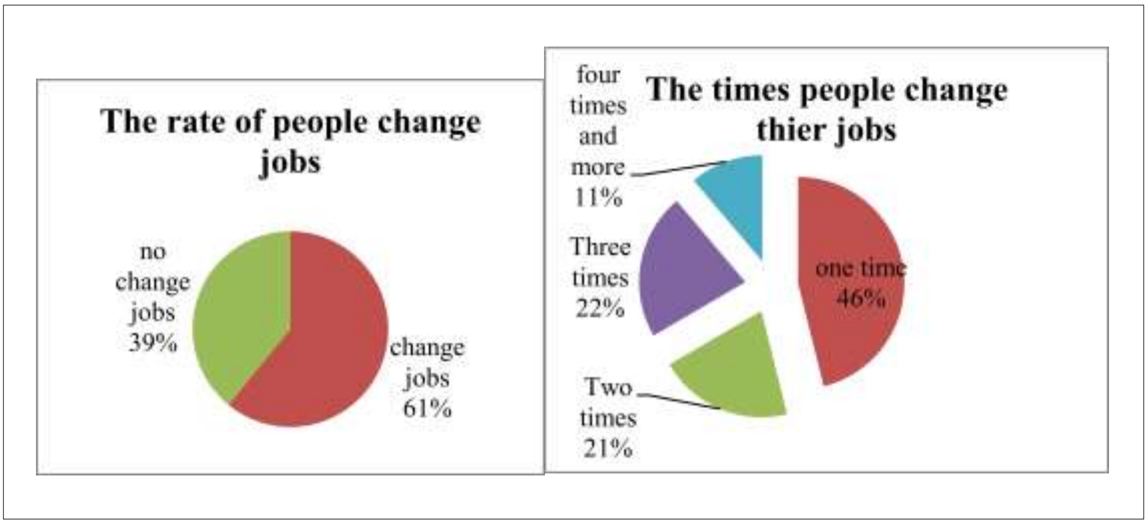

Chart 1: Proportion of people and the times People change their Jobs in the Can Tho city in 2020

Source: Survey data of author

Chart 1 shows the number of people that changed their job and the times they have changed their job. The data point that out of 784 study participants, 464 people, accounting for 61%, confirmed that they have changed their job, only 298 people, accounting for 39%, have not changed jobs. Among those who change jobs, 214 people, accounting for 46%, change jobs once, the number of people who change jobs twice is 95 people, accounting for 20.5% and the number of people who change jobs three times is 103 people, accounting for 22.2%, and 11% of people have changed jobs four or more times. Thus, from the time of the first job to the time of the survey, the average number of job changes per employee is 1.87 times. The average number of job changes is not large, which shows that the speed of economic transformation in the study area over a long period of time has been relatively slow. However, the environmental and climate changes as well as changes in science and technology in recent years have resulted in greater changes in the structure of labor and employment and forcing more people to change their jobs and occupation (*Chart 1*).

The number of time people changes job depends on factors such as: type of employment, income level, age, education level, professional qualification when having the first job; level of loss in production and life caused by unusual weather and climate events. Those who work under contracts or are civil servants and public employees are less likely to change jobs than those who work without a contract. The higher income, the less there is any change; The people with a stable job, whose less change their jobs; The age you start to work, affect the number of time people changed their jobs; Increasing the number of years in high school increases the number of times workers change thier job, whereas increase in professional qualifications reduces the number of times people change thier jobs; People affected more by environment and climate change, whose more changes thier jobs. (*Table 1*). The Linear Regression Equation has the form:

The number of times change jobs = 4.81 - 0.27*X_1 - 0.401*X_2 - 0.8*X_3 + 0.081*X_4 - 0.082*X_5 + 0253*X_6 - 0.411*X_7.

X_1: Income level of main occupation;

X_2: The level of stability of the first job;

X_3: The age when worker have the first job;

X_4: The highest class has completed at high school;

X_5: Professional qualifications;

X_6: The level of losses caused by unusual changes in weather and climate;

X_7: Labor under contract, or public employee under the state payroll.

No trasition		662 (84.4%)				
Overall mobility rate		122 (15.6%)				
Structural mobility rate[6]		6.5%				
Net mobility [7]		9%				

Source: Survey data of author

Table 2 shows the percentage of the worker who trasitioning between occupation. Out of a total of 784 people in the study sample, there are 662 people, accounting for 84.4% who did not change their job status at the time of the survey (662 people who did not change occupation); 122 people who changeed their occupation accounting for 84.4%) If compared with developed countries where the occupational structure is relatively stable, the level of

[6] Structural mobility rate = ({|[177-202]+|[172-198]+|[157- 114]|+|[278-270]|}/2x784)x100 = 6.5%
[7] Net mobility = Overall mobility rate – Structural mobility rate = 15.6 -6.5 = 9%

occupational mobility in Mekong River Dalta is much larger.Earlier research has shown that **the** average occupational mobility rates for France were 4.7% and 7.4% (7.4% of French workers are are employed in an occupation that different from their reported occupation before)[8]. Research on labor and employment in European countries showed that on average 3% of workers in Europe changed their occupation each year. [9]The high rate of occupational mobility showed the change in the structure of labor and employment in the study area and at the same time, it shows occupational instability in the context of science and technology, environment and climate changes.

Table 2 also shows that workers and skilled labor are the groups that transition occupation highest; 33.1% of them moved to other occupations, of which 23.6% work in intermediate technical or professional qualification group; 6.4% move up to senior management or technical expertise and 3.2% of mobile workers go down to freelance jobs or farmers. Groups that are the highest rate of maintaining an occupation status are leaders, managers, senior technical professionals, and simple workers and farmers. 98.3% of those in the group of managerial leadership, high-level technical expertise did not change their occupation status.The unchanged rate in the group of simple labor and farmers is 94.6% this means there is not much movement of workers out of the agricultural sector .This shows that the speed of economic structural transformation towards industrialization took place relatively slowly in the Mekong River Dalta

3.2.2. Factors affecting worker's occupational mobility trend in the Mekong River Delta

To indicate the worker's occupational mobility trend, we need to find out how many people changed their job horizontal mobility (change job does not change occupation status) and how many people changed job, that leads to a change in occupation status in the occupational stratification pyramid (vertical mobility) The occupational mobility model shown in Table 3 shows the occupational transition trend in the Mekong River Delta in recent times.

Table 3: Labor mobility flows in Can Tho city by 2020

<table>
<tr><td>Horizontal mobility (change job does not change occupation status)</td><td colspan="2">395 (85.12%)</td></tr>
<tr><td rowspan="2">Vertical mobility 69 (14.87%)</td><td>Upward mobility</td><td>56 (12.06%)</td></tr>
<tr><td>Downward mobility</td><td>13 (2.81%)</td></tr>
</table>

[8] Etienne Lalé, *Trends in Occupational Mobility in France: 1982-2009*, Sciences-Po Department of Economics, – 28 rue des Saints-Pères, 75007 Paris, France.

[9] Ronald Bachmann Peggy Bechara Christina Vonnahme (2019), *Occupational Mobility in Europe: Extent, Determinants and Consequences*, tại trang https://papers.ssrn.com/sol3/papers.cfm?abstract_id=3468627, [truy cập ngày 28/11/2020], p.1

Table 3 shows that the main occupational flows in Can Tho by 2020 is horizontal mobility. The rate of horizontal mobility is higher than the rate of vertical mobility (85.12% and 14.87 %) Out of 464 people, who changed their job, in which 395 people account for 85.12% did not change their occupation, only 69 people, accounting for 14.87. % changed their occupational status. In vertical mobility, upwards mobility is higher than downward mobility. Upwards mobility is 12.06% compared to 2.81% of downward mobility.

Horizontal mobility occurs predominantly among leaders, managers, senior technical professionals and unskilled workers and farmers. The horizontal mobility rates of these groups are 98.2% and 92%. The rate of vertical mobility shown in outward and inward mobile flows of these two occupational groups is very low, suggesting that this is still a relatively closed occupation group. Vertical mobility occurs mainly in the workers and skilled labor, the vertical mobility of this group is 62.2%, of which 51.1% is in an upward mobility and 11.1% is in a downward mobility.

Occupational mobility trend depends closely on factors such as: age, gender, professional education, economic sector, and the level of damage caused by the climate to the household. In terms of age, if the employee increases by one year, the ability to mobility increases by 0.074 compared to the increase in mobility and the decrease of 0.073 times to increase in mobility. If increases one-year attendance in high school, non-mobility decreases by 0.652 times compared to rising mobility, and mobility decreases by 0.288 compared to increased mobility. If increases professional qualification one notch, non-mobility increases 0.156 times as mobility goes up, and mobility drops 0.518 times as mobility goes up; The damage level goes up by one tier, upside mobility 0.879 times lower than the go up and down 0.217 times the go up; Compared to workers living in urban areas, the non-mobility of workers in rural areas increased by 3,377 times compared to upward mobility and downward mobility of the group. This is 3,527 times more than up-going mobility. If moving from the informal economy to the formal sector, the non-mobility of the group of workers working in the formal economy decreases by 0.64 times compared to upward mobility and mobility. This group's downward movement is down 0.64 times compared to the upward mobility. (Table 4)

3.2.3 Factors affecting the ability of workers to move forward in occupation in the Mekong River Delta

The occupational mobility model (Table 4) gives us a look at the occupational mobility trend that took place in the recent time period of the people in Can Tho city. However, in order to see the long-term transition trend, or rather to indicate the move up or move down in employees' occupations, we need to consider the transition occupation compares the first occupation with the occupation at the time of the census (*Table 5*)

Table 5: Model of occupatinal transition in Can Tho (Model of transition occupation (competition current occupation to the fist occupation))

		current occupation				Total
		Management leadership and high expertise	Middle-level technical expertise and staff	workers and skilled labor	Farmers and other simple labor	
The fist occupation	Management leadership and high expertise	78 98.7%	0 0.0%	0 0.0%	1 1.3%	79 100.0%
	Middle-level technical expertise and staff	93 72.1%	35 27.1%	1 0.8%	0 0.0%	129 100.0%
	Workers and skilled labor	6 4.2%	20 14.0%	20 14.0%	97 67.8%	143 100.0%
	Farmers and other simple labor	14 12.4%	14 12.4%	3 2.7%	82 72.6%	113 100.0%
Total		191 41.2%	69 14.9%	24 5.2%	180 38.8%	464 100.0%
Horizontal mobility (change job does not change occupation status)		215 (46.4%)				
Vertical mobility 249 (53.6%)		Upward mobility			150 (32.3%)	
		Downward mobility			99 (21.3%)	

Source: Survey data of author

Table 5 shows the occupational mobility trend of workers in Can Tho over a long period. Considering over a long period, we see that the rate of vertical mobility is greater than the rate of horizontal mobility. Out of 464 people who changed their jobs, in which 215 people account for 46.4% only changed their job but did not change their occupation and

249 are for 53.6% changed their occupation. Upward mobility makes up 32.3 % of vertical mobility and downward mobility makes up 21.3%. Compared with occupational mobility which took place recently shown in Table 3, the proportion of vertical mobility in this model is much higher (53.6% compared to 14.87%).The data shows that: the transformation in the economic structure thanks to the scientific and technological changes along with the changes caused by the urbanization process taking place over a long time has created many jobs in the upper part of the occupational stratification. Therefore, it creates many opportunities for workers to move in the upward direction.

Occupational advancement ability depends closely on factors such as occupation group, education level, professional qualifications, gender, area of residence or population composition, age. In the occupational mobility model that compares the first job with the current job, if the employee's age increases by one year, the rate of employee's horizontal mobility will increase by 1,012 times compared to the rate of their upward mobility and the rate of downward mobility will decrease by 0.894 times compared to upward mobility. If increases one year the labor attended in high school, the horizontal mobility of the employee will decrease by 0.295 times compete to upward mobility and the downward mobility will decrease by 0.339 times compete to upward mobility. If the professional qualification of the labor increases by one level, for example, from college to university, the horizontal mobility rate will increase 1,079 times compared to the upward mobility ability and downward mobility ability will decrease 0.532 times.

Regarding sex, compared with the female group, the decrease of downward mobility of the male group will decrease by 0.552 times compared to upward mobility. Compared to indigenous people, if they are migrants, their job change ability will decrease 0.773 times compared with their upward mobility and downward mobility will decrease by 0.433 times. Compared with workers without contracts, job transition ability of contracted workers and payroll workers will increase 1,912 times compared to the upward occupational mobility of this group *(Table 6).*

4. Discussion and Conclusion

The research shows that the environment, climate change, and economic structural transformation along with the process of industrialization have created challenges, so many people have to change their job or their occupation. However, the pressure of transformation also creates many opportunities for people to change job skills so that they can move up to occupy a better occupation. In terms of overall scale, we see that the transition in the economic structure over the years has created many job vacancies at the top of the occupational stratification. The upward occupational mobility rate are high. However, the sizes, speeds, and the trend of occupational mobility are very different when comparing in groups with different social characteristics.

In addition to context factors, individual characteristics such as occupational groups, education, professional qualifications, gender, area of residence, or demographic composition, age are a major factor, that has great effect to occupational mobility. Accordingly, in the coming years, to support people in the transition context, the government should create an environment, policies to help workers to have knowledge and skills to improve their adaptive ability to changes, sho labor can take opportunities, reduce risks caused by the transition. The policies need to be implemented such as 1) Implement

* p<0.01; ** p<0.05; $^{*\,**}$p<0.1

programs and policies to help employees to better access training services, improve basic skills to create a prerequisite for the career transition process. The implementation of labor and employment policies should not be based on job stability, but rather on workers' adaptation to economic changes to promote development livelihood diversification. The government needs to invest appropriately for people through health care policies, improve the quality of education, provide skills in labor, and jobs, whereby continued investment in basic education is required. the reform period improves the quality of vocational education and training, training high-quality human resources to meet the labor market demand.2) In addition to improving adaptive capacity through basic skills training, the state should pay attention to promoting labor market expansion through promoting economic structural transformation. Besides, it is necessary to diversify forms of providing labor-employment information for workers, especially for female workers and other disadvantaged groups.

GREEN COSMETICS PURCHASE: A MODIFICATION OF KNOWLEDGE - ATTITUDE - BEHAVIOR MODEL

MSc. Le Bao Ngoc

lebaongoc.tuti@gmail.com

Faculty of Marketing, Economic Research Institute of Posts and Telecommunications, Posts and Telecommunications Institute of Technology, Hanoi, Vietnam

Abstract

Due to the rising trend of healthy living style, organic products, ranging from food, means of transport, and house decoration to cosmetics are now gaining popularity. Vietnam is facing huge opportunities for organics cosmetics due to the country's richness in herb and natural ingredients. There is still a lack of literature on determinants of purchase intention of green cosmetics, especially in developing countries. This study aims to provide an in-depth understanding of the knowledge – attitude – behavior model, also known as KAB as well as suggest a modification of its model in order to apply it to investigate the green cosmetics buying intention.

Keywords: *Beauty products, developing countries, green cosmetics, knowledge, purchase intention*

1. Introduction

1.1. Research background

The concern towards a healthy life and natural products are on the rise, leading to a rapid growth in consumer consciousness of the risk associated with using synthetic chemicals. This has called the need for a healthier lifestyle in a variety of aspects, including beauty products, ranging from skincare, haircare, oral care, color cosmetics and hygiene products (Ghazali et al., 2017). Rising disposable income in Thailand, Philippines, Vietnam and Indonesia, coupled with changing lifestyle is expected to support the growth of green cosmetics market over the next six years.

The green cosmetics could be simply understood as the use of organic ingredients in personal care products such as skin cream, anti-aging lotions, shampoos, and hair conditioners as an alternative to toxic substances. Although rising demand for green cosmetics has attracted the interest of marketing managers, little academic research has been made to study the purchase intention of this product type. Most of studies have revolved around determinants of purchase intention of green products in general (Mohd Suki, N. 2016; Tih, S. and Choslay, S.H., 2011; Nguyen, 2019), green apparel (Bong Ko, S. and Jin, B. 2017).A majority of these researches have employed the Theory of Planned Behavior (TPB) (Aril et al., 2018).

Vietnam is meeting the challenges of environmental protection and sustainable development with regards to population growth, resulting in increasing consumer demand of society. Several attempts to study the organic products buying behavior of Vietnamese consumers have been made (Nguyen et al., 2019).

Vietnam has a population of 97 million inhabitants, with a GDP of $245 million. Member of the ASEAN, the country has seen its GDP skyrocketing over the last 20 years, becoming one of the countries with the highest growth rate in the world. As incomes rise, standard of living increase and so does consumption. The growth of the cosmetic market is mainly due to these factors, as well as the increasing use of social media. In 2019, only 14% of women in Vietnam do not use makeup, while two years ago it was 24%. Statistics also show that half of the women in Vietnam wear makeup at least once a week, and the percentage is even higher for skincare products. Vietnam is open to opportunity for manufacturing green cosmetics with no chemicals and respectful of the environment. Yang (2017) stated that consumers recently have shown interest in in safe cosmetics that use natural ingredients, eco-friendly packaging and ethics in their manufacture. Allergy and skin damage problems as results of using synthetic beauty products are also playing a part in raising the ecological concern among consumers (Pudaruth et al., 2015).

1.2. Research gap

There is a need to find out the intention to purchase green cosmetics as women use them frequently and exploring their attitude on organic can provide significant guidelines and insights about the consumer for the marketing managers to raise the consumer perception and purchase intention in the future. However, empirical studies related to green cosmetics and purchase intention among Vietnamese consumers is still limited. Al-Haddad et al. (2020) examined the relationship between selected dimensions of brand equity, namely brand awareness, brand loyalty and perceived quality, and green cosmetics purchase intention. Nguyen (2019) in their paper termed “Determinants affecting green purchase intention: a case of Vietnamese consumers” reported a positive relationship between consumer trust, eco-labelling environmental concern and attitude towards green cosmetics and green purchase intention. Nonetheless, this study did not take into account the role of health consciousness and knowledge in making impact on consumers’ attitude towards purchasing organics cosmetics and purchase intention.

1.3. Research objectives

The aim of this study therefore is to understand the consumer insight on green cosmetics regarding environmental concern, perceived safety, health consciousness, green cosmetics knowledge and the success dimension of materialism.

2. Method

This section describes the methodology of the study, which covers the development and approach of research model and hypotheses.

2.1. Research model and hypothesis development

Define green cosmetics

Current environmental issues are stimuli for consumers, motivating them to purchase green products. Green products have several advantages, for instance: less water, material and energy usage during production, none or slightly pollutant to natural environments, and their package can be recycled. According to Amberg and Fogarasy (2019), green or natural cosmetics are made out of natural resources, without the usage of chemicals, coloring additives, or other non-natural mixtures. The European Cosmetics Standards Working Group launched the Cosmetics Organic and Natural (COSMOS) Standard (D'Amico, 2008). For further progress, the COSMOS standard certification was officially launched in February, which is trying to be an internationally recognized standard. Green cosmetics are also often called organic cosmetics; however, the latter has a more strict definition and selling them in the consumer system can be challenging due to short expiration and the need for careful storage. Green cosmetics are usually priced higher (Smith et al., 2018). Lin et al. (2018) pointed out that green cosmetics are eco-friendly in the sense that they are non – hazardous to natural resources and renewable. Green cosmetics are natural cosmetics, primarily made up of plant and fruit extracts and renewables. Natural ingredients such as argan oil, coconut oil, green tea, calendula, pomegranate and soy have advantages, for example, anti-inflammation, anti-oxidation, hydration, UV – protection, and other effects. The similarities of the mentioned studies suggest that using green cosmetics is a lifestyle or treating self – care and treating the environment with respect.

Cosmetic chemists fought hard against the idea that natural ingredients are inherently safer than their synthetic counterparts. In their view of opinion, ingredients should be chosen on safety and efficacy regardless of its natural or synthetic makeup. Some companies are overestimating the merits of natural ingredients versus synthetic ingredients to protect the reputation of the industry.

Motivated by healthy trend in the market, hundreds and thousands of companies and suppliers are now producing and selling cosmetic products which they claim are "green" and better for the consumer and environment (Green Choices 2012). In 2010, Mintel suggested a regular innovation campaign about natural and organic ingredients will help maintain growth in the UK's beauty products industry that are estimated to be worthy of £6.7 billion.

However, there are obstacles that could destabilize consumer confidence, including the lack of regulation and misleading marketing information (Mintel 2010). Different standards and abundant cosmetics boasting green concepts confuse enthusiastic consumers. Consumers are confused by the different standards and exaggerated marketing of green cosmetics. They find it difficult to select green cosmetic products. Mason (2012) found that cosmetic consumers purchase benefits, not features. Therefore, they pay more attention to functions rather than detailed ingredients.

In Vietnam, many cosmetics brands have recently introduced products that are environmentally friendly. Though the quantity of these products is not significant, the variety in products such as lipstick, foundation, contour kit, face cleanser, toner and moisturiser has impressed many customers.

These products tend to have simple packaging, including a glass bottle or bamboo box. Many cosmetics firms said that as ingredients of their products are taken from natural coconut, turmeric, and honey, among other items, they are safe to use even on sensitive skin.

Take rose mask as an example. It is made from rose petals grown in non-chemical environment and later ground into a powder form for easy application on the skin.

Local green cosmetics are sold in a relatively affordable price range compared to those of international brands. For example, an eyelash serum made from coconut oil costs VND 30,000 per tube while face toner is usually VND 500,000 per bottle (Vietnamnews, 2019).

Knowledge – attitude – behavior

Knowledge, attitude and behavior (KAB) model is an important theoretical model of health and environmental education, which claimed that behavior change, is affected by knowledge and attitude (Schneider and Cheslock, 2003). KAB model was first developed in the 1950s and has been widely used in the field of health education. Researchers assume that knowledge, attitude and behavior are related, and that knowledge and attitude directly influence behavior. Knowledge, according to Merriam-Webster on line dictionary (2011) refers to “the fact or condition of knowing something with familiarity gained through experience or "the fact or condition of being aware of something” or “the range of one's information or understanding” or “the sum of what is known: the body of truth, information, and principles acquired by humankind. Knowledge could be measure by self – report data which is criticized for measuring people’s confidence in their knowledge, not how they actually know about the subject. Another way to measure knowledge is through multiple choices or other similar forced choice item formats. However, knowledge does not always translate into actual behavior (Kyu and Van der putten, 2005). The past literature suggested that exclusive dependence on knowledge change is likely to have little behavioral impact (Schneider and Cheslock, 2003).

A second component of the KAB model is the assumption that attitudes are closed related to behavior. Attitude is measured by the feelings and beliefs of people towards a problem. Allport (1967) and LaPiere (1967) define attitude in a behavioral sense, as a mental and neural state of readiness conditioned by stimuli directing an individual's response to all objects with which it is related. The KAB model proposed that knowledge about any behavior will determine how the person's attitude towards the behavior then the attitude will display through the behavior.

Ajzen also states "although formal definitions of attitude vary, most contemporary theorists agree that the characteristic attribute of attitude is its evaluative (pro-con, positive-negative) dimension" (1993, p. 41). As a result, most assessment and scaling techniques (see Gable & Wolf, 1993) result in a score that locates the individual on an evaluative continuum. From one perspective, what an individual knows may inform his or her attitude about that topic, and how he or she feels about that topic may influence behavior.

Nguyen et al. (2019) on their study regarding the influence of consumers' personal factors and green marketing practices of food stores acknowledged a positive influence of organic food knowledge on organic food purchase behavior. A research in India found that consumers are willing to go green especially in the cosmetics market that used natural or herbal components.

The following hypothesis is formulated:

H_1: Green cosmetics knowledge is positively correlated with the purchase intention of organic cosmetics

Attitude could be simply defined as one's like or dislike (Blackwell et al., 2011). Ajzen (1991) characterized it as "a degree of positive or unfavorable behavioral assessment and acts as a primary factor in deciding intent". Past studies have confirmed the positive relationship between attitude towards purchasing green cosmetics and green cosmetics purchase intention.

H_2: Attitude towards purchasing green cosmetics is positively correlated with purchase intention of green cosmetics

Environmental concerns

Dunlap and Jones (2012) define environmental concern as "the degree to which people are aware of problem regarding the environment and support efforts to solve them or indicate the willingness to contribute personally to their solution". Consumers who show concern about the environment tend to develop positive environmental attitude, express willingness to pay for eco-friendly products and exhibit pro-environmental behavior.

By using natural, oleo chemical sources, green cosmetics avoid many of the toxic elements found in popular brands. These chemicals damage environmental and human health, and consumers should never read them on a "green" label. Thus, consumers with an environmental concern are likely to purchase green beauty products. The following hypothesis is formed:

H_3: Environmental concern is positively correlated with attitude towards green cosmetics

Health consciousness

Health consciousness refers to an individual's alertness on one's own diet and healthy living style. Pass researches have confirmed health benefit is a key factor motivating the use of green products. Kim and Chung (2011) stated that health awareness plays a crucial role in influencing consumers' purchase behavior. Yang et al. (2014), along with Cabuk (2014) reported the positive relationship between health consciousness and positive attitude. Hence, it encourages the below hypothesis:

H_4: Health consciousness is positively correlated with attitude towards green cosmetics

Materialism (success)

Materialism is commonly viewed as a value that consumers give to possessions and should be studied within the context of the larger value systems that individuals hold (Richins and Dawson, 1990; Kasser and Ryan, 1996). Richins and Dawson (1992, p. 308) further defined materialism as a "value that emphasis the importance of possessions and material goods in person's life towards achieving life goals or desired states". Success dimension of materialism refers to wealth and material possessions as signs of success in life. An investigation into the relationship between materialism and green purchase behavior in Vietnam (Nguyen, 2019) found a positive influence of success on attitude towards green products. This could be explained as using green products may help consumers express their self as knowledgeable ones and a sign of their success. The following hypothesis is proposed:

H_5 Success (materialism) is positively correlated with attitude towards green cosmetics

Perceived safety

This could be simply understood as the safety features that the products have based on literature. It was found that consumers perceive safety towards organic products is an important predicting factor that could lead to consumers to have the intention to purchase the organic personal care products (Mohammad and Baharun, 2017).

This brings to another hypothesis for the study:

$H_{6:}$ Perceived safety is positively correlated with attitude towards green cosmetics

2.2. Research approach

Data collection and sampling

The population of the study comprises of individuals who have purchase cosmetics in the past 3 months. Sample was form by convenience sampling technique. Participants would be asked to fill in online and offline survey form.

Measurements

In process of operationalizing the constructs, various literatures were reviewed and adopted for present study. For environmental concern, 4 items were adopted from Yadav and Pathak's study. For health consciousness, 3 items were taken from Tarkiainen and Sundqvist (2005). A total of 3 items were used to measure green cosmetics knowledge. Attitude towards buying green cosmetics and purchase intention were operationalized using items from Chang (1998) and Armitage and Conner (199). Success dimension of materialism was measured using items from Richins & Dawson (1992).

All the items were measured using a 7 – point Likert scale, which ranged from 1 for "Strongly disagree" to 7 for "Strongly agree". Regression analysis would be employed for data analysis.

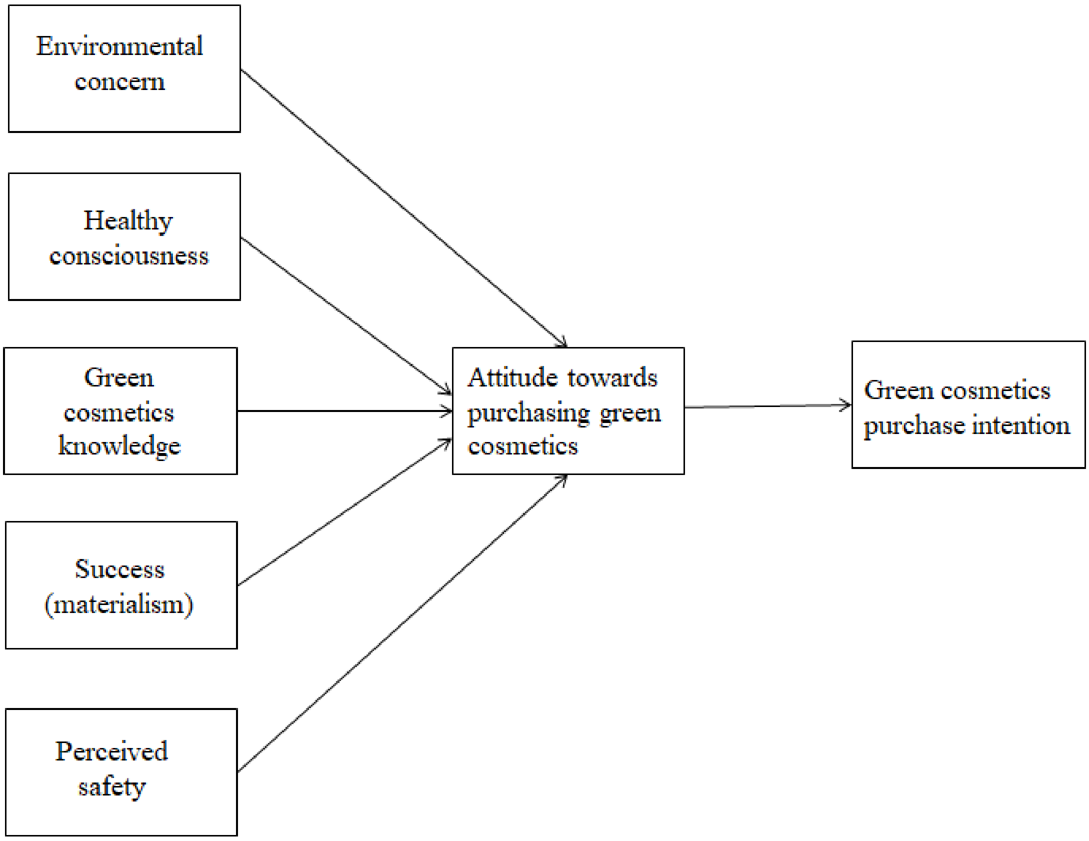
Variables and their measurement items are summarized in the table below:

Variables	Measurement items
Environmental concern	The balance of nature is very delicate and can be easily upset Human beings are severely abusing the environment Humans must maintain the balance with nature in order to survive Human interferences with nature often produce disastrous consequences
Green cosmetics knowledge	Compared with an average person I know a lot about green cosmetics I know a lot about how to evaluate the quality of green cosmetics People who know me, consider me as an expert in the field of green cosmetics
Health consciousness	I choose cosmetics carefully to ensure good health I think of myself as a health – conscious consumer I think often about health issues
Perceived safety	For the amount I paid, I am convince that green cosmetics have

Variables	Measurement items
	no side effect I am convinced that the green products contain pure natural ingredients from nature Green products labeled claimed is completely safe to use
Success (materialism)	I admire people who own expensive homes, cars and clothes Some of the most important achievements in life include acquiring material possessions I place much emphasis on the amount of material objects people own as a sign of success The things I own say a lot about how well I'm doing in life I like to own things that impress people
Attitude	Purchase of green products is a smart choice Purchase of green products bring many benefits Purchase of green products is a good thing to do
Green cosmetics purchase intention	I intend to make purchases of green cosmetics I plan to buy green cosmetics I want to buy green cosmetics

3. Results

Based on the rationale of these above hypotheses, a proposed model can be established as the following to test all mentioned hypotheses:



The following hypotheses are tested:

H_1: Green cosmetics knowledge is positive correlated with purchase intention of green cosmetics

H_2: Attitude towards purchasing green cosmetics is positively correlated with purchase intention of green cosmetics

H_3: Environmental concern is positively correlated with attitude towards purchasing green cosmetics

H_4: Health consciousness is positively correlated with attitude towards purchasing green cosmetics

H_5: Success (materialism) is positively correlated with attitude towards purchasing green cosmetics

H_6: Attitude towards purchasing green cosmetics is positively correlated with intention to purchase green cosmetics

4. Discussion and Conclusion

4.1. Discussion

This study has not conducted an empirical research yet, proposed hypotheses are not confirmed. Therefore, an empirical research as a follow up should be done soon. Once the research is conducted, it will contribute to the current literature of green cosmetics research by two points: First, it show a detailed analysis of the relationship between environmental concern, health consciousness, perceived safety, green cosmetics knowledge, success dimension of materialism and attitude towards green cosmetics. Although green products have been researched in many articles, little is known with regards to beauty products. Second, there has been a lack of studies about Vietnamese green cosmetics market, so this study will be a significant contribution.

Implication

This study also has a practical implication because it will provide insight into consumers' motivation to purchase green cosmetics and give recommendations to marketing managers or the authority on what can be done to promote green living style.

Limitations

Due to actual research has not been undertaken, proposed hypotheses are not confirmed yet.

4.2. Conclusion

To sum up, the purpose of this study is to examine the effects of environmental concerns, health consciousness, green cosmetics knowledge, perceived safety and the success dimension of materialism on attitude towards purchasing organics cosmetics. A modification of knowledge – attitude – behavior model is deployed to test six hypotheses.

This study contributes to the current literature in two ways. First, to the author's best knowledge, it is the first research to study the influence of knowledge on green cosmetics purchase intention. Second, it complements existing literature by providing an insight into green cosmetics purchase behavior in Vietnam, an emerging economy where green living style is becoming a trend.

LITERATURE REVIEW ON LIVELIHOOD VULNERABILITY ASSESSMENT TO CLIMATE CHANGE AND RECOMMENDATION OF THE ASSESSMENT METHOD FOR THE NORTH CENTRAL COAST OF VIETNAM

MA. Do Thi Ngoc Thuy
ngocthuy2791@gmail.com
Hanoi University of Narural Resources and Environment, Hanoi, Vietnam
Assoc. Prof. Dr. Vu Thi Hoai Thu
thuvh@neu.edu.vn
National Economics University, Hanoi, Vietnam

Abstract

Households' livelihoods are particularly vulnerable to the increased impacts of climate change. Assessment of livelihood vulnerability to climate change will help to identify suitable adaptive livelihood strategies that balance risks and opportunities to allow continued development while ensuring adaptive capacity to climate shocks. Sustainable livelihood approach associated with climate change vulnerability assessment framework can help assess the livelihood vulnerability to climate change in order to maintain sustainable livelihood in the context of increased climate change. This paper presents a literature review on livelihood vulnerability assessment to climate change, and propose the method for climate change vulnerability assessment to livelihood for the North Central Coast of Vietnam.

Keywords: *climate change, livelihood, vulnerability*

1. Introduction

Climate change tends to increase in terms of magnitude, extent and scope of impacts which requires actions on a global scale on both mitigation and adaptation (IPCC, 2014). Gibbs (2020) pointed out that the growing evidence of increased risks from climate change makes it necessary for global adaptation efforts to mitigate and manage climate change risks. Identifying how natural and human systems are sensitive and vulnerable to the impacts of climate change have become important inputs for setting goals and formulating policies to adapt to climate change.

Theories and methods of vulnerability assessment have been developed over the past decades in areas related to natural hazards, food security, poverty, and human livelihoods. Climate change vulnerability assessment can be undertaken at international, national, sectoral, local, and community levels. It serves to provide a strong scientific foundation to support the identification and implementation of practical strategies and solutions for climate change adaptation activities.

Household's livelihoods are particularly vulnerable to the increased impacts of climate change. Adaptive livelihood strategies may be ineffective without accurately assessing and identifying livelihoods vulnerability to climate change. The sustainable livelihood approach associated with climate change vulnerability assessment framework can help assess the vulnerability of climate change to household's livelihoods and then determine sustainable livelihood options for people in the context of increasingly severe climate change worldwide.

The coastal zone is an area of great potential for development, but also a place that experiences great and immediate impacts from changes in the nature and human activities. At global level, coastal areas are considered to be hot spots suffering severe impacts of climate change, including sea level rise, coastal erosion, flooding, drought, and saline intrusion (IPCC, 2007). The livelihoods of coastal residents are severely affected by climate change impacts. Vulnerability assessment to climate change of coastal livelihoods plays an important role in proposing appropriate adaptive livelihood strategies.

Vietnam is assessed as a country that has suffered heavy damages from long-term and continuous changes in the climate over the past years. The Vietnam North Central Coast region, including 6 provinces/cities namely Thanh Hoa, Nghe An, Ha Tinh, Quang Binh, Quang Tri and Thua Thien – Hue, has been heavily affected by extreme weather events in recent years. Assessing the vulnerability of climate change to livelihoods will help identify suitable adaptive livelihood strategies for the region in order to balance the risks and opportunities for continued socio-economic development while maintaining resilience to the climate shocks.

2. Method

Using a desk-based approach combined with statistical, descriptive, and comparative methods, this paper presents a literature review on climate change vulnerability assessment to livelihoods and proposes the method for climate change vulnerability assessment to livelihoods for the North Central Coast region of Vietnam.

The study uses secondary data and information which were collected from a variety of sources, including reports from Intergovernmental Panel on Climate Change (IPCC), Vietnam's Ministry of Natural Resources and Environment (MONRE), books, journals, papers, and research reports of individuals and organizations (DFID, UNDP, UNEP…) related to the research topic.

3. Results

3.1. Literature review on vulnerability assessment to climate change

Since the 1990s, theories and methods of climate change vulnerability assessment have been developed and applied at international, national, sectoral, local, and community levels. In general, climate change vulnerability assessment frameworks focus on sectors most affected by climate change impacts such as agriculture, water resources, coastal areas, human health, and livelihoods. According to IPCC (2001), vulnerability to climate change is the degree to which a system is susceptible to, or unable to cope with, adverse effects of climate change, including climate variability and extremes. Vulnerability is a function of the character, magnitude, and rate of climate variation to which a system is exposed, its sensitivity, and its adaptive capacity and is calculated by an index. Depending on the research object, a suitable set of indicators and statistics can be used to calculate the index. The most common indexes are Climate Change Vulnerability Index (CVI), Social Vulnerability Index (SVI), and Livelihood Vulnerability Index (LVI). Once climate change adaptation measures are strengthened, vulnerability to climate change will therefore decrease (IPCC, 2007).

Frameworks for assessing vulnerability to climate change serve as a solid scientific foundation to support the identification of plans and solutions for society's climate change adaptation activities. Vulnerability assessment to climate change impacts are applied to geographical areas (e.g. coastal areas, urban areas, forest land, agricultural land), sectors (e.g. agriculture, fisheries, tourism, industry, human health, poverty, natural resources), vulnerable groups (e.g. farmers, the poor, children, women), or type of hazards (e.g. storms, floods, droughts, saline intrusion). Typical climate change vulnerability assessment frameworks have been developed by IPCC (1992), UNEP (1998), UNDP (2004), and USAID (2016). Although the implementation process of these assessment frameworks may vary, key elements of climate change vulnerability assessment include the identification of vulnerable groups, assessment of current and future vulnerability to climate change impacts of different groups, and usage of the vulnerability assessment results to propose policies and strategies to adapt to climate change.

3.2. Literature review on livelihood vulnerability assessment to climate change

At local level, climate change vulnerability assessment helps people understand how climate change affects people's lives and livelihoods. Household livelihoods are particularly vulnerable to the increased impacts of climate change. Gibbs (2020) argued that adaptation of local people is slowing down compared to the rate at which climate risks are exposed. When government support is not timely and inadequate, households must mobilize their own resources based on their experience and knowledge in implementing adaptive livelihood strategies. However, adaptive livelihood strategies can be ineffective without accurately assessing and identifying climate change vulnerability to livelihoods. The Sustainable Livelihood Approach (SLA) associated with the Vulnerability Assessment (VA) can help assess the vulnerability of livelihoods to climate change, and then suitable adaptive livelihood strategies can be proposed.

The Sustainable Livelihood Approach (SLA) analyzes the livelihood resources, livelihood activities and livelihood outcomes under the impact of external context and institutions and policies. Typical sustainable livelihood frameworks have been developed by Scoones (1998) and UK Department for International Development DFID (2001). Generally, the sustainable livelihood approach shows how people access, control, and use inherent resources to improve their livelihoods and reduce vulnerability to natural disaster shocks and diseases. Livelihood resources (including 5 categories: human capital, natural capital, financial capital, physical capital, and social capital) and the ability to access these resources have a major impact on sustainable livelihood outcomes (Figure 1).

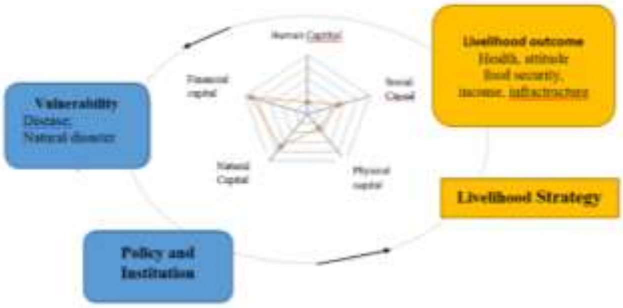

Figure 1: Sustainable Livelihood Framework

Source: Birkmann (2006)

To assess the vulnerability of household livelihoods to climate change impacts, Hahn et al. (2009) developed a livelihood vulnerability index (LVI) comprised of 7 components based on the framework of climate change vulnerability assessment of IPCC (2001) and the Sustainable Livelihood framework of DFID (2001). Hahn (2009) examined different aspects of vulnerability and differences in household efforts and adaptive capacity to sustain livelihoods. Household's resilience and the ability to access livelihood resources to recover from climate shocks depend on many factors, including magnitude of impact (external factors) and internal factors within the household (Bohle, 2001). There are three main factors that determine the vulnerability of a household's livelihoods, including exposure (E), sensitivity (S) and adaptive capacity (AC). The LVI value ranges from 0 to 1 and is calculated by using the partial weighted indexes to compare the vulnerability among different objects/groups. LVI – IPCC is calculated via using the function as LVI = f (E, S, AC).

Subsequent studies have adjusted and supplemented the determinants of vulnerability in the LVI. For example, Shah (2013) analyzed the gender difference, the ability to access to livelihood resources with support from local authorities to minimize the vulnerability. Madhuri et al. (2014) used LVI to compare the vulnerability of livelihoods between 7 different regions in Bihar and added indicators of skill to change planting schedules, loans, main water sources, available adaptation measures, public and private hospitals, and sanitary facilities. In particular, natural resources (including access to forest products, land fertility and arable land ownership) play an important role in the lives of rural people. When people have difficulties in accessing these natural resources, agricultural livelihoods will be vulnerable. Therefore, it is necessary to add the factor of cultivated land to calculate the LVI.

Ankita Paul's study (2019) aimed at vulnerability assessment of poor people living in urban areas and disadvantaged communities. The research question was the role of livelihoods in adjusting and mitigating vulnerability. The study compared three different approaches to vulnerability assessment, including (i) the LVI index - a composite of 6 equally weighted components, (ii) the LVI - IPCC including 7 individually weighted components and (iii) the Climate Change Vulnerability Index (CVI) estimating the climate change vulnerability of eight other livelihood groups in the city of Guwahati, Assam, India. A survey was conducted for construction workers, shop keepers, farmers, taxi driver/rickshaw drivers/trailers, drink shops/fast food vendors, gas delivery people, street vendor/shopkeeper, traffic police/policeman, doctor, and boatman. The results showed that farmers were the most vulnerable communities suffering the most economic losses, because they had a high sensitivity to health and are exacerbated by poor adaptability. Doctors were the least vulnerable because of their higher cognitive and adaptive levels. This again confirms the importance of awareness and access to livelihood resources in reducing vulnerability.

In Vietnam, there have been studies related to mitigating vulnerability from floods and storms in Quang Ngai, Thanh Han river (Quang Tri), Thu Bon river basin (Quang Nam). Studies calculated flood vulnerability index by weighting method to build a set of flood vulnerability index for Quang Nam province. However, there are few studies on livelihood vulnerability assessment to climate change impacts. In 2016, Tran Quoc Nghi applied the LVI index developed by Hahn (2009) to calculate 7 components that make up the LVI. Similarly, in 2016, Phan The Cong et al published an article applying LVI to the case of Nam Dinh province. Although this study has limitations on how to apply the formula to calculate the LVI, it showed the flexible application of the LVI values to rank vulnerability of different types livelihoods.

Overall, the Livelihood Vulnerability Index (LVI) is a method that has been used extensively recently to assess the livelihood vulnerability of climate change impacts. LVI is derived from the theoretical foundation of climate change vulnerability framework of IPCC (2001), then developed by Hahn (2009) into LVI index, and further edited and supplemented by other studies such as Shah (2013), Madhuri (2014), and Paul (2019). It has been applied widely in many other studies. The outstanding advantage of the LVI is that it uses primary data from household surveys instead of using climate and socio-economic development scenarios. With focus on local and household level, LVI has taken advantage of the informational value due to the combination of expert consultation, flexibility in research subjects and research scope. Therefore, the research results derived from LVI have practical implications for the livelihood vulnerability of households and communities. The essence of LVI is built on three important points of view. Firstly, LVI is based on information of indigenous knowledge and practical experience of local people to select the elements constituting the LVI. Although it has limited predictive power, this index can identify vulnerable factors. Secondly, LVI is grounded on the argument that vulnerability and resilience are constrained by available resources, contextual conditions, and accessibility to livelihood resources. Thirdly, climate change vulnerability assessment to livelihoods is based on empirical observations and field studies to deeply analyze local climate change adaptation and mitigation planning. With these advantages, using the LVI to assess the climate change vulnerability of household's livelihood in the North Central Coast coastal region is of high scientific and practical significance.

3.3. Recommendation of the method for climate change vulnerability assessment to livelihoods for the North Central Coast of Vietnam

Vietnam is considered to be a country that has suffered heavy impacts and damages from long lasting changes in the climate over the past years. Storms and floods are typical types of natural disasters in the country. Natural disaster risks are forecasted to continue increase in the near future. The coastal region is the center of dynamic economic activities that provide livelihoods for millions of people. Key economic sectors in coastal areas of Vietnam, such as agriculture, fisheries, tourism and industry, will experience risks from floods and storms annually. It is estimated that approximately 316,000 workers will be directly affected by coastal and river flooding each year in Vietnam (World Bank, 2020).

The North Central Coast of Vietnam consists of 6 coastal provinces, including Thanh Hoa, Nghe An, Ha Tinh, Quang Binh, Quang Tri and Thua Thien-Hue which share common climate and socio-economic characteristics. Livelihood activities in this area are diverse, but have similar characteristics of coastal livelihoods. The natural topography of this area is relatively steep, fast-flowing river water and frequent floods causing difficulties for life and production. On average, the six provinces suffer from 3 to 5 storms from August to November annually. Several provinces such as Ha Tinh, Quang Binh, and Quang Tri experienced the harshest climate conditions (e.g. intense heat, heavy rains, severe storms, and frequent floods). In the context of increasingly complex and unpredictable climate change, it is crucial to assess the vulnerability of climate change impacts to livelihoods in this region.

Applying the method of calculating the LVI developed by Hahn (2009) and other researchers, the data collected from the household survey need to be encoded and calculated into the indicators as shown in the Table 1.

Table 1: Major components and sub-components comprising the Livelihood Vulnerability Index (LVI)

Major components	Sub-components	No
(1) Socio-demographic profile	- % of female-headed households (HHs) - % of HHs where head of family has not attended school - % of HHs with orphans - % of HHs with members needing dependent care	4
(2) Heath	- % of HHs with family member with chronic illness - % of HHs receives treatment in hospitals - % of HHs receives proper facilities for child delivery and immunisation - % of HHs that do not have toilet facilites	4
(3) Food	- % of HHs primarily dependent on self farmed food - % of HHs struggle to find food when disaster occurs - Crop Diversity Index - % of HHs that do not save crops - % of HHs that do not save seeds	5
(4) Water	- % of HHs utilizing natural water source - % of HHs reported conflicts over water when natural disaster happens - % of HHs that have to store water - % of HHs that do not have consistent water supply	4
(5) Natural disaster and climate variable	- Average number of floods and droughts in the past year - % of HHs that did not receive warning about natural disasters - % of HH members with an injury or death as a results of the most severe natural disasters in the past year - Mean standard deviation of the daily average maximum temparature by month - Mean standard deviation of the daily average minimum temparature by month - Mean standard deviation of the average precipitation by month	6
(6) Livelihood strategies	- % of HHs with family members working outside the community - % of HHs solely dependent on agricultures as source of income - Average agricultural livelihood diversification	3
(7) Social network	- % of HHs receives and given by households in kind - % of HHs who borrowed and lent money -% of HHs that have not gone to their local government for assistance in the past 12 months	3
(8) Natural Capital	- % of houses with weak storm resistant construction (floor, roof) -% of HHs without fertile land - % of HHs without ownership of the lands they live on	3

Sources: Hahn (2009), Shah (2013), Madhuri (2014)

There have been many studies applying LVI in many different ways. Combining vunerability assessment of IPCC (2001) and Sustainable Livelihood Framework of DFID (2001), LVI can be calculated as indicated in the Table 2. Overtime, the components of LVI have been increasingly supplemented and completed to the study context. T. Lung et al (2013), Islam (2013), and Huafeng (2016) have implemented empirical studies to determine components of LVI and investigated significance of the components contributing LVI as well. Paul (2019) compared LVI values among diferent groups of livelihood. In Vietnam, LVI has been applied and adjusted by Phan The Cong (2016).

Table 2: Major components of LVI contributing factors to vulnerability

LVI contributing factor to vulnerability	Major components
Exposure (E)	(1) Natural disaster and climate variable (NDCV)
Adaptation Capacity (A)	(2) socio-demographic profile (SDP)
	(3) Livelihood strategies (LS)
	(4) Social network (SN)
Sensitivity (S)	(5) Health (H)
	(6) Food (F)
	(7) Water (W)
	(8) Natural Capital (NC)

To calculate LVI, there are 4 main following steps:

Step 1: Standardizing the sub- components when calculating the LVI. Because the crude data is in different units (number of people, age, percentage…), it is necessary to standardize index. Each of sub- component is called Sd, where d is district.

$$index_{S_d} = \frac{s_d - s_{\min}}{s_{\max} - s_{\min}}$$

where Smin, Smax are the minimum and maximum values, respectively, for each sub-component determined using data from collecting. For variables that measure frequencies, they are set from 0 to 100.

Step 2: Calculate the value of each major component, the sub-components were averages using:

$$M_d = \frac{\sum_{i=1}^{n} index_{s_d i}}{n}$$

where: Md is one of eight major components for LVI. These are NDCV, SDP, LS, SN, H, F, W, NC; (n) is number of sub-components in each major component.

Step 3: The major components are combined according to the categorization scheme in Table 2 using the following equation:

$$CF_d = \frac{\sum_{i=1}^{n} w_{M_i} M_{di}}{\sum_{i=1}^{n} w_{M_i}}$$

Where: CF d is one of contributing factor **E**xposure, **A**daptation, **S**ensitivity for district (d); M_{di} are the major component; **E** (includes NDCV), **A** factor (includes SDP, LS, SN), **S** factor (includes H, F, W, NC)

W_{Mi} is the weight of each major component

Step 4: Using equation LVI= (E+ S-AC). Value of LVI ranges at (-1; 1) representing the least vulnerable and the most vulnerable respectively. There are some different equations to calculate LVI, but Paul (2019) shown that the above equation is best used to analyze vulnerability to different areas of human livelihood and evaluate the effects of climate change. Antwi- Agyei et al. (2012), Cinner et al. (2012) and Silva & Lucio (2014) used this equation instead of others.

4. Discussion and Conclusion

Firstly, the paper reviewed both theoretical and practical studies relating to livelihood vulnerability assessment to climate change impacts. Global climate change has been causing increasingly unpredictable impacts which requires assessment of the vulnerability caused by climate change to different socio-economic groups and sectors. Paul (2019) asserted that assessing vulnerability to climate change impacts involves the application of combined methods and data to analyze human and social interactions within the environment. At household level, assessing the climate change vulnerability to livelihoods needs to make full use of information related to human capacity, necessary resources, and physical assets to implement livelihood strategies (Chambers and Conway, 1992) and data on human development index (HDI), living standards, and characteristics of natural resources and environment (Paul, 2019). Assessment of climate change vulnerability to livelihoods informs decision-making process on planning and proposing appropriate adaptation solutions to address vulnerability, poverty, and sustainable development goals.

Secondly, the paper pointed out advantages of using LVI to assess livelihood vulnerability to climate change impacts. Studies on climate change vulnerability assessment to livelihoods around the world will be a useful reference for assessing climate change vulnerability to livelihoods in the North Central Coast of Vietnam. However, sound results of vulnerability assessment and recommendations need to be performed by selecting proper method. Progress of collecting data and caculating LVI are written clearly, which can be applied for different regions, types of livelihood, and vulnerable groups.

BENEFITS OF JOINING THE GREEN SUPPLY CHAIN IN COFFEE PRODUCTION: RESEARCH OF TAY NGUYEN, VIET NAM

Pham Van Chinh
phamvanchinh090389.hust@gmail.com
National Econmics University, Hanoi, Vietnam

Abstract

This paper aims to analyze and discuss the benefits of coffee growing households when participating in the green supply chain in the production. Coffee is the main produced in Tay Nguyen, Viet Nam, accounting for 94% of agricultuaral land. Due to the increasingly strict demands of consumers, they demand a higher level, to meet the needs of customers, coffee growers in Tay Nguyen, Viet Nam must change the way of production according to " Green" coffee. The reseach confirms that: when participating in the green supply chain in coffee production, there are economic, social and environmental benefits.

Keywords: *Green supply chain, coffee, economic, social, environmental.*

1. Introduction

Coffee production as well as export Viet Nam ranks second in the world for many years. However, the export price of Viet Nam's coffee is always lower than that of other countries in terms of coffee production. Vietnamese coffee so far has not had its own brand on the world coffee exchange: Coffee quality and export prices are inferior to coffee products of many countries. Vietnamese coffee products are always at the low end of the global value chain when exported and are often not classified according to their own standards. According to the International Coffee Organization (ICO), every year, over 1,5 million bags of unqualified coffee are rejected at 10 European ports, of which Vietnam's coffee accounts for 72%.

Due to consumer demand, products must meet specific standards. To meet the needs of customers, the international market. Coffee growers need to chainge from traditional production to green supply chain production. The benefits of green supply chain production are: Clean coffee, reduced input materials, no chemicals. Reduced costs in coffee production.

2. Literature Review

2.1. Green suppy chain

Johnny (2009) assert that green supply chain is the process of adding elements of " green" elements to an existing supply chain and creating a recall supply chain as a way to rebuild the resulting system. This includes not only the pursuit of efficiency, but also supply chain innovation with regard to costs, profits and the environment.

Dadhich, Genovese, Kumar & Acquaye, (2015) stated that green supply chain are limited in natural resources, rising raw material and energy prices cause irreparable damage, raising concerns about carbon, gas waste, resource scarcity, climate change and waste generation have become challenges facing business environment.

2.2. Green supply chain coffee

The green coffee supply chain is a coffee production chain from production to consumers, the coffee production process with the goal of reducing input materials, reducing chemical fertilizers, reducing irrigation water, and reduce greenhouse gas emissions. Without, affecting the environment, recycling coffee pods to make microbial fertilizers to use as fertilizer, reduces labor costs, and reduces greenhouse gas emissions to the surrounding environment.

3. Method

3.1. Comparative method

To compare the effectiveness of coffee growers who have joined the supply chain and have not jet applied to participate in the supply chain to find out what causes they have not joined the supply chain.

3.2. Expert method

Consult directly or indirectly with officials and experts with long -term expericnce from central to local levels related to coffee, agricultural departments of 5 provinces to analyze and evaluate chain development. Green supply chain in coffee production, which is the foundation to perfect policies for the development of green supply chains.

3.3. LCA Method

Calculating greenhouse gas emissions at all stages of the green supply chain in coffee production in Tay Nguyen, such as preparation, cultivation, and processing.

4. Results

4.1. Enviromental Efficiency

Source: Author's calculation from actual survey results, 2020

Before growing coffee, household in Tay Nguyen used a plow to plow the soil, and used a excavator to dig holes for coffee instead of using human strength. Apply formula 1 to calculate greenhouse gas emissions caused by Dieswel, in which the CO_2 emission factor is 74100kg CO_2. TJ. The N_2O emission factor is 0,6 kgN_2O TJ (*Table 2.5, Chapter 2, GL 2006)*. According to the survey results of 392 coffee producing households, the average pit excavator is 3,8-3,9 liter of oil, 1 liter is equal to 37,3 MJ, the coefficient of CO2 emission due to Deisel oil is 74100, the coefficient is 74100, N2O emission is 0,6. The amount of lime used for fertilizing in coffee planting holes, based on the results of subjects, the author surveyed 161 households growing traditional coffee, 131 households participating in the green supply chain. Using lime to fertilize before planting coffee trees, to increase the resistance of coffee, 1 ha of coffee fertilize 400kg of lime on average. The emission factor of using lime fertilizer is taken according to IPCC National GHG Invenrory Guidelines (2006), this study selects the emission factor of using Dolomite as a Coffee liner with the value 0,13 C/kg of lime (*GL 2006, Vol. 4, Chapter 11, P 29)*

Fertilizer N: The amount of fertilizer in the period of basic economic development, households usually use fertilizer with a ratio of 16-16-8, showing the amount of greenhouse gas emissions due to the amount of N fertilizer, traditional production by households 773,190 kgCO2tdd/ton, produced by green supply chain, emissions 686,040 kgCO2tđ/ton, difference in greenhouse gas emission reduce 87.12 kgCO2tđ/ton. GHG emissions P2O5, conventional production GHG emissions is 26 kgCO2tđ/ton, greenhouse production green supply chain emissions 6,8 kgCO2tđ/ton. The difference between the amount of greenhouse gas green supply chain emissions are reduced by 19,2 kgCO2tđ/ton compared to the traditional model. K_2O emissions from traditional production 58,240 kgCO2tđ/ton. Green supply chain production, greenhouse gas emissions 36,680 kgCO2tđ/ton. The results show that when participating in a green supply chain, greenhouse gas emissions are reduced by 21,560 $kgCO_2$tđ/ton compared to households participating in the tradional model.

+ **Electricity**: CH_4 greenhouse gas emissions, for traditional production, 0,006 kgCO2tđ/ton, production in the direction of a green supply chain, emissions 0,000544 kgCO2tđ/ton. Compared to using electicity when participating in the green supply chain, it reduces 0,006 kgCO_2tđ/ton.

+ **Deisel Oil**: CO_2 greenhouse gas emissions, traditional production 80,15 kgCO2tđ/ton, green supply chain production, emissions 49,75 kgCO_2tđ/ton. The results show that greenhouse gas emissions when households participating in the green supply chain decrease by 30,4 kgCO_2tđ/ton compared to households participating in the traditional way. The amount of greenhouse gas emissions CH_4, produced in the traditional way is 260 kgCO2tđ/ton, produce under the green supply chain, the greenhouse gas emission CH4 is 180 kgCO2tđ/ton. It shows that households participating in green supply chains have reduced greenhouse gas emissions by 110 kgCO2tđ/ton compared to traditional production. N2O emissions, when engagel in traditional production with an emissions of 17,4 kgCO2tđ/ton, production in the green supply chain has N_2O emissions of 10,8 kgCO2tđ/ton. The difference in traditional production is 6,6 kgCO_2tđ/ton compared to production in the green supply chain.

+ **Pesticides:** CO_2 greenhouse gas emissions of fertilizers, traditionally produced emissions 0,052 kgCO2tđ/ton, households participating in the green supply chain do not use pesticides, so the amount of gas emitted greenhouse gas emissions are 0.

+**Manure:** CH4 emission of manure, traditionally produced greenhouse gas emissions is 0,052 kgCO2tđ/ton, households participating in the green supply chain have greenhouse gas emissions of 0,039 kgCO2tđ/ton. The difference when participating in the green supply chain, the amount of greenhouse gas emissions reduced by 0,013 kgCO2tđ/ton compared to traditional production. N2O emissions of manure, for traditional production is 0,010 kgCO2tđ/ton, GHG production in green supply chain is 0,007 kgCO2tđ/ton. It shows that the amount of GHG of traditional production households is 0,003 kgCO2tđ/ton more than households participating in the green supply chain.

+ **Collection point**

- Greenhouse gas emissions

The amount of greenhouse gas emissions from using oil for agricultural vehicles to transport coffee from the field to home is 43 kgCO_2tđ/ton for traditional production; for households that transport by buggy or trailer, the GHG is 0. For households participating in the green supply chain, the GHG amount is 26,64 kgCO2tđ/ton. The difference between the amount of GHG for households producing traditionally is more than 16,36 kgCO2tđ/ton with households participating in the green supply chain.

The amount of CH4 GHG in the process of coffee milling for traditional households is 0,065 kgCO2tđ/ton, households producing in the green supply chain are 0,09 kgCO2tđ/ton.

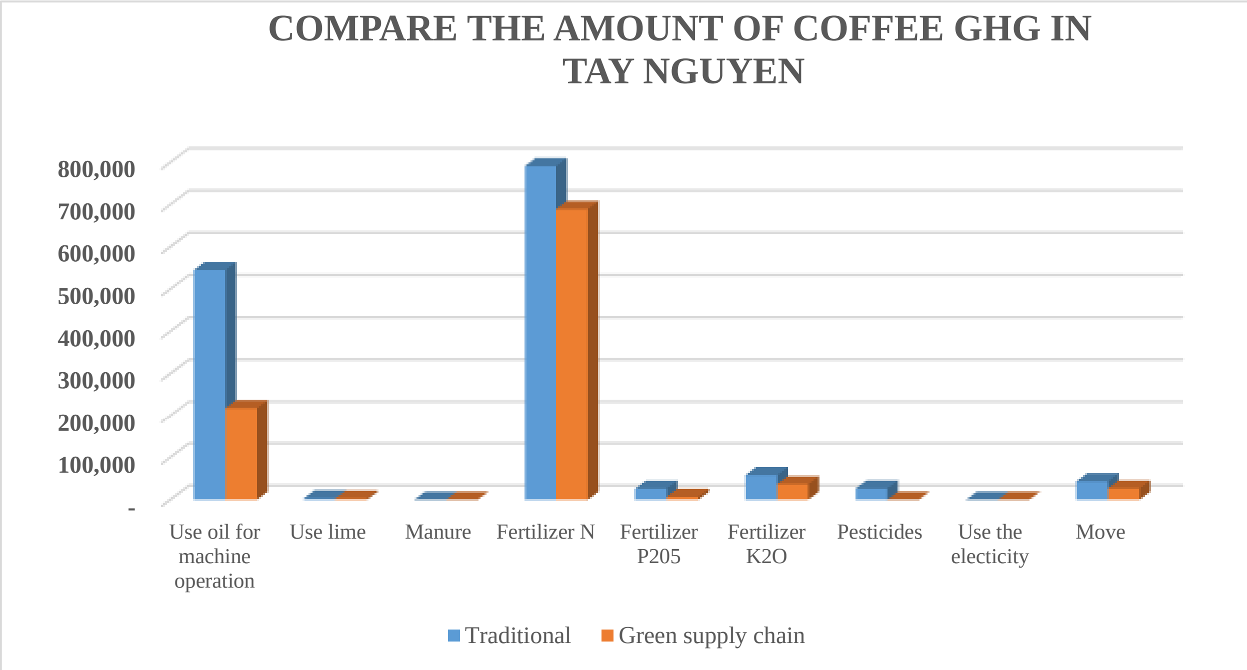
Carbon footprint (kgCO2tđ/ton)			1.494	981

Source: Author's calculation from actual survey results, 2020

- **Compare the amount of coffee GHG in Tay Nguyen**

Table 3 shows that coffee production in Tay Nguyên is produced in a traditional way with an output of 1 ton of fresh coffee, with a GHG amount of 1,494 *KgCO2tđ/ton.* Production in green supply chian GHG amount is 981 *KgCO2tđ/ton.* According to green supply chain production reduces greenhouse gas emissions compared to the traditional 512,89 *KgCO2tđ/ton.*

Table 3: Compare the amount of coffee GHG in Tay Nguyên



- **Economic efficiency**

According to the survey results of the author, to harvest 1 ton fresh coffee includes the following costs:

Thus, the total cost of growing coffee to harvest 1 ton of fresh coffee is 5,880,000 VND

Table 4: Coffe Production Costs When Participating In Green Supply Chain

Unit: VND/Ton

Costs	Green supply chain coffee
Coffee tree	275.000
Watering system**	130.000
Labor cost	417.000
Fertilizer cost *	4.158.000
Manure cost	500.000
Energy cost	400.000
Total	**5.880.000**

The amount of fertilizer 3 years from the production stage to the start of harvest

When participating in the green supply chain, it is necessary to bring the most practical efficiency to facilitate the development of the green supply chains bring to coffee procers are shown in table 4.

Table 5: Economic Benefits Of Joining A Green Supply Chain

Unit: VND/Ton

Saving money on watering system	70,000
Saving labor cost	183,000
Reduce inorganic fertilizers	12.006,000
Reduce organic fertilizers	200,000
Saving time converting to money	130,000
Saving time, convert to money	85,000
Cost	2.500,000
Reduced energy	400,000
Sell carbon credits	25,383
Tatol	**15.416,566**

Source: Author's calculation from actual survey results, 2020

Traditional coffee production has a greenhouse gas emission of 1,494 KgCO2tđ/ton, after joining the green supply chain, greenhouse gas emissions decrease to 981 KgCO2tđ/ton. The selling pric of carbon credits is 981 KgCO2tđ/ton. The money is 25,383 thousand VND.

- Using time – saving in coffee irrigation, each year saves 130,000 VND
- Saving money on treatment of diseases caused by environmental pollution is 85,000 VND/ year.
- When participating in the green supply chain, cost of buying 1kg of coffee increases by 2,5 thousand VND/kg compared to the traditional. Join the green supply chain with a profit of 2,5 million VND/ton of fresh coffee.
- Joining a green supply chain, cost such as electricity and oil are reduced by 40,000 VND compared to the traditional.
- Using inorganic fertilizers when participating in the green supply chain brings benefits of 12,006 million VND. Manure benefits when participating in the supply chain is 200,000 VND.

- **Social efficiency**

Joing a green supply chain in coffee production in Tay Nguyen, in addition to environmental benefits, also has social benefits such as reducing the burden on wonmen and the elderly in coffee production, watering, saving time for children and the elderly to spend time working more gently, suitable for each age. Saving a lot of time, men can do other jobs to increase family income, women can spend that time talking care of the family.

Through the survey, people who have participated in green supply chain in coffee production are shown as follows:

Improving the quality of life for workers: After surveying households/farms involved in coffee production that have joined the green supply chain. They use drip irrigation technology instead of watering in the traditional way of pulling the rope to the root, saving 100% of irrigation manpower, saving 9 labor/time/ton. 27 labor/ha/ year. The current labor price is 260.000 VND/ day, increasing income is 7,020,000 VND/ha/year, for coffee producing households that have not joined the green supply chain. The time thay save is used by them fof social activities, looking for alternative jobs to increase their living income, such as village activities (100%), talking care of the family 52%. Increase income 60%, read books 13%. According to the comments of coffee farms/ households, since joining the green coffee supply chain, thay have more time to take care of their families, study and children, and have time to do other jobs.

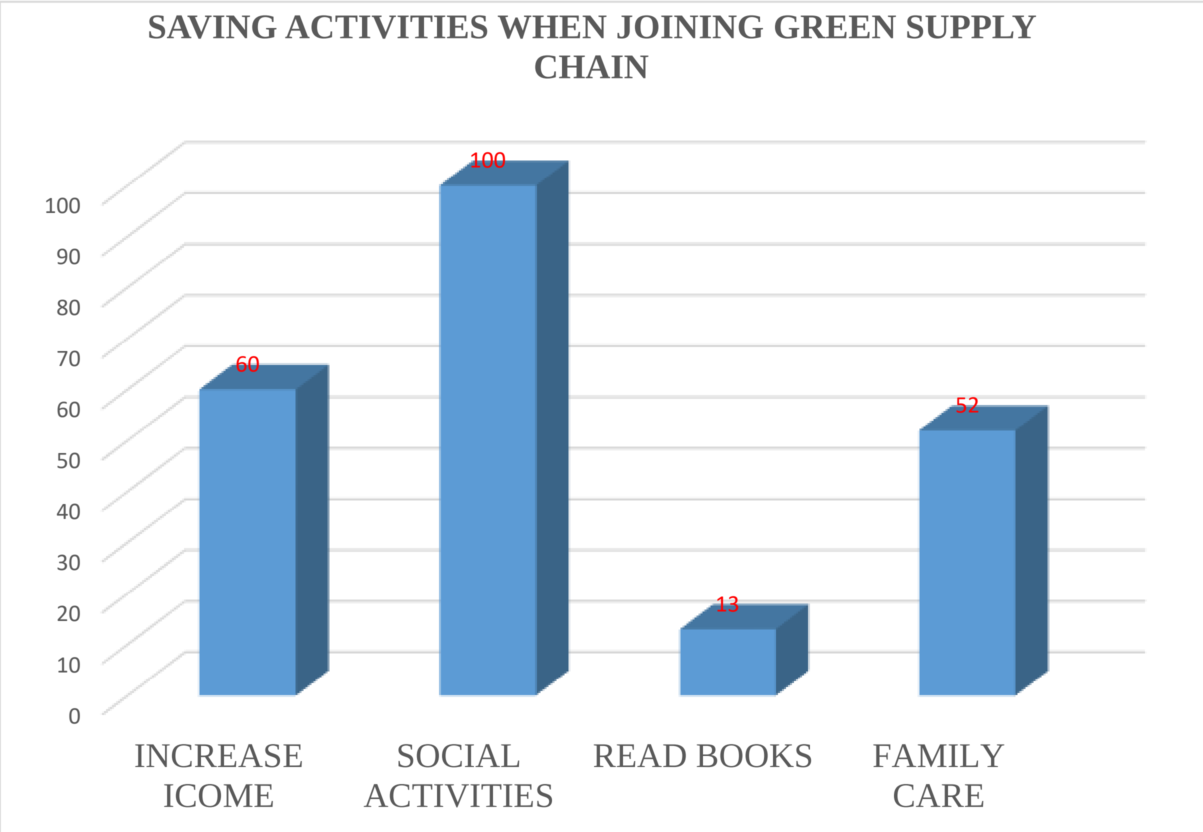


Figure 1: Saving activities when joining green supply chain

Improving people’s health: Of which 131 households and participants in the green supply chain, 125 households (accounting for 97,2%), believe that participating in the green supply chain can reduce diseases caused by environmental pollution. In addition, health diseases affect people due to side effects from organic chemical fertilizers, sprays for coffee trees when spraying in bathches, flowering before ioning the green supply chain. The reduction of envirmental pollution caused by pruning coffee branches and coffee husks increases the stench, since joning the green supply chain, talking advantage of coffee pruning to mank cooking firewood coffee husks for composting, fuel for coffee roasting. Each year on average. Each households/ farm seves about 459,300 VND/year on respiratory diseases… compared to before joining the green coffee supply chain.

Reducing the amount of flies, mosquitoes and insects when producing traditional coffee. According to the author's survey of 131 households/ farms, 47,2 of insects, ants and flies are completely reduced. 38,2% of households/farms reported that the amount of insects, files, and ants reduced slightly. Most of the farms take advantage off coffee husks before joining the green supply chain.

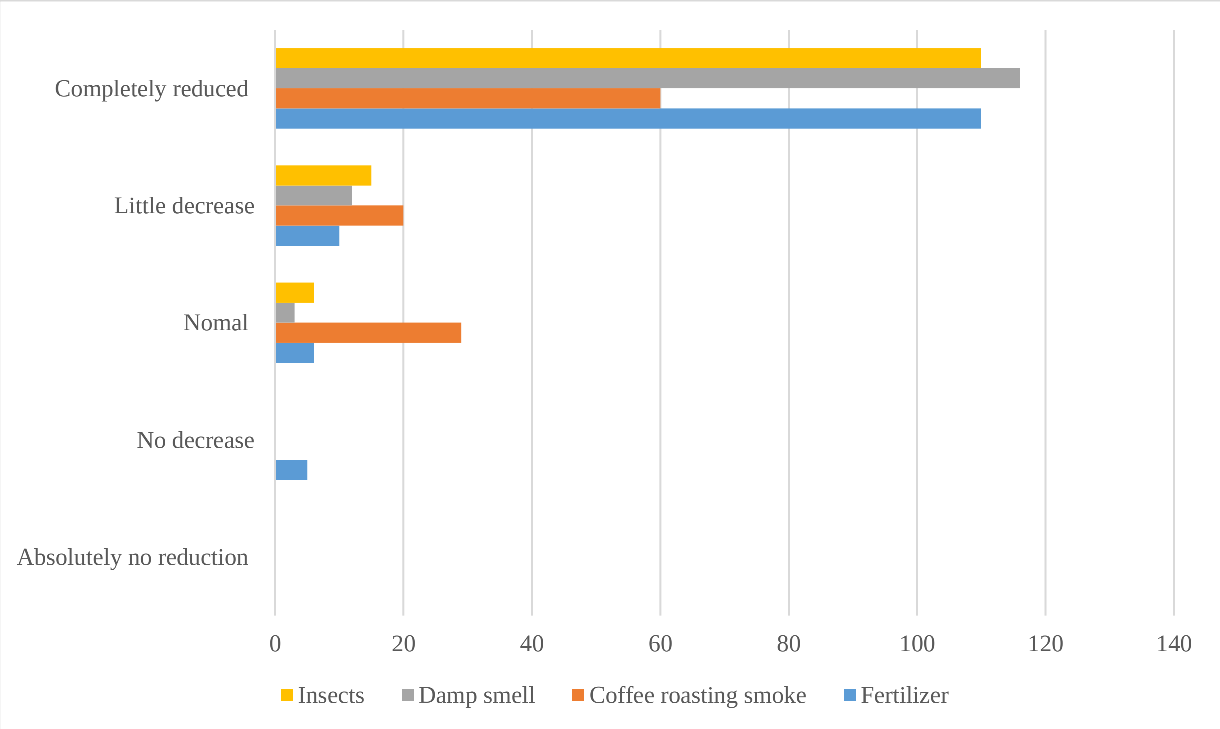

Figure 2: Air pollution reduction and insect counts after joining the green supply chain

5. Discussion

In recent years. Cofffee has been exported a lot in countries around the wworld, coffee growing households in Tay Nguyen, Viet Nam have joined the green supply chain in production, replacing the traditional production method. They found that, when participating in green supply chains, there are many economic, social and environmental benefits compared to traditiopal production.

FACTORS IMPACTING ON THE LIVELIHOOD OF RAGLAI PEOPLE IN BAC AI DISTRICT, NINH THUAN PROVINCE

MA. Nguyen Thi Thu Trang

thutrangxhnv@gmail.com

Faculty of Social Sciences & Humanities, Ton Duc Thang University, Ho Chi Minh city

Abstract

Nowadays, the livelihood of ethnic minority communities has become a central issue in many countries around the world. In our country, the living conditions of many ethnic minority communities have improved, but in general, it is still mainly agricultural production with low productivity, so the rate of poor and near-poor households is still high. Bác Ái district, Ninh Thuận province is where more than 90% of Raglai people live and work. Although the government has many livelihood programs and policies on labor and employment, the life of Raglai people still faces many difficulties. This paper is an attempt to analyze objective and subjective factors that affect the livelihood activities of Raglai people, Bac Ai district, Ninh Thuan province. By a combination of quantitative research methods and qualitative research methods, the study shows that natural conditions, human resources, financial resources, social resources, etc. have an influence on livelihood activities leading to poverty of the Raglai community.

Keywords: *Raglai ethnic group, poverty, poverty reduction.*

1. Introduction

Bac Ai is one of 61 poor districts (now 64 districts) according to Resolution 30a of the Government. The district has 09 communes/38 villages (of which 31 are particularly difficult). Population 7,372 households/31,353 people (as of the end of 2018), mainly Raglai ethnic people (accounting for over 87%). The number of people of working age is 16,303 workers, accounting for 52% of the total population of the district, mainly engaged in agricultural production and animal husbandry.[10] Bác Ái is an arid sub-climate, typically with a tropical monsoon climate, relatively high temperature, hot dry, and high winds, so droughts often occur every year. Although the government and local authorities have been implementing many livelihood programs, poverty reduction policies, and infrastructure construction, the rate of poor households and falling back into poverty is still high. Therefore, understanding factors impacting on the livelihood of Raglai people in Bác Ái district will contribute to assessing the current status of labor and employment, identifying

[10] UBND Huyện Bác Ái, (2019), Sơ kết đánh giá kết quả 10 năm *(giai đoạn 2008-2018)* triển khai thực hiện Nghị quyết số 30a/2008/NQ-CP ngày 27/12/2008 của Chính phủ
trên địa bàn huyện Bác Ái.

the main causes that directly affect the livelihood their. Proper assessment and accurate identification of the causes will be an important basis for local authorities to find effective solutions to solve livelihood problems and help people escape poverty. Through a theoretical approach to the Department for International Development (DFID) sustainable livelihoods framework. The author analyzes the impact of human resources (skills, knowledge, work capacity and health); social resources (networking, membership of groups, relationships of trust, access to broader social institutions); natural resources; physical resources (basic infrastructure, equipment and means of production); financial resources (savings, credit or deposit to help choose different livelihood activities) to the livelihood activities of Raglai people in Bác Ái district, Ninh Thuận province.

2. Method

The study was carried out by survey method by questionnaire with more than 700 households in three communes: Phước Thành, Phước Thắng, Phước Tân of Bác Ái district, Ninh Thuận province. On the other hand, to learn more about factors affecting livelihood activities; the level of participation and satisfaction of the Raglai with the programs and policies being implemented in the locality. The study conducted 30 more in-depth semi-structured interviews with subjects who were local people, officials, village elders, and village heads. The study also conducted 6 focus group discussions for people (according to the criteria of sex, age, occupation), officials. Survey data by questionnaire will be processed by SPSS 18.0 software to identify variables that have an impact on poverty of Raglai people in Bác Ái district, Ninh Thuận province.

3. Results

3.1. Livelihood of Raglai People in Bac Ai District, Ninh Thuận Province

Research on livelihood activities of Raglai people in three communes Phước Thành, Phước Tân and Phước Thắng in Bác Ái district, the results show that the Raglai people mainly focus on working in occupational groups such as cultivation 203 people (29%); animal husbandry 295 people (49%); freelance 115 people (16.4%). Occupation groups such as trade profession, services, cottage industry, etc. have a very low percentage of Raglai people participating.

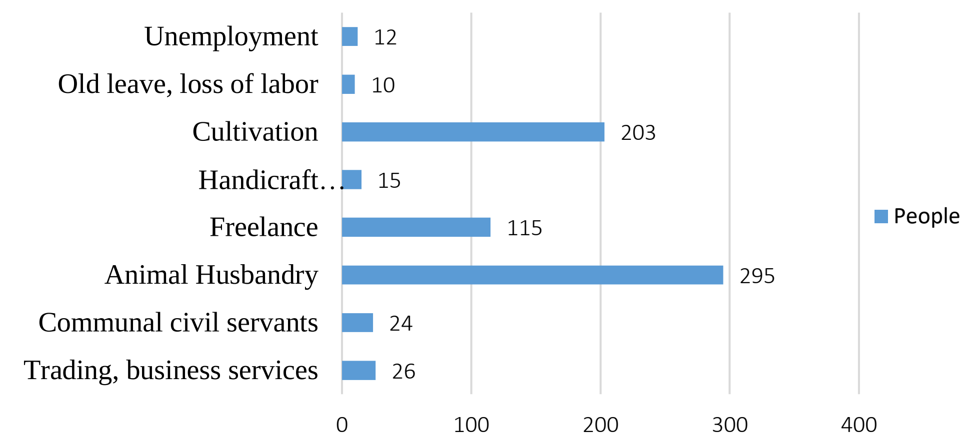

Figure 1. People's current main occupation

Source: Results of the study in 2017

Finding out about the incomes of occupational groups, the research results show that the average income of Raglai people is quite low (1,371,000/person/month), in which high-income occupation groups are mainly officials (3,097,000/person/month), workers 3,100,000/person/month) and traders (2,037,000/person/month). However, a paradox is that the number of people working in high-middle-income occupations accounts for a very low percentage. On the contrary, people working in the cultivation and animal husbandry groups have low income but many people participate. This is influenced by many different factors and will be analyzed in more detail later.

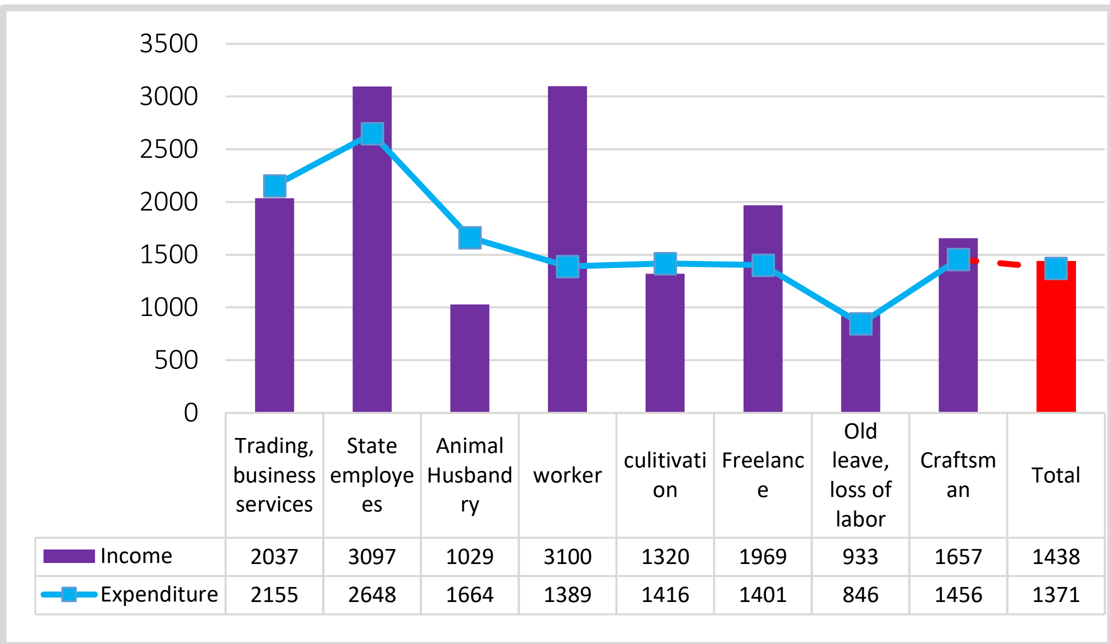

Figure 2. Comparison between income and expenditure by occupation group (thousand VND/month)

Source: Results of the study in 2017

On the other hand, looking at figure 2, we see that the income of the two groups of cultivation and animal husbandry is much lower than that of the other groups. In particular, considering the balance of income – expenditure of these two occupation groups, it is always negative (Animal husbandry: -635,000/month; cultivation: -96,000/month). This result tells us more that, when the main income generating profession is always in the state of spending more than receiving, the life of Raglai people is always in a state of deprivation, difficulties are inevitable. Currently, the exploitation and use of arable land has not been thoroughly used, so the agricultural production of people is also facing many difficulties. Raglai ethnic people still continue to exploit swidden land on the mountain slopes to grow corn, rice and vegetables. This land area is very difficult to estimate, it depends a lot on the human resource conditions of each household, because in order to use it for farming, it is necessary to give up quite openly.

3.2. Factors impacting on the livelihood of Raglai people in Bác Ái district, Ninh Thuận province

3.2.1. Natural resources

About climate, weather: Bác Ái is an arid sub-climate, typically with a tropical monsoon climate, relatively high temperature, hot, dry, windy, high evaporation, which are favorable conditions for intensive farming, increasing crops, especially especially for the group of plants that like light and to develop large-scale livestock raising such as buffaloes and cows; in the rainy season, crops can grow and develop normally, but need additional irrigation water to increase productivity and combat drought; in the dry season, if it is not irrigated, it is almost impossible to carry out production.

About land resources: Bác Ái has a relatively large area of natural land, large forests and forest land, accounting for 79,71% of the natural area, with all three types of forests, namely special-use, watershed protection and production; agricultural production land area accounts for 11,94%. Land has 6 groups, 12 land units, including: semi-arid gray-brown soil group accounting for a large proportion with 72,2%; group of gray and gray soil 10,5%; alluvial soil 6,9%; valley land due to slope product accumulation 5,46%; red and yellow soil 4,72%; The rest is gravel.[11]

In general, the climate and weather conditions in Bác Ái district are very harsh, often lacking water for agricultural production and in the dry season. In addition, the soil has low nutrient content, heavy mechanical composition, many acidic soils, degraded due to harsh climate, little annual replenishment and excessive use of pesticides; Therefore, the

[11] UBND Huyện Bác Ái, (2020), Báo cáo kết quả triển khai thực hiện Chương trình mục tiêu quốc gia giảm nghèo bền vững 9 tháng đầu năm 2020, và phương hướng thực hiện nhiệm vụ 3 tháng cuối năm 2020 trên địa bàn huyện Bác Ái.

livelihoods of Raglai people based on cultivation and animal husbandry face many difficulties.

3.2.2. Human resources

The level of education has a close relationship with labor skills, adaptation in livelihood activities under the impact of natural conditions and risks from the market, epidemics, etc. Quantitative results shows that the education level of the Raglai is very low (more than 37,1% have never attended school; 59,9% have primary education and have dropped out), the dropout of children is still very common.

Table 1. A detailed description of educational attainment of local children

Description table		**Frequency**	**%**
Kindergarten	Male	123	10,0
	Female	117	9,5
Primary school level (from grade 1 to grade 5)	Male	293	23,9
	Female	223	18,2
Secondary school level (from grade 6 to grade 9)	Male	170	13,8
	Female	137	11,2
High school level (from grade 10 to grade 12)	Male	96	7,8
	Female	69	5,6
Total		**1,228**	**100,0**

Source: Combining results of the study in 2017 and data posted by District Education Department on the website http://bacai.edu.vn.

The results of Table 1 show that the percentage of students from primary to high school is gradually decreasing. The total number of primary school students was 516, but by high school only 165 students, a decrease of about 3,1 times. In which, the number of students decreased the most in the period from secondary school to high school, the number of boys decreased by 1,8 times (170 compared with 96) and the number of girls decreased by 2 times (137 compared with 69). The sharp decrease in the number of students across classes and levels is alarming. A teacher at Hung Vuong School – Phước Tân Commune shared: *"After a few days of Tet holidays, I had to go to each student's house to remind them to come to school tomorrow, sometimes I had to go to students' homes to drive them to school. It was very hard work, but I loved my job… Anger was anger at parents, they did not care about their children's education. Sometimes, students were absent from school for a whole week, when I went to students' houses to ask about their parents, they said that they did not pay attention because they went to work..."*.

Low level of education has a great influence on Raglai people's perception of livelihood activities. In farming, despite being granted land by the local government for cultivation, many households still keep the old and outdated farming methods, so the productivity is very low. Even, many resettled households have refused the land in the plains granted by the government to return to their old places of residence (on the high mountains) to cultivate. An agricultural extension officer said: *"Although people in Phuoc Thang commune were resettled, provided with cultivated land, and had a house, but they were not familiar with it. Many households just left their homes and then went to the mountains to stay for a whole month before returning. In the mountains, they still grew corn, rice, and bananas just like they used to. Although they did not have high productivity, they were not used to growing wet rice. It was difficult to get water here, it took technology to be productive. Even though the people had been trained in farming techniques, they were still not used to it, so they did not do it"* (Male, 45 years old, district official). For livestock production, although the local authorities are very well trained in methods and techniques to take care of livestock and poultry, many households still do not understand and follow the old practices. An official from the district's Department of Labor, War Invalids and Social Affairs said: "…The state provided each poor household with a cow under the program 135, but it was no longer available after that. There were cows that die due to disease, due to lack of food and drink, the cows became thin and boneless, or they were slaughtered. No one took care of cows like that. Every day, they took the cow out into the field and tied it to the tree until evening to bring it back. The important thing is that there was no water around, no grass, no cow could live".

From distant past to present day, The Raglai do not have the ability and habit of doing business, so making money through trading is not their forte and advantage. In particular, the local economic conditions are underdeveloped (in 2008 for the first time the district had a market supported by Oxfarm) plus very few households with low educational attainment, no math skills, no business knowledge. Raglai family participates in trading. Local trading activities are mainly carried out by Kinh people. Some Raglai households doing small business (selling groceries, selling chè, xôi) have much better income. However, buying and selling activities also face many difficulties when people of the same ethnic group buy without payment or owe but do not pay for many days, even they are afraid of being cursed (bỏ dậu) by neighbors when they see these families do better than them. One young woman, grocer said: *"…Trading made a little money, but sometimes neighbors bought it without paying, 'it' did not pay, sometimes 'it' said 'all are people from the same village, so they did not need to pay'. In fact, I was also afraid, because many people naturally had money, became rich, they were cursed by their neighbors and died from illness, so many families did not dare to be rich"* (Female, 25 years old, grocer). In spending management, due to not knowing how to calculate so the revenue - expenditure is ineffective, they do not have monthly spending plans or know how to accumulate, save to spend in difficult times, or risks from epidemics and natural disasters. A grocery store owner, Kinh people said: *A grocery* *store owner, Kinh people said: "Many households were suffering, but fortunately, the government planned the administrative area should be compensated a lot of money. But you knew what? they brought a whole bag of money to the grocery store to pay off the debt. They did not know how much they owe, but they just told the owner to take the money out of their own pocket for the amount they owe. Then they went to Ninh Sơn market to buy all kinds of things, ate a bowl of pho for 25,000 VND and gave 50,000 VND without taking any change. They were like that, very different, not like our Kinh people".* Or a woman officer said: *"People who worked far away, father and son worked in Lam Dong had more than 20 million VND, wife bought 2 phones and laptops, then husband bought 2 then buys 2 TVs, daughter got married in the West. Father and son worked together to provide for his wife (mother). The state facilitated land allocation (program 135) but they refused to do so, how could they escape poverty? Compared to people in other places, people here were narrower".*

In the present time, the local government strengthens vocational training classes so that young people of Raglai have full skills to access jobs. The number of vocational classes is being opened more and more, such as cultivation, animal husbandry, veterinary medicine, construction, repairing engines and motorcycles, industrial sewing *(Phước Bình 223 workers/10 classes; Phước Hòa 274 workers/10 classes; Phước Trung 322 employees/11 classes; Phước Tân 475 workers/14 classes; Phước Tiến 950 employees/27 classes; Phước Thắng 625 workers/18 classes; Phước Chính 414 employees/12 classes; Phước Đại 350 employees/10 classes; Phước Thành 550 workers/16 classes).*[12] However, after they receive vocational training, they also face many difficulties because the Raglai do not want to work away from home, while in the locality, the industrial economy is not developed. This is a difficult problem for households and for local authorities.

3.2.3. Social resources

A social network is a social structure formed by individuals or organizations, bound by interdependence through the knots are relationships such as family, kinship, friends, etc. Social capital is established from social networks, in addition, social networks are increased and expanded by individuals and groups through the benefits that social capital brings. The Raglai people have a close relationship with their neighbours, only their relationship with local political organizations and product purchasing establishments are very limited. Therefore, they have little information about the fake market and are often pressured by traders for the agricultural products they earn. A particularly important issue is that relatives and neighbors only live around the village, very few people work far away so they do not have information about employment or are influenced by people with economic knowledge

[12] UBND Huyện Bác Ái, Bác cáo kết quả triển khai thực hiện Chương trình MTQG giảm nghèo bền vững năm 2019, phương hướng, nhiệm vụ, giải pháp thực hiện năm 2020 trên địa bàn huyện Bác Ái.

to the Raglai. Through actual observations, the Raglai often trade with the Kinh (households who sell groceries and buy all the products earned by the Raglai) but learn nothing from these household businesses. In fact, Kinh business households in order to achieve high profits often force prices, buy products at very low prices compared to the market price, they encourage Raglai people to buy alcohol to exchange agricultural products. Raglai people are very limited in accessing information as well as expanding their relationships with local cultural and social organizations. That is also the reason why they lose many opportunities to access information about policies, programs and projects for them. In addition, Raglai people's access to information is mainly through information from village loudspeakers, word of mouth information, audio-visual media such as television, cassette, radio. However, during the actual observation in the locality, we found that there are some barriers in accessing information for the people such as: radio stations do not have wide coverage, only focus on a few densely populated places such as markets, schools, administrative areas. The form of broadcasting is not suitable for listeners, because Raglai people have low education level, do not understand the Kinh's voice, one interviewee shared: *"I listened to music but I did not understand, sometimes they spoke too fast so I could not hear it in time. I could only listen to it when I had free time, but when I went to work in the field, there was no loudspeaker in the field for me to listen to"* (Male, Raglai people).

In general, the social capital of the Raglai is very limited, mainly the relationship with family and neighbours. However, the people in the family, relatives, and neighbors also live around the village, and their understanding of doing business is the same, so they cannot learn from each other. Therefore, it can be seen that social networks play an important role in supporting people to access information in life.

3.2.4. Physical resources

Over the years, through the benefits of policies under Resolution 30a of the Government, the local physical conditions have been significantly improved. Housing support for poor households under Program 167 is 1,629/1,100 units, reaching 148,1% of the plan; housing under Decision No. 22 is 237 units; The remaining 1,257 houses are supported by other sources, such as: solidarity houses, support houses from organizations and businesses,…; 01 station has a fixed doctor, the remaining 08 stations have a rotating doctor according to the project 1816; schools at all levels are built spaciously, there are schools for boarding students; asphalt and clear road delivery system to communes; 01 central market of the district, the fairs of Phước Bình, Phước Trung, Phước Thắng, Phước Tiến.

Compared with ethnic minority areas in the Northwest, the physical conditions in Bác Ái district are much better, but due to harsh natural conditions, it is not favorable for agricultural development. On the other hand, Raglai people still keep the old habit of cultivation, so they often grow crops on high mountains, these places have no roads, so they are often pressured by small traders. In addition, due to their low level of education and slow absorbing techniques and technologies, they have not effectively used the resources provided by the government. For example, Raglai people still have the habit of giving birth at home without going to local health facilities, they do not have the habit of regular antenatal check-ups to receive iron and calcium supplements as well as vaccinations. Therefore, the rate of malnourished children (short, stunted) is still high. The school is spacious, but most of them only study until the end of secondary school and then drop out of school to follow their families to the fields or to work as hired laborers.

3.2.5. Financial resources

Financial resources are very important for the livelihood activities of households. Bác Ái district is a poor district, so the government is very interested in lending capital for the Raglai to do business and live. According to an official from the district's Department of Labor, War Invalids and Social Affairs, the state's current sources of loans to people are not lacking, even not fully lent. A paradox taking place in the Raglai community is that people are lacking in business capital, but the state loan fund is still available. The reason for the above contradiction is because Raglai people do not know what to borrow money for? They fear that if they borrow money and do nothing, they will spend it all and not have enough to pay back to the state. On the other hand, for some households that know how to do business, the loan amount is too small and it is not enough for them to expand their production. A person living here said: *"...If you did not dare to take money from the state, if you did not know what to do, where could you get the money to pay the debt? I saw my neighbors borrow money to buy TVs, bought an old motorbike, then ate and drank. After using all the money, how do I return the money to the state? I was so scared, I did not dare to borrow money"*. An official from the Women's Union also shared: *"In general, people were a bit afraid, shy, did not dare to contact, lack trust with strangers. The State facilitated low-interest loans. Previously, the interest rates of poor households were about 6% to 8%. Interest rates were low but they did not dare to borrow, 10 million, 15 million, I did not know how they determine it. They did not specify whether to borrow for economic purposes, to raise cows or for what?".*

4. Discussion and Conclusion

In general, according to the theoretical approach to sustainable livelihoods framework of the Department for International Development (DFID). Results show that the Raglai people's livelihood activities are influenced by the following factors: (1) natural resources; (2) human resources; (3) social resources; (4) physical resources; (5) financial resources. In particular, the study shows that resources (1) and (2) have the strongest impact on livelihood activities of Raglai people. However, if viewed comprehensively, cultural resources are the key factor in the livelihood of Raglai people in Bác Ái district, Ninh Thuận province. Cultural resources are understood as the customs, habits, and traditional behaviors that have created inertia for the economic activities of the people here. About the regional culture, the Raglai follow the matrilineal system, with women being the main labor force in the family, performing many different roles. Therefore, male are less likely to participate in heavy work, they drink as much as they do, so some families have a hard time. In addition, Raglai people do not have the habit of working far away, they do not want their family members to go to big cities or go abroad to work in search of good job opportunities. On the contrary, they want their children to gather with their families even if they are hungry all year round. The Raglai also do not force their children to study or work to earn money when they reach adulthood. Or if the children go to work to earn money, they can completely decide with the money they earn without having to give it to the family. Some other families still keep outdated customs that cost the family a lot of money such as the custom of bỏ mả, cúng mùa, etc.

Abstract

The article aims to explore the causal relationship between economic growth, industrialization, and urbanization in Vietnam between 1987 and 2016 using the VECM. In the short run, it has been empirically found that CO_2 emissions have positive effect on GDP, while industry value added, and urban population have negative relationships with GDP. Results also indicated that CO_2 emissions and urban population negatively affect industry value added, but an increase of GDP may enhance the industry value added. Results showed that both GDP and industry value added have negative impacts on urban population. In the long term, results demonstrated that economic growth harms the environment, while surprisingly, industry value added, and urban population can improve the environmental quality. Results of the Johansen co-integration test indicate that there is a long run relationship between economic growth, industry value added, urban population, and CO_2 emissions in Vietnam. Lastly, policies are recommended to achieve both targets in economic growth and sustainable development for Vietnam.

Keywords: *carbon dioxide emissions, economic growth, industrialization, urbanization*

1. Introduction

The theme on the relationship between carbon dioxide (CO_2) emissions, economic growth, industrialization, and urbanization has been strongly debated by scholars all over the world. Dong *et al.* (2019) found that urbanization and income level have a significant influence on CO_2 emissions in 14 developed countries, and urbanization has a negative effect on CO_2 emissions in the mid-urbanization stage, while Hossain (2011) concluded that energy consumption in the newly industrialized countries generates CO_2 emissions, but economic growth, trade openness, and urbanization had positive effects on the environmental quality in the long run. A study by Nasir *et al.* (2021) argued that the industrialization process does not affect CO_2 emissions in Australia, while Mahmood *et al.* (2020) claimed that the effect of industrialization on the environment is inelastic, but the elastic effect has been found in the impact of urbanization on the emissions in Saudi Arabia.

Vietnam has experienced in economic reform and industrialization for more than two decades and it had great changes in economic structure (Tran and Doan, 2011). By 2019, the agriculture, forestry and fishing sector increased by 2.01 percent, while the industry and construction sector increased by 8.90 percent, and the services sector increased by 7.3 percent. The contribution to the overall growth of each sector accounted for 4.6 percent, 50.4 percent, and 45 percent, respectively (General Statistics Office, 2019). In Vietnam, due to the after-war housing pressures and land speculation, the process of urbanization occurs many years before the industrialization process, causing the urban model, and thinking to experience many crises. By 2020, the urbanization rate of Vietnam will be accounted for about 40 percent with the urban population of more than 45 million people (Chu and Nguyen, 2017). Industrialization and urbanization of Vietnam have progressed considerably. Urbanization of this country is lower than that of the global, however it is higher than the average in other developing countries and Southeast Asian countries (Ha *et al.*, 2019).

Table 1. GDP per capita, electricity consumption per capita, energy use per capita, urban population, and CO_2 emissions in Vietnam

Year	GDP per capita (constant 2010 US$)	Industry value added (% of GDP)	Urban population (%)	CO_2 emissions per capita (metric tonne)
1987	389.8	28.4	19.7	0.4
1996	628.1	29.7	22.6	0.5
2016	1,752.5	32.7	34.5	2.1

Source: World Bank, 2021

As seen in Table 1, gross domestic product (GDP) per capita of Vietnam increased by nearly 4.5 times from US$389.8 in 1987 to US$1,752.5 in 2016, while the value added of industry sector rose by 4.3 percent between 1987 and 2016. The rate of urban population of Vietnam increased by 14.8 percent from 19.7 percent in 1987 to 34.5 percent in 2016, while CO_2 emissions per capita increased by 5.2 times from 0.4 metric tonnes in 1987 to 2.1 metric tonnes in 2016.

In Vietnam, the relationship between economic growth and CO_2 emissions has been examined in work by Thanh and Khuong (2017); and Shahbaz *et al.* (2019), while Tang and Tan (2015) focuses on investigating the relationship between energy consumption, economic growth, foreign direct investment, and CO_2 emissions. Moreover, Morelli and Mele (2020) investigated the relationship between energy consumption, CO_2 emissions, and economic growth. However, none of these studies examine the effect of economic growth, industrialization, and urbanization on CO_2 emissions in Vietnam. Therefore, to narrow down this gap, the paper aims to investigate the impact of economic growth, industrialization, and urbanization on CO_2 emissions in Vietnam between 1987 and 2016 employing the Vector Error Correction Model (VECM). The fundamental contribution of this study is to recommend appropriate policies to foster economic growth and achieve sustainable development in Vietnam.

The remainder of this paper is structured as follows. Section 2 presents the literature review. Methods are discussed in section 3. In section 4, we present results. Finally, discussion and conclusion are summarized in section 5.

2. Literature Review

The relationship between economic growth, industrialization, urbanization, and CO_2 emissions has been highly debated by scholars all over the world. Dong *et al.* (2019) assessed the effect of industrialization and urbanization on CO_2 emissions in 14 developed economies and they found that the influence of industrialization on carbon emissions gradually increases in the low and intermediate income levels, but this effect begins to weaken in the high income level, while urbanization has no correlation to carbon emissions in the low-urbanization stage, however, it has a negative impact on carbon emissions in the mid-urbanization stage. Likewise, Hossain (2011) examined the relationship between CO_2 emissions, energy consumption, economic growth, trade openness, and urbanization in newly industrialized countries between 1971 and 2007. He concluded that energy consumption has been defined as a driver generating CO_2 emissions in these countries. Economic growth, trade openness, and urbanization have positive effects on the environmental quality in the long run. A study by Nasir *et al.* (2021) investigated the relationship between economic growth, trade openness, industrialization, and energy consumption on CO_2 emissions in Australia for the period 1980–2014. Results showed that financial development, energy consumption, and trade openness have positive impacts on CO_2 emissions, while the industrialization process is found to does not affect CO_2 emissions.

In Asia, Ding and Li (2017) examined the effect of industrialization and urbanization on CO2 emissions in 30 China's provinces between 2000 to 2013. It has been empirically found that economic development is the largest driver leading to CO_2 emissions, compared to structural change, energy intensity, and social transition. The urbanization process also has a positive effect on the regional CO_2 emissions. Similarly, Liu and Bae (2018) assessed the causal relationship between CO_2 emissions, energy intensity, economic growth, industrialization, urbanization, and renewable energy consumption in China between 1970 and 2015. They found that 1 percent augments of energy intensity, real GDP, industrialization, and urbanization increase CO_2 emissions by 1.1 percent, 0.6 percent, 0.3 percent, and 1.0 percent, respectively. A research by Ali e*t al.* (2019) evaluated the influence of urbanization on CO_2 emissions in Pakistan from 1972 to 2014 and results demonstrated that urbanization has been found to increase carbon emissions both in the short run and long run. Likewise, Mahmood *et al.* (2020) explored the impact of industrialization and urbanization on the CO_2 emissions per capita in Saudi Arabia between 1968 and 2014. They found that both industrialization and urbanization impede the environment with the inelastic effect of industrialization and elastic effect of urbanization on the emissions.

In Vietnam, Tang and Tan (2015) examined the relationship between energy consumption, economic growth, foreign direct investment, and CO_2 emissions, while Thanh and Khuong (2017) estimated factors affecting CO_2 emissions between 1990 and 2011. Shahbaz *et al.* (2019) investigated the relationship between economic growth and environmental degradation in Vietnam from 1974 to 2016 and they found that this country may expect a temporary reduction in CO_2 and therefore the government should concentrate on long-term economic and environmental strategies. Morelli and Mele (2020) investigated the relationship between energy consumption, CO_2 emissions, and economic growth in Vietnam between 1970 and 2014 and they concluded that there is unidirectional causality running from economic growth to energy consumption. Lastly, a study by Nguyen *et al.* (2021) assessed the effect of economic growth, financial development, transportation capacity on CO_2 emissions in Vietnam for the period 1986-2019 and results addressed that an increase in per capita GDP and financial development have negative influences on environmental quality, while transportation capacity and foreign investment can improve environmental quality.

3. Method

3.1. Data and Sources

A panel dataset for the relationship between economic growth, industrialization, urbanization, and CO_2 emissions in Vietnam for the period (1987–2016) is gathered from the World Development Indicators released by the World Bank. Thus, a total of 30 observations is entered for data analysis. The panel data is used for this research because of the following advantages: (1) it benefits in terms of obtaining a large sample, giving more degree of freedom, more information, and less multi-collinearity among variables; and (2) it may overcome constraints related to control individual or time heterogeneity faced by the cross-sectional data (Hsiao, 2014).

3.2. The Vector Error Correction Model (VECM)

The specification of a model is used to examine the relationship between CO_2 emissions, economic growth, industrialization, and urbanization can be defined as follows (Ding and Li, 2017; Dong *et al.*, 2019; and Mahmood *et al.*, 2020):

$$CO_{2t} = f(GDP_t, IND_t, URB_t) \qquad (1)$$

Where: CO_2 denotes CO_2 per capita (metric tonne); GDP_t means GDP per capita (constant 2010US$); IND_t denotes industry value added (% of GDP); and URB_t denotes the rate of urban population in the total population (%).

Table 2. Covariates of the VECM

Variable definition	Unit	Source
CO_2 emissions per capita	metric tonne	World Development Indicators
GDP per capita	constant 2010US$	World Development Indicators
Industry value added (% of GDP)	%	World Development Indicators
Rate of urban population (% of total)	%	World Development Indicators

After transforming the functional form of Equation 1, we obtain the following model:

$$LnCO_{2t} = \beta_0 + \beta_1 lnGDP_t + \beta_2 lnIND_t + \beta_3 lnURB_t + \varepsilon_t \qquad (2)$$

Where: $lnCO_{2t}$, $lnGDP_t$, $lnIND_t$, and $lnURB_t$ denote the natural logarithms of CO_2 per capita, GDP per capita, industry value added, and the rate of urban population in the total population; β_0 is the intercept; ($\beta_1,\ldots,\beta_3$) are parameters to be estimated; and ε_t presents the error term.

The procedure of a VECM includes three steps. The first step is to check the stationarity of the series or their order of integration in all variables. In this research, the Augmented Dickey Fuller (ADF) test and Phillips-Perron (PP) test were employed to examine the stationary state of the series. The second step is to check the presence of a long run relationship among all variables in the equation. In this stage, the co-integration tests will be carried out to investigate the existence of long run relationships between the variables. In the third step, the residuals from the equilibrium regression can be used to estimate the VECM (Azlina and Mustapha, 2012).

4. Results

4.1. CO_2 Emissions, Economic Growth, Industrialization, and Urbanization in Vietnam: An Overview

Table 3. Characteristics of CO_2 emissions, economic growth, industry value added, and urban population in Vietnam

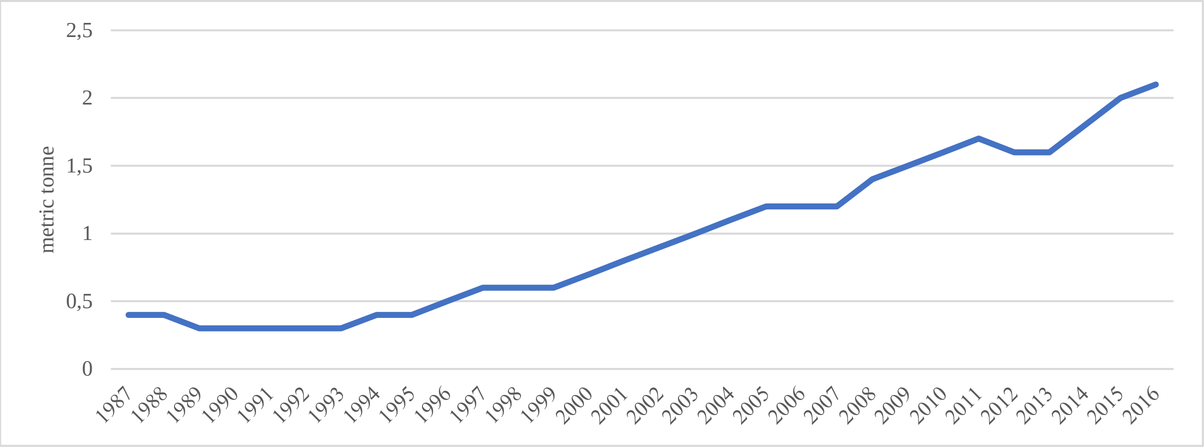
Variable	Mean	SD	Min	Max
CO_2 emissions per capita	0.96	0.57	0.3	2.1
GDP per capita	917.95	419.76	389.8	1752.5
Industry value added	32.58	5.17	22.7	40.2
The rate of urban population	25.89	4.66	19.7	34.5

Source: Author's calculation, 2021

Note: SD denotes standard deviation

The average CO_2 emissions and GDP per capita of Vietnam account for 0.96 metric tonnes and US$917.9, respectively. Industry value added and the rate of urban population of this country account for 32.5 percent and 25.8 percent, respectively, on average (Table 3).

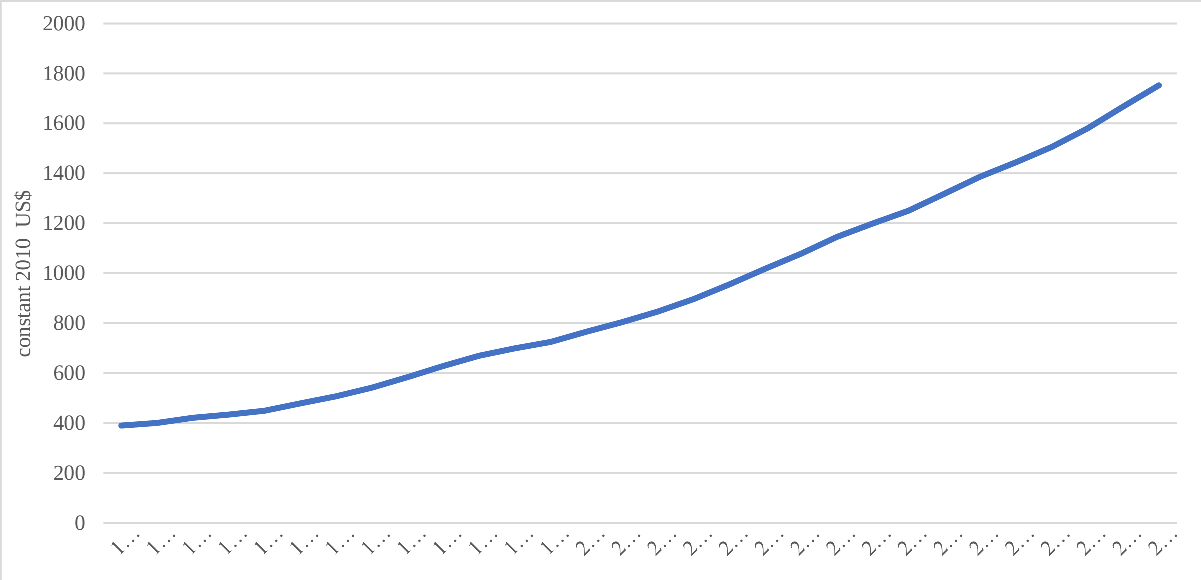
Figure 1. CO_2 emissions per capita in Vietnam



Source: World Bank, 2021

As seen in Figure 1, between 1987 and 2016, the average amount of CO_2 emissions per capita of Vietnam presented an upward trend. By 2016, CO_2 emissions per capita of this country accounted for 2.1 metric tonnes, increasing by 5.2 times compared to that in 1987. This result may be interpreted by the expansion of industrialization and modernization in the socio-economic development of this country (Figure 1).

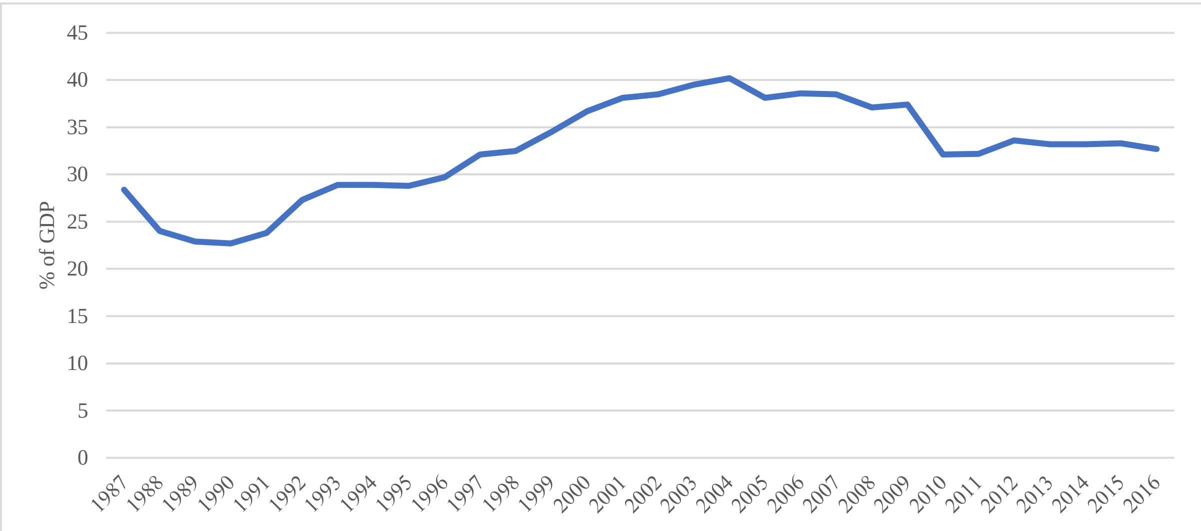
Figure 2. GDP per capita in Vietnam



Source: World Bank, 2021

As seen in Figure 2, GDP per capita of Vietnam tended to grow between 1987 and 2016. For example, by 2016, the average GDP per capita of this country accounted for about US$1,752.5, which was more than 4.5 times higher than that of 1987. This outcome expresses a remarkable achievement of Vietnam in the renovation of the economic management mechanism and integration of international economics (Figure 2).

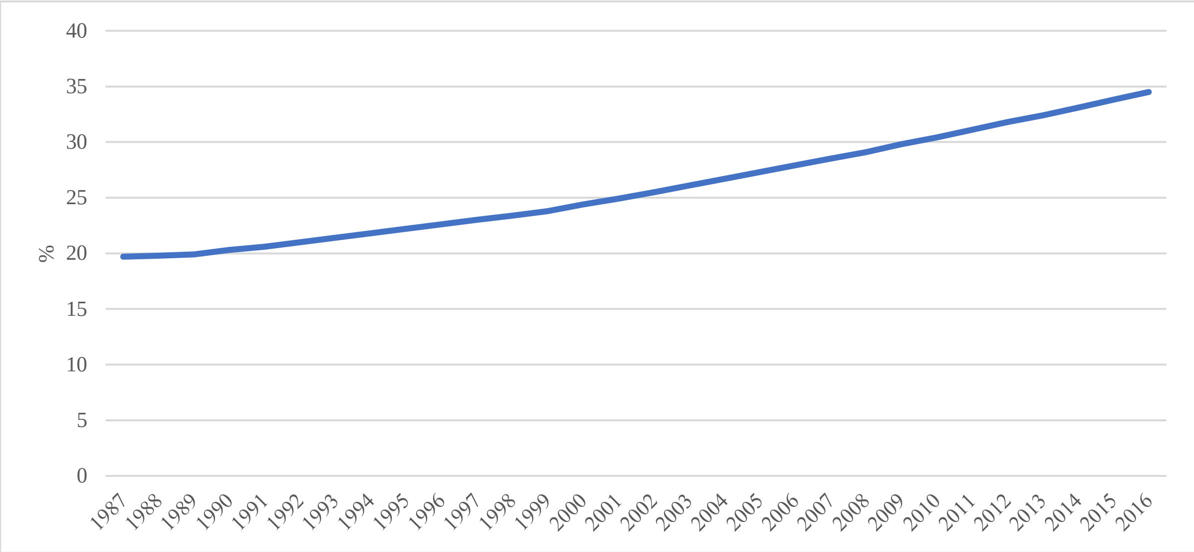
Figure 3. Value added of the industry sector in Vietnam



Source: World Bank, 2021

Value added of the industry sector of Vietnam tended to increase for the last three decades (1987–2016). For instance, by 2016, the average value added of the industry of this country accounted for about 32.7 percent, which was more than 4.3 percent higher than that of 1987. This result reflects the progress of industrialization process in this country (Figure 3).

Figure 4. Rate of urban population in Vietnam



Source: World Bank, 2021

In Vietnam, urbanization has been extended along with the process of industrialization and modernization. For instance, after 30 years (1987–2016), by 2016, the rate of urban population accounted for 34.5 percent, increasing by nearly 20 percent compare to that of 1987 (Figure 4).

4.2. Effects of Economic Growth, Industrialization, and Urbanization on CO_2 Emissions in Vietnam

4.2.1. Implementation of the Unit Root Test

The unit root test is carried out to check the stationarity of the time series variables (Adeola and Ikpesu, 2016). In this study, the Augmented Dickey-Fuller (ADF) test and the Phillips-Peron (PP) test are used to examine the stationarity of CO_2 emissions, economic growth, industry value added, and urban population in Vietnam with the hypothesis as follows:

Null hypothesis (H_0): The variables contain a unit root

Alternative hypothesis (H_a): The variables do not contain a unit root

If a variable contains a unit root, then this implies that the time series of this variable is not stationarity.

Table 4. Results of the unit root test

Variables		ADF Test		PP Test		Conclusion
		Level	1st difference	Level	1st difference	
$LnCO_2$ emissions per capita	Constant	0.02	-4.27***	0.14	-4.37***	I(1)
	Constant & trend	-3.57**	-3.97***	-3.03	-4.40***	I(1)
LnGDP per capita	Constant	-0.91	-2.34	0.04	-4.15***	I(1)
	Constant & trend	-1.85	-2.36	-2.39	-4.08***	I(1)
LnIndustry value added	Constant	-2.29	-3.47***	-1.24	-4.69***	I(1)
	Constant & trend	-1.29	-4.24***	-1.31	-5.55***	I(1)
LnUrban population	Constant	1.71	-5.17***	2.41	-4.36***	I(1)
	Constant & trend	-4.00***	-5.35***	-4.24***	-4.98***	I(1)

Source: Author's calculation, 2021

*Note: ***, ** and * denote statistical significance at 1%, 5%, and 10%, respectively*

The results in Table 4 show that the time series of CO2 emissions per capita, GDP per capita, industry value added, and urban population are not stationary at the level [I(0)]. Therefore, the first difference is carried out to examine the stationary of these variables. Results indicate that the absolute values of test statistics are greater than critical values at the 1% and 5%, respectively and therefore we can conclude that the time series of these variables do not contain unit roots and this suggests that the time series are stationary at the first difference [I(1)].

4.2.2. Examination of the Long Run Relationship among Variables

Before examining the long run relationship among variables, the optimal lag length should be determined. The purpose of this step is to specify the optimal lag for the VECM.

Table 5. Selection of the lag length

Lag	LL	LR	df	P	FPE	AIC	HQIC	SBIC
0	128.44				8.2e-10	-9.57	-9.51	-9.37
1	279.34	301.79	16	0.000	2.6e-14	-19.94	-19.67	-18.98*
2	294.05	29.42	16	0.021	3.2e-14	-19.85	-19.34	-18.10
3	310.23	32.35	16	0.009	4.1e-14	-19.86	-19.13	-17.34
4	347.97	75.47*	16	0.000	1.5e-14*	-21.53*	-20.58*	-18.24

Endogenous: $LnCO_2$ LnGDP LnIndustry value added LnUrban population

Exogenous: Constant

Number of observations = 26

Source: Author's calculation, 2021

*Notes: *denotes lag order selected by the criterion; LL means log likelihood values; LR represents sequential modified LR test statistics; FPE denotes final prediction error; AIC means Akaike information criterion; HQIC represents Hannan-Quinn information criterion, and SBIC means Schwarz's Bayesian information criterion*

As seen in Table 5, results suggest that the optimal lag length, in this case, is four lags because this value is recommended by AIC and HQIC, while one lag (the number of lag is equal to 1) is only recommended by SBIC indicator. Therefore, four lags (the number of lag is equal to 4) is chosen to run the VECM in the third step.

The Johansen co-integration test is performed to examine the long-run relationship among variables. If variables are co-integrated, it suggests that there is a long-term relationship among variables (Musunuru, 2017).

The hypothesis to be tested can be identified as follows:

Null hypothesis (H_0): There is no co-integration among variables

The alternative hypothesis (H_a): There is co-integration among variables

In this study, the Johansen co-integration test is carried out by the trace statistic test. Trace test is a likelihood-ratio-type test, which operates under different assumptions in the deterministic part of the data generation process (Lutkepohl *et al.*, 2001).

Table 6. Results of Trace statistic in the Johansen co-integration test

Maximum rank	LL	Eigenvalue	Trace statistic	5% critical value	1% critical value
0	278.08		64.03	47.21	54.46
1	292.27	0.63	35.65	29.68	35.65
2	302.44	0.51	15.30^{*1*5}	15.41	20.04
3	310.09	0.42	0.00	3.76	6.65
4	310.10	0.00			

Source: Author's calculation, 2021

*Note: *^{1} and ^{*5} denote the number of co-integration (ranks) chosen to accept the null hypothesis at 1% and 5% critical values*

As seen in Table 6, we cannot reject the null hypothesis in the rank two (two co-integrations) because trace statistics are less than the 1% critical value (15.30 < 20.04) and the 5% critical value (15.30 < 15.41) and these reflect that there are two co-integrations at the 1% and 5% critical values among variables.

As seen in Table 7, CO_2 emissions positively affect GDP, but industry value added, and urban population have negative relationships with GDP. It has been empirically found that GDP has a positive effect on industry value added, while CO_2 emissions and urban population have negative relationships with industry value added. In addition, GDP and industry value added have been found to have negative impacts on urban population in Vietnam.

Table 8. Estimation of the VECM in the long run

Variables	Coefficient	Std. Error	z	P-value
LnCO_2 per capita	1			
LnGDP per capita	5.881***	1.00	5.87	0.000
LnIndustry value added	-1.888***	0.26	-7.07	0.000
LnUrban population	-17.724***	2.52	-7.02	0.000
Constant	24.696			

Source: Author's calculation, 2021

*Note: *** and * denote statistical significance at 1% and 10%, respectively*

In the long run, the growth of GDP per capita has been defined as a factor generating environmental degradation, but industry value added, and urban population are significant determinants which contribute to improve the environmental quality in Vietnam (Table 8).

5. Discussion and Conclusion

In the short run, the evidence has been found to show that CO_2 emissions have positive influence on GDP, while industry value added, and urban population negatively affect GDP. These reflect that economic growth in the short run of Vietnam depends on other sectors such as agriculture and services and the rural area rather than the industry and urbanization. CO_2 emissions and urban population have negative relationships with industry value added, but GDP contributes to the growth of the industry sector. Results indicate that both GDP and industry value added have negative effects on urban population. Thanh and Khuong (2017) concluded that GDP can reduce CO_2 emissions in the short run, but our results did not find a relationship between these variables. The difference can be interpreted by the model and duration employed for the study. The VECM is used in our research to examine the relationship between economic growth, industry value added, urban population, and CO2 emissions between 1987 and 2016, while Thanh and Khuong (2017) employed the Autoregressive Distributed Lag Model for the period 1990–2011.

In the long term, results addressed that economic growth harms the environment. This result is consistent to argument of Thanh and Khuong (2017); Ding and Li (2017);

Shahbaz *et al.* (2019); and Nguyen *et al.* (2021). Our results also found that industry value added, and urban population are significant factors since these can improve the environmental quality. However, Dong *et al.* (2019) addressed that industrialization may increase CO_2 emissions in developed countries, and Ding and Li (2017) claimed that urbanization contributes to CO_2 emissions in China's provinces. These imply that the progress of industrialization and urbanization of Vietnam is carefully considered along with environmental protection in the long term.

Results of the Johansen co-integration test indicate that there is a long run relationship between economic growth, industry value added, urban population, and CO_2 emissions in Vietnam. This result is consistent to conclusions of Tang and Tan (2015); Thanh and Khuong (2017); Shahbaz *et al.* (2019); and Nguyen *et al.* (2021).

The article aims to explore the causal relationship between CO_2 emissions, economic growth, industrialization, and urbanization in Vietnam between 1987 and 2016 using the VECM. In the short run, it has been empirically found that CO_2 emissions have positive effect on GDP, while industry value added, and urban population have negative relationships with GDP. Results also indicated that CO_2 emissions and urban population negatively affect industry value added, but an increase of GDP may enhance the industry value added. Results showed that both GDP and industry value added have negative impacts on urban population. In the long term, results demonstrated that economic growth harms the environment, while industry value added, and urban population are positive factors because these can improve the environmental quality.

Policies are recommended to enhance economic growth and achieve sustainable development in Vietnam. First, industrialization and urbanization should be carefully controlled because these can reduce economic growth in the short run. Therefore, the industry sector should be restructured, and urbanization should be carefully controlled in the short run to contribute to economic development. Moreover, the government should invest more on other industries such as agriculture and services and the rural area because these are motivators for economic growth in Vietnam for the short run. Second, CO_2 emissions and urbanization should be managed since these have negative effects on the growth of the industry sector and consequently, development of industrialization and urbanization should be considered along with environmental protection. Third, economic growth should be encouraged because it contributes to increase the industry value added. Fourth, in the long term, economic growth should be carefully considered because it decreases the environmental quality. Finally, industrialization and urbanization are positive factors contributing to reduce CO_2 emissions in the long run and therefore the government should concentrate on feasible policies such as "green economy", "green growth", "low carbon economy", and "circular economy" to achieve both targets in economic growth and sustainable development.

Faculty of Biotechnology, Chemical and Environmental Engineering, Hanoi, Vietnam

Tran Duc Thanh

thanh.tranduc@phenikaa-uni.edu.vn

Faculty of Tourism Studies, Phenikaa University, Hanoi, Vietnam

Abstract

Environmental protection education is the responsibility of the whole society, especially in the university system. Although virtually all students have also recognized the harmful effects of environmental pollution on humans, the awareness of preserving and protecting the environment from the smallest actions is not the habit and regular action campaign of the country's future generation students. In this study, by examining students' behavior of using plastic-related products to pollute the environment of college students, the authors want to verify behaviors that directly or indirectly affect the environment. The authors conducted a survey with 454 representative samples of students from 15 private and public universities in Hanoi. In particular, this study also offers solutions and recommendations for universities to raise awareness of environmental protection.

Keywords: *Awareness of environmental protection, plastic waste, university students*

1. Introduction

Plastic waste is one of the causes of pollution to the living environment of people in the world and in Vietnam. In fact, plastic waste is discharged from construction sites, factories and especially from civil products serving people's daily lives. The use of plastic-related products brings many conveniences for life, contributing to reduce product costs, plastic-related items can be easily transported and distributed globally. This is reason why plastic waste is present all over the world. According to statistics of the Ministry of Natural Resources and Environment in 2020; on average, each household uses 1kg of plastic bags over a month; for the period from 1990 to 2015 the amount of plastic consumption in Vietnam has increased rapidly, from 3.8 kg/person/year up to 41 kg/person/year (Hiệp hội nhựa Việt Nam); Up to now, the average amount of plastic waste discharged into the market every day is 80 tons. Therefore, it is very important to raise awareness to help young people take specific actions to protect the environment. Studying the factors affecting the awareness of environmental protection of university students through the use of plastic-related products is a message that the author wishes to contribute, propagate and support to protect our living environment.

Not only in Vietnam, but also in the world, there have been many environmental studies. According to the author (Yurttaş & Sülün, 2010), (Mert, 2006), the development of society such as urbanization, industrialization, modernization has caused pollution to the natural living environment, greenhouse effect, natural disasters, floods, epidemics, depletion of the ozone layer, extinction and weakening of plant and animal species useful for life on earth.

According to the author (Herrera et al., 2018) plastic waste with durable properties, difficult to destroy, from large pieces of plastic will break into very small plastic particles called microplastics, they are considered as microplastics. Environmental pollutants are found in all marine, freshwater and terrestrial ecosystems, in the ground, in the air. The abuse of plastic products along with a lack of awareness of environmental protection has become common and there is increasing evidence that plastic waste can cause adverse effects on the living environment of people. Some of the used plastic products are often contaminated with pathogens and must be disposed of as hazardous waste to avoid increasing pollution in the terrestrial and marine ecosystems. Waste management systems around the world have been unable to adequately deal with the existing plastic waste. That is why the increasing amount of waste today threatens the waste management system and challenges the global health system (Ardoin & Bowers, 2020). Therefore, educating the sense of using environmentally friendly products to gradually replace plastic products is essential in accordance with the world's trend to restore the ecosystem on earth. Doing this requires transformative actions in behaviors related to human production and consumption that reflect individual choices as well as large-scale collective action (Ardoin & Bowers, 2020).

According to (Zelezny and Schultz, 2000), (Corraliza, 2001) "awareness of environmental protection includes psychological factors related to individuals, it occurs when actions are based on groups of values, beliefs and regulations combined with an effort to reduce your negative impact on the environment". According to the author (Grop, 1995) the awareness of environmental protection arises when emotions are associated with the realization that there are environmental problems often related to human behavior. According to the author (Hines et al, 1986), (Balwada et al., 2021) environmental consciousness was explored by four groups of factors; sociology includes age, gender, education level; awareness and knowledge of the current environmental situation; environmental and psychosocial interference through the expression of self-responsibility for their actions. According to the author's study on disposable plastic products consumption behavior in universities (Nguyen Thi Thanh Huyen et al., 2020) shows that students in universities from Da Nang and above are about 82.32% of the The students surveyed had a positive sense of limiting the use of plastic products once to protect the environment.

However, in order to perfect the study of environmental protection consciousness through the use of plastic products, the author would like to survey students from private, national and international universities. in Hanoi to help the author have a more holistic view in assessing the awareness of environmental protection against pollution from plastic waste.

To complete this study, the authors selected and applied behavioral theory and a planned research model of Ajzen (1991), inheriting on the basis of the studies of (Jones et al., 2013) and (Trang & Thao, 2018). Planning behavioral theory in which the intention to perform the behavior will be influenced by three groups of factors; attitudes toward behavior, subjective standards and awareness of behavioral control (Trang & Thao, 2018), (Chen & Yang, 2019). Based on the experimental research models Stanford (2006), Han et al (2010), Pipitvanichtham (2013), the author would like to propose a research model (Figure 1) with independent variables including: attitude, subjective standards, behavioral control perceptions, past experiences. The dependent variable is the intent to protect the environment through the use of plastic-related products.

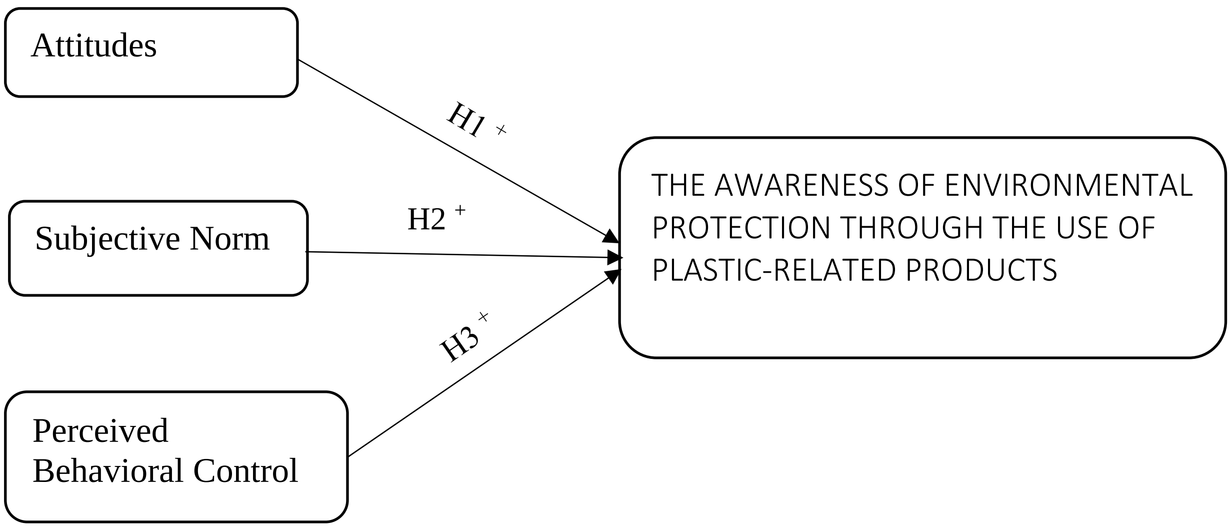

Figure 1: Proposed research model

(Source: Theory of planned behavior Ajzen,1991)

Research question:

H1: Attitude has a positive impact on awareness of environmental protection

H2: Subjective norm has a positive impact on awareness of environmental protection

H3: Perceived behavioral control has a positive impact on awareness of environmental protection

2. Method

The object of the study was determined to be the awareness of environmental protection through the student's behavior of using plastic-related products. In terms of space and research subjects, they are students of private and public universities in Hanoi. The research sample was identified as 420 students in representatives of 10 private and public universities in Hanoi area. Content of the survey consists of 2 parts; personal information part to verify the reliability of the sample, the scale part to explore observed variables and factors. All this content is designed on servey monkey software with google drive app and QR code encoding. How to deploy the survey via email, Facebook, Zalo in 15 days, then extract it to excel, use SPSS software to verify the reliability of the factors and the correlation between variables, then regression to confirm the research hypothesis. The study period is 3 months from the time the research plan is received to the end.

To complete this article, the author uses a number of research methods; descriptive statistics, synthesis of descriptive statistics, quantitative research. In the review of research papers, the authors chose to refer to the publications in prestigious journals of the World Scientific Council, the journal catalogs on Scimago as the basis for this study. The research model building is based on the theories of planned behavior of Ajzen (1991). Using the Likert 5 scale with five answer options "totally disagree, disagree, hesitate, agree and completely agree" on the basis of consulting experts for the purpose of adjust the content fit of the observed variables in the factor so that it is most reasonable. Total 3 independent factors; AT (Attitudes), SN (Subjective norm); PBC (Perceived Behavioral Control) and dependent variable EA (Environmental protection consciousness through the use of plastic-related products). The observed variables of the independent variable are denoted: AT (AT1, AT2); SN (SN1, SN2, SN3); PBC (PBC1, PBC2, PBC3). The observed variables of the dependent variable EA are denoted (EA1, EA2, EA3, EA4, EA5).

3. Results

3.1. Description of the study sample

With a research period of 3 months of which the survey was conducted for 15 days. The number of votes issued was 420 votes, 420 votes were collected, of which 420 were valid, 0 was invalid. The percentage of valid votes accounted for 100%, the survey results are guaranteed according to the requirements set forth. The information to assess sample quality includes the name of the school, the major, the age, the year of the student, the results are listed as follows: 10 public and private universities in Hanoi, the number of students. students in a total of 20 different majors, the average age is about 20 years old, mainly first-year students, second-year students account for 64%, third-year, fourth-year and final-year students account for 36%.

3.2. Result of factor analysis

3.2.1. The reliability of the scale according to Cronbach's Alpha coefficient

Cronbach's Alpha coefficient of the dependent variable Consciousness (EA) is 0.914 and the correlation coefficient of the total variable is > 0.3, so the data has very good reliability (Hair và cộng sự, 1998).

Reliability Statistics

Cronbach's Alpha	N of Items
.914	5

Item-Total Statistics

	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted
EA1	15.68	12.057	.770	.896
EA2	15.70	11.958	.802	.890
EA3	15.78	11.544	.863	.877
EA4	16.05	11.484	.765	.898
EA5	15.80	12.135	.707	.909

The reliability coefficient of the standard variables (SN) is 0.883 and the correlation coefficient of the total variable > 0.3 should have good reliability (Hair và cộng sự, 1998).

Reliability Statistics

Cronbach's Alpha	N of Items
.883	3

Item-Total Statistics

	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted
SN1	8.31	3.421	.788	.820
SN2	8.30	3.460	.748	.855
SN3	8.06	3.404	.781	.826

Cronbach's Alpha coefficient of the Perception variables (PBC) is 0.885 and the total correlation coefficients > 0.3 should have good reliability (Hair và cộng sự, 1998).

Reliability Statistics

Cronbach's Alpha	N of Items
.885	3

Item-Total Statistics

	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted
PBC1	7.90	3.410	.767	.845
PBC2	8.08	3.301	.756	.857
PBC3	7.76	3.434	.809	.810

Cronbach's Alpha coefficient of Attitude (AT) is 0.766 and the total correlation coefficients are > 0.3, so the scale has good reliability (Hair và cộng sự, 1998).

Reliability Statistics

Cronbach's Alpha	N of Items
.766	2

Item-Total Statistics

	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted
AT1	3.35	1.074	.621	.
AT2	3.13	1.172	.621	.

3.2.2. Exploratory factor analysis (EFA)

The KMO coefficient is 0.863 > 0.5, so it meets the criteria for exploratory factor analysis (Hair và cộng sự, 1998).

KMO and Bartlett's Test

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.863
Bartlett's Test of Sphericity	Approx. Chi-Square	2022.260
	df	28
	Sig.	.000

The total variance extracted from the factors is 81.805%, showing that 80.273% of the variation of the data is explained by 3 groups of factors (Hair và cộng sự, 1998).

Total Variance Explained

Component	Initial Eigenvalues			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	4.474	55.927	55.927	4.474	55.927	55.927	2.577	32.215	32.215
2	1.419	17.736	73.664	1.419	17.736	73.664	2.296	28.703	60.917
3	.651	8.141	81.805	.651	8.141	81.805	1.671	20.887	81.805
4	.404	5.044	86.849						
5	.306	3.825	90.673						
6	.284	3.549	94.223						
7	.249	3.109	97.332						
8	.213	2.668	100.000						

Extraction Method: Principal Component Analysis.

Rotation Matrix: The rotation matrix table shows the factors that have convergence and distinction. At the same time, the load factor of the factors > 0.5 should meet the criteria (Hair và cộng sự, 2015).

Rotated Component Matrix[a]

	Component		
	1	2	3
SN2	.834		
SN1	.823		
SN3	.813		
PBC2		.895	
PBC3		.788	
PBC1		.720	
AT1			.894
AT2			.880

Extraction Method: Principal Component Analysis.

Rotation Method: Varimax with Kaiser Normalization.

a. Rotation converged in 5 iterations.

3.2.3. Correlation Matrix

The correlation matrix table shows that the pairs of independent and dependent variables are all correlated at the 0.1% significance level. At the same time, no pair of independent variables has a correlation coefficient greater than 0.8, so there is no serious multicollinearity (Hair và cộng sự, 1998).

Correlations

		TC	NT	TD	YT
SN	Pearson Correlation	1	.742**	.304**	.734**
	Sig. (2-tailed)		.000	.000	.000
	N	420	420	420	420
PBC	Pearson Correlation	.742**	1	.256**	.790**
	Sig. (2-tailed)	.000		.000	.000
	N	420	420	420	420
AT	Pearson Correlation	.304**	.256**	1	.259**
	Sig. (2-tailed)	.000	.000		.000

	N	420	420	420	420
EA	Pearson Correlation	.734**	.790**	.259**	1
	Sig. (2-tailed)	.000	.000	.000	
	N	420	420	420	420

**. Correlation is significant at the 0.01 level (2-tailed).

3.2.4. Linear regression analysis by least squares (OLS)

The Durbin-Watson coefficient is 1,828 and lies within (1,3), so there is no autocorrelation. In addition, the adjusted R-squared coefficient is 0.671, showing that the independent variables explain 67.1% of the variation of the dependent variable.

Model Summary[b]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.821[a]	.673	.671	.48808	1.828

a. Predictors: (Constant), AT, PBC, SN

b. Dependent Variable: EA

The P Value of the linear regression analysis is 0.000, so the model is statistically significant at the 0.1% significance level.

ANOVA[a]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	204.291	3	68.097	285.858	.000[b]
	Residual	99.099	416	.238		
	Total	303.390	419			

a. Dependent Variable: EA

b. Predictors: (Constant), AT, PBC, SN

The estimated results show that the Pvalue coefficients of SN and PBC are both 0.000, indicating that Standard (SN) and Perception (PBC) have a positive impact on Consciousness (EA) at the significance level of 0.1%. Besides, the Pvalue coefficient of Attitude (AT) is 0.490 > 0.05, so Attitude has little impact on Consciousness at the 5% significance level. In addition, all variance exaggeration factors (VIF) < 4 should not cause serious multicollinearity (Hair và cộng sự, 1998). At the same time, PBC's standardized Beta coefficient is 0.545 > SN's standardized Beta coefficient is 0.324, so PBC's impact on EA is larger than SN.

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	.581	.127		4.571	.000		
	SN	.306	.040	.324	7.629	.000	.436	2.293
	PBC	.519	.040	.545	13.030	.000	.449	2.227
	AT	.018	.026	.020	.691	.490	.905	1.105

4. Discussion and Conclusion

Environmental protection is a very important action in the current period, especially for the young generation and students in universities. Based on the results of the study on factors affecting the awareness of environmental protection through the use of plastic-related products of university students in Hanoi, the authors would like to offer some discussion as follows:

Firstly, attitude (AT) is an important factor contributing to environmental protection, however, in this study, there are only 2 observed variables in the factor that have the strong influence on awareness of environmental protection. According to the author (Creswell, 2009) the difference in language, meaning in observed variables for different research environments can be accepted in a factor with 2 observed variables. In fact, in this study, attitude (AT) has an influence on Environmental Awareness (EA), but compared with the other factors, it is not high. Therefore, the author would like to share his opinion as follows: Sometimes we have a good attitude in protecting the environment, but the actual objective conditions, the current social environment does not meet the needs, For example, the majority of students "have a habit of using plastic-related products", and they think that using "plastic-related products is very convenient in life". The problem here is to change habits by educating awareness, propagandizing, launching campaigns and providing eco-friendly alternatives, orienting new consumption habits with reasonable prices. If so, the attitude towards environmental protection consciousness will have higher results.

Secondly, the subjective norm factor (SN) has a strong impact on the awareness of environmental protection (EA), through the observed variables, we see the average value of SN: 4.111 (SN1: 4.0261; SN2: 4.0357; SN3: 4.2714). Most of the students support environmental protection by using alternative products, or support people to use substitutes for plastic-related products; According to survey statistics, 78% agree and completely agree, 16% are confused and 6% disagree with the above opinion. Regarding the idea of limiting the use of plastic products, 78% said that it is a good behavior to protect the environment; 14% are confused and 18% disagree. For the collection and classification of plastic waste, 85% agree, 8% are confused and 7% disagree.

Thirdly, the perceived behavioral control factor has the strongest impact on the awareness of environmental protection through the use of plastic-related products. According to the research results, among all the regression coefficients Beta, the independent variable PBC has the largest value of 0.545 compared to other factors.

Raising individual awareness about environmental issues and changing the behavior of using plastic-related products will contribute to a better living environment, reducing pollution and indiscriminate waste discharge into the environment. Therefore, students need to fully absorb information related to environmental issues. Along with the most practical actions such as participating in campaigns to collect and recycle waste to protect the environment. Propagating and spreading the value of raising awareness of environmental protection. Students can actively choose to use environmentally friendly organic products. This is also a good opportunity for businesses and organizations in society to develop environmentally friendly substitutes, orient new consumption habits by applying advances in biodegradable polystyrene and Prospective solution for plastic waste pollution. Faced with these realities, the Vietnamese government, the Ministry of Natural Resources and Environment, the Ministry of Health, agencies and social organizations have adopted policies and propaganda activities on preserving and protecting the living environment through specific actions such as waste segregation, use of alternative products, campaigns to clean up the environment. Especially control the implementation of the environmental protection law for organizations and individuals living and working in the territory of Vietnam. Having policies to attract and promote businesses to develop environmentally friendly substitutes in order to promptly meet the demands of life for consumer goods

DEVELOPING INDUSTRIAL PARKS ASSOCIATED WITH ENVIRONMENTAL PROTECTION IN BAC NINH PROVINCE

PhD student. Dang Minh Khoa

minhkhoasqct@gmail.com

Academy of Politics, Ministry of Defense, Vietnam

Abstract

After more than 20 years of re-establishment, from a purely agricultural province, Bac Ninh has basically become a modern industrial province. Industrial zones of Bac Ninh province began to be formed and developed in 1998. By December 2000, Tien Son was the first concentrated one of Bac Ninh to be built. By the end of 2015, the province had 16 concentrated industrial parks with a total area of 6,381.68 hectares and 12 industrial parks that have been granted investment certificates and decisions on establishment with a total planning area of 4,552.91 hectares. In which, there are 10 industrial parks operating with a planned land area of 3,696.94 hectares, with infrastructure investment capital of 775.30 million USD. By 2018, industrial parks had created a production value of 1,166,572 billion VND, export value reached 35,873 million USD, import value was 24,540 million USD, contributed 11,268 billion VND to the state budget, surpassing Ho Chi Minh City, becoming the leading locality in the country in terms of industrial production value and making great contributions to the socio-economic development of Bac Ninh province. In recent years, environmental protection in industrial parks in Bac Ninh has always attracted the attention of all authorities and investors, contributing to the sustainable development of industrial parks of the Province. Within the scope of this article, the author focuses on evaluating the achievements of the development process of industrial parks and the current situation of environmental protection in industrial zones in the province of Bac Ninh. On that basis, some solutions to protect the environment in industrial parks in Bac Ninh in the coming time are proposed.

Keywords: *Enterprises, environment, industrial parks.*

1. Introduction

Bac Ninh is a province located at the northeast gateway of Hanoi, with the smallest acreage in the country (823.1 square kilometers) and a population in 2019 of 1.446 million people. After more than 20 years of re-establishment, under the leadership of the Provincial Party Committee, the People's Council, the People's Committee of Bac Ninh, with the efforts, the spirit of solidarity and creativity of the whole political system, business community and people in the province, Bac Ninh has achieved many outstanding and comprehensive achievements in various fields. From a purely agricultural province, up to now, Bac Ninh has basically become an industrial province in the direction of modernity, with many socio-economic indicators leading the country. The economy has developed comprehensively, the growth rate has always maintained at double digits. Average growth in the period of 1997-2016 reached 15.1%/year, in 2017 the figure was 18.6%. Bac Ninh's economic scale has continued to expand, accounting for 3.11% of the gross domestic products, ranking fourth in the country and the economic structure has continued to shift towards industrialization and modernization.

Industrial parks in Bac Ninh began to be formed and developed in 1998, along with that, the province's Industrial Parks Management Board was established under Decision No. 152/1998/QD-TTg dated August 25th, 1998 by the Prime Minister. It performs the function of direct state management of Bac Ninh's industrial parks; manages and organizes the performance of the function of providing public administrative services and other supporting services related to investment and production and business activities for investors in industrial parks of the province. By December 2000, the construction of Tien Son, the first concentrated industrial park of Bac Ninh, was started. Since then, construction planning management in industrial parks has been carried out in accordance with the order and regulations, meeting the requirements of investors and the province's socio-economic development orientation. Up to now, Bac Ninh has had 16 concentrated industrial parks approved to adjust and supplement by the Prime Minister according to Document No. 1511/TTg-KTN dated August 20th, 2014 and Document No. 2007/TTg-KTN dated November 6th, 2015, with a total acreage of 6,381.68 hectares; 12 industrial parks have been granted investment certificates and decisions of establishment with a total planning acreage of 4,552.91 hectares, industrial lands for lease are 3,181.94 hectares. In which, there are 10 industrial parks put into operation with a planned acreage of 3,696.94 hectares, acreage of industrial land for lease is 2,000.10 hectares, acreage of the leased one is 1,670.4 hectares, occupancy rate on the planned land area reached 83.49%, on the recovered land area reached 88.52%. The registered infrastructure investment capital was about 775.30 million USD (including 02 FDI projects with registered capital of 160 million USD, 12 domestic projects with registered capital of 11,390.69 billion VND) (Bac Ninh Provincial Statistical Office, 2017; Management Board of Bac Ninh's Industrial Parks, December 2018, December 2020). In recent years, environmental protection in industrial parks in Bac Ninh has always attracted the attention of all authorities and investors. Environmental protection has been strengthened, contributing to the reduction of pollution, improving environmental quality, gradually solving pressing environmental problems, making positive contributions to the sustainable development of industrial parks of the province.

Within the scope of this article, the author only analyzes the contents based on statistics, summarizes the process of construction and development of industrial parks in the province of Bac Ninh associated with environmental protection by by the authorities of Bac

Ninh from 1998 to 2020. At the same time, the article is also based on Circular No. 07/2007/TT-BTNMT dated July 3rd, 2007 of the Ministry of Natural Resources and Environment, on guiding the classification of the list of establishments causing environmental pollution that need to be dealt with in order to evaluate the achievements of the development process of industrial parks and the current situation of environmental protection in industrial parks in Bac Ninh. On that basis, the author proposes some solutions to protect the environment in industrial parks in the province in the coming time.

2. Method

Data collection methods: The documents and data used in this article are mainly imported from the Bac Ninh statistical yearbook, data from agencies such as: Statistical Department, Management Board of industrial parks and Department of Natural Resources and Environment of Bac Ninh province in the period from 1998 to 2020.

Data analysis and processing methods: The data in the article are analyzed and processed using Microsoft Word software to clarify the construction and development process of industrial parks in province of Bac Ninh and the situation of environmental protection in industrial parks, on that basis, solutions to protect the environment to ensure that industrial parks in Bac Ninh develop sustainably are proposed.

3. Results

3.1. Achievements in combining development with environmental protection in industrial parks in Bac Ninh

a) The development of industrial parks in Bac Ninh province over the past time

Firstly, the results of attracting investment in industrial parks in Bac Ninh.

In the early years of industrial parks' construction, there were mainly small projects with low capital scale, focusing almost on agro-food processing, production of consumer goods and materials and high-end construction materials. In the electronics industry, there are only two projects of Canon Company, accounting for 14% of the total investment capital in industrial parks of the province (130 million of 896 million USD). At this stage, the investment rate was only 1 to 2 million USD per hectare and about 3 million USD per project. Since 2007, the industrial parks have attracted many foreign investment projects. The quantity and quality of which, especially FDI ones, increased sharply with investment rates reaching 13.07 million USD per project and 9.03 million USD per hectare. The structure of industries has changed drastically, forming a spearhead electronics - telecommunications industry. In the period from 2014 to 2018, the industrial parks attracted the number of projects increasing from 153% to 193% and the amount of registered investment capital increased from 237% to 431% compared to the period from 2009 to 2013 and the period of ten years between 1998 and 2008. By the end of 2018, there had been 1,329 projects, with a total registered investment capital of 17,830.03 million USD. Investment rate in the period between 2014 and 2018 reached 17.72 million USD per project. In 2018, there were 901 enterprises operating in industrial parks, creating a production value of 1,166,572 billion VND. As a result, Bac Ninh industrial parks saw export value of 35,873 million USD, import value of 24,540 million USD and a payment of 11,268 billion VND to the state budget. Industrial production in the province surpassed Ho Chi Minh City, becoming the leading locality in the country. The industrial development index in 2018 increased by 7.4% compared to 2017. In which, the manufacturing industry increased by 7.4% due to the growth of 7.4% in manufacturing electronic, computer and optical products. Besides, production and distribution of electricity, gas and hot water increased by 13.5% and industry of water supply, waste treatment and wastewater increased by 1.5% (Management Board of Bac Ninh's Industrial Parks, December 2018; Table 1).

In 2020, 97 Certificates of Investment were newly issued for 71 FDI projects (328.73 million USD) and 26 domestic projects (2,798.64 billion VND, being equivalent to 121.68 million USD) with total registered investment capital of 450.41 million USD and 393 turns of adjusted projects were granted. There were 91 projects adjusted to increase investment capital by 408.04 million USD (the investment capital of 79 FDI projects increased by 374.06 million USD and that of 12 ones increased by 781.44 billion VND, being equivalent to 33.98 million USD), however, there were 4 FDI projects seeing the reduce of investment capital to 4.08 million USD. By the end of 2020, industrial parks in Bac Ninh had attracted 1,584 projects, with a total registered investment capital of 20,317.80 million USD. That of 1,089 FDI projects and 495domestic ones reached 17,778.66 million USD and 2,539.14 million USD respectively. Currently, in Bac Ninh's industrial parks, there are 1,100 projects in operation, creating jobs for 331,609 workers. The average income of indirect workers is 9.5 million VND per capita a month and that of direct ones is 7.5 million VND per capita a month (Management Board of Bac Ninh's Industrial Parks, December 2020; Table 1).

In terms of territories, there are 37 countries and regions investing in industrial parks in Bac Ninh, of which South Korea has the largest number of projects and investment capital (499 projects with the capital of 11.6 billion USD), the second is Japan (79 projects with the capital of 1.34 billion USD) and followed by Taiwan… The proportion of FDI capital is increasing in industrial parks. All projects are in the fields of electronics, telecommunications and supporting industries, using modern technology to produce clean, non-invasive products that do not generate factors affecting the environment negatively, including projects of large corporations such as: Canon, Samsung Electronics, Samsung Display, Fushan Technology Co., Ltd… (Bac Ninh Provincial Statistical Office, 2019). This is an important factor promoting technology value of products, improving competitiveness and thereby improving the value of industrial production and export turnover in the province's industrial parks.

Table 1: Results of attracting investment into industrial parks in Bac Ninh province in the period from 2010 to 2020

Year	Total of industrial zones	Business es in operation	Projects with new certificates of investment in the year	Total of new and adjusted capital in the year*(Million USD)*	Total of projects granted certificates of cumulative investment	Total of capital newly granted and cumulativel y adjusted *(Million USD)*
2010	13	209	62	461,40	447	3.442,00
2011	13	263	68	558,68	527	4.100,00
2012	13	285	39	334,37	564	4.400,00
2013	13	353	77	1.420,00	645	6.660,00
2014	13	420	67	820,31	774	8.364,21
2015	15	555	137	989,23	892	9.572,13
2016	16	715	135	794,45	1.050	13.099,51
2017	16	827	135	3.422,75	1.024	16.619,52
2018	16	901	125	1.210,51	1.329	17.830,03
2019	16	1.007	134	1.390,46	1.463	19.220,49
2020	16	1.100	97	854,38	1.584	20.317,80

Source: Industrial Park Management Board of Bac Ninh.

Secondly, the contribution of industrial parks to Bac Ninh's socio-economic *development.*

Industrial production value: In 2005, industrial parks in Bac Ninh only contributed 13.5% of the total industrial production value of the province, but by 2011, the number reached 142,704 billion VND, accounting for 58.6%. In 2012, the figure was 273,065 billion VND, which accounted for 65.4% of the province's total industrial production value. Industrial production value of the industrial parks increased sharply after 2012. In 2013 Bac Ninh saw a growth of 510,000 billion VND, an increase of 86.76% compared to 2012. In a period of four years, between 2013 and 2016, the value of industrial production of industrial parks in the province increased insignificantly, remaining at a stable level of more than

500,000 billion VND per year. In 2017, this increased 28.20% compared to 2016, reaching 664,674 billion VND. From 2018 to 2020, the production value of industrial parks in Bac Ninh province reached over 1.5 million billion VND. In 2020, due to the impact of the Covid-19 pandemic, the industrial production value reached 1,162,394 billion VND, 4,178 billion VND lower than that in 2018, which is 1,166,572 billion VND.

Exports: In 2005, when enterprises in Bac Ninh's industrial zones initially stabilized their production with the contribution of foreign-invested enterprises, export turnover reached 12.278 million USD, accounting for 24% of the province's export value. In 2007, the number was 346.82 million USD. Especially, in 2009, with the operation of the project by Samsung Electronics Vietnam Company in Yen Phong Industrial Park, Bac Ninh's export turnover had a remarkable growth, making Bac Ninh gain trade surplus in 2009. By 2012, industrial parks had become a major contributor to Bac Ninh's export value with 13,620 million USD, accounting for 99.1%. From 2013 to 2017, the export value of industrial parks in the province reached over 20 billion USD (in 2017 the figure was 28,428 million USD). In the period between 2010 and 2020, the industrial parks reported the highest export value, reaching 37,392 million USD in 2019. In 2020, their export turnover reached 35,056 million USD, accounting for 97.22% of the export value of the whole province (lower than that in 2019 due to the impact of the covid-19 pandemic).

Payment to the state budget: From 2010 to 2020, the rate of payment to the state budget of industrial parks in Bac Ninh continuously increased. In 2011, enterprises in the industrial zones paid the budget of 2,653 billion VND, that accounts for 36.8% of the total budget revenue of the province. In 2012, the number reached 3,980 billion VND, which was 43.9% of total budget revenue of Bac Ninh. From 2013 to 2017 (except 2015), industrial parks' contribution to the state budget, on average, increased by about 1,000 billion VND per year. In 2018 there was a sharp increase in state budget payments compared to 2017, increasing from VND 8,700 billion in 2017 to VND 11,268 billion in 2018. Between 2018 and 2020, these industrial parks paid over VND 11 trillion to the state budget every single year. In 2020, the number paid to the budget was 11,342 billion VND, accounting for 37.10% of the budget revenue of the whole province (125 billion VND lower than in 2019 because the covid-19 pandemic affects the production and business results of enterprises in the province) (Management Board of Bac Ninh's Industrial Parks, December 2018, January 2020, December 2020; Table 2).

Industrial zones in Bac Ninh have become an important economic entity, promoting the transformation of the province's economic structure and labor structure towards modern industry, contributing to increase local budget revenue, turning Bac Ninh into a province with surplus value and promoting its sustainable socio-economic development.

Table 2: Production and business results of industrial parks in Bac Ninh between 2010 and 2020

Year	Value of the industry production *(Billion VND)*	Export *(Million dollars)*	Import *(Million dollars)*	Payment to national budget *(Billion VND)*
2010	48.350	3.458	2.837	2.146
2011	142.704	7.630	5.995	2.653
2012	273.065	13.620	12.200	3.980
2013	510.000	25.000	21.000	4.500
2014	500.600	23.600	19.700	6.500
2015	511.500	23.300	18.500	6.000
2016	518.446	25.432	17.095	7.414
2017	664.674	28.428	23.462	8.700
2018	1.166.572	35.873	24.540	11.268
2019	1.151.265	37.392	22.686	11.467
2020	1.162.394	35.056	23.468	11.342

b) Environmental protection in Bac Ninh's industrial parks over the past time

Along with the process of socio-economic development, Bac Ninh always pays attention to and focuses on environmental protection, determining that industrial development associated with environmental protection is one of important tasks and conditions to promote its socio-economiy to develop sustainably in the coming years. The Provincial Party Standing Committee of Bac Ninh issued Action Program No. 80-CTr/TU on May 27th, 2005 to implement resolution No. 41-NQ/TW dated November 15, 2004 of the Politburo (the IX term) on "Environmental protection in the period of accelerating industrialization and modernization of the country". On November 11th, 2005, the Provincial People's Committee of Bac Ninh approved the "Project on environmental planning of Bac Ninh for the period from 2006 and 2020, the environmental protection plan for the period from 2006 and 2010". On November 8th, 2016, the Provincial Party Standing Committee of Bac Ninh issued Resolution No. 05-NQ/TU on "Strengthening the Party's leadership in environmental protection" with the view: Protecting environment is the foundation to ensure the socio-economic development of Bac Ninh sustainably;

Environmental protection is the responsibility and obligation of each organization, enterprise, household and individual; For environmental protection, prevention is consider the main measure, combined with pollution treatment; Avoid focusing on economic development and neglecting environmental protection. Understanding and implementing the policy of the province, the development of industrial parks must always be closely associated with environmental protection. In recent years, the environmental management of industrial zones in Bac Ninh has basically come into order.

Firstly, on environmental management in industrial parks.

The Management Board of Bac Ninh Industrial Parks has developed and implemented the Regulation on coordination in environmental management and protection in industrial zones with the Department of Natural Resources and Environment, the Bac Ninh Provincial Police and the People's Committees of the districts, city and towns. Carrying out overall environmental monitoring of industrial parks and enterprises in industrial zones in Bac Ninh, guiding and appraising new investment reports and environmental protection commitments of enterprises in these industrial zones. Since June 2012, the Management Board of Bac Ninh Industrial Parks has joined the new investment appraisal council for investment projects in industrial parks, coordinating with relevant departments and agencies in the province and with industrial park infrastructure development investment companies to propagate the law on environment in industrial parks, solve problems about waste discharge, wastewater treatment of enterprises in industrial zones and chairing, inspecting and supervising the environment in Bac Ninh’s industrial parks (Management Board of Bac Ninh’s Industrial Parks, December 2018).

Secondly, on the proportion of industrial parks with infrastructure for environmental treatment.

By the end of 2007, Bac Ninh province had had only 10 industrial parks approved, 04 industrial parks starting their operation, 02 new industrial parks established and finishing ground clearance and 04 industrial parks in the process process of completing the establishment dossier and attracting investors to build infrastructure. Among them, there were 03 industrial parks (Tien Son, Que Vo I, Yen Phong I) investing in building environmental treatment infrastructure, while Dai Dong - Hoan Son industrial park had not been built yet. Up to now, Bac Ninh has had 16 industrial parks approved to be planned by the Prime Minister, 10 industrial parks being in operation with synchronous transport infrastructure and basic installation of the infrastructure system for environmental treatment in industrial parks; seven out of ten operating industrial parks have a complete clean water supply plant with a total design capacity of 52,300 cubic meters per day. The total amount of water actually being used is 48,565 cubic meters per day. The water supply stations of the industrial zones take into account the amount of clean water supplied to the communes adjacent to the industrial park and the urban centers and social houses around it. In 2020, industrial parks in Bac Ninh will use about 100,000 cubic meters per day. Up to now, ten out of ten industrial parks have basically implemented the regulations on environmental protection in general and wastewater treatment in particular, 100% of industrial parks have operated with concentrated wastewater treatment systems. The investors of the industrial parks' infrastructure has synchronously deployed technical infrastructure for environmental protection such as the collection and drainage system of rain water and wastewater, and a centralized wastewater treatment plant. All 10 industrial parks, that have been operating, have installed automatic environmental monitoring systems to regularly and continuously monitor the quality of wastewater before being discharged into the environment (Department of Natural Resources and Environment of Bac Ninh province, April 2019).

Thirdly, on the proportion of enterprises with infrastructure for environmental treatment.

Along with the process of investing in building factories, businesses in industrial parks in Bac Ninh have built a system of environmental treatment infrastructure at their factories. All of them are invested with wastewater collection systems, rainwater drainage, and shallow tanks to collect solid waste. Domestic wastewater is filtered through the tank to treat sediment and garbage; Wastewater from the process of production is collected to the tank, filtered through a foam system, and then treated to ensure level B in accordance with regulations on industrial wastewater before being discharged into the general wastewater drainage system of the industrial parks. Domestic waste, production scrap, and toxic waste are collected in shallow tanks and classified before being transported to the garbage collection place for treatment by Environmental Company. Secondary enterprises have invested in preliminary wastewater treatment systems that meet the discharge standards of the industrial parks, connected to the centralized wastewater treatment system to treat it up to Vietnamese standards before being released into the environment. The system of environmental treatment infrastructure at enterprises has been tested and put into operation together with the enterprises' operation, so 100% of enterprises in industrial parks in Bac Ninh have been operating. The general environmental treatment infrastructure system of the whole industrial zones has handled well the factors affecting the environment arising from the operation of the industrial park. Therefore, the operation does not create a huge impact on the living environment of the population around the industrial parks.

3.2. Drawbacks in environmental protection in Bac Ninh's industrial parks

Wastewater: Industrial parks in Bac Ninh all develop multi-sectoral and multi-field production, so they release many different types of wastewater. Collecting and general treatment is very difficult. Although the number of centralized wastewater treatment plants has increased, according to the report of the Management Board of Industrial Parks, in the surrounding area of some industrial zones, some wastewater standards exceeds the permissible limit.

Emissions: Although companies have consciously implemented regulations on emissions, the equipment for this is still sketchy, simple, and has not thoroughly minimized the impact of emissions on surrounding environment. Air quality in industrial parks has had a significant impact on workers' health.

Hazardous waste and solid waste: Some enterprises in industrial parks do not register for waste sources as prescribed, some even store their own wastes, that causes local pollution. There are no company which collect and treat hazardous waste for secondary enterprises in industrial parks, so those are not preserved and treated according to regulations, creating a risk of pollution. In some industrial zones, it is difficult to collect solid waste for treatment because of lack of locations for this.

3.3. Causes of drawbacks in environmental protection in Bac Ninh's industrial parks

The first, industrial parks still attract a number of projects with low investment capital, limited financial capacity, leading to limited investment in infrastructure construction. They have not given priority to building waste treatment systems, and some do not even have waste treatment systems and their waste is released directly into the environment.

The second, investors in the construction of industrial park infrastructure are not fully aware of their responsibilities for environmental protection as prescribed by law. Awareness of environmental protection of companies in industrial parks is still limited, many owners do not understand clearly or accurately and do not even update the regulations of the current law of environmental protection.

The third, many businesses have built a waste treatment system, committing to environmental protection, but failed to fulfill their promises, leading to more serious pollution. The investment in environmental protection increases the enterprises' operating costs, directly affecting the profits achieved, so environmental protection has not been voluntarily implemented by them. The inspection and supervision is still not effective and the authorities are still slow in controlling and urging enterprises to protect the environment.

4. Discussion and Conclusion

Since its establishment, industrial parks in Bac Ninh have been constantly developing, making great contributions to the province's socio-economic development. Along with the development of industrial parks, environmental protection has always been concerned and has achieved good results. In order to ensure the effectiveness of environmental protection in industrial zones in the coming time, Bac Ninh needs to well implement the following solutions:

Planning: The province needs to review and adjust the planning of industrial parks to ensure that it is synchronous and consistent with Bac Ninh's socio-economic development plan. The planning process must immediately take into account the factors causing environmental pollution and propose solutions to reduce pollution and protect the environment. The establishment and development of industrial parks must ensure compliance with the approved planning.

Investment attraction: Attracting investment in industrial parks in the direction of prioritizing clean, low-pollution industries, ensuring the industry structure is suitable to the ability and reality of Bac Ninh's pollution solving. The province needs to attract key investments to develop key economic sectors as well as create favorable conditions for factory layout and environmental protection plans.

Mechanisms and policies: Bac Ninh should review and continue to adjust and amend legal documents related to the decentralization of environmental management in the direction of promoting decentralization and give direct rights and responsibilities for environmental protection to the Management Board of Bac Ninh's Industrial Parks. In addition, the documents also need to clearly define the responsibilities of the industrial parks' investors for the secondary enterprises investing in the industrial park in terms of environmental protection. Besides, there is a need of developing mechanisms and policies to encourage enterprises to carry out cleaner production and save energy in industrial parks.

Decentralization and assignment of centralized management responsibilities: The Management Board of Bac Ninh's industrial parks must have full authority and responsibility for environmental management in the industrial parks and implementation of relevant environmental protection regulations. Measures should be taken to improve the environmental management capacity for the Management Board of Bac Ninh's Industrial Parks in terms of both human resources and equipment, enabling them to be more proactive in performing their duties on environmental protection in industrial parks. The investors are responsible for fully implementing the commitments according to the industrial parks' environmental impact assessment report; building and completing centralized wastewater treatment systems which need to be properly designed, suitable to actual conditions, constructed and installed according to the design, maintaining stability and effectiveness during the operation process of the industrial parks; participating in responding to environmental incidents in industrial parks. Investors also need to arrange locations for construction of temporary storage and transit areas for solid and hazardous wastes from enterprises in the industrial parks. All companies in the industrial parks having wastewater must preliminarily treat it up to the input standards of the centralized wastewater treatment system before discharging it into the wastewater collection system of the industrial parks. Enterprises that generate emissions must have an exhaust gas treatment system that meets

Vietnamese standards before discharging. If hazardous waste is generated, they must have a contract with a competent and capable agencies to collected and disposed of properly.

Supervision of enterprises' dealing with environmental pollution: Periodically Periodically monitoring the environment to take timely measures to deal with arising pollution. Proactively propagating and disseminating environmental legislation for industrial park infrastructure development enterprises as well as secondary enterprises to help companies clearly and fully realize their responsibilities for environmental protection inside and outside the industrial parks.

THE ROLE OF MYANMAR IN ASEAN ENERGY SECTOR

Dr. Ah Mar
drmarmar1967@gmail.com
Associate Professor, History Dept., East Yangon University, Myanmar

Abstract

As the government of the union of Myanmar has made significant progress towards the marked oriented economy, the government has been striving hard to promote all-round development of national economy to upgrade the living standards of its people, results that have been achieved. So far are quite favorable for the general well-being of the people, what is really needed for further development is the influx of capital and appropriate technology, managerial Skills and access to international market in order to reap the most effective benefit of its endowment in natural and human resources. This is the most opportune time for foreign investors to do business in Myanmar. Myanmar Industries Association and ASEAN organization is most desirable at the present moment to obtain the successful development of an economic trade and investment atmosphere that will ultimately lead to the prosperity of the Southeast Asia country.

Keywords: *Myanmar, ASEAN, Energy programs, commerce and trade*

1. Introduction

Myanmar has been a full time of ASEAN Since July 1997. Indonesia, Malaysia, Philippine, Singapore and Thailand founded the ASEAN of Bangkok on 1 August 1967. ASEAN countries were developed in economy since last three decades. Myanmar was more than twenty years ago with socialist economy. After 1988, the state law and order Restoration council (SLORC) Government was in Myanmar. SLORC Governments economy policy was market oriented economy. In 1997, Myanmar become a ASEAN member and also a BIMST-EC member So ASEAN nations will have opportunity to cooperate in the economic programs. In 1992, ASEAN nations agreed to AFTA agreement ASEAN nations competed to get the good prices in raw materials and enhance to develop the production. ASEAN economic co-operations persuaded external investors.

Myanmar started the agreements to elaborate in 1st January 1998. Myanmar firstly Started the AICO program. Economic cooperation was to expand the ASEAN Industrial markets. The AICO program could be utilized in independent companies in ASEAN region. ASEAN Economic program committee was organized in April 1998. This committee collaborated with UMFCC and National (AFTA) unit.

In 1998 Hanoi in Vietnam had many attitudes to develop the AESAN Vision 2020. The ASEAN plant of Action for Energy cooperation (1994-2004) had six programs by Hanoi plan of Action1998. Myanmar worked in ASEAN program in an energy cooperation. Myanmar also agreed to the program of natural gas pipeline connection and coal production. Myanmar also studied energy sector of the ASEAN plus 3 countries of china, South Korea and Japan. In the Future Myanmar may be important in ASEAN Energy sector.

This paper aims to analyze the tasks from the The Role of Myanmar in ASEAN energy sector, major objectives of this paper are: (i) to study the Associating of the South East Asia Nation (ASEAN); (ii) to cooperate Myanmar and BIMST-EE; (iii) to find out the major factor to develop benefits from ASEAN energy programmed for Myanmar.

2. Method

This study user descriptive method based on available secondary data and information from ASEAN countries economic of BIMST-EC from libraries and internet.

3. Results

According to the studies, to establish interconnecting arrangement in the field of energy and utilities for electricity, natural gas and water within ASEAN through the ASEAN power Grid and Trans-ASEAN Gas pipeline and promote cooperation in energy efficiency and conservation, as well as the development of new and renewable energy resources of the country and systematically implementing plants of Energy Sector.

The Founders of the Association of Southeast Asian Nations (ASEAN) envisioned it as eventually bringing together all the countries of Southeast Asia and getting them to cooperate in securing the region's peace, stability and development. Only five countries Indonesia, Malaysia, the Philippines, Singapore and Thailand-signed the ASEAN Declaration of 8 August 1967. Thirty-two years later on 30 April 1999 ASEAN encompassed all ten countries of Southeast Asia by admitting Cambodia. Brunei Darussalam had been admitted in 1984, Viet Nam in 1995 and Laos and Myanmar in 1997.When the east Asian financial crisis broke out in July 1997, many people thought the Southeast Asian countries would retreat into isolationism and protectionism-ending ASEAN's vision of regional economic integration. Even at the height of the crisis, in December 1997, ASEAN leaders had spelled out their vision of an integrated ASEAN economy in the first two decades of the century. As their ASEAN Vision 2020 put it, the leaders committed themselves to "closer cohesion and economic integration". The Declaration reads: "We will create a stable, prosperous and highly competitive ASEAN Economic Region in which there is a free flow of goods, services and investments, a freer flow of capital, equitable economic development, reduced poverty and social-economic disparities."

ASEAN's path to economic integration has evolved over the years. The very first sentence of the Bangkok Declaration, which set up the organization in 1967, spoke of "mutual interests and common problems among countries in Southeast Asia" and called for a “firm foundation for common action to promote regional cooperation”. Economic cooperation at the time dealt with programs for joint ventures and complementation schemes among ASEAN governments or companies.

The most important move towards this new model was made at the Fourth ASEAN summit in 1992, at which member countries agreed to create the ASEAN Free Trade Area. A market of close to half a billion people would allow corporations in ASEAN to take advantage of economic of scale. They would also have access to the best prices for the raw materials they require, even as competition among them would stimulate their productivity and efficiency. An integrated ASEAN Economy would be a potent attraction for investors outside the region-who generally prefer large, integrated and efficient markets to small, fragmented and in efficient ones.

The 1992 agreement to set up the ASEAN Free Trade Area (AFTA) was the organization’s first breakthrough towards creating an integrated ASEAN economic region. The main implementing mechanism for AFTA is the Common Effective Preferential Tariff (CEPT) Scheme, also adopted in 1992. Under the CEPT, tariffs on a wide range of products traded within the region are progressively either lifted totally or limited to a maximum of 5 percent. Quantitative barriers -limits on the volume of certain products a country imports and other non-tariff barriers such as outright prohibition ad unnecessary technical requirements are being eliminated.

AFTA’s final goal is to eliminate altogether import duties on all products to create a truly free-trade, or tariff-less, region. The Third ASEAN Informal Summit in Manila in 1999 advanced the time table for this goal to 2010, ahead of the original schedule of 2015, for the six original signatories to the CEPT scheme - Brunei Darussalam, Indonesia, Malaysia, the Philippines, Singapore and Thailand. The newer ASEAN members - Cambodia, Laos, Myanmar and Viet Nam - have committed themselves to eliminating all import duties by 2015, with some sensitive products to follow these members’ original target for 2018.

Table 1: Year 2001 CEPT (Common Effective Preferential Triff)

Product List	Percent
Sensitive	0.55
Temporary	13.21
General exception	1.27
Inclusion	84.97

According to the CEPT Agreement, member countries have to complete the establishment of AFTA within ten years. As Myanmar is a new member country, the commencing will start from 1st January 1998. In order to achieve the ASEAN free trade area the main instrument is the CEPT scheme. The year 2002 and 2003 ending date is applicable to Brunei, Indonesia, Malaysia, Philippines, Singapore and Thailand i.e. ASEAN-Six. For Vietnam, it will be in the year 2006, for LAOS PDR and Myanmar in 2008, for Cambodia in 2010. So there is a phase-in period here, of the year 2003, 2006, 2008, 2010. Now that's the background, so call ASEAN free trade area exercise.

The focus of ASEAN free trade area is trading activities. CEPT scheme is actually a trading scheme. When we look at the intra-regional trade share, we find that since the implementation of CEPT scheme in 1993 and after one year, the share of intra regional trade of ASEAN is 21%. In 1997 it is 25%. For the year 2000, it is about 23 to 24 percent. That means ASEAN trade among ourselves in terms of total export is 25%. That is for every dollar that ASEAN earned only 25 cent come from the intra ASEAN trade. In order to increase this percentage of Intra- ASEAN Trade, the CEPT scheme was used as one tool and the other tool that could be used in the ASEAN Industrial Cooperation scheme. Simply because there is this lack of industrial complementarily between companies operating in the region.

Therefore, the objective of the AICO scheme is to enhance that complementarily, so that a company in Myanmar get supplied of it's intermediate goods in the production of the final products somewhere else in the region or vice versa. The objective of the AICO scheme is also to enlarge the ASEAN market through this complementarily. It is also to improve the competitiveness of the companies operating in ASEAN, if there is a combination of a market bigger than own domestic market, then it can reap the advantage of economies of scale and the economies of production. It can also stimulate investment within the ASEAN. So, those are the primary objectives of AICO scheme.

Within this AICO scheme, the first benefit or the most visible is the 0 to 5 percent preferential tariff rate. When AICO scheme was launched in 1996, the CEPT tariff of all ASEAN countries is above 5%. If companies apply for the AICO scheme and if they are approved, then they will get a head-start and will get the 0 to 5% immediately compare to others. This situation, so-called the privilege, the Preferential Tariff Rate, will slowly diminish for companies operating in ASEAN-SIX countries. By 2002 or 2003 the latest, the CEPT tariff rate will have been 0 to 5%. Therefore, the AICO rate that we granted will no longer be special. But this is only applicable to ASEAN Six. For Cambodia, Myanmar, Laos and Vietnam, this 0 to 5% target will only be reached in the year 2006 and 2008, 2010. Therefore, any company that apply for AICO scheme from the CLMV (Cambodia, Laos, Myanmar & Vietnam) countries will have this head-start of 0 to 5%. This is the number one benefit.

Myanmar cooperation with ASEAN as a member attacked India to stimulate for promotion of bilateral trade between the two countries. It also pared away for Myanmar to be member of BIMST.Ec. The Government of union of Myanmar has formed the steering committee headed by Secretary (1) of the State Peace and Development Council (SPDC), the minister and Deputy Ministry of the Ministry of Commerce is a member in the BIMST Committee. Ministry of commerce has assigned to participate the two categories among the BIMST-EC projects such as BIMST-EC Economic form and Senior official meeting to promote intra-regional cooperation on elimination of non-tariff barriers, on market access issues and preferential trading arrangements among BIMST-EC member states.

To achieve the economic reforms in Myanmar, a serious of economic reform measured were undertaken by the government since 1988. Some of reform measures can be summarized as follows:

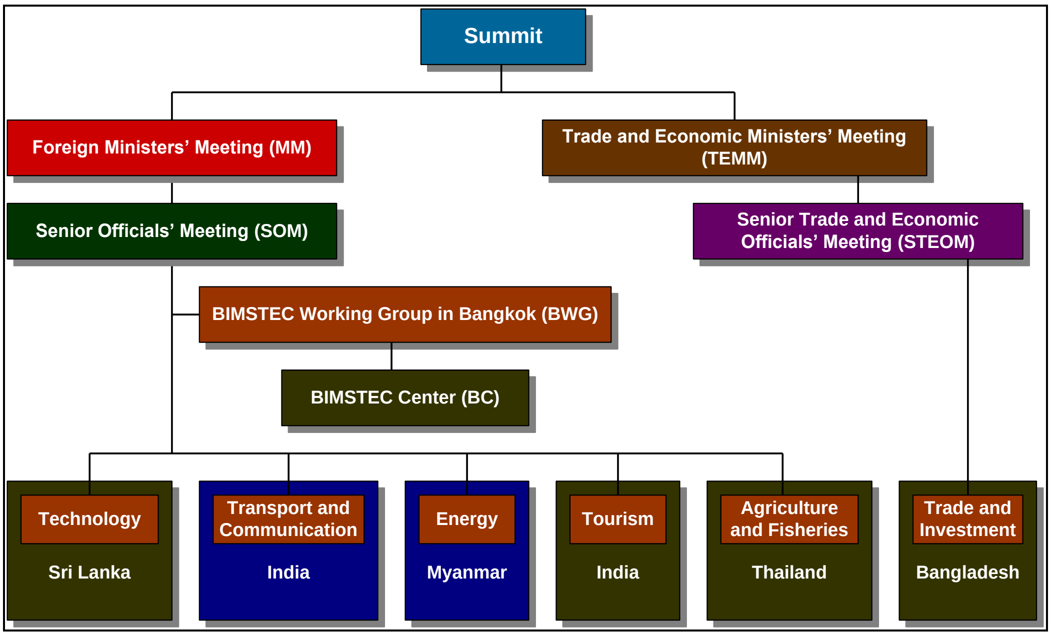
- Introduction of Myanmar Foreign investment law in 1988.
- Revocation of 1965 law that established the Socialist economic system, Introduction of state-owned Economic Enterprise law delineating of the scope of the state sector and Regularization of border trade in 1989.
- Introduction of private Industrial Enterprise law, Introduction of Central Bank of Myanmar law, Introduction of Financial Institutions Myanmar law. Introduction of commercial Tax Law in 1990.
- Initiation of Industrial Zone in Myanmar, Announcement of the Central Bank of Myanmar Rules and Regulations, Introduction of Financial Institutions of Myanmar law.
- Initiation of Industrial Zone in Myanmar, Announcement of the Central Bank of Myanmar Rules and Regulations Introduction of promotion of cottage Industries law and Re-establish of Myanmar chamber of Commerce and Industry in 1991.
- Introduction of Tariff law and Introduction of Saving bank law in 1992.
- Introduction of Myanmar Insurance law in 1993.
- Introduction of Myanmar Citizens law in 1994.
- Announcement of the formation of privatization committee in 1995.
- Permission given to local private banks to conduct foreign exchange in 1996.
- Entry of Regional organization (ASEAN & BIMST-EC) in 1997.

Accordingly, the market-oriented system was adopted in March 1989. The private sector was allowed to participate both in domestic and the external trade with some restrictions. Foreign and domestic enterprise were allowed to invest in the country.

When BIST-EC was established in June 1997, Myanmar was approached by India through diplomatic channel to join the group as a founding member. However, it was the time for Myanmar preparing to join the regional groupings such as ASEAN and BIST-EC so that she attended the first meeting as an observer. Consequently, Myanmar decided to join the group, and was unanimously accepted as a full member at a special Ministerial Meeting held in Bangkok on 22nd December 1997. The name of the group was renamed as BIMST-

EC. Myanmar is now serving as a leading country in Energy sector for three consecutive terms since the inception of BIMST-EC.

Figure 1: BIMST-EC



In the sector, the ASEAN member countries are Myanmar's largest trading partners. This fact also covers the danger of China's influence in Myanmar's economy and one of the counter balance activities to take out Myanmar from China's orbit. For ASEAN, although ASEAN members such as Singapore and Thailand, are the main investors in Myanmar, they can not give aids and loans like China. Nowadays, China's massive investment in oil and gas sector can change the position of China in Myanmar's investment list.

Now, Myanmar leaders realize that China is not a negative factor for them. But they always notice China's influence and they try to reduce and balance China's dominance to Myanmar. In doing so, Myanmar became a member of ASEAN and other regional organizations. "Constructive engagement" policy moved Myanmar to co-operate more closely with other countries in the world. To reduce Myanmar's over-reliance in China, Myanmar needs the countries and but also from other industrialized countries of the world.

On the other hand, to overcome the prediction of some scholars, Myanmar need to establish good relations with, ASEAN, India and other industrialized countries such as Japan, United States, United Kingdom, Germany by holding of strategic neutralist policy between China and other counties of world.

The ASEAN vision 2020 had adopted the energy sector. The special Meeting of the ASEAN seminar officials meeting on energy on 26 Novembers 1998 at Hanoi, Vietnam, Hanoi plan of Action 1998 had ASEAN plan of action for energy co-operation 1998-2004.

1. ASEAN power Grid.

2. Trans- ASEAN Gas pip-line.
3. Energy Efficiency and conservation
4. New and Renewable sources of Energy
5. Coal
6. Regional Energy outlook, Energy Policy Land Environment Analysis.

The implementing or the organization or the energy subsector organization are:

1. HAPUA - Heads of Power Utilities and Authorities
2. ASCOPE - ASEAN Council on Petroleum
3. EEC - SSN - Energy Efficiency and Conservation Subsector Network
4. NRSE-SSN- New and Renewable sources of Energy Sub-Sector Network
5. AFOC - ASEAN Form of Coal
6. ACE - ASEAN Centre for Energy

Myanmar is effectively participating in ASEAN plan of Action of Energy cooperation. The Deputy Ministry of Energy's is a chairman in Myanmar committee. The Director General from Section Ministry of Foreign Affairs, Electrical power Department, Mining Department, Ministry of Science and Technology, and Forest Department are the member of Myanmar committee in ASEAN. The Director General form Energy Management Department is a secretary in Myanmar Committee.

Myanmar Signed the agreement chatters, and projects for ASEAN energy sector

(A) Agreement on the Establishment of the ASEAN center for Energy.

Myanmar Foreign Affair Ministry signed the agreement on the Establishment of the ASEAN Center for Energy at Manila, Philippine on 22 May 1998. This agreement is to manage the energy sector in ASEAN countries, and ASEAN Region for economic development, to support the regional energy activities, and funding the development program.

(B). ASEAN Memorandum of understanding on the Trends

ASEAN Gas Pipeline project. This MOU was signed in Ministerial Meeting of ASEAN at Bali, Indonesia on 5 July 2002.

(C) ASEAN forum on Coal Chatter

Myanmar signed coal charter on 16 October 2000. Myanmar participation in ASEAN Energy Cooperation program.

(D) By Energy Efficacy and Conservation program, the ASEAN Auditing group have arrived Myanmar on 2001 and 2003. This group visited Man Then Payakan Factory of petroleum and pan sea Hotel, FMI building. This group studied the energy efficacy and - conservation dates, and they gave the data, and suggestions to Myanmar petroleum and Chemical Product Department.

(E) The Kanbawza Banking Building, Pyay Road, Myanmar was a ward the Appropriate Technology form 2002, ASEAN, Energy Efficiency can serration Building competition.

(F) Myanmar received the Energy Planning Model (Market) form ASEAN - Castration Economic Co-operation program (AAECP).

Myanmar technician, and engineer scholars are attending the scholarship grants from Indonesia. This program was sponsored by Initiative on ASEAN Integration. This program is to prevent the different advantages between original ASEAN six member countries and newly four member countries.

Above mentioned, ASEAN energy co-operation program is to sponsor the meetings, conferences, and workshops are held in available sectors. The responsible persons attend, and concert the energy affairs. So Regional ASEAN meeting other ASEAN plus 3 countries participate and ASEAN members learn about. ASEAN plus 3 are China, South Korea and Japan. Gil and National Gas production in early member of ASEAN (Brunei, Indonesia, Malaysia, Philippine, Singapore, Thailand and Vietnam.)

Myanmar is a rich country of mineral resources, because of geographical background and weather condition. Estimation of Myanmar energy resources in April 2003 is as follows. Future Recoverable Resources as at (1.4.2003).

(a)	Oil	3208.438 million barrel
(b)	Natural gas	87.085 trillion cubic
(c)	Hydro-electronic power	3.9720 Mega watt
(d)	Coal	7 10.773 million ton

Myanmar is an under developing country. Myanmar's energy demand is more less than other developing countries, but energy demand is yearly progressing.

No. Description 1999-2000, 2000-2001, 2002-2003

(a) Gas and oil products

(b) Natural gas

(c) Coal

(d) Hydro electronic power

(e) Biomass

After 1988, Myanmar invited the International Oil Companies for especially production of oil and natural gas. Myanmar shared with the foreign companies for production of oil and Natural Gas. Myanmar signed the contract of cooperation and sharing production.

Table 2: Gas Suppply to Thailand from Myanmar

Gas Supply to Thailand from Myanmar		
FROM	AMOUNT	PERIOD
	(MMCFD)	
Yadana Field	525	30 Years (July 1998)
Yetagun Field	200-400	20 Years (April 2000)

Table 3: Hydroelectric Power Projects for Export

Hydroelectric Power Projects for Export		
Export To	MW	Projects
Thailand	11110 MW	Tasang / Ywathit / Hutgyi / Tanintharyi
India	2350 MW	Tamanthi / Mawlaik / Shwezaye / Homelin
Total	13460 MW	

In 1998, Yadana offshore Natural Gas project at Mataban offshore, and in 2000, Yetagun offshore Natural Gas Project at Taninthayi produced the natural gas and sold it to neighboring Thailand with pipeline. Now, that projects production is 1000 mill cubic facts for Thailand. This daily production of Natural gas is 30%. Fulfillment to Thailand's energy demand. Myanmar continued to produce the natural gas form Yetagun offshore project.

Other projects from Mataban and Taninthayi offshore are signing the production sharing contract with PTT Petronas and other companies. That offshore natural gas project has many expectations for economic progress. The offshore Natural project was starting in A-I site at Rakihine offshore. In January 2004, we were finding huge natural gas in A-I site. Daily, production of A-I site is 32 million cubic feet. The recoverable gas reserves are 4.2 to 5.8 trillion cubic feet. Estimation of A-1 site have 14 trillion cubic feet.

Beside the A-1 site of A-3 have not only the natural gas also finding the oil. The production of natural gas site A-1 shall change the gas to LNG. This LNG shall be sold to Asia and ASEAN countries to Myanmar location and geographical background are supposed to plenty of hydro electronic power. The estimation of World Bank is 108000 megawatt of hydro-electronic power in Myanmar. Myanmar Electronic Ministry estimates the Myanmar Electronic energy production electricity.

Myanmar and neighboring countries agreed the cooperation of hydroelectricity. Those projects are following:

	Country	Electricity
1.	Thailand	11,110 (Tasan, Yorathit, Uutkyi, Thantlayi projects)
2.	India	2250 (Tamanthi, Mawlyke, Shwesuryay, Homalin project)
	Total	13,460

Present Myanmar coal resources is 710,773 million tons. Myanmar sold the coal to India and China, and also used in local.

Above mentioned facts were local energy production and division of energy supply. Myanmar has many projects for electricity projects, natural gas projects and oil production projects. Developing countries of ASEAN will be return to import the energy in coming decades. In Myanmar energy sector, Myanmar has many natural and mineral resources. So Myanmar may be important in ASEAN sphere in coming decade.

4. Conclusion

As the government of the Union of Myanmar has made significant progress towards the market oriented economy, the government has been striving hard to promote all-around development of national economy to upgrade the living standards of its people, results that have been achieved. This is the most opportune time for foreign investors to do business in Myanmar, and to make the best use of its abundant resources for mutual benefits. Close cooperation between the Union of Myanmar chamber of commerce and industry. Myanmar chamber of commerce and industry of Myanmar Industries Association and ASEAN organization is most desirable at the present moment to obtain the successful development atmosphere that will ultimately lead to the propriety of the South East Asia Country. As Myanmar is rich in oil and natural gas resources, the government is trying to extend the exploration of on shore and off shore oil fields to meet the domestic consumption and to develop the national economy Energy sector of Myanmar has developed year by year. by making the effective use of energy resources of the country and systematically implementing plants on the Energy sector. The development of energy sector of Myanmar can contribute to the uplift of social life of the country ASEAN leaders adopted the “constructive engagement” policy on Myanmar. This policy intends to encourage Myanmar to move gradually towards democracy and a market economy and to contribute to outcome the ASEAN community in 2015. In the age of knowledge within the process of “globalization, education is the key for improving all kinds of development. It has played an important role in the development a highly knowledgeable and skilled labor force, which is crucial for sustaining development in youth cooperation has focused on enhancing quality education among ASEAN youth, increasing employment opportunities for youth and creating and atmosphere of frank and friendly discussion.

NATURAL RESOURCE CONSUMPTION TAX FOR GREEN ECONOMIC DEVELOPMENT IN VIETNAM: LEGAL ISSUES AND SOLUTIONS

MA. Dinh Van Linh

linhdv.hvnh.edu.vn@gmail.com

Faculty of Law, Banking Academy, Hanoi, Vietnam

Abstract

How is natural resource consumption tax for green economic development regulated in legal documents in Vietnam? What are the legal issues that arise during the implementation? Studies in Vietnam have not been studied and fully reviewed. So, this study is aimed at two goals: (1) assessment of the legal framework for natural resource consumption tax for green economic development in Vietnam; (2) recommendations on remedial measures when implementing the legislation of natural resource consumption tax for green economic development in Vietnam. To achieve the purposes set out in this study, the study was conducted as a survey of the Law on Natural Resource Consumption Tax for green economic development in Vietnam. The research objects are the Law on Natural Resource Consumption Tax in 2009, decrees and circulars guiding the Law on Natural Resource Consumption Tax in 2009. The methods used in this study are: Desk Research and Theoretical Research. These are typical methods of the legal science industry. Results of this study show that the legal framework of natural resource consumption tax for green economic development is incomplete. Besides, results of this study also show that the legal framework of natural resource consumption tax for green economic development still faces many limitations and problems, which requires the need to complete the law.

Keywords: *Green economic development, law, natural resource consumption tax, tax*

1. Introduction

The legal framework of natural resource consumption tax for green economic development is promulgated by the State of the Socialist Republic of Vietnam to regulate the exploitation of natural resources in Vietnam.

The theoretical basis for the promulgation of the legal framework of natural resource consumption tax for green economic development is: Natural resources are owned by the State, most of them are non-renewable, so they need to be exploited and managed reasonably and effectively. When individuals and organizations exploit natural resources, they must pay the owner (the state) a sum of money. The money must pay the state is tax. The more natural resources are exploited, the more depleted resources become, environmental pollution and climate change. The legal framework of natural resource consumption tax for green economic development must be in the context of implementation “National strategy on green growth for the period 2011- 2020 with vision to 2050” in Vietnam”. So, the Socialist Republic of Vietnam must issue a legal framework to regulate the behaviours of individuals and organizations towards green economic development.

Research on the legal framework of natural resource consumption tax for green economic development in Vietnam has attracted attention in recent years. But, researches on the legal framework of natural resource consumption tax for green economic development is is extremely limited.

Thu, N.T.G (4/2009), *Develop the Law on Natural Resource Consumption Tax in Vietnam,* Hanoi Law review of Vietnam No4. The study comments on the contents of the draft the Law on Natural Resource Consumption Tax in 2009 such as: Scope of regulation; taxable object; tax payers; tax-liable price and tax rate. In which, the author points out that new types of resources such as channel are not subject to tax; responsibility must pay natural resource consumption tax if there is a joint venture with foreign countries.

Truong, L.X and Tung, P.T (7/2016), *Complete the legal provisions on natural resources tax to both ensure the target of budget collection and create a favourable environment,* Journal of Finance and Accounting Research of Vietnam No7. This study has given the inconsistencies between the Law on Natural Resource Consumption Tax in 2009 and the legal system of taxation in Vietnam about severance tax-liable price and finalization of natural resource consumption tax.

Thao, L.T and Tuan, N.Q (2011), *Using economic and legal instruments in environmental management and protection,* Journal of Legislative Studies Electronics of Vietnam No9. This study has given solutions for environmental management and protection through the Law on Environmental Protection Tax, the Law on Natural Resource Consumption Tax, and the Law on Enterprise Income Tax v.v.

The above studies have studied natural resource consumption tax in many different aspects. However, none of the above studies have conducted research on the Law on Natural Resource Consumption Tax in relation to green economic development in Vietnam today. In addition, the above studies do not give a legal framework of natural resource consumption tax for green economic development in Vietnam. Therefore, this research of the author has two goals: (1) assessment of the legal framework of natural resource consumption tax for green economic development in Vietnam; (2) recommendations on remedial measures when implementing the legislation of natural resource consumption tax for green economic development in Vietnam.

2. Method

This study must be in the context of implementation “National strategy on green growth for the period 2011- 2020 with vision to 2050” in Vietnam”. The study was conducted as a survey of the Law on Natural Resource Consumption Tax for green economic development in Vietnam. The research objects are the Law on Natural Resource Consumption Tax in 2009, decrees and circulars guiding the Law on Natural Resource Consumption Tax in 2009.

To conduct this research, the author has collected legal documents, including: The Law on Natural Resource Consumption Tax in 2009, decrees and circulars guiding the Law on Natural Resource Consumption Tax in 2009. The methods used in this study are: Desk Research and Theoretical Research. First, the author read documents and study legal theories. After, the author compares with the theoretical basis when building a legal framework of natural resource consumption tax for green economic development in Vietnam, relevant legal theories and practice to find the conflict points. Finally, the author recommends how to resolve those conflicts.

3. Results

"National strategy on green growth for the period 2011- 2020 with vision to 2050" in Vietnam" with three main contents as follows: first, reducing the intensity of greenhouse gas emissions and boosting the use of clean energy, renewable energy; second, production greening; third, greening lifestyle and boosting sustainable consumption. Inside, "Green Economy: It creates and distributes environmentally friendly products and services, renewable energy, transport and clean fuels and green works, reduces energy consumption, raw materials and water through effective strategy of energy and natural resources and switching from carbon components to non-carbon". After using research methods are: Desk Research and Theoretical Research, results show:

3.1. Advantages

First, the legal framework of natural resource consumption tax for green economic development has synced with the legal system in Vietnam.

The State of the Socialist Republic of Vietnam uses legal instrument to regulate economic relations, helping economic relations develop according to its will. After economic relations are regulated by law, these economic relations become legal relations. Objects participating in these legal relations will have objective rights and must perform object obligations. The legal framework of natural resource consumption tax for green economic development promulgated by Socialist Republic of Vietnam to encourage the efficient, economical exploitation and use of natural resources towards a green economy, no-environmental pollution and sustainable development.

The legal framework of natural resource consumption tax for green economic development is fully promulgated, with a transparent and clear legal framework. This legal framework is established by Law No. 45/2009/QH12 of November 25, 2009, on Natural Resource Consumption Tax; Law No. 71/2014/QH13 dated November 26, 2014, amendments to tax Laws; Decree No. 50/2010/ND-CP of May 14, 2010, detailing and guiding a number of articles of the Natural Resource Consumption Tax; Decree No.

12/2015/ND-CP dated February 12, 2015, on elaboration of the Law on amendments to tax Laws and amendments to some articles of decrees on taxations; Circular No. 152 /2015/TT-BTC dated October 02, 2015, guidance on Natural Resource Consumption Tax. This legal framework is consistent with the provisions of the Law on Tax Administration in 2019 regarding on the order and procedures to collect natural resources consumption tax; taxable object; tax exemption; tax reduction is consistent with the Law on Petroleum, the Law on Investment, the Law on Mineral; Taxable price of natural resource is consistent with the Law on Customs. Furthermore, the Article in the Law on Natural Resources Consumption Tax in 2009 is consistent with the legal system of environmental protection, non-renewable resources are object to a higher tax rate than renewable resources. This regulation helps to efficiently, economically exploit natural resources and reduce environmental pollution towards green economic development and sustainable development.

Second, the legal framework of natural resource consumption tax for green economic development has undertaken Vietnam's commitments to the international community about environmental protection direction, green economic development and sustainable development.

The Law on Natural Resource Consumption Tax has prescribed the natural resources in taxable object, including: (1) Metallic minerals; (2) Non-metallic minerals; (3) Crude oil; (4) Natural gas, coal gas; (5) Natural forest products, other than animals; (6) Natural aquatic products, including marine animals and plants; (7) Natural water, including surface water and groundwater; (8) Natural swallow's nests. This action demonstrates Vietnam's commitment to the many international commitments to which it is a member. Normally, for a State party to an international commitment to fulfil the international commitments to which it is a party, that country will “Internalize international treaties”. Internalize international treaties will be done by incorporating such international commitments into the relevant legal frameworks. As such, Vietnam has fulfilled such international commitments by means of regulations or by reference to such international commitments in the Law on Natural Resource Consumption Tax. Up to now, Vietnam has " internalize international treaties" into the Law on Natural Resources Consumption Tax and Decrees and Circulars with the following commitments: Convention on the Law of the Non-navigational Uses of International Watercourses May 21, 1997; Convention on Biological Diversity, May 22, 1992; Convention RAMSAR 1971; v.v.

Third, the legal framework of natural resource consumption tax helps the State of the Socialist Republic of Vietnam to manage and exploit natural resources to develop a green economy.

Legal instrument helps Vietnam to orient economic relations according to its will. Natural resources are owned by the state, so when individuals and organizations exploit natural resources, they must pay to the State. The money must pay the state is tax. In order to collect money from natural resource consumption tax, the state must issue a full, clear and transparent legal framework. The Socialist Republic of Vietnam must issue a legal framework to have three main purposes: first, show state ownership over natural resources; second: the state is the manager of the exploitation of natural resources; Third: through the collection of taxes on the exploitation of natural resources, the State has a direct impact on the behaviour of exploiting natural resources by individuals and organizations. This impact is that individuals and organizations that exploit non-renewable resources will have to pay higher taxes than exploiting renewable resources. Since then, natural resources are exploited efficiently, economically, towards green economic development and sustainable development.

3.2. Problems

First, regulations on taxable object in the Law on Natural Resource Consumption Tax.

In Article 2 of Law on Natural Resource Consumption Tax, Article 2 of Circular No. 152 /2015/TT-BTC, Decree No. 50/2010/ND-CP, taxable objects are: "The items object to natural resource consumption tax prescribed in this Circular are natural resources within the land, islands, internal waters, territorial sea, contiguous zones, exclusive economic zone, and continental shelves under the sovereignty and jurisdiction of Socialist Republic of Vietnam". As such, Vietnam's taxable objects is very wide, including natural resources under Vietnam's sovereignty on land, islands, and sea. In addition, these articles also list the taxable objects such as: Metallic minerals; Non-metallic minerals; Crude oil; Natural gas, coal gas; Natural forest products, other than animals; Natural aquatic products, including marine animals and plants; Natural water, including surface water and groundwater; Natural swallow's nests. However, in the Law on Natural Resource Consumption Tax, Decrees and Circulars guiding the Law on Natural Resource Consumption Tax is not regulated natural resources in the airspace under Vietnam's sovereignty are taxable object; and is not regulated wind energy to be a taxable object. Meanwhile, wind energy is an abundant resource that has been exploited in Vietnam.

Second, regulations on natural resource output used for natural resource consumption tax calculation

Natural resource output used for natural resource consumption tax calculation regulated in Article 5 of the Law on Natural Resource Consumption Tax; Article 5 of Circular No. 152 /2015/TT-BTC; Article 3 of Decree No. 50/2010/ND-CP. Accordingly, natural resource output used for natural resource consumption tax calculation is divided into the following cases: "(1) For an exploited natural resource the quantity, weight or volume of which can be determined, the natural resource output used for royally calculation is the quantity, weight or volume of natural resource actually exploited in a natural resource consumption tax period; (2) For an exploited natural resource the quantity, weight or volume of which cannot be determined because this natural resource contains different substances and impurities, the natural resource output used for natural resource consumption tax calculation shall be determined based on the quantity, weight or volume of each substance obtained from sorting and classification; (3) For natural resources which are not sold but used for turning out other products, if their actually exploited quantity, weight or volume cannot be directly determined, the natural resource output used for natural resource consumption tax calculation shall be determined based on the output of products turned out in a natural resource consumption tax period and the use norm of natural resource per unit of product; (4) For natural water used for hydropower generation, the natural resource output used for natural resource consumption tax calculation is the output of electricity sold by a hydropower generation establishment to an electricity buyer under an electricity purchase and sale contract or the output of delivered electricity, in case such contract is unavailable, which is determined according to the metering system up to Vietnam's measurement and quality standards, certified by the purchaser and seller or the deliverer and recipient; (5) For natural mineral water, natural thermal water and natural water used for industrial purposes, the natural resource output used for natural resource consumption tax calculation shall be determined in cubic meter (m^3) or litre (l) according to the metering system up to Vietnam's measurement and quality standards; (6) For natural resources exploited on a manual, scattered or mobile, irregular basis, if the planned output of exploited natural resources in a year is valued at under VNI) 200 million, a fixed output of exploited natural resources may be determined on a regular or seasonal basis for natural resource consumption tax calculation. Tax offices shall coordinate with local concerned agencies in determining the fixed output of exploited natural resources for natural resource consumption tax calculation".

Whereby, natural resource output used for natural resource consumption tax calculation is based on the declared behaviour of the resource exploiter. Practice has proven that the consequences of self-declaration have led to loss of revenue for the state budget and inefficient exploitation of natural resources. All of this is due to the fact that the output of natural resources exploited is not the output used as a basis for calculating natural resource tax.

Third, regulations on jurisdiction stipulates the types of natural resources that are taxable objects.

In Article 2 of the Law on Natural Resource Consumption Tax, the law prescribed the types of natural resources as object to tax, including: (1) Metallic minerals; (2) Non-metallic minerals; (3) Crude oil; (4) Natural gas, coal gas; (5) Natural forest products, other than animals; (6) Natural aquatic products, including marine animals and plants; (7) Natural water, including surface water and groundwater; (8) Natural swallow's nests. Besides, other resources prescribed by the National Assembly Standing Committee of Vietnam in Clause 9 Article 2 of the Law on Natural Resource Consumption Tax.

According to the regulations on the Constitution in 2013 of the Socialist Republic of Vietnam, the National Assembly of Vietnam is the highest state power body of the Socialist Republic of Vietnam. It shall exercise constitutional and legislative powers. So, it decides on the tax Laws or change or abolish them. Therefore, in Vietnam, only the National Assembly has the authority to decide which natural resources are taxable objects. However, according to the current provisions of the Law on Natural Resource Consumption Tax, the

National Assembly Standing Committee of Vietnam has this authority. This provision is inconsistent with the Constitution in 2013.

4. Discussion and Conclusion

4.1. Discussion

The results of this study show problems that need to be discussed:

First, regulations on taxable objects in the Law on Natural Resource Consumption Tax.

Natural resources are owned by the state. So, the state has right to imposed on the act of natural resource consumption within its territory. In Vietnam, Natural resource consumption tax is a type of tax to imposed on the act of natural resource consumption under the sovereignty of Vietnam. However, up to now, in the Law on Natural Resource Consumption Tax has only regulated natural resources in water and land areas under the sovereignty of Vietnam are taxable objects, but there are no regulations the natural resources in airspace under Vietnam's sovereignty are taxable objects.

According to research by D. Truong - D. Tuan (2009), "Wind energy is an important resource with wind energy with a total capacity of 13,360 MW, 200 times the capacity of Son La Hydropower Plant and 10 times the total forecasted capacity of the whole electricity industry by 2020". So, wind energy should be regulated a taxable object in the Law on Natural Resource Consumption Tax, because of the following two reasons: first, wind energy exploitation will bring the state revenue to support economic development. This activity is consistent with "National strategy on green growth for the period 2011- 2020 with vision to 2050" in Vietnam; second, wind energy is a kind of clean energy, so using them will reduce environmental pollution. Meanwhile, reducing environmental pollution is one of the key tasks in green economic development in Vietnam.

Second, regulations on natural resource output used for natural resource consumption tax calculation.

In the Law on Natural Resource Consumption Tax, tax bases include: natural resource output used for tax calculation, tax-liable price and tax rate. Therefore, the correct determination of natural resource output used for tax calculation will determine the amount of natural resource tax to be paid to the state. However, at present, the method of determining the output for calculation of natural resources tax in the Law on Natural Resources Tax in 2009 is appropriate, because of the following reasons: first, resource operators decide on their own that natural resource output used for tax calculation is not suitable. Because they only choose high-value resources to mine, while other times, to find this resource, they must also exploit low-value resources. This is extremely profitable for them. But as a result, low-value natural resources are left in the mines. This is a waste; The wasteful exploitation of resources is the reason why the state does not collect natural resource exploitation tax from the portion of resources that have been exploited but left in the mines. And as a result, the state budget is reduced because it cannot collect natural resources consumption tax. The above consequences show that it is difficult for Vietnam to achieve the important goals of the “National strategy on green growth for the period 2011- 2020 with vision to 2050” if it does not provide solutions to overcome this problem.

Third, regulations on jurisdiction stipulates the types of natural resources that are taxable objects.

According to the regulations on the Constitution in 2013 of the Socialist Republic of Vietnam, the National Assembly of Vietnam is the highest state power body of the Socialist Republic of Vietnam. It shall exercise constitutional and legislative powers. Therefore, in Vietnam, only the National Assembly has the authority to decide which natural resources are taxable objects. Article 44 of the Law on organization of the National Assembly of Vietnam, “the Standing Committee of the National Assembly shall draft law- and ordinance-making programs and submit them to the National Assembly for decision; direct the implementation of the law- and ordinance-making programs; adjust these programs and report the adjustments to the National Assembly at its next session; set up drafting committees and designate agencies to verify bills and draft ordinances in accordance with law; give comments on bills before they are submitted to the National Assembly; direct the study, assimilation and justification of opinions of National Assembly deputies in order to revise and finalize bills and submit them to the National Assembly for consideration and passage”. Therefore, Standing Committee of the National Assembly has no authority to decide on the tax Laws or change or abolish them. Therefore, the provision in Clause 9 Article 2 of the Law on Natural Resources Consumption Tax is a "constitutional violation". And these provisions will have no legal effect. Therefore, it is necessary to improve this provision.

4.2. Recommendations

First, amendment to the Law on Natural Resource Consumption Tax. Accordingly, to regulation that wind energy is an object to natural resource consumption tax.

This regulation is consistent with current practice in Vietnam and some countries around the world when it is considered that wind energy is an inexhaustible natural resource. And the exploitation of wind energy can bring high economic benefits to Vietnam. In addition, wind energy is clean energy, so consuming this energy will reduce environmental pollution. This is essential for a green economy. It uses clean energy, reduce environmental pollution and develop sustainably.

Besides, the regulation of wind energy as a object of natural resource consumption tax also brings the state an abundant and stable revenue for the state budget. Legally, this regulation also demonstrates the state's right to collect taxes on natural resources in its territory. Moreover, this regulation is the legal basis for wind energy exploiters and users to be economical, efficient and according to the will of the state. However, at the initial stage of applying this new legal regulation, the state needs to stipulate a lower tax rate or apply a tax rate bracket according to the roadmap from low to high. And stipulate a number of other cases when exploiting wind energy is exempted from tax or reduced tax to encourage the exploitation and use of wind energy efficiently and economically.

Second, amendment to the Law on Natural Resource Consumption Tax on natural resource output used for natural resource consumption tax calculation.

In Vietnam, natural resource output used for natural resource consumption tax calculation is based on the declared behaviour of the resource exploiter. Consequences of self-declaration have led to loss of revenue for the state budget and inefficient exploitation of natural resources. So, amendment to the Law on Natural Resource Consumption Tax on natural resource output used for natural resource consumption tax calculation.

Recommendations for this issue are given as follows: Natural resource operators must have a natural resource extraction plan. This plan must clearly show how much potential future production is, how long it will take and what resources will be extracted. Tax authorities will base on this potential catch to temporarily collect tax money. This tax amount will correspond to the potential catch in the natural resource extraction plan. At the end of the year, when finalizing tax, the resource exploiter will provide records and papers to prove that the exploited output is in fact. This mining output is used to compare with the potential yield in the previous resource mining plan. Based on this, the tax authority will decide to collect more tax or refund the tax. This solution will solve two problems: first, avoid loss of tax revenue for the state budget; secondly, it is imperative that natural resource exploiters have a plan to exploit resources efficiently and economically. Only then, "National strategy on green growth for the period 2011- 2020 with vision to 2050" can be implemented in reality.

Third, amendment to the Law on Natural Resource Consumption Tax on jurisdiction stipulates the types of natural resources that are taxable objects

In Article 74 on the Constitution in 2013 of the Socialist Republic of Vietnam, the National Assembly Standing Committee of Vietnam has only the authority to issue ordinances. Ordinance is a legal document with lower validity than law. And, the National Assembly Standing Committee has the power to interpret the Constitution and laws. So, the National Assembly Standing Committee of Vietnam has no authority to change or abolish the law that has been promulgated by the National Assembly of Vietnam. This authority belongs to the National Assembly of Vietnam.

Therefore, it is necessary to change in Clause 9, Article 2 of the Law on Natural Resource Consumption Tax in 2009. Accordingly, the National Assembly of Vietnam must cancel the authority of the National Assembly Standing Committee of Vietnam in Clause 9 Article 2 of the Natural Resource Consumption Tax and give this authority to itself. This solution will solve a very important problem: in accordance with the Constitution in 2013 of the Socialist Republic of Vietnam (The Constitution is the legal document with the highest legal validity in Vietnam. All documents must be complied with. its effect).

4.3. Conclusion

The practice of implementing the 2009 Law on Natural Resources in Vietnam has shown that: First, regulations on taxable object in the Law on Natural Resource Consumption Tax are incomplete; Second, regulations on natural resource output used for natural resource consumption tax calculation are not consistent with the practice of natural resource exploitation in Vietnam. The wasteful exploitation of resources is the reason why the state does not collect natural resource exploitation tax from the portion of resources that have been exploited but left in the mines; Third, regulations on jurisdiction stipulates the types of natural resources that are taxable objects are not consistent with the Constitution. Therefore, in order to achieve the goals set out in "National strategy on green growth for the period 2011- 2020 with vision to 2050", Vietnam needs to: first, regulation that wind energy is an object to natural resource consumption tax; second, amendment to the Law on Natural Resource Consumption Tax on natural resource output used for natural resource consumption tax calculation; third, amendment to the Law on Natural Resource Consumption Tax on jurisdiction stipulates the types of natural resources that are taxable objects.

IMPACTS OF CLIMATE VARIABILITY ON LIVELIHOOD ACTIVITIES OF VIETNAM COASTAL FISHERS COMMUNITY TODAY*

PhD. Nguyen Binh Duc

duchvct3@gmail.com

PhD. Le Van Phuc

lephuccnxh@yahoo.com

Academy of Politics Region III, Da Nang, Vietnam

Abstract

Currently, climate variability is taking place on a global scale and has profound impacts on human life. Vietnam is considered as one of the countries most affected by climate change, especially for the livelihoods of fishing communities in coastal areas. The main content of the article clarifies the concept of climate change, the manifestations of climate change, on that basis, analyzes the impacts of climate change on the livelihoods of fishermen in coastal fishing community in Vietnam today in aquaculture, exploitation and supply of fisheries products.

Keywords: *Climate variability; livelihoods; coastal fisher.*

1. Introduction

Climate variability is a global issue, posing many challenges to countries, especially developing countries like Vietnam. According to international organizations, Vietnam is one of the countries heavily affected by climate variability. This has had a great impact on the livelihoods of people, especially fishermen in coastal areas. Climate variability causes floods, sea level rise, saltwater intrusion..., has seriously affected the livelihoods of coastal fishermen in aquaculture, exploitation and provision of aquatic services. Therefore, research on climate variability and its impact on the livelihoods of coastal fishing communities is an urgent issue today.

2. Method

On the basis of using methods of analysis, synthesis, systematization and generalization of relevant documents on climate variability, livelihoods, coastal fishing communities combined with actual surveys, sociological investigations in some coastal localities. The article clarifies the concept of climate variability, its manifestations and its

* The article is a research product within the overall research project of the ministerial-level scientific research topics in 2020 2021: *"The livilihood or coastal fishers community acceptable to climate change in south central provinces"*.

causes; explain the impact of climate variability on the livelihood activities of coastal fishing communities in Vietnam today in three aspects: aquaculture, exploitation and provision of fisheries services.

3. Results

3.1. The concept of climate variability

The term climate variability first appeared in the United States in 1968, referred to in a report by the Stanford Research Institute, USA (SRI) titled "Resources, Redundancy and Fate of gases that pollute the environment" to the American Petroleum Institute (API), a trade organization involved in the fossil energy industry. The report was assessed by scientists from the Center for International Environmental Law as the first alarm to alert the world about the harmful effects of excessive CO2 in the air. In the study, scientists from Stanford University said that if the amount of CO2 is not controlled, it will cause "climate variability " through specific manifestations such as increasing temperatures, melting ice at the poles and rising sea levels.

Following the phrase "climate variability " in 1968, the world appeared the term "global warming". "Global warming" was first used in a scientific journal by geochemist Wallace Broecker from the Lamont-Doherty Geological Observatory at Columbia University, USA. This article is titled "Climate variability: Are we on the brink of a climate variability?".

In 1988, the famous NASA scientist - James Hansen convinced the US Congress that climate variability had begun despite the suspicions of many other scientists. Hansen said that Earth's temperature in the first five months of 1988 was the warmest in 130 years since scientists started recording annual temperatures. Hansen asserts with 99% certainty that the cause of climate variability is not natural but man-made. Since then, the world has begun to pay more attention to climate variability.

Some achievements to date can be mentioned such as the Kyoto Protocol signed in 1997 and came into effect in 2005 and later the Paris Agreement within the framework of the United Nations Framework Convention on Climate Change (UNFCCC) governs CO2 reduction measures from 2020.

Currently, the concept of climate change has many different views:

According to the definition of the United Nations Framework Convention (UNFCCC): Climate change is a change in climate, which is directly or indirectly caused by human activities that change the composition of the atmosphere, and contribute further to the observed natural climate variability over comparable time periods.

According to researchers from the Vietnam Administration of Seas and Islands: Climate variability is a change of weather that normally occurs in a certain place. It can be the variation in rainfall in a year, or it can be the variation in temperature in a month or in a season. Climate variability is also a change in the earth's climate. It could be a variation of the usual temperature of the earth. Or it could be the variation of rain and snowfall on the earth [5].

Climate variability is a change in climate and related components including the oceans, land, Earth's surface, and the cryosphere, such as increasing temperatures, melting ice, and rising sea levels. Previously, climate change occurred over a long period of time due to the impact of natural conditions, however, recently, climate change occurs due to the impact of human activities such as the use of natural resources. use fossil fuels in transportation and industrial production, emit greenhouse gases (eg CO2) [6].

Climate variability is changes in the physical or biological environment that cause significant adverse effects on the composition, resilience or reproduction of natural ecosystems or on the functioning of natural ecosystems. socio-economic system or to human health and welfare [7].

Climate variability is adverse changes in natural physical or biological environments that have harmful effects on the living things on earth with specific and direct effects on weather, all The manifestation of the weather becoming more severe is due to the adverse effects of the climate. As a result, the climate situation also develops in a more extreme direction, and at the same time brings about bad manifestations that the whole world is facing such as floods, natural disasters, tsunamis or heat and drought.... [8].

3.2. Manifestations of climate variability and its causes.

3.2.1. Manifestations of climate variability

- The greenhouse effect and global warming.

The greenhouse effect is the effect that makes the earth's atmosphere warm because the shortwave radiation of the Sun can penetrate the atmosphere and reach the ground; The absorption ground heats up, creating long wave radiation into the atmosphere for CO2 to absorb, making the air warmer. The CO2 in the atmosphere is like a thick layer of glass covering the Earth, making the earth no different from a large greenhouse. According to calculations, without the atmosphere, the average temperature at the earth's surface layer would drop to -23 degrees Celsius, but the actual average temperature is 15 degrees Celsius, which means that the greenhouse effect has made for the earth to warm up to 38 degrees Celsius. In addition to CO2, there are also methane, ozone, halogens and water vapour, which also have an important effect on the greenhouse effect. Along with population and industrial development at an increasing rate, CO2 emissions into the atmosphere also increase. The forest is over-cut, CO2 should be absorbed by the forest, but the forest area is cut down, so the amount of CO2 is increasing, the greenhouse effect is increasing continuously. According to analysis in the past 200 years, the concentration of CO2 has increased by 25%, the average temperature of the Earth has increased by 0.5 degrees Celsius. It is estimated that by the middle of the next century, the Earth's surface will be hotter by 1.5 more. - 4.5 degrees Celsius; in which the temperature in middle and high latitudes increases more and more [9].

According to the 2nd National Notice of the Ministry of Natural Resources and Environment: From 1958 to 2007, the average annual temperature in Vietnam increased by about 0.5 - 0.7 degrees Celsius. Winter temperatures increased. faster than summer temperatures, and temperatures in the northern regions rise faster than those in the south. Specifically, in 2007, the average annual temperature in Hanoi, Ho Chi Minh City and Da Nang was 0.8 - 1.3 degrees Celsius higher than the average of the decade 1931-1940; higher than the decade 1990 - 2000 is 0.4-0.5 degrees Celsius [10].

- Increasing temperature, hot weather, and drought appear more.

According to experts, the recent warming phenomenon in many parts of the world is the result of huge hot air masses "swirling" around the northern half of the planet, leading to the phenomenon of heat, heat, and heat. growth in the Americas, Europe and Asia.

In Vietnam, according to hydrometeorological experts, the ongoing heat wave has caused temperatures in some areas to exceed the highest levels in history (in 2019). According to statistics from meteorological and hydrological centers across the country, the hottest area is the North Central region with a temperature of up to 43 degrees Celsius (previously, the highest temperature in this locality at the same time was also the highest in the central region). only reach 41 to 42 degrees Celsius). Even an area with a cool climate like the Northwest also recorded a record temperature increase of 40 to 43 degrees Celsius [11].

- Sea level rise.

A worrying manifestation of climate change is that sea level rise has been causing widespread flooding, salinization of water sources, great impacts on agricultural production, and risks to industry and ecosystems. future socio-economic system. Observational data at Vietnam's coastal hydrographic stations show that the current average sea level rise rate is 3mm/year, equivalent to the average growth rate in the world. Over the past 50 years, sea level at Hon Dau Hai Van Station has increased by about 20cm [10]. Global climate change is causing global warming every day, resulting in countless consequences such as melting ice, rising sea levels... Only in the past decade, the rate of increase has increased. of sea level has almost tripled over the last century.

According to United Nations statistics, due to the direct impact of climate *variability*, sea level in the global ocean has increased by 15-20cm since 1900 [12]. Until recently, sea level rise was due to increased water volume due to higher temperatures. Today, the phenomenon of melting glaciers, especially the ice sheets at the top of Greenland in the North Atlantic and Antarctica, have become the main cause of rapid sea level rise.

Around the world, many countries have had to warn about sea level rise or people have to evacuate because sea water has submerged coastal areas. In Vietnam, according to 2018 data, if the sea level rises 1m, there will be about 40% of the Mekong Delta area, about 10-12% of Vietnam's population will be directly affected, and about 10 % GDP. Recently, forecasts have also confirmed that our country's sea level may increase by 33.3cm in 2050 and 45cm in 2070, about 1m in 2100 [13]. If this scenario plays out, many coastal land areas and low-lying areas will be submerged. Some areas will even be permanently flooded.

Sea level rise not only shrinks the land area, but also salinizes some freshwater sources, adversely affecting agricultural production, threatening people's lives. The most affected area is the Mekong Delta. Accordingly, it is forecasted that by 2030, about 45% of this area will be locally saline and cause heavy damage to the crop industry (about 17 billion USD) as well as the water supply system in the low-lying areas of the South [12].

- The phenomenon of saline intrusion.

The most obvious impact of climate variability is to greatly change the flow regime on most rivers and streams, causing many rivers and streams to have their flow severely reduced, in many places to reach record lows and increase increasing the situation of floods, pipe floods, flash floods, riverbank and stream erosion in many localities across the country. Its consequences are leading to drought, water shortage, saltwater intrusion, especially lack of clean water for people's living purposes in many localities as we have seen in recent times.

- Present flash floods and landslides.

Flash floods and landslides are clearly seen in the mountainous terrain of Vietnam. Climate change is likely to make natural disasters more severe and potentially catastrophic, posing great risks to economic and social development or erasing many years of development gains. The regions and areas that are expected to be most affected by negative climate phenomena are the Central Coast, the Northern and North Central Highlands, the Northern Delta and the Mekong River Delta.

According to the Central Hydro-meteorological Forecasting Center, the main impacts of climate change on the factors causing floods, flash floods and landslides are very large; it changes precipitation in the seasonal, spatial distribution; increase the intensity of rain in most situations of floods, flash floods, landslides; increased evaporation and decreased soil moisture. In addition, it causes changes in the vegetation cover due to changes in temperature and precipitation; increased inundation and loss of coastal wetlands due to sea level rise.

According to climate change scenarios, for the Northern mountainous region, the impact of climate change will cause summer rainfall to increase, spring rainfall to decrease; The rainy season as well as the dry season becomes more irregular: starting and ending can be too early or too late, rain is more intense in the peak months of the rainy season and drier in the last months of the season. dried.

In particular, in recent years, flash floods and landslides with unexpected, fast, and devastating characteristics often occur in small and medium-sized basins in the high mountains of the North, Central and West regions. Original. According to experts, flash floods and landslides are increasing in frequency and intensity.

Flash floods and landslides occur in river basins of the Northern and North Central mountainous regions with favorable features for formation: Dissected topography, large slopes of basins and streams, and high degree of elevation. The stability of the topsoil is weak due to strong weathering and the climate seasons of the year are sharply contrasted, the vegetation cover is strongly destroyed, and water concentrates rapidly when there is heavy rain.

3.2.2. Causes of climate variability.

There are many reasons leading to climate variability, but basically it can be reduced to the following two causes:

- Objective causes (due to natural variations), including: changes in solar activity, changes in the earth's orbit, changes in the position and size of the continents, the changes in ocean currents, and circulation within the atmospheric system.

Natural causes of climate variability include changes in the intensity of the sun's brightness, the appearance of sunspots (Sunspots), volcanic activity, ocean changes, and changes in the Earth's orbit.

The change in the intensity of the sun's light causes the energy reaching the ground to change, thereby changing the temperature of the earth's surface. Specifically, since the formation of the Sun until now, nearly 4.5 billion years the intensity of the Sun's brightness has increased by more than 30%. Thus, it can be seen that for such a long time, the change in sunlight intensity does not significantly affect climate change.

Volcanic eruption - When a volcano erupts, it releases into the atmosphere an extremely large amount of sulfur dioxide (SO2), water vapor, dust, and ash into the atmosphere. Large volumes of gas and ash can affect the climate for many years. Small particles called aerosols are ejected by volcanoes, aerosols reflect solar radiation (energy) back into space so they have the effect of reducing the temperature of the earth's surface layer.

Oceans Today - The oceans are a major component of the climate system. Ocean currents move large amounts of heat across the planet. Changes in ocean circulation can affect climate through the movement of CO_2 into the atmosphere.

Change the orbit of the earth - the earth revolves around the sun with one orbit. The axis of rotation has an inclination angle of 23.5°. Changing the tilt of the Earth's orbit can lead to small changes. The rate of change is extremely small, can take into account the time of billions of years, so it can be said that it does not have a big impact on climate change.

It can be seen that the causes of climate change due to natural factors contribute a very small part to climate change and are cyclical from the past to the present. According to research results and published from the Intergovernmental Panel on Climate Change, the cause of climate variability is mainly due to human activities. Invite readers to follow the next article on the causes of climate variability due to human activities.

- Subjective causes (due to human impacts) stem from the change in land and water use purposes and the increase in emissions of CO_2 and other greenhouse gases from human activities.

Thus, climate change is not only a consequence of the greenhouse effect (warming of the earth) but also of many other causes. However, there is a lot of scientific evidence to show that there is a relationship between the increase in earth's temperature and the increase in the concentration of CO_2 and other greenhouse gases in the atmosphere, especially in the industrial era. . During the nearly 1 million years before the industrial revolution, the concentration of CO_2 in the atmosphere ranged from 170 to 280 parts per million (ppm). It is now much higher at 387 ppm and will continue to grow at an even faster rate. Therefore, an increase in the concentration of CO_2 in the atmosphere will cause the earth's temperature to increase and the cause of climate change is because the earth cannot absorb all the CO_2 and other gases, causes the greenhouse effect and other effects due to an excess of gases in the atmosphere.

Since pre-industrial times (circa 1750), humans have used more and more energy, mainly from fossil fuel sources (coal, oil, gas), which have been released into the atmosphere. increasing greenhouse gases of the atmosphere, leading to an increase in the temperature of the earth.

Atmospheric CO_2 data determined from ice cores drilled in Greenland and Antarctica show that, during glacial and thaw cycles (about 18,000 years ago), CO_2 levels in the atmosphere the atmosphere is only about 180 -200ppm (parts per million), which is only about 70% of the pre-industrial period (280ppm). From around 1,800, the CO_2 content started to increase, surpassing 300ppm and reaching 379ppm in 2005, which is about 31% increase over pre-industrial times, outstripping natural CO_2 levels by about 650 thousand past year.

Concentrations of other greenhouse gases such as methane (CH_4), nitrous oxide (N_2O) also increased from 715ppb (parts per billion) and 270ppb in pre-industrial times to 1774ppb (151%) and 319ppb (17%). 2005. Particularly, chlorofluorocarbons (CFCs) are both a greenhouse gas with a global warming potential many times greater than CO_2, as well as a stratospheric ozone-depleting substance, which has only been found in the atmosphere produced by humans since the development of refrigeration and cosmetics industries.

The scientific assessment of the Intergovernmental Panel on Climate Change (IPCC) shows that the energy consumption due to burning fossil fuels in energy production, industry, transportation, construction... contributes about approx. half (46%) to global warming, tropical deforestation contributes about 18%, agricultural production about 9% chemical manufacturing industries (CFC, HCFC) about 24%, the rest (3%) is from other operations.

Between 1840 and 2004, the total CO_2 emissions of rich countries accounted for 70% of total global CO_2 emissions, of which the United States and Great Britain emitted an average of 1,100 tons per person, about 17 times more than in China and 48 times in India.

In 2004 alone, US CO_2 emissions were 6 billion tons, about 20% of total global CO_2 emissions. China is the second largest emitter with 5 billion tons of CO_2, followed by Russia 1.5 billion tons, India 1.3 billion tons, Japan 1.2 billion tons, Germany 800 million tons, Canada 600 million tons, UK 580 million tons. Developing countries emit a total of 12 billion tons of CO_2, accounting for 42% of total global emissions compared to 7 billion tons in 1990 (29% of total global emissions), which shows the rate of emissions. The CO_2 emissions of these countries have increased quite rapidly over the past 15 years. Some developed countries rely on it to require developing countries to also commit under the Climate Change Convention.

In 1990, Vietnam emitted 21.4 million tons of CO_2. In 2004, emissions of 98.6 million tons of CO_2, an increase of nearly 5 times, per capita 1.2 tons/year (world average is 4.5 tons/year, Singapore 12.4 tons, Malaysia 7). 5 tons, Thailand 4.2 tons, China 3.8 tons, Indonesia 1.7 tons, Philippines 1.0 tons, Myanmar 0.2 tons, Laos 0.2 tons).

Thus, Vietnam's CO_2 emissions have increased quite rapidly over the past 15 years, but are still low compared to the global average and many countries in the region. It is estimated that Vietnam's total greenhouse gas emissions will reach 233.3 million tons of CO_2 equivalent in 2020, an increase of 93% compared to 1998 [14].

However, it is worth noting that, while rich countries account for only 15% of the world's population, their total emissions account for 45% of total global emissions; African and sub-Saharan countries with 11% of the world's population emit only 2%, and the least developed countries with a third of the world's population emit only 7% of total global emissions. That is what developing countries raised about equality and human rights at the negotiations on the Climate Convention and the Kyoto Protocol.

Therefore, a fundamental principle, first enshrined in the United Nations Framework Convention on Climate Change, is: Parties must protect the climate system for the benefit of present and future generations of mankind, on the basis of equity, in accordance with common responsibilities, developed countries must take the lead in combating climate change and its harmful effects.

3.3. Impact of climate variability on livelihoods of coastal fishing communities

Livelihood is the activity of making a living of people through the use of resources (human, natural, material, financial, social...) managed by organizations, institutions, and policies [4].

Vietnam currently has about 480,000 people directly involved in fishing; 100,000 people work in the seafood processing industry and about 2,140,000 people are engaged in fisheries services [15]. Fishery livelihoods, including fishing and aquaculture, which depend on water availability and the abundance of coastal resources, should be among the most sensitive and vulnerable to impact of CC. The survey results of the Ministry of labour, Invalids and Social Affairs in 2011 showed that the surveyed localities had a high percentage of workers working in the aquaculture sector, the number ranging from over 50 % to 90% of the workforce. Due to limited investment capital and knowledge/technique, people's aquaculture activities are almost dependent on the natural environment, weather, etc. Losses in aquaculture tend to increase increase in recent years due to the influence of sea level rise, drought, saline intrusion, unseasonal rains and floods, changes in water environment. The loss of aquaculture production in some provinces, such as Bac Lieu, Ben Tre, Ca Mau, etc. has increased by 30-40%/year.

Climate variability has negatively impacted the livelihoods of coastal fishermen in our country in the following ways:

Firstly, the impact of climate change on livelihood activities of coastal fishing communities in aquaculture.

Climate variability causes sea water temperature to increase, which is detrimental to the habitat of some aquatic products; The faster process of mineralization and decomposition affects the organism's food source, making it more expendable in respiration and other activities. The oxygen content in the water decreases rapidly, slowing the growth of aquatic products, creating unfavorable conditions for aquatic organisms that have adapted to the aquatic environment so far, reducing the amount of food for fisheries species.

Climate variability causes changes in the position and intensity of tidal currents and upwelling areas and increases the frequency and intensity of storms and small vortices. The changing hydrological and hydrological conditions have affected the quality of life and the growth rate of aquatic resources. Inundation due to sea level rise will lead to loss of arable land for agriculture. If sea level rises by 1m, it is estimated that about 40% of the Mekong Delta and 3% of other coastal provinces will be inundated [16]. Flooding will cause loss of arable land in coastal agricultural and fisheries areas of Vietnam, especially in the Mekong Delta and Central Coast. On a national scale, Vietnam will lose more than 2 million hectares of agricultural land (about 50%) if the sea level rises by 1m.

Due to limited investment capital and knowledge and technology, people's aquaculture activities are almost dependent on the natural environment, weather, etc. Damages in aquaculture tend to increase increased in recent years due to the influence of sea level rise, drought, saline intrusion, unseasonal rains and floods, changes in water environment. Losses in aquaculture production have increased markedly in recent years.

Second, the impact of climate variability on livelihood activities of coastal fishing communities in fishing.

Climate variability not only negatively affects aquaculture activities in terms of both scale and output, but also negatively impacts fishing activities. Climate variability with the erratic changes of weather at sea (heavy rain, big storms, rising sea level...) has caused many difficulties and dangers for fishermen's ships going out to sea to exploit fishery products. In addition, the time to sail for fishermen is longer and farther from the shore due to the reduction of fishery output, which has a significant impact on human costs and costs incurred in the fishing process of fishermen, affecting the lives and livelihoods of fishermen. In general, climate change tends to change the habitats of aquatic species, leading to changes in the stock of aquatic species due to migration or deterioration of habitat quality; thereby narrowing the fishing ground, catch and aquaculture output.

Third, the impact of climate variability on livelihood activities of coastal fishing communities in the provision of aquatic services.

Aquaculture - exploitation - services in aquaculture are three closely linked stages. Therefore, the negative impacts of climate change on aquaculture and fishing activities have also negatively impacted on aquaculture service provision.

Climate variability also has a direct impact on the activities of aquaculture, because the complicated and erratic changes of the weather have made transportation services from the place of exploitation to the place of processing and consumption meet. many difficulties, especially in the cross-regional and cross-border supply services facing many interruptions. This not only affects the quality of the product, but also the economic efficiency of the product, because the additional costs from providing services increase, but sometimes the product price decreases due to disadvantages of climate variability.

In addition, due to climate change leading to more and more negative weather phenomena (rainstorms, floods, droughts...) Service equipment is increasing, the cost of repairing, maintaining and rebuilding wharves, fishing ports, ships... has greatly affected the livelihoods of fishermen.

4. Conclusion

Currently, climate variability has been causing the greenhouse effect and global warming; temperature increases, heat and drought appear more; sea level rise; saltwater intrusion; flash floods and landslides are becoming more and more complicated. This has had a negative impact on people's livelihood activities, especially on the livelihoods of coastal fishing communities in aquaculture, exploitation and provision of aquatic services. This is a hindrance and a big problem in achieving the goal of stabilizing and improving the lives of fishermen in coastal areas. Faced with that reality, it is required that the Party, State and authorities at grassroots levels have quick response measures in order to minimize negative impacts and adapt to climate variability, and improve the quality of life. life for fishermen in coastal areas.

Abstract

In Vietnam's Mekong Delta, drought and salinity intrusion are among the dominant natural disasters that have a significant impact on the whole region. Cai Lon - Cai Be sluice gate system is being constructed to regulate water resources with the aim of creating stable and sustainable production conditions for agricultural land; proactively responding to climate change, sea level rise, and reducing damages caused by drought and salinity in the dry season to benefit the Ca Mau peninsula with the agricultural area of nearly 350,000 ha. However, the sluice gates can also be exposed to the climate risks which may negatively affect the functions and operation of the infrastructure. Climate proofing measures are necessary to protect the sluice gates from failure due to extreme climatic events. The application of proofing measures requires higher investment and operational cost while the benefit is in question. This paper presents preliminary results of a cost - benefit analysis of applying two climate proofing measures, which are (1) upgrading concrete for pillars and ship locks, and (2) using epoxy coating for the sluice gates. The costs of applying climate proofing measures are the increments in investment and operational costs. The investor's benefits are less repairing cost and less maintenance costs for pillars, ship locks and the *sluice gates. The social benefits also are estimated to include the avoided damages of agricultural households in the area. Using the social discount rate, the net present value (NPV) estimated for two measures are all positive. The results of benefit/cost ratio (BCR) indicate that every dollar spent on the first measure would bring benefit of 17 dollars, and each dollar spent on the second measure would result in 32.5 dollars benefit to the whole society. The results show that the two climate proofing measures for Cai Lon – Cai Be Sluice Gates are very economically efficient.*

Keywords: *cost - benefit analysis, climate proofing, Mekong Delta.*

1. Introduction

Cai Lon – Cai Be (CL-CB) Sluice Gates project is the largest sluice system being conducted in the Mekong Delta of Vietnam, with the estimated cost of VND3.3 trillion (equivalent to US$142 million) (Government of Vietnam, 2017). The main functions of the infrastructure include regulating water sources (e.g. sea water, brackish water, and fresh water), creating stable and sustainable production conditions for production models (fresh, salty - brackish, fresh - brackish alternately) for the beneficiary area with the natural area of 384,120 ha, of which land for agricultural and fishery production is 346,241 ha; combining with the west sea dyke to form a cluster of works proactively responding to climate change, sea level rise and natural disaster prevention; reducing inundation in lowlands in flood season; reducing the damage of drought and salinity intrusion in the dry season for regional production models; and supplying fresh water for domestic use and agricultural production.

However, the Mekong Delta of Vietnam is one of the world's river deltas, most vulnerable to climate change (IPCC, 2007; World Bank, 2011). With the unpredictability of climate change and its impacts, there is worrying that infrastructure projects, such as the CL-CB sluice gate project, might not hold up to its designed function for the lifespan of 100 years. Thus, the United Nations (UN) set Sustainable Development Goal (SDG) 9 to "build resilient infrastructure, promote sustainable industrialization and foster innovation". Many countries, including Vietnam, have committed to achieving this goal and have identified this in their Nationally Determined Contributions (NDCs). To address this objective, it is necessary to assess climate risks on infrastructures and (Comprehensive Climate Risk Assessment13) and analyse cost – benefit of climate proofing measures, as well as mainstreaming these tools into investment planning processes, to secure a resilient future for the country's infrastructures. While CCRAs examine the main climate and hydrological thresholds, probabilities and severity of impacts

[13] The CCRA has been based on the Canadian PIEVC protocol to assess existing and newly planned physical infrastructure in a 5 step process which can be added by a so-called triple-bottom analysis to not only assess current and future risks in relation to climate change, but to provide adaptation options. For further information refer to www.pievc.ca

posing on components of infrastructures and recommend concrete improvements to make the infrastructure more resilient towards climate change and climate variability, an economic analysis helps to ensure the best possible use and allocation of society's limited resources, a concept referred to as economic efficiency.

A climate risk assessment has been conducted for the planning phase of the CL-CB sluice gates since 2018/19 (GIZ, 2019). The CCRA results indicate that the sluice gates will be exposed to the climate parameters such as high temperature, heat wave, heavy rain, tropical storms, drought, high wind, tornadoes, and thunderstorm/lightning. High water level, salinity combined with high temperature and high-water level combined with heavy rain would affect the lifetime and the operation of the structures.

Given the role of the CL-CB Sluice Gates project, it is important to ensure that it operates stably throughout the infrastructure's life cycle against climate impacts. Measures to improve the project's resilience to climate change impacts have been recommended by CCRA, but the question is with limited resources, which measures should be applied from the society's point of view. This study was conducted to perform an economic analysis of CL-CB Sluice Gates climate proofing measures to provide information to decision makers. The analysis provides a means to identify, quantify, and wherever possible value all impacts of each option, including private impacts, which are the cost/benefits of the investor and its social impacts where relevant. The outcome of the analysis will shed light on the economic efficiency of the approved climate proofing measures in Cai Lon – Cai Be Sluice Gates Project.

The detailed objectives of this study are as follows:

1. To review the climate risk of CL-CB Sluice Gates based on Climate Risk Assessment report and the recommended climate proofing measures;
2. To identify and quantify the social cost and benefit of the recommended climate proofing measures for CL-CB sluice gate; and
3. To assess if these climate-proofing measures are socially efficient and make recommendations for the authorities.

2. Method

2.1. Study site

The scope of this study is the area of CL-CB sluice gate project, including the Cai Lon sluice, Cai Be sluice and the dike connecting the sluices to the National Highway 61 and the National Highway 63. The study area is within the Cai San canal in the North – West, Quan Lo – Phung Hiep canal in the South – East, the Hau River (the Bassac River) in the North – East and the West Sea in the West. The total area is 909,248 ha, spreading over 32 districts/cities of 6 provinces of the Mekong Delta of including: Bac Lieu, Ca Mau, Kien Giang, Hau Giang, Soc Trang and Can Tho City.

2.2. Theoretical framework

The climate proofing of infrastructure can be conceptualized from an economics standpoint as insurance against the adverse impacts of climate change (Kotchen, 2011). Determining the right amount of climate proofing requires consideration of both the costs and benefits. Based on Kotchen (2011)'s ideas, the following paragraphs present models of the costs and benefits of climate proofing measures.

- *The costs of climate proofing measure*

Climate proofing measures designed for infrastructure projects (e.g. roads, bridges, etc.) seek to reduce the vulnerability of the investments to changes in climatic conditions (e.g. increased rainfall, high-speed winds, flooding, etc.). In principle, the effectiveness of an infrastructure project can be in the range between 0 and 100 %, where 100 % means that with certainty floods or winds will not damage or destroy the infrastructure. Climate forecasts, as well as input from engineers, can be used to determine such effectiveness and the specifications need. Market valuation can be used to evaluate the direct costs of climate proofing based on the additional costs necessary to increase effectiveness.

- *The benefits of climate proofing measures*

The benefits of climate proofing measures are avoided damages to the property (e.g. structural or operational failures of infrastructures), forgone economic activity as a result of damages (e.g. electrical outages, failed bridges), effects on health and human life, and impacts on environmental services (e.g. erosion, loss of natural capacity to protect from future climate risk). Typically, these benefits are not straightforward to monetize because they are not observable through market transactions and do not have prices. Quantification of them, therefore, usually requires some form of nonmarket valuation.

The benefit and cost of implementing each measure should be adjusted with the time value for money. The introduction of time increases the complexity of the analysis because the monetary value of costs or benefits at some point in the future is not directly comparable to the same monetary value of costs or benefits today mainly due to market changes, individual preferences and inflation. Comparison of measures over time is hence achieved by discounting costs and benefits in each future time period and summing them to arrive at their net present value. The net present value is calculated in the following formula:

$$NPV = \sum_{t=0}^{n} \frac{B_t - C_t}{(1+r)^t}$$

In which, NPV is net present value;

B_t: total social benefit in the year t;

C_t : total social cost in the year t;

r: social discount rate; and

n: project lifespan.

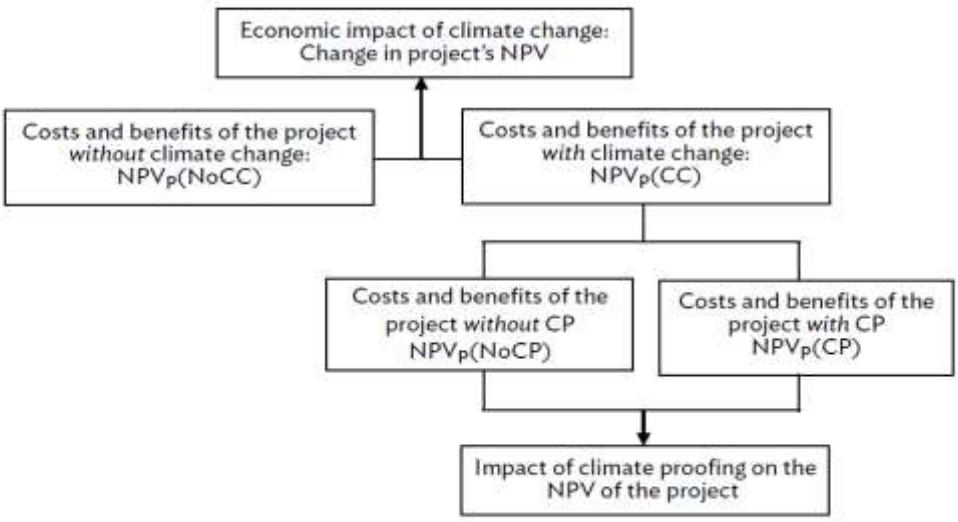
Subject to budget constraints and other considerations, and assuming that there are no alternative measures under consideration, a measure may be accepted if the sum of its discounted benefits exceeds the sum of its discounted costs; that is, where its net present value exceeds zero. Where mutually exclusive measures are under consideration (that is, where projects offer alternative solutions to a single problem), the measures which maximises net present value should be selected.

Another criterion used in CBA is the benefit/cost ratio (BCR). A benefit-cost ratio (BCR) is a ratio used in a cost-benefit analysis to summarize the overall relationship between the relative costs and benefits of a proposed measure. BCR can be expressed in monetary or qualitative terms. If a measure has a BCR greater than 1.0, it is expected to deliver a positive net present value. The formula for BCR is:

$$BCR = \frac{\sum_{t=0}^{n} B_t}{\sum_{t=0}^{n} C_t}$$

According to ADB (2015), a key objective of a cost–benefit analysis is to estimate the net benefits of climate-proofing measures. At the project level, it is important to distinguish between (i) the costs of climate change and (ii) the benefits of climate proofing. As illustrated in Figure 1, given a scenario with climate change, the impact of climate proofing is estimated as the difference between the Net Present Value (NPV) of the project without climate proofing measures (noted NPV_P(NoCP) - where CP stands for climate proofing measures) and the NPV of the project with climate proofing (NPV_P[CP]) - where NPV_P(CP) includes the cost of climate proofing measures.

Figure 5. Impact of Climate Change and of Climate Proofing measures



Source: ADB (2015)

A key feature of the approach is to recognize that the costs and benefits of the climate proofing measures must be assessed by identifying and quantifying the climate change along two scenarios:

➢ Scenario ***without adaptation***: What are the expected of climate change on the project in the future if there were to be no climate-proofing measures in place?

➢ Scenario ***with adaptation***: What are the expected of climate change on the project in the future if there were to be climate-proofing measures in place?

2.3. Data collection

Data for analysis was collected from primary and secondary sources. The secondary data includes the climate risks and their impacts on CL-CB sluice gates as well as on production and properties of residents in Kien Giang provinces; the possible climate proofing measures that can be undertaken; and the additional cost and avoided cost of applying climate proofing measures. They were collected from Kien Giang's General Statistics Office; Kien Giang People's Committees and the Water Resources Investment and Construction Board 10 (PMU10 - the investor). Data on climate risk and its impact were collected through technical reports and interviews with experts from the Southern Institute for Water Resources and Planning (SIWRP) and GIZ on climate risk assessment.

Primary data includes the damages caused by climate change on economic activities when the climate proofing measures are undertaken. In-depth interviews and discussion were conducted with 13 officials, 6 farming households to collect information and opinions on the costs and benefits of sluice gates, production costs and benefits of different farming models and the climate proofing measures for sluice gates. Based on this information, the questionnaire was designed and surveyed by face-to-face interview.

The survey areas include rice farms and shrimp-rice farms. For comparative analysis purpose, the survey focused on the farms within the protected area of CL-CB sluice gates (in Binh An Commune, Minh Hoa Commune of Chau Thanh District and in Hung Yen Commune, Dong Yen Commune of An Bien District) and also the farms outside of the beneficiary area of CL-CB sluice gates (in Binh Giang Commune, Linh Huynh Commune and Son Binh Commune of Hon Dat District. The survey had a total of 213 respondents, consisting of 50 rice farming households and 55 shrimp-rice farming households in the protected area of CL-CB sluice gates and 70 rice farming households and 38 shrimp-rice farming households outside of the protected area of CL-CB sluice gates.

2.4. General assumptions for the economic analysis

Time-horizon

The time-horizon of the evaluation is directly linked to the discount rate. The horizon depends on the lifespan of the options under consideration. The lifespan of CL-CB is expected to be 100 years, which is based on the design of the physical structures (cast-in-situ concrete composition).

Social discount rate

Boardman et al. (2014) suggested that a declining discount rate should be used in long-time project They defined an intragenerational projects as one whose effects occur within a 50-year horizon. Projects with significant effects beyond 50 years are considered intergenerational. They also suggested a social discount rate of 3.5% from year 0 to year 50 and 2.5% from year 50 to year 100. However, the rate of 3.5% is relevant for developed countries. The social discount rate for developing countries should be higher as it ought to incorporate a higher risk premium. In Vietnam, the interest rate of 30-year government bond is 3-4%. The interest rate of social housing loan is 4.8%. Thus, in this analysis, the social discount rate is chosen at 5% for the year 0 to year 50 and 2.5% from the year 50 to year 100.

Exchange rate

The exchange rate used in this report is the average daily central rate of VND versus USD quoted by the State Bank of Vietnam in 2021, which is 23.180.

3. Results

3.1. Economic analysis of the climate proofing measure of upgrading concrete for pillars and ship locks

In order to adapt to the increasing risk due to exposure to high temperature, heat waves and salinity intrusion to pillars and ship locks, the CRA analysis suggested to upgrade the concrete of pillars and ship locks from grade M300 (in the 1st preliminary design) to grade M500 with sulphate resistant cement and anti-corrosion additive mixture. This suggestion has been considered and in fact, the climate proofing measure has turned out as follows:

- M300 concrete was upgraded to M400 concrete (for the pile parts deep below the ground);
- M300 concrete was upgraded to M400 concrete with sulphate resistant and anti-corrosion additive mixture (for the parts in contact with sea water/at risk of corrosion);

Our economic analysis then examines the according actual costs and benefits of the climate proofing measure of CL-CB sluice gates.

Firstly, the according costs can be identified as follows:

- Increased cost to upgrade from M300 concrete to M400 concrete;

- Increased cost to upgrade from M300 concrete to M400 concrete with sulphate resistant and anti-corrosion additive mixture (12 pillars of Cai Lon and Cai Lon ship lock and 3 pillars of Cai Be + Cai Be ship lock).

The increased costs are calculated based on the amount of upgraded concrete, the upgrade level (from M300 to M400, from M300 to M400 with sulphate resistant and anti-corrosion additive mixture), and the prices of different concretes (**Table 1**).

Table 8: Cost identification of upgrading concrete for pillars and ship locks

Item	Cai Lon Sluice Gate	Cai Be Sluice Gate
Amount of M300 concrete updated to M400 concrete (in tons)	11,000	2,200
For the Pillars: Amount of M300 concrete updated to M400 concrete with sulphate resistant and anti-corrosion additive mixture (in tons)	66,000	13,500
For the Ship locks: Amount of M300 concrete updated to M400 concrete with sulphate resistant and anti-corrosion additive mixture (in tons)	20,000	12,500
Price of M300 concrete (VND/ton)	780,000	
Price of M400 concrete (VND/ton)	940,000	
Price of M400 concrete with sulphate resistant and anti-corrosion additive mixture (VND/ton)	1,204,000	
Cost increase (VND)	**49,600,000,000**	
Cost increase (USD)	**2,139,775.6**	

Secondly, the investor's according benefits of the climate proofing measure are identified as follows:

- Benefit from higher endurance to climate risk: less repairing cost for pillars and ship locks during a 100 years' time horizon.
- Benefit from increased expected lifespan: less cost of replacement for pillars and ship locks during a 100 years' time horizon.

In terms of the benefit from increased expected lifespan, our expert consultations (using questionnaire) resulted that the average increase is 21 years, meaning, pillars and ship locks and last 71 years (instead of 50 years) with the upgradation.

In addition, the benefit from higher endurance to climate risk is measured based on the saving of maintenance cost (or sometime called repairing cost). This saving is estimated according to the maintenance cost and the probability of such cost occurs.

- Since the maintenance cost was not identified in the design of CL-CB sluice gates. This cost is expected to be estimated by the management board when needed (after the construction finished), which is very common in the region. In fact, Circular No. 03/2017/TT-BXD on Guideline for determination of costs of maintenance of construction works set the standard maintenance cost from 0.18 to 0.25% of the total investment. In order to avoid over-estimation of the saving, we chose 0.18 % for our calculation.
- The probability of occurring maintenance cost is, in fact, equivalent to the percentage change in risk scores (R) in PIEVC analysis, which reflects how vulnerable a component of CL-CB sluice gate system would be due to effects of climate factors (e.g. heat wave, high temperature, salinity intrusion). According to the formula (R = P*S), R scores take into account both probability (P) of climate extreme occurrence and the severity (S) of impacts associated with individual climatic factor. It is also noteworthy that the application of adaptation measures (including the concrete upgradation) is expected to reduce S but not P. In our calculation, when an adaptation measure is applied, the decrease in the probability of repairing cost occurs is measured as the percentage decrease in R scores from future levels to baseline levels. Accordingly, the average reduction of risk score Δ R is estimated at 2.05% (**Table 2**).

Table 9: The percentage change in risk scores (R) for pillars and ship lock

Climate factor	**Risk Baseline (R0)[a]**	**Risk Future (R1)[a]**	**Standardized[b] change in R: [(R1-R0)/R0]/49**
Pillars			
Heat wave (≥ 8 consecutive days with temperature ≥35°C)	6	12	2.04%
Water level (0.9m)	7	14	2.04%
Salinity (3g/l)	7	14	2.04%
Salinity intrusion + high temperature (Salinity = 3g/l and high temperature ≥ 35°C)	12	20	1.36%

Climate factor	**Risk Baseline ($R0$)[a]**	**Risk Future ($R1$)[a]**	**Standardized[b] change in R: [(R1-R0)/R0]/49**
High water level + heavy rain (Water level ≥ 0.9m and heavy rain ≥ 100mm/day)	4	8	2.04%
Average ΔR of Pillars			**1.90%**
Ship lock			
Lock chamber			
Heat wave (≥ 8 consecutive days with temperature ≥35°C)	3	8	3.40%
Water level (0.9m)	21	28	0.68%
Salinity (3g/l)	7	14	2.04%
Salinity intrusion + high temperature (Salinity = 3g/l and high temperature ≥ 35°C)	12	20	1.36%
High water level + heavy rain (Water level ≥ 0.9m and heavy rain ≥ 100mm/day)	8	20	3.06%
Lock head			
Heat wave (≥ 8 consecutive days with temperature ≥35°C)	3	8	3.40%
Water level (0.9m)	21	28	0.68%
Salinity (3g/l)	7	14	2.04%
Salinity intrusion + high temperature (Salinity = 3g/l and high temperature ≥ 35°C)	12	20	1.36%
High water level + heavy rain (Water level ≥ 0.9m and heavy rain ≥ 100mm/day)	8	20	3.06%
Filling and discharge culverts			
Heat wave (≥ 8 consecutive days with temperature ≥35°C)	3	8	3.40%
Salinity (3g/l)	7	14	2.04%
Salinity intrusion + high temperature (Salinity = 3g/l and high temperature ≥ 35°C)	8	15	1.79%

Climate factor	Risk Baseline (R0)[a]	Risk Future (R1)[a]	Standardized[b] change in R: [(R1-R0)/R0]/49
Leading jetty			
Heat wave (≥ 8 consecutive days with temperature ≥35oC)	3	8	3.40%
Salinity (3g/l)	7	14	2.04%
Salinity intrusion + high temperature (Salinity = 3g/l and high temperature ≥ 35°C)	12	20	1.36%
Average ΔR of Ship lock			**2.19%**
Average ΔR of Pillars and Ship lock			**2.05%**

a Risk score R = P*S, where P: probability of climate extreme occurrence; S: severity of impacts associated with individual climatic factor. The values of P and S were collected from the climate risk assessment results for the planning phase of the CL-CB sluice gates (GIZ, 2019).

b Standardized change in R is calculated based on dividing by 49 because both P and S scores are based on the scale of 1 to 7

Increasing the climate-resilience of the sluice gates would also benefit the agricultural production households in the project area. Thanks to the climate proofing measures, the CL-CB sluice gates are resilient enough to work stably, creating favourable conditions for agricultural production households in the project area. The climate proofing measures are to avoid damages because of inadequate water availability for agricultural production when the sluice gates fail due to extreme weather and climate induced hazards. The avoided damage estimate is based on the average household income lost during salinity intrusion.

For rice farming households, the average revenue and cost per hectare per year are shown in the Table 3. The survey shows that the largest percentage of loss that the households have faced in recent years due to salinity intrusion is 35% on average. Taking this as the maximum level and considering the minimum level as 0%, that is, people fully adapt to salinity intrusion by, the average loss is 17.5%. Thus, thanks to the CL-CB sluice, an average of one hectare of production by rice growers will avoid losses of VND 12,474,836. Using the average reduction in risk score Δ R estimated at 2.05% above, the application of climate change adaptation measures for CL-CB project will help rice growers avoid losses. The avoided losses is estimated at 255,734 VND/ha/year (= 12,474,836 x

2.05%) or USD11/ha/year. It is noteworthy to remember that the benefit value of 255,734 VND/ha/year is the benefit of climate proofing measure for CL-CB sluice gates and is not the benefit of the whole CL-CB sluice gate.

Similarly, with shrimp - rice production households, the survey shows that largest percentage of loss that the households have faced in recent years due to salinity intrusion is 26% on average. Taking this as the maximum level and considering the minimum level as 0%, the average loss is 13%. It is notable that the loss reported by the households is for the income from rice crop. With the same calculation method as mentioned above, the application of climate change adaptation measures for the CL-CB project will help shrimp-rice farming households avoid the potential damage of 152,836 VND/ha/year or USD 6.6/ha/year.

Table 10: Benefit of climate proofing measures for rice farming households

Items	Value (VND/hectare)
Annual revenue	71,797,619
Annual cost	28,539,286
The highest loss (in percentage) in recent years due to salinity intrusion	35%
Average loss (in percentage)	17.5%
Decrease in net income due to salinity intrusion or benefit of the Sluice Gates	12,474,836 (17.5% of annual revenue)
Average ΔR	2.05%
Benefit of climate proofing measures	255,734

Table 11: Benefit of climate proofing measures for shrimp-rice farming households

Items	Value (VND/hectare)
Annual revenue	143,174,793
Annual cost	40,535.256
The highest loss (in percentage) in recent years due to salinity intrusion	26%
Average loss (in percentage)	13%

Decrease in net income due to salinity intrusion or benefit of the Sluice Gates	7,455,392
Average ΔR	2.05%
Benefit of climate proofing measures	152,836

According to the Feasibility Study of CL-CB Sluice Gates, the areas affected by drought and salinity intrusion are as follows: Kien Giang province: 65,679 ha of rice crop; Ca Mau province: 35,221 ha of shrimp-rice crop and 14,121 ha of rice crop; Hau Giang province: Total area of damage is 1,203 ha of rice crop; Bac Lieu province: 8,057 ha of shrimp-rice crop and 3,326ha of rice crop; and Soc Trang province: 13,565 ha of rice crop. Using this information and assuming that the provinces near CL-CB including Kien Giang and Ca Mau would suffer the average percentage of loss which is calculated above and the other provinces (Hau Giang, Bac Lieu and Soc Trang) would suffer half of the average percentage of loss, the annual avoided damage of climate proofing measures in CL-CB Sluice Gates is VND 28,719,930,019 or USD 1,238,951.58.

Applying NPV formula with the discount rate as discussed and the original year of 2020, the Present value of the benefit is estimated at VND 843,011,971,718.12 or USD 36,366,767.30.

Recall the cost of VND 49.6 billion or USD 2.14 million, the NPV of the adaptation measure (concrete upgradation for pillars and ship locks) is then estimated at VND 793,411,971,718.12 or USD 34,227,068.56 for the 100 years' time horizon. Comparing to the investor's benefit which is VND 23.6 billion (USD 1.133 million), the society's net benefit is much larger as the benefit of more than 100,000 households in the project area is counted in this analysis. The benefit/cost ratio (BCR) also increases from 1.52 to 17, meaning that every dollar spent on climate proofing would bring 17 dollars benefit to the whole society. This implies that such adaptation measure is economically beneficial from both investor and society's point of view.

Table 12: Benefit identification of upgrading concrete for pillars and ship locks

	Sum value of CL – CB (VND)
PV of maintenance cost saving due to adaptation	435,398,250.65
Cost of replacement in BAU scenario	441,768,000,000*
PV of cost of replacement in BAU scenario	131,742,181,271.2
Cost of replacement in adaptation scenario	441,768,00,000**
PV of cost of replacement in adaptation scenario	78,437,487,979.17

PV of benefits of increase the lifetime of concrete structure	**53,304,693,292.02**
Residual value of adaptation scenario	261,327,549,295.775***
PV of residual value	**22,120,689,335.18**
Annual households' avoided damage in adaptation scenario	28,719,930,019
PV of households' avoided damage in adaptation scenario	**767,151,190,840.28**

*Note: * cost occurs in 50th year; ** cost occurs in 71st year; *** residual value in 100th year*

Another approach to estimate the climate proofing measures' benefit for the agricultural households is using Willingness to Pay (WTP). WTP is a relevant measure of benefit that a good or service brings to the consumers when there is no market for such good/service. The very first estimation of WTP of agricultural households for a better sluice gates system in the project area is VND500,000/hectare or USD21.6/hectare for one year. Using the affected area of salinity intrusion in the Feasibility Study which is 141,172 in total, we can estimate the total WTP or the benefit of a better sluice gate system for the society is VND 57,510,500,000 per year. Then the total PV of benefit would be VND 1,612,050,058,898.29 (USD 69,542,369). With the cost stays the same at VND 49.6 billion, NPV of the adaptation measure (concrete upgrade for pillars and ship locks) is VND 1,562,450,058,898.29, equivalent to USD 67,402,669.97. In this estimation, the BCR is much higher at 32.5, meaning that every dollar spent on climate proofing would bring 32.5 dollars benefit to the whole society. This approach brings higher results because measuring benefit by WTP would capture both use value and non-use value of the sluice gates.

3.2. Economic analysis of the measure of using epoxy coating for the sluice gates

Based on climate risk assessment, the lift gate type was recommended for the design of both Cai Lon and Cai Be sluice gates. The primary duty of this infrastructure component is to control salinity intrusion. The sluice gate will be installed on the sluice gate structure and the gate(s) move up and down vertically along hydraulic cylinders. The three main components of the sluice gate are the gates, watertight gaskets and bolts. As the gates are closed (i.e., they are under water), they may be affected by water pressure (due to water level differences), flow velocity (obstructing the operation), sediment and salinity intrusion (increasing the corrosion). On the other hand, when opened (the gates are hanging), they are likely to be affected by high wind, heavy rain, storms and lightning. Water level affects the function of the sluice if overflowing, and its stability if the water level difference between front and back of the sluice is large. In addition, the water level also indirectly causes physical and chemical corrosion.

Study of mechanisms and causes of metal corrosion in the Mekong Delta showed that the suitable prevention measure is using a stainless steel together with coating method by epoxy.

Economic benefit of using epoxy coating for the sluice gates

Using coating method by epoxy will increase the corrosive-proof properties of the gates, thus increase the lifespan of the sluice gates. Results from interviewing the engineers participated in the climate risk assessment process of CL_-CB project showed that with the normal coating method (i.e. without the climate proofing measure) .e., the duration of the sluice gates is usually 15-20 years. Ackermann (1998) found that in the salty water, normal coatings may last the duration of steel structure to 10–15 years. To avoid overestimating the benefit, the upper value of 20 years is chosen as the lifespan of the sluice gates in the BAU scenario (without adaptation measure), or the sluice gates would be replaced 4 times during the operation of the whole CL-CB works (100 years).

If epoxy coating method is applied, the lifespan of the sluice gates will be longer. Bleile and Rodgers (2001) estimated that the lifespan of the steel with correct coatings would be 20 years. Our expert consultation indicates that with the special materials of the sluice gates (S355R which contains stainless steel, nickel and chromium) the sluice gates in CL-CB project can be used 30 to 40 years before replacement. For the same reason of avoiding overestimating the benefit, we assumed that the lifespan of the sluice gates with climate proofing measure would be 30 years. Therefore, in 100 years, the sluice gates will be replaced 3 times. The first benefit of using epoxy coating for the sluice gates is cost saving, which is the difference in the present value (PV) of replacement cost in BAU scenario and the PV of replacement cost in adaptation scenario.

The cost of replacement of sluice gates is estimated by the investor, PMU10, at VND 250 billion. In BAU scenario, the PV of replacement cost is VND 221,230,830,628.69 while the PV of replacement cost in adaptation scenario is VND 141,754,206,127.46. Then the value of the first benefit is VND 79,476,624,501.24, which is equivalent to USD 3,428,549.

The second benefit is cost saving due to expanding the lifetime of the coating. Using normal coating required that the sluice gates must be repainted every 3 years and in the year of replacement. The cost of normal coating includes cost of two layers of anti-rust coating and cost of one layer of surface coating. This cost which would be incur every 3 years and in the year of replacement in 100 years if no adaptation measure is applied will be discounted to present to calculate the savings.

The prices of anti-rust coating and surface coating were collected from the quotations of different suppliers in the market. The total amount of paint for in CL-CB sluice gates was estimated by the PMU10 as 35,000 liters, of which 3,889 liters would be used for surface coating and the remaining 31,111 liters would be used for anti-rust coating. PV of cost saving is VND 28,858,915,787.83 (USD 1,244,947).

Therefore, the PV of total benefit of using epoxy coating for the sluice gates is VND 108,335,540,289.07 or USD 4,673,296.

Table 13: The cost of coating the sluice gates in Cai Lon – Cai Be in one year

Item	Value (VND)
Unit price of normal surface coating (VND/liter)	109,437.44
Amount of paint used for surface coating (liter)	3,889
Unit price of normal anti-rust coating (VND/liter)	81,055.33
Amount of paint used for anti-rust coating (liter)	31,111
Total cost of normal coating (VND)	**2,947,311,543.21**
Unit price of epoxy surface coating paint (VND/liter)	163,190.22
Amount of epoxy paint used for surface coating (liter)	3,889
Unit price of epoxy anti-rust coating (VND/liter)	148,303.11
Amount of epoxy paint used for anti-rust coating (liter)	31,111
Total cost of epoxy coating (VND)	**5,248,503,209.88**

Economic cost of using epoxy coating for the sluice gates

The cost of using epoxy coating for the sluice gates is the incremental cost due to using more expensive paint. Two layers of anti-rust coating and one layer of surface coating are necessary for coating the sluice gates in CL-CB. Using epoxy coating required that the sluice gates must be repainted every 15 years. Then the cost of repainting would incur every 15 years in 100 years and in the year of replacement. This number will be discounted to present to calculate the cost of adaptation measure.

The prices of epoxy anti-rust coating and epoxy surface coating were collected from the quotations of different suppliers in the market. The amount of paint which would be used for CL-CB sluice gates is the same as estimation in the calculation of benefit, which is 3,889 liters for surface coating and 31,111 liters for anti-rust coating. PV of cost of using epoxy coating for the sluice gates is VND 11,588,202,424.05 (nearly USD 500,000).

Net benefit of using epoxy coating for the sluice gates

The investor's net benefit of using epoxy coating for the sluice gates or NPV is the difference between the PV of the total benefit and PV of the cost, which is VND 96,747,337,865.02 or USD 4,137,592. The BCR is 9.35, meaning that spending 1 dollar in this adaptation measure would bring 9.35 dollar of benefit to the investor. The NPV is a positive number and the BCR is larger than 1, showing that using epoxy coating for the sluice gates is a beneficial adaptation measure for the investor.

The society's net benefit can also be calculated by adding the benefit of the households in the project area. In this case, using WTP to measure the benefit is an appropriate method as coating the sluice gates with epoxy may not directly decrease the risk of failed operation of sluice gates, but it would enhance the efficiency of the sluice gates' operation. As calculated above, the PV of agricultural households' benefit is VND 1,536,189,278,020.45 or USD 66,269,083. Then the PV of total social benefit is VND 3,181 billion or USD137,2 million. The NPV would be VND 3,169 billion or USD 136.7 million (and the equivalent BCR is about 32.5). The NPV of society is much higher than NPV of the investor, which means that the adaptation measure is very beneficial for the whole society.

4. Conclusion

CL-CB sluice gates is still under construction and will be finalized in 2021 with the expectation of controlling the flood and salinity intrusion to create stable and sustainable production conditions in the Mekong River Delta, Vietnam. However, the climate risk assessment showed that sluice gate materials and components would be exposed and vulnerable to climate induced hazards such as high temperatures, heat waves, heavy rains, tropical storms, droughts, high winds, tornadoes, and thunderstorms/lightning. High water level, salinity combined with high temperature and high-water level combined with heavy rain would affect negatively on the lifetime and the operation of the structures. The results of the CBA of show that the two climate proofing measures: upgrading concrete for pillars and ship locks and using epoxy coating for the sluice gates are efficient both from the investor and the society's point of view as the Net Present Values are positive in all the cases. Thus, it is strongly recommended that the investor should invest in climate proofing measures at the beginning for long term benefit.

IMPACTS OF CLIMATE CHANGE ADAPTATION MEASURES ON RICE PRODUCTION IN YEN THANH, NGHE AN

Dr. Do Thanh Thu
thudt@tlu.edu.vn
Faculty of Economics and Management, Thuyloi University, Hanoi, Vietnam

Abstract

In recent years, increasing climate change has caused natural disasters such as droughts, storms, floods and salination, leading to heavy losses in agricultural production, especially in the field of crop production. In Yen Thanh, the adaptation to climate change has faced many difficulties due to complex topography, along with pressure from rapid economic development and population growth. Based on 146 survey samples, this study addresses the impact of climate change adaptation measures that farmers have been implementing on rice revenue in Yen Thanh, Nghe An.

Keywords: *Climate change adaptation, rice, Yen Thanh, Nghe An*

1. Introduction

According to the World Bank (2018) and Eckstein, Hutfils and Winges - Germanwatch - (2019), Vietnam regularly suffers from extreme weather phenomena, causing serious damage to people and properties. According to statistics from the Ministry of Natural Resources and Environment, natural disasters tend to increase abnormally, with increasing frequency and increasing intensity, especially strong storms, floods, cold weather, drought, and salination. Climate change is warned to negatively affect human life. According to the IPCC scenario by 2050, climate change will reduce about 50% of the food production of Asian countries, including Vietnam.

As a semi-mountainous plain, Yen Thanh has a complex climate. Due to the great radiation from the Sun, Yen Thanh often suffers from drought. On the other hand, the average annual rainfall here is relatively high, from 1,500 to 1,700mm, Yen Thanh thus has been directly affected by many storms, accompanied by heavy rain, sometimes over 300mm per day. In recent years, climate change has caused the average rice-yield in Yen Thanh to decrease by 30% to 40%. In 2010 and 2018, storms and floods damaged thousands of hectares of summer-autumn rice, nearly 4000 hectares of rice crop, and about 700 hectares of vegetables. Although most of the negative weather phenomena are forecasted, in Yen Thanh, adaptation is still difficult.

Most studies in Vietnam focus on selecting climate change scenarios and assessing those scenarios' impacts on the economy and society without paying attention to quantifying the effectiveness of implemented climate change adaptation solutions. Therefore, this study aims to analyze climate change adaptation measures in relation to rice revenue, thereby, making recommendations to improve the effectiveness of these measures in the context of climate change in Yen Thanh, Nghe An.

2. Method

The data used in this study includes primary and secondary data. Secondary data is collected mainly from published documents such as domestic and foreign specialized reports, meteorological agency reports and local statistics. Primary data was collected by interviewing 146 rice growing households at the intensive research sites (Hoa Thanh, Phu Thanh and Dong Thanh communes) Yen Thanh district, Nghe An.

This study selected OLS regression to analyze the impact of climate change adaptation measures on rice cultivation of Yen Thanh households. The model is applied to cross-sectional data. The specific model is as follows:

$$Ln\_revenue_i = \beta_0 + \sum \beta_1 measure_{ij} + \sum \beta_2 household_{ij} + U_i$$

In which,

- The dependent variable $ln\_revenue_i$ is the base e logarithm of revenue from rice of household i. Since the revenue is relatively large compared to the values of other variables in the model, the study uses the base e logarithm of this indicator.

- The independent variable $measure_{ij}$ includes the group of j climate change adaptation measures that households apply. The variable is assigned to 1 when the household i applies measure j ; assigned to 0 when the household i does not apply measure j.

- Control variables are characteristics of the household ($household_{ij}$), including gender of the head of household i ($gender_i$), age of the head of household i (age_i), education level of the head of household ($academic\_level_i$).

- β_i are the coefficient of the variables and U_i are the random errors.

3. Results

3.1. Overview of adaptation to climate change

According to IPCC (2014), Adaptation to climate change is an adjustment to life in changing climate conditions. The purpose of this process is to minimize damage caused by harmful effects of climate change and further to help people prepare well in terms of living habits, and production techniques. Thereby, people can take the advantage of all potential opportunity to gain maximum benefits (for example, flexible crops or changes in crop and livestock structure to ensure productivity and farmers' incomes).

There are many adaptation measures that can be taken in response to climate change. The IPCC report mentioned 228 different adaptation measures, which will be divided into 6 groups, including (1) Loss acceptance (doing nothing); (2) Loss sharing through insurance packages or community supports; (3) Flood controls by reinforcing dams, ditches, dykes; (4) Prevention of negative impacts by strengthening irrigation systems, increasing fertilization, and controlling pests; (5) Change in production methods (switching to drought or moisture-tolerant crops, or changing in land use purposes); (6) Relocation of production activities such as shifting main crops to more favorable areas.

Climate change adaptation is a long-term process, requiring the attention of actors. Over the years, the system of legal documents on strengthening the capacity to respond to climate change has built a legal framework to improve management efficiency and implementation efficiency. Along with that, due to frequent natural disasters, people have been applying many measures to cope with climate change. According to experts, the community's awareness and understanding of climate change will result in an effective measure (Bryant et al. 2000; Wang et al. 2009). As a typical example, farmers in the Central region that are frequently affected by drought understand that planting drought-tolerant crops such as peanuts as an alternative to rice will achieve high production efficiency and reduce risks from natural disasters.

3.2. Climate change situation in Yen Thanh

Yen Thanh is located in the monsoon tropics with cold winters and divided into two seasons: hot, humid summers with a lot of rain and cold winters with little rain. The average annual temperature is from 24 to 25^0C. The temperature difference between months of the year is quite large. The average temperature of the hottest months (June to July) is 30-31^0C, the absolute high temperature is $42{,}7^0$C, while the average temperature of the coldest months (December to February next year) is 19^0C. and the absolute low temperature is $-0{,}5^0$C. The average number of sunshine hours per year in Yen Thanh is around 1.500 to 1.700 hours.

Yen Thanh is the area with average rainfall compared to other areas in Nghe An. The average annual rainfall ranges from 1,200 to 1,900 mm per year with around 123 to 152 rainy days and divided into two seasons. The dry season from November to April next year, the rainfall accounts for 15-20% of the annual rainfall; The driest months are January and February (rainfall reaches 7-60 mm/month). The rainy season from May to October, the rainfall makes up 80-85% of the year's rainfall; The most rainy months are August and September with a rainfall of 220-540mm per month and 15 – 19 rainy days per month. During these two months, rain is often accompanied by stormy winds.

Table 1: Climate change in Yen Thanh

Source: North Central Hydro-meteorological Center

The number of cold days in Yen Thanh has tended to decrease, however, the temperature has shown negative signs, the extremely low temperature has gradually decreased in recent years, especially reaching 4-7 degrees with frost in 2018 . Similarly, the number of heavy rainy days per year has slightly decreased, but the rainfall per has increased. In the period 1991-1999 the maximum rainfall was 320 mm/day, then in the period 2010 - 2018 the maximum rainfall was reported at 345.3 mm/day. Regarding the number of storms, although the number of storms affecting Yen Thanh has decreased, the storm intensity have been alarming. Due to climate change, the number of hot days tends to increase significantly, especially, in 2016 there were 12 times of 5-7 hot days, the temperature reached approximately 43^{0}C.

Table 2: Extreme weather phenomena in Yen Thanh

Periods	Number of days with heavy rain per year (over 100mm/24h)	Number of storms per year	Number of extreme cold days per year (less than 13^0C)	Number of hot days over 37 degrees per year
1991-1999	46	12	13	16
2000-2009	42	8	11	29
2010-2018	39	5	9	41

3.3. Impact of climate change on rice production

In Yen Thanh, agricultural production is heavily affected by climate change. Interviews with 146 farmer households showed that many extreme weather phenomena, namely salinity, severe cold, harmful cold, heat, drought, and storms have seriously affected their crops.

Table 3: Impact of climate change on rice production

	Cultivated area decreased	Productivity is reduced	Rice plants grow slowly	Lack of water for irrigation	More diseases	Plants are dead	Crops are lost	Not affected
Salinity	103	90	79	0	0	59	0	26
Cold	6	57	120	2	13	103	29	4
Drought	11	42	35	92	4	73	16	0
Heat	1	29	57	86	41	60	10	0
Storm	12	120	7	0	18	39	85	0

Source: Author's calculation from survey data

The above table shows that the cold weather in Yen Thanh in recent years caused slow growth and death of crops (82.19% and 70.55% of surveyed households, respectively). Salinity has also made many areas uncultivable. In fact, according to the survey, 70.55% of the households believed that salinity caused a decrease in the cultivated area, 61.64% of the households confirmed that the rice yield decreased. In Yen Thanh, heat and drought are the main environmental constraints. These two phenomena caused water shortage (63.01%), dead rice plant (50%), and a decrease in crop yield (26.1%). Prolonged periods of heat with high temperatures in the summer affected labor efficiency, spring rice harvest progress, and summer rice cultivation. The most severe impact on crop productivity is the storm. Storms have reduced productivity (82.19%), especially storms caused damage to crop areas accounting for a high proportion (58.22%). Since storms are often accompanied by heavy rains and floods, the disease on crops is very serious.

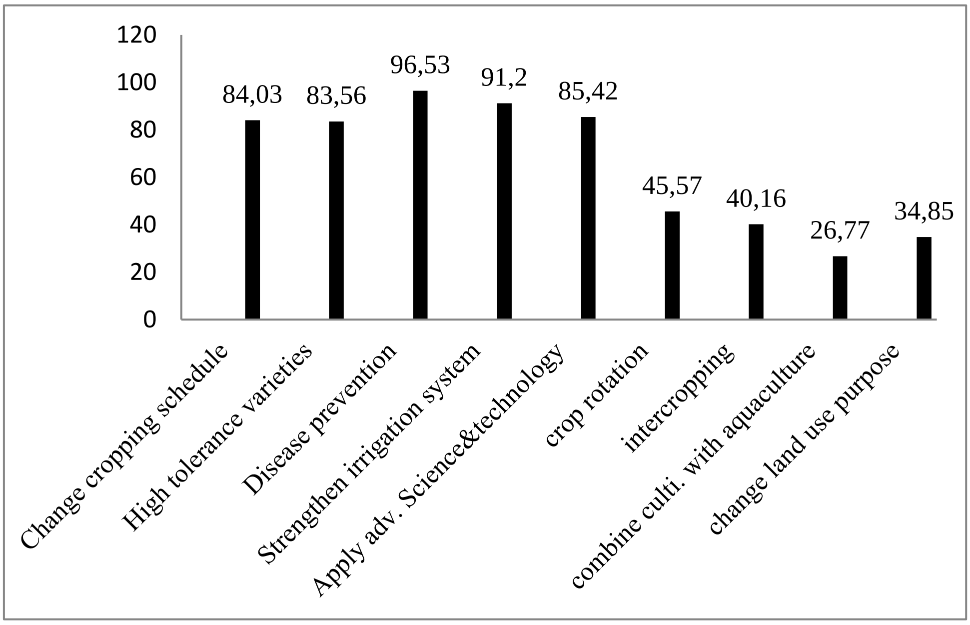
3.4. Climate change adaptation of rice farmers

3.4.1. Overview of climate change adaptation measures of households

According to the survey results, farmers in Yen Thanh have applied five main measures to adapt to climate change, including: (1) Changing the cropping schedule; (2) Select rice varieties with high tolerance; (3) Strengthen disease prevention; (4) Strengthen the irrigation system; (5) Application of advanced science and technology. In addition, some other measures used by households are crop rotation, intercropping, combination of rice cultivation with aquaculture, and change of land use purpose.

The chart shows that in adaptation activities, measures to strengthen disease prevention for rice made up the highest percentage (96.53%), followed by strengthening irrigation system (91.2%), applying advanced science and technology (85.42%), changing the cropping schedule (84.03%), and using rice varieties with high tolerance (83.56%).

In addition, according to the survey, to adapt to climate change, farmers use many different methods at the same time. Most of the households have applied two or more adaptation measures (accounting for 70%). That proves, climate change strongly affects production activities, farmers have to find many different ways to adapt. To have a more specific analysis on the impact of climate change adaptation measures on rice production results, the study will perform a regression.



Source: Author's calculation from survey data

Figure 1: Climate change adaptation measures applied by households

3.4.2. Impact of climate change adaptation measures on rice production results

To analyze the impact of climate change adaptation measures on rice production results, the study implements OLS regression as follows:

$$Ln\_revenue_i = \beta_0 + \sum \beta_1 measure_{ij} + \sum \beta_2 household_{ij} + U_i$$

Within the scope of the analysis, the study deals with the measures applied by farmers with the highest percentage, The variables used in the model are described in the table below:

Table 4: Descriptive statistics of variables in the regression model

Variables	Unit	Coding variables	Mean	Min	Max
Age		Age	46	23	78
Gender		Gender	0.601	0	1
Education level		Academic_level	3.6875	1	5
Revenue from rice	Mil. VND	Revenue	5.923	4.830	14.212
Changing the cropping schedule		Change_schedule	0.8403	0	1
Select rice varieties with high tolerance		Tolerant_varieties	0.8356	0	1
Strengthen disease prevention		Disease_prevention	0.9653	0	1
Strengthen the irrigation system		Irrigation	0.912	0	1
Application of advanced science and technology		Science_tech	0.8542	0	1

Source: Author's calculation from survey data

Since the rice revenue has a high value that exceeds the values of the variables, the topic uses the base e logarithm of the revenue from rice *(ln_revenue)* to make the data uniform. In addition, gender and the application of adaptation measures are coded 0 and 1, in which male takes the value 1; female takes the value 0; households have applied the measure of receiving value 1; otherwise it is 0.

OLS regression result with dependent variable the base e logarithm of the revenue from rice under the influence of household characteristics and dummy variables of climate change adaptation measures, after checking for defects including multicollinearity, heteroscedasticity and autocorrelation is as follows:

Table 5: Regression results

VARIABLES	model ln_revenue
Age	-0,00165
	(0,00347)
Academic_level	0,0673*
	(0,0524)
Gender	0,0256
	(0,0798)
Change_schedule	1,632***
	(0,141)
Tolerant_varieties	0,184**
	(0,0901)
Disease_prevention	0,154*
	(0,105)
Irrigation	0,0171**
	(0,127)
Science_tech	0,034***
	(0,083)
Constant	7,744***
	(0,234)
Observations	146
R-squared	0,782

Standard errors in parentheses

*** p<0.01, ** p<0.05, * p<0.1

Source: Author's calculation from survey data

The above results show that all five main measures have a positive impact on rice revenue, in which, measure of changing in cropping schedule has the greatest effect.

Regarding the change in cropping schedule, because the weather and natural disasters forecast of Nghe An province are relatively good, the instructions from the authorities on natural disaster prevention are timely, resulting in reduced damage. Additionally, to cope with natural disasters such as storms, droughts, heat, cold or salinity, local authorities have instructed farmers to plant or harvest early. Regression results show that changing in cropping schedule can increase rice revenue by 1,632% compared to cropping in the usual schedule.

For the measure of selecting rice varieties with high tolerance, the agricultural extension agencies have useful advice on rice varieties for farmers. For pure rice, farmers have changed from Bac Thom to BC15 and RVT ,,…; for hybrid rice, farmers have changed from Tap Giao 838, 903, CT16 to TH3-3. According to the results of the regression, farmers that choose varieties with high tolerance in production can increase rice revenue by 0,184% compared to households that do not apply this measure.

Disease preventing for rice needs to be carried out regularly, especially before and after natural disasters. Accordingly, farmers who well apply these techniques can increase their rice revenue by 0,154%. This measure need to be learned from local communities and agencies.

In terms of strengthening the irrigation system, the improvement of economical irrigation methods, strengthening the irrigation system to ensure enough water for the winter-spring and summer-autumn crops, preventing salinization can increase tolerance of rice, thereby increasing revenue. The regression results also prove this, compared with farmers that do not regularly strengthen their irrigation systems, farmers with good irrigation systems could earn 0,0171% higher rice revenue.

For the measure of applying advanced science and technology, the regression results show that farmers applying this method could gain 0,034% higher rice revenue than traditional rice farmers. Currently, many Yen Thanh farmers have applied advanced farming methods such as Good Agricultural Practices (VietGAP), Integrated Crop Management (ICM), 3 decrease 3 increase rice cultivation techniques (3G3T), 1 must 5 reduce cultivation techniques (1P5G), System of Rice Intensification (SRI), Integrated food-energy system (IFES),... These successful models will create new directions in farming, contributing to soil protection, stabilizing productivity, increasing income and economic efficiency for farmers.

4. Discussion and Conclusion

The study has contributed to understanding the effects of climate change on rice production of farmers in Yen Thanh, Nghe An. Regarding the impact of climate change on rice cultivation, natural disasters such as cold, heat, salinity, drought, and storm have caused many adverse impacts on production activities to varying degrees. from low, medium to high. These effects generally cause difficulties for rice cultivation, affecting rice yield, growth and production output. Storms cause the most impact and damage, followed by drought and salinity.

Regarding measures to adapt to climate change of farmers, the study proposed nine main adaptation measures, however, there are five measures chosen by the majority of people, which are strengthen disease prevention for rice, strengthening irrigation system, applying advanced science and technology, changing the cropping schedule, and using rice varieties with high tolerance. The analysis results show that these measures, when applied, have a positive effect on rice revenue.

On the basis of the research results, the study makes some recommendations on solutions to increase the effectiveness of the response for households to changes in climate change as follows: (i) Local authorities play an important role in enhancing the response capacity of local communities. Therefore, it is necessary to effectively promote the role and responsibility of local authorities in climate change adaptation programs in the locality; (ii) With agricultural production as the main activity, farmers are the first to suffer the consequences of these adverse effects. Therefore, farmers must be the first and proactive in raising awareness and capacity to respond to climate change.

THE TEMPORAL EVOLUTION OF THE RESEARCH IN CLIMATE CHANGE ADAPTATION

MSc. Nguyen Thuy Linh

thuylinh@neu.edu.vn

MA. Tran Ngoc Thuy

ngocthuytnt@neu.edu.vn

Faculty of Environmental, Climate Change and Urban Studies, National Economics University, Hanoi, Vietnam

Abstract

Research on climate change adaptation has increased in number and significance since the 1970s. Yet, the volume of information on adaptation is now difficult to manage given its vast scope and spread across journals, institutions, disciplines and themes. While an increasing number of researchers have used systematic literature reviews to analyse particular themes within this rapidly growing field of research, there is still missing an overall analysis of the current state of climate change adaptation science literature and its evolution. This paper provides a bibliometric review of climate change adaptation science literature that is focused on the human dimensions and how it has been constructed across time, disciplines, social relationships and geographies. Our novel review, spanning from 1978 to mid-2020, identifies the underpinning foundations of climate change adaptation literature, leading authors, countries and organisations as well as dominant research themes and priorities and explores how these have changed over time.

Keywords: *Climate change adaptation, Climate adaptation science, Bibliometric analysis, VOSviewer*

1. Introduction

Over the last two decades climate change adaptation has emerged as a central and now acknowledged component of the international climate change policy and research agenda (Klein et al., 2014; Owen, 2020; Swart et al., 2014). The Paris Agreement and its Article 7 have secured a prominent platform for climate adaptation as a key issue for global governance (Persson, 2019). Adaptation received its own ISO standard in 2019, cementing it further as a distinct area of research, policy and practice. Specific climate change adaptation conferences, such as the Adaptation Futures series, have been running since 2010 and new scientific degrees and professional certifications are being developed specifically for climate adaptation. That climate change adaptation literature is flourishing is evidenced also by the rapid expansion of the number of publications with a focus on climate adaptation. In fact, thousands of climate adaptation papers are now published each year (Noble, 2019).

Yet, to date, a focused analysis is still missing on the evolution of this literature, including its extent, growth and diversification over time. Adaptation science is both basic and applied (Moss et al., 2013) and includes knowledge about the processes of adaptation and knowledge generated about adaptation". This science however finds itself in a paradox: while it has quickly amassed a wealth of knowledge about the problem and potential solutions, it is "still characterized by an evolving epistemological base" (Eisenack and Stecker, 2012, p. 244). The field is plagued by "the dependent variable problem" (Biesbroek et al., 2018, p. 2) as to what counts as "adaptation" (Dupuis and Biesbroek, 2013). Large bodies of work exist that, even if not explicitly framed as climate change adaptation, still form a critical mass of knowledge that supports climate change adaptation ideas, theoretical development, and implementation (Biesbroek et al., 2018; Dupuis and Biesbroek, 2013; Keskitalo and Preston, 2019). The overall knowledge base remains fragmented (Cradock-Henry et al., 2019), including difficulties in capturing other forms of knowledge outside peer-reviewed literature such as the lived experiences in the Global South, and Indigenous knowledge in its different forms (Parsons et al., 2016). Method-focused reviews by Biesbroek et al. (2018) have focused on design, data and methods for adaptation policy reviews, Dupuis and Biesbroek (2013) reviewed underlying factors in conducting comparative studies on climate adaptation policies while Berrang-Ford et al. (2015) reviewed and synthesised methodologies for systematic reviews on adaptation. Lesnikowski et al. (2019) used topic modelling in adaptation governance research with UNFCCC COP (United Nations Framework Convention on Climate Change, Conference of the Parties) speeches and 25 Canadian municipalities as a methodological example of data analytics in adaptation research. Other recent review studies have looked at adaptation progress in Australia (Palutikof et al., 2019), public participation and engagement (Hügel and Davies, 2020), role of local knowledge (Klenk et al., 2017), and adaptive capacity (Siders, 2019). Others have used innovative methods to for example define generic trends across case studies such as adaptation finance archetypes that hold true across a range of local governments (Moser et al., 2019b). While these systematic reviews provide key insights into specific trends within particular themes and methodological advancements for adaptation science, they are limited by focusing on necessarily small sample sizes, specific topics and short time horizons. Complimentary methods, such as bibliometric analysis, provide therefore a significant opportunity to discover and examine broad trends through large datasets across long time periods (Hood and Wilson, 2001; Mingers and Leydesdorff, 2015; Mongeon and PaulHus, 2016). This broad scale analysis is particularly important since individual scientists do not operate in an intellectual vacuum but ideas are always intertwined with the "background knowledge of the time" (Chalmers, 1982, p. 56). Yet, to date the few papers that have attempted bibliometric reviews of climate change adaptation science literature have been too broad to provide robust explanations of the changes in research focus over time (e.g. Wang et al., 2018), not focused on climate adaptation per se (e.g. Di Matteo et al., 2018; Giupponi and Biscaro, 2015;

Haunschild et al., 2016) or are now outdated (e.g. Janssen, 2007; Janssen et al., 2006). Our aim therefore is to provide a novel analysis of the main trends in peer-reviewed literature that specifically focus on the human dimensions of climate change adaptation. We demonstrate the evolution of climate adaptation science, how the research topics have changed over time, the social networks of authors via co-authorship, and the most cited papers and the foundational literature that underpins the climate adaptation science literature. This broad overview is one of the first attempts to quantify the rapid growth of climate adaptation science literature, identify the geographical and institutional sources of this knowledge, and explain the evolution of adaptation science priorities over time. The paper is organised as follows: next, we explain the methodological choices in bibliometric analysis and the parameters that were used to search, include and exclude. Section 3 presents the result of the temporal evolution of the research (including core research topics and themes). This is followed by a discussion on what these underlying trends mean for the development of climate adaptation science and what they tell us at present how the field has and is behaving. We also reflect on the potential new areas that are likely to influence the field and discuss the intricacies of conducting large reviews given that these kinds of research methods are likely to increase in importance in the future.

2. Method

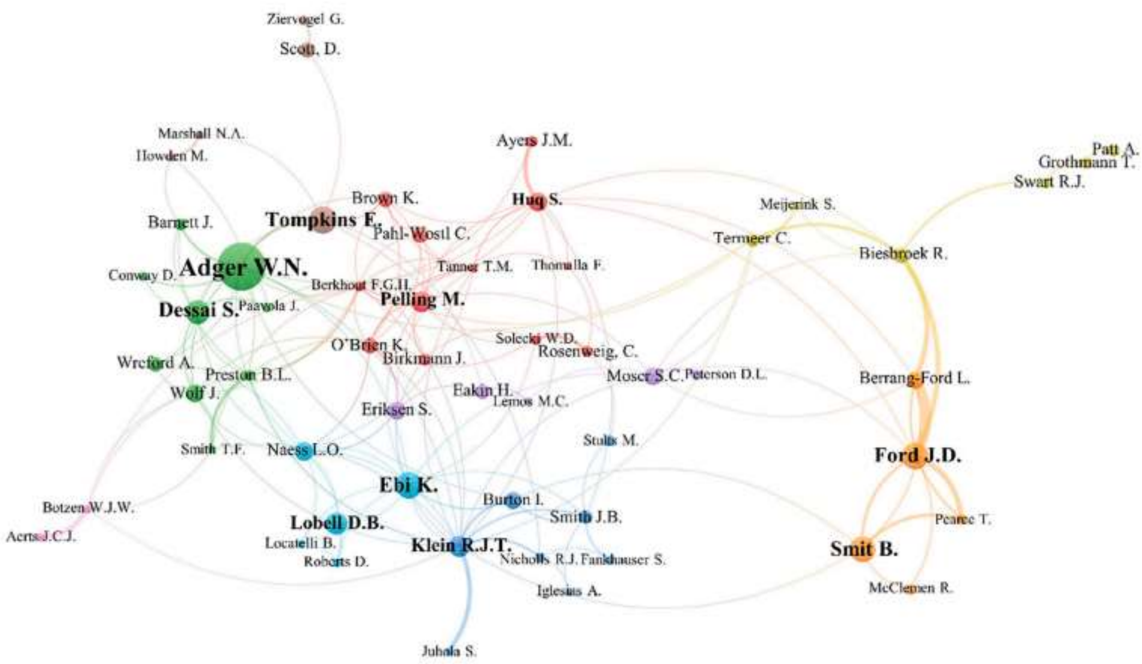
The production of knowledge within the field of climate change adaptation has exploded since the start of the century, with increases in both specialised and transdisciplinary research (Giupponi and Biscaro, 2015; Janssen, 2007; Janssen et al., 2006; Wang et al., 2018). These factors render it near impossible to stay on top all this literature and assess the collective developments made by J. Nalau and B. Verrall Climate Risk Management 32 (2021) 100290 3 this field. Thus, review methods that can assess massive and diverse sets of literature to track the rapidly evolving knowledge base are now more relevant than ever. Several literature review techniques exist such as narrative reviews (e.g. Baumeister and Leary, 1997; Wong et al., 2013), systematic reviews, and meta-analyses (e.g. Davis et al., 2014; Liberati et al., 2009; Moher et al., 2014) as well as bibliometric, visualisation and content analysis reviews (Mingers and Leydesdorff, 2015; Vinkler, 2010). While narrative, systematic and meta-analyses are well-established and explored review methods in this field, they are constrained by their ability to assess relatively small bodies of literature (e.g. less than 500 publications), whereas bibliometrics use statistical analysis of publication metadata and thus, can assess much larger literature sets (van Eck and Waltman, 2010). The current study employs a combination of bibliometric, visualisation and content analysis techniques to analyse the climate change adaptation science literature. And still, capturing all relevant publications related to a specific field is difficult (Buckland and Gey, 1994), especially with a rapidly developing, comprehensive and transdisciplinary research field like climate change adaptation. Historically, this field has been conceptualised under several collective phrases as it has evolved (Wang et al., 2018). Thus, determining an appropriate query requires a systematic approach, such as iterative query reformulation (Wacholder, 2011) where analysis of preliminary search results of key papers inform renewed searches (Wang et al., 2014). This study implemented a similar query formulation method to search for climate change adaptation literature in the well-regarded, international databases Scopus and Web of Science Core Collection (Fig. 1), where these databases were selected to prevent geographic biases and increase publication coverage (Falagas et al., 2008). However, initial search results returned numerous publications concerning biological adaptation to climate change, as terminology is shared between these research fields. Therefore, irrelevant publications that lacked a societal dimension where iteratively filtered out by adding exclusion terms to the query. This process included successively adding exclusion terms (e.g. physiology, phenology, genes, genetic, plasticity, genus, species or molecular), which were determined using iterative query reformulation (Wacholder, 2011) and do not reflect the human dimensions of climate change adaptation. Search results were then limited to articles, reviews, book chapters and books in addition to limiting to 'topic section' (title, keywords and abstracts) to identify publications primarily focusing on climate change adaptation. While this may not identify all relevant publications, it selects the publications where authors have prioritised climate change adaptation as a core focus of their publication. Thus, bibliometric metadata were retrieved from the Scopus and Web of Science database on 16 June 2020 (Fig. 1). Scopus returned 10,274 publications while there were 8,586 publications extracted from Web of Science Core Collection. Publication metadata from these two sources were compiled into a database and duplicates were removed (N = 7,070). Although the query used in this study included exclusion terms to filter those publications that concerned biological adaptation to climate change, a further 284 publications were removed from the database after careful review of abstracts, keywords and titles by both authors. The final database contained 11,506 publications, where metadata were manipulated to identify temporal patterns in the literature including splitting into three broad time periods (early research 1978–2010, emerging research 2011–2015 and the latest research 2016–2020) as well as on an annual basis. The parameters of these time periods were selected based on temporal distribution of publications, ensuring there was enough data within each period to make sound comparisons (Verrall and Pickering, 2020), and to highlight the rapid expansion of publications after 2010. The number of publications were not normalised by population given that the number of researchers within a population is unlikely to explain why some countries fare better in adaptation science than others. Main authors, organisations, journals, subject areas (Web of Science Core Collection Categories) and spatial trends in the research were assessed. Since subject areas differ between Scopus and Web of Science, we coded publications from Scopus to the Web of Science Core Collection Categories based on abstracts, titles and keywords (Verrall and Pickering, 2020). Publications assigned to countries for spatial analysis were calculated in two ways: (a) by author affiliation and (b) by content analysis of 'topic sections' to determine where research was focused. Determining where the research was focused was calculated by analysing the abstracts for the frequency of occurrences for each country to provide a relative measure of research density (Verrall and Pickering, 2020). All contributing authors and subject areas are included, so some publications may be counted multiple times (Haunschild et al., 2016; Mingers and Leydesdorff, 2015). To identify dominant research topics and themes as well as co-author and co-citation interconnections, the bibliometric analysis package VOSviewer (van Eck and Waltman, 2010) was used to visualise and map the literature (see www.vosviewer.com). To reduce ambiguity, keywords, authors and reference titles were clustered using thesauri prior to analysis (Waltman et al., 2010). The distancebased maps produced here are generated by bibliographic coupling as a method to position nodes (e.g. keywords, authors, reference titles) and are weighted by number of documents/citations and link strength (Waltman et al., 2010). The distance between nodes is relative to the bibliographic similarity and nodes are allocated clusters which identify closely interrelated nodes. VOSviewer uses a modularity-based clustering method, which is comparable to multidimensional scaling and is generated by the smart local moving algorithm (Waltman and Van Eck, 2013; Waltman et al., 2010).

3. Results

3.1. Temporal evolution of the research

The first recorded publication from this literature was published in 1978 and assessed the relationship between climatic variations and horticultural trade flows in Europe (Folley, 1978). There were only 1,188 publications (10.3%) over the next 32 years (1978–2010), after which there has been a rapid increase in research on this topic with 4,035 publications (35.1%) over the following five years in the emerging period (2010–2015) and a further 6,283 publications (54.6%) in the latest five years. The greatest increase in publications on this topic occurred between the five-year period of 2006–2010 (540% increase from previous five years). Overall, this literature has seen an average annual growth rate of 28.5% and is thus set to double in size by early 2022.

Figure 1: Co-authorship of leading authors with at least 10 publications and 500 citations (60 authors) with the data displayed as distance maps, using VOSviewer software



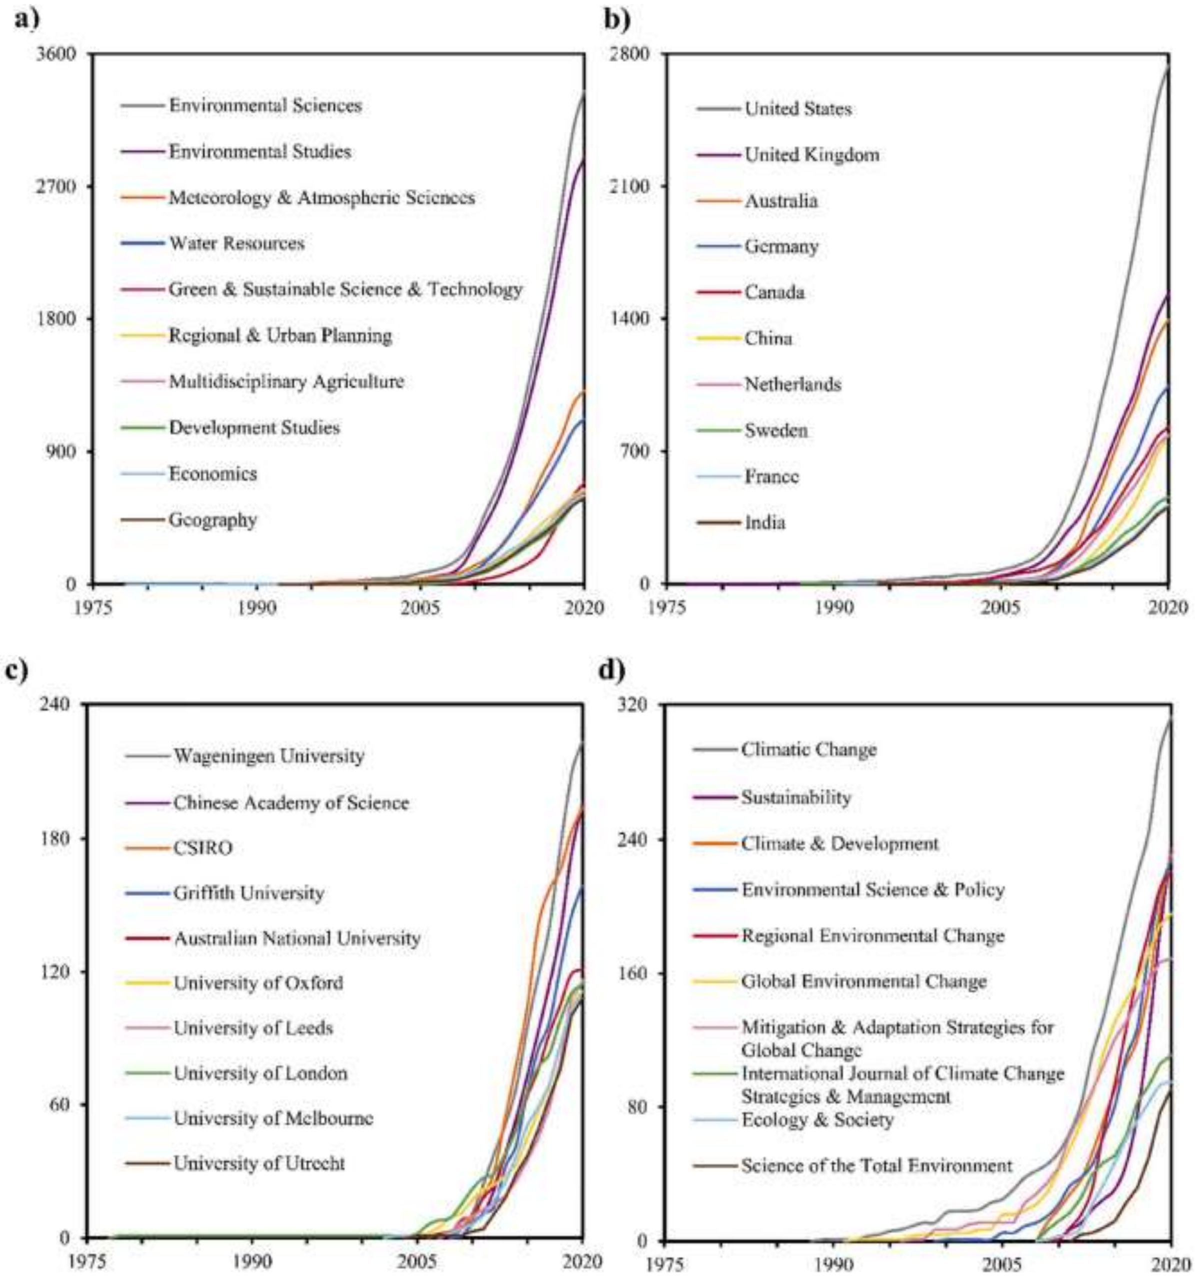
Source: Van Eck and Waltman, 2019 (Lines are weighted by the number of links, with minimum line strength indicating one co-authored publication. Circles are weighted by the number of citations and top ten cited authors denoted by bold labels).

The diversity of subject areas covered by this literature has expanded considerably through time (Figure 2a). The first publications from this literature focused on 'economics', 'meteorology and atmospheric sciences' and 'multidisciplinary agriculture' but 'environmental sciences' and 'environmental studies' have become the dominant subject areas through time. Both 'multidisciplinary agriculture' and 'economics' were key subject areas until 1995, after which research on 'water resources' increased considerably. Research focus began to diversify from natural sciences to better encompass human dimensions such as 'regional and urban planning', 'development studies' and 'geography' from 2005 onwards, and most recently, 'green and sustainable science and technology' has become a key research area. Considering the temporal publication dynamics of countries, the United States and the United Kingdom have led this literature since its inception while Canada was also an important early contributor (Figure 2b). Since 2010, Australia has emerged as a research powerhouse, with Germany also considerably increasing its research output. The research of these leading countries has been excelled by a handful of research organisations (Figure 2c), with several organisations from Australia (CSIRO, Griffith University, Australian National University), the United Kingdom (University of Oxford, University of Leeds and University of London) and the Netherlands (Wageningen University and University of Utrecht). University of London and University of Oxford were leading contributions to this literature before 2010, but more recently, Wageningen University, CSIRO, the Chinese Academy of Science and Griffith University have emerged as the core organisations publishing on this topic. The leading journals that have published this literature have also evolved over time (Figure 2d). Early work on climate change adaptation was naturally published in those journals that were forerunners in this area: Climatic Change (established 1978), Global Environmental Change (established 1990) and Mitigation and Adaptation Strategies for Global Change (established 1996). Regional Environmental Change (established 1999) has risen rapidly as a major publication outlet for climate adaptation since 2010. From 2004 onwards, journals such as Environmental Science and Policy (established 2001) have also increased their publication outputs on climate adaptation. After 2005, several newer journals began rapidly publishing on this topic including Sustainability (established 2009), International Journal of Climate Change Strategies and Management (established 2008) and Science of the Total Environment (established 2014). The overall strongest journal in this field remains Climatic Change.

3.2. Core research topics and themes

The most cited publications of this literature cover topics such as food security (Lobell et al., 2008; Pittelkow et al., 2015; Rosenzweig et al., 2013; Smit and Skinner, 2002), adaptive capacity (Adger et al., 2005, 2003; Bryan et al., 2009; Füssel, 2007; Grothmann and Patt, 2005; Kates et al., 2012; Pahl-Wostl, 2009; Pelling, 2010; Smit et al., 2000; Wilby and Dessai, 2010), health impacts (Costello et al., 2009), climatic extremes (Dore, 2005; Field et al., 2012; Littell et al., 2009; Taylor et al., 2013), social capital (Adger, 2003; Pelling and High, 2005), and limits (Adger et al., 2009; Riahi et al., 2017) and barriers (Moser and Ekstrom, 2010) to adaptation.

Figure 2: Temporal trends (1978–2020) of cumulative number of publications by leading subject areas (a), countries based on author affiliation (b), organisations (c), and journals (d). (All assigned subject areas and contributing authors are included, so some publications may be counted multiple times. Data from 2020 is incomplete as it was collected on June 16. Subject area categories are based on Web of Science Core Collection Categories).



Source: Author's statistic

4. Discussion and Conclusion

This paper has investigated the evolution of and current trends in peer-reviewed climate adaptation science. By using a bibliometric method, we have captured geographical representation, temporal trends in research priority topics and provided a review of the most cited papers, authors, foundational journals and research collaboration clusters. Overall, the subject of climate change adaptation is now truly global in its reach given its mainstreaming across journals, sectors and disciplines combined with rapid annual growth rate that is set to continue. The key topics have clearly diversified over time with new topics such as ecosystem-based adaptation and green infrastructure in particular in the last five years. Yet, despite this diversification and mainstreaming of climate adaptation science, the literature is still heavily dominated by developed countries. This leads to a pressing need to increase especially developing country contributions to this vast literature so that it adequately reflects the diversity of climate adaptation insights and experiences. Future research could also look into similar trends in grey literature to capture the implementation experiences across the world and provide additional insights into how adaptation has evolved as a topic over time and identify future directions on emerging trends that are relevant to adaptation science, policy and practice.

Abstract

The main objective of the study is to estimate the willingness to pay (WTP) for conserving the Le Quy Don park in Thai Binh city, Thai Binh Province, Vietnam. In doing so, contingent valuation method is applied. A survey of 128 households by face-to-face interview using questionnaire was conducted in Thai Binh city. The results of the study showed that each household of the Thai Binh City were willing to pay 27.1 thousand VND/quarter or VND 108,532.3 every year for preserving the public parks in the city. The WTP for preservation of Le Quy Don park is affected by household leaders' education level, income and distance from the park. The higher education level and higher income will bring higher WTP while the farther from the park, the lower WTP.

Keywords: *contingent valuation, willingness to pay, public parks.*

1. Introduction

Urban parks are considered as important contributors to a sustainable development of cities both in developed and developing countries. They bring the local people a wide range of benefits a such as recreational activities, fresh air, aesthetic, and ecological functions. Urban parks can sequester carbon dioxide emissions and produce oxygen (Jo, 2002). They are also a major contributor in stabilizing the urban climate, the growth of biodiversity (Konijnendijk et al., 2005) and economic development Besides many environmental and ecological services, urban nature provides important social and psychological benefits to human societies, which enrich human life with meanings and emotions (Chiesura, 2004). This maybe the reason for an increasing interest for their development in urban setting. Hence, a policy that aimsat improving on urban environmental amenities by the provision of public goods such as urban parks make life in cities easier (Warner and Hefetz, 2002). The creation of urban parks has become a major concern for policymakers who are greatly interested in the importance and value of urban parks (Jacobs, 1961). Therefore, the improvement of urban parks is aimed at harmonising town planning with the environment in the quest for sustainable cities. Due to a large increase in urban population, these open spaces are increasingly in demand for the numerous advantages they offer. Residents of urban areas generally place a lot of importance on urban parks and green spaces and some of them are more willing to directly or indirectly fund their creation to obtain the benefits or amenities they provide (Bolund and Hunhammar, 1999). The amount that the visitors are willing to pay for an improved urban park is relevant to stakeholders when making tariff decisions.

In Vietnam, the urban park which were defined public space in the Circular 19/2010/TT – BXD of Ministry of Construction is one of the criteria to rank the cities in Vietnam. However, urbanization, economic growth and rapid population growth is posing growing challenges to public space. In this study, we took the Le Quy Don Park in in Thai Binh city, Thai Binh province to investigate the state and condition of public parks and estimating the willingness to pay (WTP) for preserving it. In Thai Binh city, to meet the requirements of rapid urbanization and standards of grade I urban areas, the investment in upgrading and modernizing the urban technical infrastructure system, water supply and drainage, roads, public Members ... and development of public space is a policy set out by the City Party Congress for the term 2020 - 2025. At present, with the rapid urbanization rate and the rapid population growth, the green spaces of the park are no longer balanced with the urban areas. Besides, due to less investment, these parks do not meet the entertainment and entertainment needs of the people. Green parks are now “a luxury” for the city. Le Quy Don Park in De Tham ward, Thai Binh city, has a total land fund of nearly 34,000 m2, of which land for flower gardens and trees is more than 23,000 m2, including 360 trees. Although it is the park with the largest scale and located in the city center, Le Quy Don Park still has many shortcomings: the land area is used for wrong purposes; poor and degraded facilities; the loose management of functional agencies; status of hygiene, security, order and safety; does not attract people, especially young people; The percentage of trees in the park is not really “green” enough. From the above shortcomings, the research and assessment of the willingness to pay (WTP) for the maintenance and improvement of the park is extremely important and necessary to ensure the sustainable development and direction.

The main objective of this study is to value the Le Quy Don park in Thai Binh City, Thai Binh province by estimating the willingness to pay (WTP) for preserving it, which will provide us a monetary estimate about its importance. And the more specific objectives of the study are as follows: (i) To identify the explanatory factors influencing the willingness to pay; (ii) to trace out the main problem (s) prevalent in public parks, and (iii) to suggest ways to concerned bodies for improvement and development of public parks.

2. Methods

In valuing environmental goods like public parks, the value includes both use (value derived from actual use of a good or service) and non-use (also referred to as passive use values, are those not associated with actual use, or even the option to use a good or service) values. Accordingly, contingent valuation method (CVM) would be relatively more appropriate for our study, which is used to estimate both use and non-use values and can be applied to find economic values for almost all kinds of environmental amenities.

2.1. Questionnaire design

First of all, in order to ensure the quality of a large-scale investigation, the study developed a sample questionnaire and conducted a pilot survey with 10 people. The questionnaire was revised based on the observed shortcomings during the pilot investigation, so that it was included in a large-scale investigation. The research was conducted based on the survey of the people through the random assessment method (CVM) questionnaire. The structured questionnaire consisted of 4 parts: Part 1 contains questions on the perception of the benefits that the park brings to people in terms of health, spirit, environmental improvement, urban landscape construction. Part 2 has 6 questions to gather qualitative information on people's perceptions and perceptions about the renovation and maintenance of Le Quy Don Park, the important benefits the park brings, and the inadequacies of the park are given priority. overcoming and developing the development orientation of the park. Respondents were asked to select the level of importance that they consider most appropriate for each question about problems of and their level of interest in the park. The third part collects information on people's willingness to pay (WTP) level for the renovation and maintenance of Le Quy Don Park in Thai Binh City. Before answering the question about the level of WTP, the respondents were specifically explained about the current status of Le Quy Don Park, and the reasons for the park preservation. Following is the description of the hypothetical scenario as follows: “Every year, every household must pay money into the Infrastructure Development Fund for the protection and development of Le Quy Don Park and collect via quarterly garbage collection service bill. This amount of money will be used for renovation and maintenance of Le Quy Don Park in Thai Binh City”. a Binary question is used to ask the Willingness-to-pay with 3 levels of payment: 15 thousand VND, 30 thousand VND and 45 thousand VND per person per quarter. Respondents should answer whether they are willing to pay the rates asked for the renovation and maintenance of Le Quy Don Park. Payment rates are randomly distributed to each person. Following this scenario are some questions about the certainty of respondents' responses and why they are not willing to pay (if WTP = 0). The fourth part includes questions about the socio-economic characteristics of the respondents. Questions include age, gender, education level, occupation, income, years lived in the city, plan to live permanently in Thai Binh City, and distance from home location to the job member Le Quy Don.

2.2. Data collection

Data and information on people's perceptions and perceptions, willingness to pay for park rehabilitation and maintenance and information on their socio-economic characteristics were collected through face-to-face interview. The study surveyed and interviewed 128 people (representing 128 households). The study uses a stratified sampling method for a sample of 128 people of Thai Binh city, in which the number of samples in each ward is determined based on the ratio of the population of each ward to the total population of wards.

Specifically, the study was investigated in 4 wards: De Tham (21 households); Ky Ba (29 households); Bo Xuyen (27 households); Tran Hung Dao (15 households) and 2 communes: Dong Xuan (15 households); andVu Chinh (21 households).

3. Results

3.1. Descriptive statistics of the sample

The average age of respondents is 38 years old, mostly between 25 and 55 years old. Regarding the sex ratio of the subjects surveyed is similar in 128 samples, there are 59 males (46%) and 69 females (54%). The survey results show that the majority of interviewees have a relatively high education level (Table 2.1). Respondents have university and college degrees (54 respondents), accounting for 42.19%, followed by postgraduate qualifications (9 respondents), accounting for 7.03%. The number of respondents with high school degree is 43 samples, accounting for 33.59%. 22 respondents left finished secondary or primary school, accounting for 17.19%.

Of the 128 respondents surveyed, 21.09% are civil servants / state officials / private enterprises and 31.25% are workers / employees / managers of private enterprises, 25% are self-employed. The houseworkers and retired people account for 17.19% and students account for 5.47%. The income level of the interviewees in the survey sample fluctuates between the lowest of less than 1 million VND and the highest of 15-20 million VND with the average income of about 6 million VND. This is a factor that will greatly affect people's willingness to pay for the renovation and maintenance of Le Quy Don Park. Most of the respondents will definitely intend to live permanently in Thai Binh City, accounting for 86%, 12% are unlikely to live permanently in Thai Binh City. There is only a small percentage of the respondents do not live permanently in Thai Binh City.

Table 1: Education level of the sample

Education level	Number of survey samples	Percentage
Secondary or primary school	22	17,19%
High school level	43	33,59%
University and college degrees	54	42,19%
Postgraduate	9	7,03%

3.2. People's assessment of Le Quy Don Park

Park benefits

Regarding the benefits that Le Quy Don Park brings, the survey shows 5 main benefits. Interviewees chose 3 out of 5 benefits that they think are the most important that Le Quy Don Park brings. 384 choices were made by 128 respondents, of which 97 choices were entertainment and activities. The benefit of outdoor activities accounted for 25.26%. 86 choices were “helping to improve physical and mental health”, accounting for 22.4%. Next are the benefits of reducing environmental pollution, controlling climate and creating urban landscape with 81 choices, equivalent with 21.09%. Finally, the benefit of Better community engagement accounts for 10.16% (39 choices).

Problems in the park

Regarding inadequate issues at the park, the study raises 5 main issues. Out of 5 shortcomings, respondents choose 3 out of 5 problems that they think should be prioritized to solve. 23.44% of the answers were the problem of pollution: the waste collection and treatment in the park was ineffective. 22.92% of respondents think that infrastructure is still poor, degraded, and cannot meet the needs of the people, which is a problem that needs to be overcome. Following is the problem of weak management from government agencies: The land was used for wrong purposes (17.79%); many shops were allowed to run business in the park illegally (17.45%); The percentage of tree cover is low (16.41%). When asked about the level of people's concern about the above issues, 46.1% of respondents are interested, while 15.63% do not care and 1.56% do not care at all. Thus, according to the assessment results, the awareness and concern of Thai Binh city people about the shortcomings happening at Le Quy Don Park is generally quite high. The survey also had questions about the situation of the Park in the next 5 years. There were 67.18% of the respondents saying that the park will develop in a better direction while 14.84% thought that the park will be deteriorated. The number of people thought it was necessary to improve the Le Quy Don Park was relatively high at 77.35% of the respondents. Only few respondents said that this was unnecessary, accounting for 5.47%.

Table 2: People's views on preservation and management of Le Quy Don Park

People's views on park preservation and management	***Totally disagree***	***Disagree***	**No idea**	**Agree**	**Totally agree**
1.The issue of preservation and park management is the responsibility of state agencies and governments	3,91%	8,59%	12,5%	60,94%	14,06%
2.We need to sacrifice part of our income and living conditions so that the next generation can enjoy a better environment.	1,56%	3,13%	33,59%	51,56%	10,16%
3.The issue of preservation and park management is an issue of society, rights and responsibilities of state agencies, organizations, households and individuals.	1,56%	2,34%	17,97%	53,13%	25%

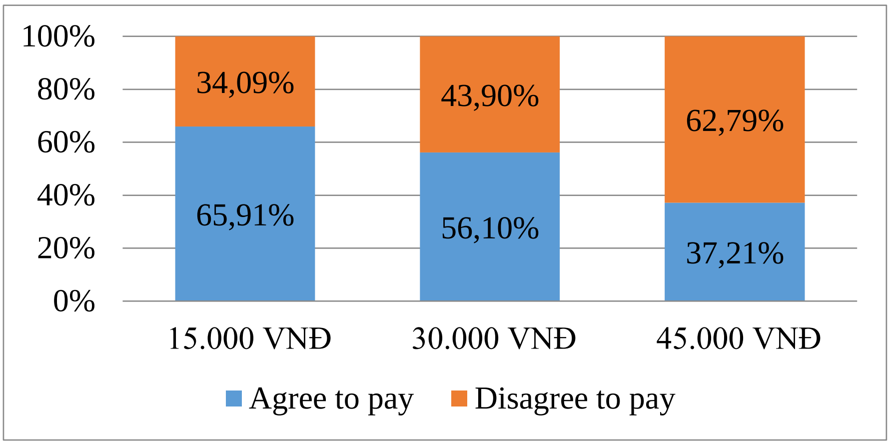
Table 2 shows that 75% of the people agreed that park preservation and management is the responsibility of state agencies, while 3.91% totally disagreed and 8.59% disagreed. More than 61% of respondents are willing to sacrifice part of their income and living conditions so that the next generation can enjoy a better environment. The percentage of people who opposed this point of view was very small, only 4.69%. People in the low-income group were also willing to spend part of their income to protect the environment.

Besides, 78.13% of the respondents agreed and completely agreed that the preservation and management of the park was the responsibility of the whole society including the state agencies, the social organizations and the community. Only a small percentage of the respondents disagreed (3.9%).

3.3. Estimated WTP for park preservation

The questionnaire gave 3 levels of quarterly payments (as the payment vehicle is quarterly waste collection service bill), which were VND 15,000, VND 30,000 and VND 45,000. Payment rates are randomly distributed to each person. Respondents should answer whether they are willing to pay the rates asked for park preservation. The number of respondents for the rate of VND 15,000, VND 30,000 and VND 45,000 were 44, 41 and 43 respectively. Figure 1 showed the percentage of the answers for each level of payment. Nearly 66% of the interviewees agreed to pay at the rate of 15,000 VND; 56.1% agree with the rate of 30,000 VND and about 63% disagree with the payment rate of 45,000 VND.

Figure 1. The rate of willingness to pay and the unwillingness to pay according to each level of payment



This rate is completely consistent with the law of demand: as the payment increases, the rate of agreeing to pay for park preservation will gradually decrease. Out of a total of 128 respondents, 60 people disagree with the level of payment questioned. All the reasons that the respondents are not willing to pay are summarized in Table 2. The average WTP is calculated as in the following formula:

$$\text{Average WTP} = \frac{\sum_{i=1}^{n} pi * BIDi}{\sum_{i=1}^{n} pi}$$

BIDi : The level of payments that people are asked to pay

pi: probability of agree to pay at BIDi ($0 \leq pi \leq 1$)

n: The number of level of payment

Thus, the average WTP was 27.1 thousand VND/quarter or VND 108,532.3 every year for each household.

Table 3 shows that the reason for the highest percentage (31.67%) that people are not willing to pay for park preservation is “I agree with the renovation and maintenance of parks, but THE GOVERNMENT MUST BE RESPONSIBLE for the entire cost because we already paid them the tax”. 19 of 62 respondents said that they have paid the tax and fees to the State and parks under the management of the City People's Committee, then the state budget must be used for the renovation and maintenance of the park. Up to 23.33% of people refuse to pay for the reason "I agree with the renovation and maintenance of the parks, but I DO NOT BELIEVE my donation will be used ONLY for this PURPOSE". There are 20% who choose the reason “I CAN'T CONTRIBUTE because I have only enough money to spend for me and my family”. These people say that there are many expenses in the family and their income is only enough to cover their daily life’s needs. 16.67% thought that “the renovation and maintenance of parks was NOT USEFUL to me”. 10 out of 60 respondents said that renovating the park would not benefit them, maybe because most of them live far away from the park and do not visit the park very often. To assess the level of certainty of willingness-to-pay of the respondents, a scale of 1 to 10 were developed, where 1 is “Very uncertain.” And 10 is “Very certain”. Most respondents are quite sure with their willingness to pay, up to 61% of respondents have a very high degree of certainty (from 8 to 10) and nearly 40% of respondents with medium certainty average (from 5 to 7).

Table 3: Reasons for unwillingness to pay for the preservation of Le Quy Don Park

Reason	**Frequency**	**Percentage**
1. I agree with the renovation and maintenance of the parks, but I DO NOT BELIEVE my donation will be USED ONLY for this purpose.	14	23,33%
2. I agree to renovate and maintain the parks, but I CANNOT CONTRIBUTE because I have only enough money to spend for me and my family.	12	20%
3. I agree with the renovation and maintenance of parks, but THE GOVERNMENT MUST BE RESPONSIBLE for the entire cost because we already paid them the tax.	19	31,67%
4. Renovating and maintaining parks is NOT USEFUL to me	10	16,67%
5. Other reasons	5	8,33%

3.4. Factors influencing willingness to pay for park preservation

To analyze WTP for the preservation of Le Quy Don Park in Thai Binh City, the study uses a linear regression model with WTP as the dependent variable affected by independent variables including sex (SEX), age (AGE), education level (EDU), income (INCOME), distance from housing to park (DISTANCE). The willingness to pay for any observation takes the form:

$$WTP_i = a_1 + b_1 * SEX_i + b_2 * AGE_i + b_3 * EDU_i + b_4 * INCOME_i + b_5 * DISTANCE_i + \varepsilon_i$$

In which: a_1 is the intercept; b_i (from 1 to 5) is the slope of the independent variables; ε_i is the effect of other variables not included in the model on the WTP.

The results of regression estimation of factors affecting people's willingness to pay for preservation of Le Quy Don Park are shown through the equation:

$$WTP_i = -29{,}8713 + 3{,}0568 * SEX_i + 0{,}1012 * AGE_i + 2{,}7373 * EDU_i + 0{,}0009 * INCOME_i - 0{,}7926 * DISTANCE_i + u_i$$

We see P-Value (Prob (F-Statistic)) = 0.0000 <0.05, this result shows that the above model is suitable. Besides, the correlation coefficient R2 received the value of 0.4815, meaning that 48.15% of the variation of WTP was explained by the variable introduced into the model.

The SEX variable has a regression coefficient of b_1 = 3.06 > 0 and the P-Value = 0.1609 > 0.05, which shows that the gender variable is not statistically significant at the 95% significance level. Therefore, there is not enough evidence to conclude that there is a difference in affordability between men and women.

The regression coefficient of AGE variable is b_2 = 0.1012 > 0 and P-Value = 0.4152 > 0.05, this result shows that the age variable is not statistically significant at the 95% significance level. So it is not to conclude that age affects WTP of people.

According to the research results, the WTP depends closely on the income variable. The regression coefficient b_3 = 2,7373 > 0 and P - Value = 0.0000 < 0.05 show that the variable of people's education level is positively related to affordability and systematic significance. statistic at the 95% significance level. This shows that, the awareness of environmental protection and the desire to have a green, clean and beautiful environment of people with higher qualifications is higher.

Table 4: Regression models of WTP

Variable	**Sign**	**Coefficient**	**P - Value**
C	a_1	-29,8713	0,0076
SEX	b_1	3,0568	0,1609
AGE	b_2	0,1012	0,4152
EDU	b_3	2,7373	0,0000**
INCOME	b_4	0,0009	0,0287**
DISTANCE	b_5	-0,7926	0,029**
R- squared	0,481456		
Mean	14,29688		
F- statistic	22,65479		
Prob(F-statistic)	0,000000		

Note: **: significant at 5%

The income level has a certain influence on WTP, with the significance level of 95%, we have P-Value (income) = 0.0287 < 0.05, proving that the income variable is statistically significant. Besides, we have b_4 = 0.0009 with a positive sign, meaning that as income increases, our willingness to pay will also increase. This is completely consistent with the theory and similar experimental studies. In fact, when the income is high, people will pay more attention to the quality of the surrounding environment, they always want to live in a green, clean, beautiful and fresh environment, then the need to consume quality goods and services. Increased environment leads to increased affordability as well.

The influence of the distance from the house location to the park has a relatively large impact on the WTP. With P - Value (distance) = 0.029 < 0.05, this proves that the variable DISTANCE is statistically significant at the 95% level. The sign of the coefficient b_5 = - 0,793 is negative, implying that the farther the distance from home to the park is, the lower the willingness to pay. Reality proves that the farther people are from the park, the less benefits and importance the park gives them than those who are near the park or even they will not enjoy any value. benefit that the park brings. At the same time, these people are often less concerned with the park's problems, so their affordability or may not be willing to pay because they believe that renovating and maintaining the park is not. useful to them.

Thus, out of the 5 factors included in the model, only 2 factors are not statistically significant, namely the gender variable and the age variable. The remaining variables identified as having an influence on WTP are education level, distance from home location to park, and income which also have certain effects on WTP. This is an important basis for giving orientation and proposing solutions for the management and preservation of Le Quy Don Park in Thai Binh City in particular and improving the quality of the environment in general.

4. Discussion and Conclusion

In recent years, Thai Binh city has a fast urbanization rate, so the city is focusing on research and planning to build a smart city and towards urban standards of grade I. In which, development is Environmental infrastructure, especially investment in upgrading and renovating green parks is an urgent issue in Thai Binh city in particular and urban areas in Vietnam in general. Currently, the status of Le Quy Don Park is facing serious problems such as environmental pollution, waste collection; poor and degraded facilities do not meet the needs of the people; park land is used for wrong purposes; security and order have not been guaranteed; The proportion of trees is still low, along with the weak management from government agencies. Research results show that people are aware of the benefits as well as the shortcomings that exist at Le Quy Don Park and the importance of environmental protection. People’s interest in the park is also relatively high. Most of the respondents accepted to sacrifice part of their income and living conditions so that future generations could enjoy a better environment. However, despite paying great attention to environmental protection, the role and participation of individuals and households in the preservation of the park are not fully understood. Most of the people believe that they have paid taxes to the State, so renovating and maintaining the park is the responsibility and job of the government. The paper uses the CVM method with a binary question form to estimate the people's willingness to pay for the preservation of Le Quy Don Park. The survey results showed that 68/128 (53.125%) of the subjects agreed to pay and the average WTP was estimated at 27.1 thousand VND/quarter or VND 108,532.3 every year. The people's willingness to pay depends closely on income, education level and distance from housing to parks. Specifically, income and educational attainment are proportional to WTP, while the gap is inversely related to WTP. In addition, the study does not have enough evidence to show the influence of factors such as gender and age on the affordability of Thai Binh people. From the above results, some solutions to manage and preserve the park can be recommended, such as enhancing financial resources, capital; raise awareness of the community, increase income and living standards of the people, develop regulations on park management and protection. However, since the number of observations in the article is quite small compared to the total population of Thai Binh city, a more in-depth and detailed study with a larger sample of survey is required to clearly demonstrate attitudes and abilities payment of the people for the preservation of Le Quy Don Park.

Abstract

The Mekong Delta is a key rice development area of the country, but the region also faces many challenges. Growing rice brings lower efficiency to farmers than other crops on the same area. The government has a policy to allow households to switch from rice-growing land to other crops. Based on survey data of 72 households in 3 provinces of Hau Giang, Dong Thap and Long An, the analysis results show that when changing the crop structure from rice to fruit trees, the profit of fruit trees is higher 9 times that of rice. But the conversion faces environmental problems as growing fruit trees uses four times more fertilizers and pesticides than rice. People change crop structure due to profit, price level of fruit and market demand. Therefore, in parallel with the policy to allow the conversion, it is also necessary to strictly control and form concentrated conversion areas for fruit trees in order to improve efficiency and ensure a balance of economic, social, and environmental benefits.

Keywords: *rice, fruit trees, efficiency, crop structure conversion*

1. Introduction

The Mekong Delta region has many natural conditions of soil and climate, rich resources and favorable Vietnam. The economic development of this area depends heavily on the development of agricultural, forestry and aquaculture activities. This is the largest agricultural production center of Vietnam, contributing 50% of rice production, 65% of aquaculture production and 70% of fruits of the country; 95% of rice exports and 60% of fish exports (Government, 2017). This is an area suitable for the development of fruit trees, with alluvial soil, fresh water all year round, mild climate, lush four-season fruit trees, forming many famous specialty tree growing areas (Nguyen Bao Ve, 2019). However, there are many challenges such as the impact of climate change, in addition to the developments in the upstream, which will cause great impacts and changes to the hydrology. These impacts and their consequences are geographically distributed, presenting specific opportunities and constraints in land and water use and economic development in the upstream region in the Mekong Delta (Government of Vietnam and Government of the Netherlands, 2013). Climate change and sea-level rise are happening faster than forecast, causing many extreme weather events, affecting people's livelihoods. The exploitation of water resources in the upstream of the delta, especially the construction of hydroelectric dams, has changed the flow, reduced the amount of alluvium, decreased aquatic resources, and deeply penetrated the interior of the region, causing negative impacts on the environment, and the socio-economic development of the region (Government, 2017). In addition, the region is facing internal problems such as water management, industrial and urban intensification, accompanied by pollution of soil, water, ecosystems and resource depletion (Le Anh Tuan, 2020). According to the "Mekong Delta Plan – Long-term vision and strategy to develop a safe, prosperous and sustainable Mekong Delta" in 2013, the Mekong Delta region is divided into 3 sub-regions: (1) Region upstream (including Dong Thap, An Giang and Long An provinces); (2) The middle region (including the provinces of Tien Giang, Vinh Long, Hau Giang, Can Tho city and part of the area of Ben Tre, Tra Vinh, Soc Trang, and Bac Lieu); (3) Coastal area (including part of Tien Giang, Ben Tre, Tra Vinh, Soc Trang, Kien Giang provinces, and most of Bac Lieu and Ca Mau province).

Over the past 30 years, the above trend has helped to rapidly increase the area of fruit trees in the Song Tien and Hau River areas, starting from Dong Thap, Tien Giang, Vinh Long, and Hau Giang, then expanding to areas with high-quality systems. The dyke system is closed and less affected by floods. Between 2010 and 2016, the total area of fruit trees in the Mekong Delta increased by 53% with 323,000 fruit trees (Bui Ba Bong et al., 2018). From 2015 to 2019, the government issued 3 Decrees on the management and use of rice land, which stipulate the order, conditions, and procedures for converting crops from rice to other crops of economic high economy. Many farmers in the Mekong Delta region have converted from rice to high economic value crops such as cash crops and fruit trees.

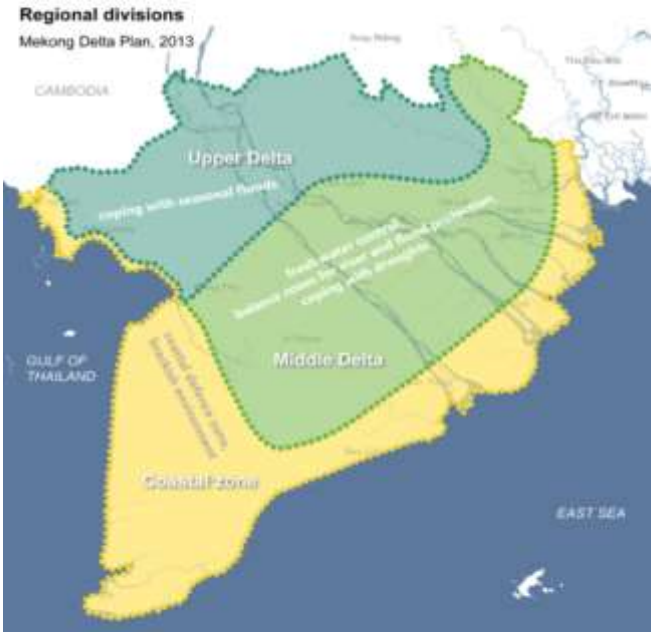

Figure 1. Map of zoning of the Mekong Delta

Source: Mekong Delta Plan - Long-term vision and strategy To develop a safe, prosperous and sustainable Mekong Delta (2013)

The Ministry of Agriculture and Rural Development issued Decision No. 586/QD-BNN-TT on formulating a plan to change the crop structure on rice land, in which the area converted from rice to other crops of the Mekong Delta accounts for about approximately 67% of the converted area of Vietnam. The main converted crops are annual crops, which are cash crops (accounting for 94%), and perennial plants are mainly fruit trees and industrial plants. The change of land use purpose or crop structure of people depends on the market, especially on the price of agricultural products. The replacement of low-yield, low-efficiency rice production areas with cash crops and fruit trees initially achieved efficiency and development prospects (Le Tran Thanh Liem, 2020).

Table 1. Plan to change crop structure from rice to other crops of provinces in the Mekong Delta in the period 2017-2020

No	Province	Total	Annual tree	Perennial tree
Total		**741.868,90**	**652.464,40**	**44.702,30**

Source: Decision No. 586/QD-BNN-TT (2017)

The conversion of land use purposes will help people increase profits on the same area of use, but also face many challenges. The conversion from rice land to other crops increases the net profit of agriculture significantly, but this conversion also increases the pollution to the environment due to the use of agricultural products. more fertilizer than growing rice (Wenjun Jiao et al., 2016). Research results of Nguyen Quoc Hau et al (2018) in Vinh Long show that the group of Fluvisols (alluvial soil) reduced the area of 25,944.38 hectares, the group of Gleysols (the gley soil) increased by 13,759.87 hectares, the Anthrosols group (the soil) factors) increased by 12,184.51 ha, the Arenosols group (sand soil) did not change in area and type of soil, mainly due to the change in crop structure in the year from 2 rice to 3 rice and land for perennial crops. The model of growing fruit trees has a negative impact on the environment for the soil and water environment (Nguyen Thi Ngoc Lan et al., 2018; Asnelly Ridha Daulay et al., 2015) pointed out that when converting from rice land to palm oil and rubber in East Tanjung Jabung Regency, the high revenue along with some difficulties faced by rice farmers made the system of sustainable land use is difficult to achieve. Balancing economic, social and environmental goals is necessary to ensure a sustainable agriculture (Pham Thanh Vu et al., 2016).

In this paper, the efficiency of converting crops from rice to fruit trees will be evaluated. Correspondingly, some sustainable development orientations are proposed when converting rice land to fruit trees in the Mekong Delta.

2. Method

In studies using qualitative and quantitative research methods. Research space selected here is 3 provinces with large conversion area including Hau Giang, Dong Thap and Vinh Long. These are provinces in 2 regions, the upper and middle are 2 regions with favorable areas and conditions to convert from rice to fruit trees. The study will conduct in-depth interviews at the provincial level to select the location with the largest converted area, and the type of fruit trees to be converted to ensure the characteristics of the province. Then, the authors conducted in-depth interviews with officials of the district's agriculture department selected for the study, then conducted in-depth interviews with officials of the Commune People's Committee where the study was conducted. Thus, there will be 9 in-depth interviews conducted. Corresponding to the 3

Figure 2. Location of the surveyed provinces in the study area

selected provinces for the study, each province will select 3 districts, and each district will select 2 communes, each commune will select 1 village with a large conversion area to conduct the survey. There will be 6 interviewees corresponding to 6 communes in 4 districts of 3 provinces selected for research. There will be 13 in-depth interviews conducted from the province to the commune level, of which the provincial level has 3 in-depth interviews, the district level has 4 in-depth interviews and the commune level has 6 in-depth interviews.

The research team selected a stratified random sample, corresponding to locations with an area converted from rice to fruit trees, randomly selected 12 converted households in a closed dike system.

Table 2. Details of selected villages for the survey

No	Research location			Typical type of conversion tree	Number of households interviewed
	Village, commune	District	Provinces		
1	Hamlet 2, Tan Hiep Commune	Thanh Hoa	Long An	Lemon, Durian, Soursop, Jackfruit, Grapefruit	12
2	Hamlet 1, Tan Tay commune			Durian, Lemon, Jackfruit, Grapefruit	12
3	Hamlet 1, Tan My commune	Thanh Binh	Đong Thap	Mango	12
4	Binh Hoa Hamlet, Binh Thanh Commune				12
5	Hamlet 8, Long Tri Commune	Long Tri Town	Hau Giang	Tangerine	12
6	Trau Hoi Hamlet, Thanh Xuan Commune	Chau Thanh A		Durian, grapefruit, longan, lemon, orange, jackfruit, rambutan	12
Total					**72**

The study selected each location 12 converted households, corresponding to 24 households in each province, and 3 provinces corresponding to 72 interviewing households based on the questionnaire. Data collection period is from November 2020 to April 2021.

3. Results

3.1. Water demand of fruit trees

When changing the crop structure from rice to fruit trees, it will reduce the amount of water for crop irrigation. This helps the region cope with problems related to drought, water shortage and saltwater intrusion and climate change. The average water demand for rice according to national standards is about 18,600 m^3/ha-year, this amount of water is 18.6 times higher than that for mango and 13 times more than for orange. In fact, according to local people's experience, the level for crops irrigated from time to time may be lower or higher than the prescribed or theoretical level of irrigation. Faced with the challenge of reducing water resources, people in the Mekong Delta have switched from inefficient rice to fruit trees. According to the Government (2020) to change the mindset on food security, to develop agriculture in the Mekong Delta based on rice; strategic pivot to fisheries - fruits - rice in line with the market, based on the established farming system and gradually adjusted according to the roadmap, avoiding disturbance affecting people's lives. When converting from inefficient rice to fruit trees, it helps to reduce water use, and at the same time, with the orientation to expand the fruit area by 2030, the total fruit area is expected to reach about 650 thousand hectares (increasing an additional 150 thousand ha in the transition zone and the flexible zone).

Table 3: Amount of irrigation water used for some crops

Type of tree	Amount of water for irrigation	Average irrigation level (m3/ha-year)
Mango	According to Tran Hung et al (2021), the amount of irrigation water is 900-1,100 m3/ha. Including, the flowering stage is irrigated from 238-301 m3/ha and the fruiting stage is 674-759 m3/ha	1,000
Oranges	Directorate of Water Resources (2013), the amount of incoming water includes: irrigation level for orange trees: (1) Basic construction phase: total irrigation rate from 1000 m3/ha/year to 1,500 m3/ha/year; (2) Fruiting stage: the amount of water for irrigation is from 1,500 m3/ha/year to 1,800 m3/ha/year.	1,400

Durian	According to Kemchart Cheychom et al (2019), the amount of incoming water for durian trees is about 600-800 m^3/rai, equivalent to 3,750 – 5,000 m^3/ha	4,375
Rice	According to the National Standard No. TCVN 8641: 2011 the irrigation regime with sown rice for 3 crops a year includes: - Winter-spring crop: The total amount of water for irrigation for the whole crop is from 7,500 m^3/ha to 8,000 m^3/ha - Summer-autumn crop: The total amount of irrigation water for the whole crop is from 5,700 m^3/ha to 6,000 m^3/ha - Autumn-winter crop: The total amount of water for irrigation for the whole crop is from 4,500 m^3/ha to 5,500 m^3/ha	18,600

Farms often install irrigation equipment for crops according to experience, and larger than the irrigation needs of the crops in terms of theoretical requirements. This causes a waste of irrigation costs for households growing crops. The amount of water used to irrigate rice is about 8 times higher than that of fruit trees. In fact, the amount of water used to irrigate fruit trees is higher than theoretically. Farmers in Dong Thap, Long An and Hau Giang provinces have about 10%-40% of the theoretical amount of water, about 30% for orange trees and about 20% for durian trees. Similar to rice cultivation, the amount of water used in individual management is lower than in the collective in all seasons (Le Canh Dung et al., 2015). This will cause water waste, and cause water pollution when this water source is polluted by fertilizers and pesticides. It also causes costly irrigation pumping for farmers who grow fruit trees.

3.2. Results of converting to fruit trees from rice plants

In the period from 2017 to 2020, households in 3 provinces converted their total area to fruit trees about 29,284.19 ha. In which, the converted area is mainly citrus such as oranges, lemons, grapefruits and tangerines with a total area of 14,509.62, accounting for 49.55% (Table 4). The converted area of each province is increasing year by year. Depending on the characteristics of each province, the converted area is usually concentrated in some key areas in the area that are drought, saline or inefficient. Converted crops are those with high selling prices, high profits and market demand, which are three factors that help farmers decide to convert.

Table 4. Total charge converted from rice-based to fruit trees in the period 2017-2020

Unit: ha

No	Type of tree	Dong Thap	Long An	Hau Giang	Total
1	Oranges	1,112.30	37.08	328.96	1,478.34
2	Lemon	334.07	11,030.12	326.66	11,690.85
3	Grapefruit		181.8	337.03	518.83
4	Tangerine	819.10		2.50	821.60
5	Dragon fruit	301.5	3,466.42		3,767.92
6	Mango	2,175.20	791.65	72.73	3,039.58
7	Jackfruit	724.10	1,561.56	454.8	2,740.46
8	Logan	441.17		252.44	693.61
9	Other tree	2,090.99	2,176.05	1,342.61	5,609.65
	Total	**7,557.26**	**19,198.67**	**2,528.26**	**29,284.19**

Source: Sub-Department of Cultivation and Plant Protection of Dong Thap, Long An and Hau Giang provinces (2021)

3.3. Efficiency of farmers when converting from rice to fruit trees

The transformation process has helped farmers increase income, improve living standards, and develop socio-economic in these areas. When changing the structure of crops from rice land to fruit trees, people will increase profits on the same area. The survey results of 72 households showed that the profit of fruit trees on the land converted from rice land was 9 times higher than that of rice. Among the most converted crops is mango (mainly concentrated in Dong Thap province), the profit of growing mango each year is nearly 12 times higher than that of rice on the same hectare. However, at present, households are not concentrated, and farmers do not form cooperative farmer organizations such as cooperative groups or cooperatives, so profits are not stable. Research results on rice for farmer households that are members of a cooperative organization or cooperative group will have an average profit of 30.3% higher than that of individual farmer households (Le Canh Dung et al, 2019). Households involved in growing tangerines in the Long Tri tangerine cooperative of Hau Giang province showed that participating in the cooperative will help members organize synchronous production, access production techniques, and reduce costs of product. In addition, it is easy to register the trademark of the crop and easy to associate with consumer businesses. At the same time, the applied cooperative is produced according to organic methods to protect the environment and ensure the health of users.

Table 5. Revenue and cost of fruit crops per hectare

Unit: million VND/year

Indicator	Rice*	Tangerine	Mango	Other tree **
Number of households		**12**	**24**	**36**
Revenue	**97.320**	**536.730**	**659.750**	**597.057**
Cost	**53.329**	**239.241**	**125.425**	**193.658**
Cost of seedlings	4.779	96.600	11.600	51.773
Cost of fertilizer	11.645	72.816	43.379	51.781
Cost of pesticides	9.578	2.477	1.933	2.416
Irrigation cost	10.398	5.135	4.008	5.371
Labor cost	6.383	49.540	46.400	66.929
Other cost (Land rental, machinery and equipment, ...)	10.547			
Initial construction cost when converting from rice land to fruit trees (investment cost of premises and irrigation systems)		12.673	18.105	15.389
Profit	**43.991**	**297.489**	**534.325**	**403.399**

Source: Calculations of the authors (2021)

*Note: *) According to Nguyen Tuan Kiet (2017), with 3 crops, each crop has an average profit of 14,664 million VND/crop*

***) Including lemon trees, custard apple, durian, jackfruit, pomelo, longan, toad, rambutan, strawberry.*

Although the amount of irrigation water for fruit trees is about 8 times lower, the annual investment and operating cost of the irrigation system is higher than that of rice. The initial investment cost for a water-saving irrigation system usually ranges from VND 69,926 million to VND 87,654 million per hectare (calculated according to state regulations). In fact, people invest in the initial construction costs ranging from 40 to 50 million VND depending on the value of each type of converted fruit tree. Corresponding to the life expectancy of mango tree is 7 years and tangerine tree is 10 years, the annual allocation cost for mango tree and tangerine tree is about 18,104 million VND/year and 12,673 million VND/year, respectively. The annual cost of irrigation for fruit trees is about 40% higher than that of rice, mainly due to electricity bills for irrigation. Converted households often build irrigation systems for fruit trees according to their experience and depending on the type of converted crops, thereby affecting neighboring rice growing households. When changing the structure of crops from rice to other crops, it will affect the soil environment because when converting from rice to fruit trees, the rice land must be improved to suit fruit trees. The amount of fertilizers and pesticides used for fruit trees is higher than that of rice, and the cost of fertilizer for fruit trees is four times higher than that of rice. The amount of fertilizers and pesticides for fruit trees will gradually seep into the soil and water sources, causing cumulative pollution, which will affect the coastal provinces.

This leads to a great impact on the soil environment in the future when converted, or when converting back to the original rice land. The cost to convert back from fruit-growing land back to rice-growing will be enormous. Besides, due to the spontaneous conversion of people according to experience and market, some places have formed conversion zones with mixed fruit trees. People change according to the market, as well as by experience, so the management agencies face many difficulties in formulating policies to develop crop structure for each region. At the same time, it is difficult to control the quality of fruits according to domestic and international standards.

4. Discussion and Conclusion

The Mekong Delta has many favorable conditions in terms of nature, climate and resources for agricultural development, but the region also faces many challenges. Although people have actively changed the structure of crops to increase their incomes and at the same time cope with challenges. But when converting the crop structure from rice to fruit trees, the profits are higher. At the same time, the requirements and costs for irrigation of fruit trees are also higher than that of rice. People convert from rice land to fruit trees according to the profit, the price level of the fruits and the market demand, thus leading to inefficient production efficiency. Especially when converting the structure to fruit trees, it will affect the environment in the future. Therefore, it is necessary to strictly control and form concentrated conversion areas for fruit trees to help improve efficiency and ensure a balance of economic, social and environmental benefits. In addition, it is necessary to form centralized production association organizations to help farmers organize synchronous production, apply production techniques that will ensure quality standards and easily link with enterprises, and increase product value.

Acknowledgments: *This research was financially supported by Science and technology program for new countryside construction in a period of 2016-2020, results from the Science research topic: Research and propose models of investment in construction and management of in-field irrigation systems when converting rice land to crops of high economic value, in order to adapt to climate change, serve construction building new countryside in Mekong Delta.*

Abstact:

The study uses the random iterative assessment method to investigate, the regression analysis method to analyze, the research results show that the average percentage of people who agree to pay to use agricultural water 60% of the total population of the district. Investment in improving agricultural water supply services to people is facing many difficulties because of the limited state budget, inadequate policies, and many damaged works.To implement the "socialization" of agricultural water services, the study estimated people's willingness to pay for the use and improvement of agricultural water services in Dong Anh, Hanoi. The research results are the basis for the development of recommendations for effective agricultural water management and are suitable to local conditions.

Keywords: *Willingness to pay, service improvement, agricultural water.*

1. Introduction

Water pollution occurs when some components or properties of water exceed a certain threshold, making the water unusable for a certain purpose. Olaniran (1995) defines water pollution as the presence of too many hazards (contaminants) in water so that it is not suitable for drinking, bathing, cooking, or other purposes other use. The willingness to pay to improve the environment depends entirely on the ownership of resources and the environment. When the environment is polluted, the owner has no right to stay in the waste area or in the case of land and water resources as common ownership, public goods.

Therefore, everyone who suffers damage from pollution wants to improve the quality of the environment in order to have a better production and living process.

In fact, environmental pollution is the cause of many diseases in the world. Investing in improved sanitation has proven to be effective and brings many benefits to human health and the community. A study was conducted in Kim Bang district, Ha Nam province on people's willingness to pay for the construction of a wastewater treatment system. The research results show that the median average of households willing to spend to build a wastewater treatment system is 1,813,800 VND, accounting for 4% of the annual income of households. The study also shows that the total willingness to spend to build the wastewater treatment system of the people is over 3.18 billion VND. In addition, factors such as a high level of education, dissatisfaction with the current wastewater treatment system, good household economy, increasing age, number of people in the household are factors that increase willingness to pay for the construction of wastewater treatment system. Men have a higher willingness to pay than women and those with occupations other than agriculture also have a higher willingness to pay (Nguyen Hoang Thanh et al., 2012).

To research the willingness to pay of the people to improve the agricultural irrigation water supply system in Ap Bac irrigation system is of great significance in helping the agricultural water supply service activities to have appropriate development orientations. Thereby satisfying the needs of most of the population, contributing to promoting the city's socio-economic development quickly and sustainably.

2. Method

2.1. Data collection methods

To have an overview and overall data about the research area as well as the research problem, the author has collected secondary data in 3 aspects. The first, On the economy - society - environment through the Socio-economic General Report of Dong Anh District, Hanoi City. The second, synthesized from sources legally published in scientific works, books, and newspapers: Report on survey results of the Institute of Environmental Science and Technology of Hanoi University of Science and Technology in 2016. Teaching materials on principles of economic statistics" by Nguyen Vu An. The third, Summary report on wastewater treatment at the research agency "AQUA Vietnam Environmental Technology Joint Stock Company". Besides, Primary data is collected through actual observations, direct interviews with individuals through questionnaires, and a randomly selected sample of interviewees.

To assess the willingness of people to pay for the improvement of the agricultural irrigation water supply system, the author conducts surveys and interviews to collect the necessary information sources for the research. Specific topics include some of the following steps:

+ *Step 1*: Determine the research objective: Find out the influencing factors and evaluate the willingness to pay for the agricultural irrigation water supply system.

+ *Step 2*: Determine the survey location: Dong Anh district, Hanoi city.

+ *Step 4*: Identify the subjects that need to be investigated and interviewed: Farmers in Dong Anh district, Hanoi city.

+ *Step 5*: Design the questionnaire, interview, and conduct the survey. The questionnaire is designed to be simple, concise, easy to understand, specific, and purposeful. The questionnaire includes the following main contents:

- Information about the subjects: full name, age, gender, occupation, income, education level.

- The situation of the agricultural water supply of Hanoi Irrigation Company, difficulties in the process of supplying agricultural water to the district. The investment cost for agricultural water supply of Hanoi irrigation company. The necessary materials to improve the system for the people.

- People's willingness to pay for the use of improved agricultural irrigation water to improve the water supply system.

+ *Step 6*: Conduct interviews with each household with the contents of the designed questionnaire.

2.2. Data Analysis Methods

Descriptive statistics method: This method is used to describe the criteria in the research such as the average values, the interviewee's assessment of the research problem, the willingness to pay off the interviewee. Hereby making statistics into tables for easy analysis.

Contingent Valuation Method (CVM) is a direct method to estimate willingness to pay. CVM is based on the simple idea that if you want to know a person's willingness to pay for certain properties of the environment, just ask the person directly.

Unlike traditional methods, CVM does not pass through an actual market but through a hypothetical market, in which the factors in the survey sample are considered as actors participating in that market. The thesis builds a hypothetical scenario related to participating in the installation of wastewater treatment systems in Phung Xa textile and dyeing village. Through the results of the individual survey, the household will determine the average WTP level of participating in the installation of wastewater treatment systems. The average WTP level is determined through the following weighted-average calculation:

$$\text{WTP} = \frac{\sum_{k=1}^{n} wtp_k \ x \ n_k}{\sum_{k=1}^{n} n_k}$$

In which:

k: index of WTP levels; k = 1÷ n

wtp_k: wtp level k

n_k: number of households corresponding to the level of wtp_k

Through the results obtained during the investigation, the author has built a multivariable linear regression model to analyze the factors affecting the spending level for WTP as follows:

$$\mathbf{WTP_i = \beta_0 + \beta_1 X_i + \beta_2 X_{2i} + \beta_3 X_{3i} + \beta_4 X_{4i} + e_i}$$

In which:

- WTP: willingness to pay (in thousands of VND)

- β0: intercept factor

- β1, β2, β3, β4 : coefficients corresponding to the variables to be estimated

- Xi: age

- X2i: gender

- X3i: level

- X4i: income

- ei: random error

- Compliance with standards and independent distributors, with the average value of zero

3. Results

3.1. Introduction to Ap Bac irrigation system

Ap Bac pumping station was invested, built, and put into operation in 1963, located at K53+950 on the left bank of the Red River. The pumping station is responsible for designing and irrigating 14,000 hectares of cultivated area in 3 districts of Dong Anh, Soc Son, and Me Linh. Since 2015, Hanoi City has assigned more tasks in addition to serving agricultural production, the Ap Bac irrigation system also supplies raw water to the North Thang Long Water Plant. The station consists of 06 units, type of pump DU 750, with a designed flow rate of each machine is 8,100 m3/h; the flow rate of the whole station is 12.4 m3/s; the minimum design water level at the suction tank is +2.60 m.

*Ap Bac field pumping sta*tion was invested and built-in 2010 and renovated and upgraded in 2018, located at K53+700 on the left bank of the Red River. When the water level of the Red River is low and the design water level is not guaranteed, Ap Bac field pumping station is responsible for replacing Ap Bac pumping station. . The station consists of 25 pump units of type HL 1100-12, the flow rate of each unit is 1,100 m3/h; flow rate of the whole station is 7.6 m3/s; the bottom of the suction tank is at a height of -1.50 m to ensure normal operation of 25 units in the condition that the water level of the Red River drops to a height of +0.10 m at the suction tank.

Vong La pepper pumping station is designed with 3 units. In which, pump 1 is used to pump domestic wastewater so as not to flow into the raw water canal: in the dry season, the symbol is DN200, Q=90m3/h, H=10m; pump 2 is used to pump rainwater for Vong La reservoir, symbol DN400, including 01 operating unit and 01 backup unit with Q=600m3/h, H=18m; pump installation height +7.8m. The pumping station is operated by 01 single-phase control cabinet. The pressure pipeline has a length of L=982m.

System of managers, control houses, security houses

- Ap Bac pumping station manager has an area of 130.2m2; is a 2-storey house; 14m long; 9.3m wide; 11m high. The structure is a reinforced concrete frame house with 200# mark, the wall is made of solid bricks of only VXM grade 75#, 22cm thick.

- Fixed pump station control house: Rebuilt in 2018; has an area of 84.7m2; 01-storey house; 10.3m long; 8.22m wide; 3.6m high. The structure is reinforced concrete bearing frame house with 200# mark, VXM brick wall with mark 75#, 22cm thick. The house is roofed with 1.76m high heat-resistant corrugated iron.

- The guardhouse at K2+300 on the Mid canal was built in 2018 with an area of 46m2 and is a 1-storey house with 02 rooms and 01 permanent room. The structure of the guardhouse is a frame house with 1x2 stone reinforced concrete, grade 200#. the foundation is driven by 1x2 stone concrete piles of 200# mark 2m deep; VXM unburnt brick wall 75#; 1x2 stone concrete roof deck, mark 200#. The whole house is painted with waterproof paint.

Substations and medium voltage lines

- Substation with machine capacity 2000KVA-22/0.4KV;

- The medium voltage line is an underground cable system Cu/XLPE/PVC/DSTA/PVC/W 24kV-(3x120mm2) with a total length of 335m.

The channel within the sanitary protection zone of the domestic water intake area has a length of 1000m from the upstream of the field pumping station and 200m from the downstream of the fixed pumping station. The channel has an average width of 100m and an average bottom elevation of -0.5m.

Canal system and works on the canal.

- Ap Bac pumping station channel has a length of 160m, solidified with concrete slab roof with roof coefficient m = 1.5; channel bottom width 22.0 m; channel bottom elevation at the beginning of the route +0.20 m.

- Ap Bac pumping station discharge canal has a length of 190m, solidified with concrete woven sheet roof with roof coefficient m = 1.5; channel bottom width 10.0 m; channel bottom elevation at the beginning of the route +7.20 m.

- Ap Bac field pumping station discharge channel has a length of 285m, solidified roof with concrete woven sheets with roof coefficient of 1.5; channel bottom width 8.0 m; channel bottom elevation at the beginning of the route +7.45m.

- The central irrigation canal has a length of 2,468m, the roof is solidified with concrete slabs with a roof coefficient of 1.5; channel bottom width 9.0 m; elevation of the canal bottom at the beginning of the route +6.74m; elevation of canal bank at the beginning of the route +9.00 m.

- Drains and regulators

+ Self-flowing sluice: At K0+215, the left bank of the discharge canal at Ap Bac pumping station; culvert has 2 doors; length L= 11m; 1.6m wide; 2.5m high; V5 opening and closing machine, electric motor with a corrugated iron roof.

+ Sluice across Vong La dike: At K53+920 on the left bank of the Red River; built-in 1962; culvert has 2 doors; 35.7m long; 2.9m wide; 2.5m high; flow rate 12.5m3/s; culvert operated by V10 collapsible machine; electric motor covered with corrugated iron. The culvert bottom is +6.6m high; the top of the culvert is +9.4m; the bottom of the upper terrace has a height of +6.72m and the downstream of the culvert has a height of +6.6m.

+ The sluice to the Viet Thang - Thanh Cong canal: At K1+474 on the right bank of the middle channel, there is a reinforced concrete one-door round sluice with length L=10m; diameter D=60cm; drains use open-closer V1.

+ Regulating at the weir: At K2+500 on the Mid channel; culvert has 2 doors; 4.2m long; 3.5m wide; 3.2m high; culvert operated by opener V10; electric motor with the corrugated iron roof; culvert bottom has a height of +6.3m; the top of the culvert has a height of +9.5m.

3.2. Demographic

Before considering the willingness of people to pay for water quality improvement, the current payment scenario is based on: “With the current urgent water situation, the supply of clean water is guaranteed for people to use". Water in Ap Bac Irrigation System, Dong Anh District, Hanoi City is necessary. To assess the role of agricultural water and propose the most reasonable water supply solution most accurately. It is assumed that in the future the water quality will be improved to ensure the current agricultural irrigation water quality standards and at the same time overcome environmental problems. Please choose the price of water/ha that you think is most suitable for the benefits that the water source brings to the family.

We need to consider some characteristics of the household group interviewed. These characteristics have a direct influence on the willingness to pay of the next people of the people in the future. The first is gender, out of a total of 172 interviewed households, a total of men accounted for 55.56% of the total sample, accounting for 44.44% of the total sample. The mean age of the survey samples was 41.93. In general, at this age, the sample has a middle age. Regarding the average income of the surveyed household group is 5.61 million/month, this income is quite high, but this is the income of individuals, not households. So if calculated on average per household, it fluctuates in the range of 2-3 million/person. Moreover, Dong Anh district is a town mainly developing trade and transportation services, the industry is also quite developed while agriculture is almost very little, mainly cum so, this income level also reflects the economic life of the people of Dong Anh district.

3.3. Evaluation of willingness to pay to participate in improving agricultural irrigation water supply system in Ap Bac irrigation system.

Regarding the assessment of willingness to pay to participate in the improvement of the agricultural irrigation water supply system in the Ap Bac irrigation system. Through the survey of 60 people representing 60 people, 56 people (93.3%) interviewed answered that they are willing to pay for the connection and installation of wastewater treatment systems, only 4 people (6.7%) interviewed said that they are not willing to participate in system installation because their income is low.

Table 1. Price people are willing to pay for participation in improving water supply systems in irrigation systems Ap Bac

k	***WTP_k (thousand dong)***	***(%)***
1	100000	14.29
2	150000	35.71
3	200000	12.5
4	250000	10.71
5	300000	7.14
6	350000	7.14
7	400000	5.36
8	450000	3.57
9	500000	3.57

So from the table and applying the formula, we can calculate the average WTP = 221,428 thousand VND/1ha. Thus, the average price that people in Dong Anh district are willing to pay for participating in the improvement of the agricultural irrigation water supply system in the Ap Bac irrigation system is on average 221,428 thousand VND/ha.

3.4. Linear regression model

Through the results obtained during the investigation, the author has built a multivariable linear regression model to analyze the factors affecting the spending level for WTP as follows:

$$\mathbf{WTP = 5127.2 + 1231.8 * AGE + 15384 * GENDER + 32476 * LEVEL + 0.0063 * INCOME}$$

Observing the model, we see that, the dependent variables that are age, gender, education level, income are all proportional to WTP. With the significance level of 0.05, we evaluate the relationship between the WTP variable, and the independent variables as follows:

P-Value (age) = 0.04 < 0.05, showing that the age variable has a close relationship with WTP. This can be explained, the older the people, the more their need for improving the irrigation water supply system at the Ap Bac irrigation system to protect the health of the people higher. Therefore, they are willing to pay for the improvement of the irrigation water supply system at Ap Bac irrigation system to protect the living environment as well as their own health. The age variable has a great influence on WTP.

P-Value (gender) = 0.286 > 0.05, showing that the gender variable is not closely related to WTP. Whether male or female, everyone realizes the importance of improving the irrigation water supply system in the Ap Bac irrigation system for the main study area. The respondents whether male or female may participate in the response, and the WTP results are not strongly related to gender.

P-Value (level) = 1E-04 < 0.05, which proves that the educational level variable has a close relationship with the WTP variable. The reason for this is that the more educated people, the more knowledgeable they have access to information sources, which helps them to have a correct awareness of the need willing to pay for the improvement of the irrigation water supply system at Ap Bac irrigation system.

P-Value (income) = 7E-06 < 0.05, which proves that the income variable has a close relationship with the WTP variable. People with higher incomes are usually more willing to pay for the improvement of the irrigation water supply system in the Ap Bac irrigation system than those with low incomes.

4. Discussion and Conclusion

Through the research model and the analysis results of the factors affecting the willingness to pay for agricultural water supply services, we find the influencing factors affecting the willingness to pay including local factors, education level, household size, number of workers in the household, total income, daily water use of the household and environmental awareness of the household head. These results are also consistent with previous studies. Besides, the study also discovered 4 new factors that were found to be statistically significant variables: living area of the household, number of people working in the household, water source used and environmental awareness.

The government when developing programs/projects on improving the water environment in localities should pay attention and consider factors such as contribution to the fund, household income, education level, and household's attitude towards the environment. In particular, the expected contribution of funds should revolve around the value of WTP estimated from this study.

The results of this study can be used as a basic source of information to estimate the total amount of funds that can be obtained. This will serve as a basis for estimating the financial ability of the people to develop programs to improve the quality of polluted agricultural water environment in the locality.

ENHANCING THE EFFECTIVENESS OF CLIMATE CHANGE COMMUNICATION MESSAGES IN LOCAL NEWSPAPERS IN THE MEKONG DELTA REGION

MA. Ho Thi Thanh Bach

htthanhbach@cantho.gov.vn

Can Tho Department of Foreign Affairs, Can Tho city, Vietnam

Abstract

With severe impacts on livelihoods, climate change (CC) is considered as one of the biggest challenges of humankind in the 21st century. Vietnam is among 5 countries that are mostly affected by CC, while the Mekong Delta area of Vietnam is one of the three global deltas vulnerable to sea-level rise. Considering its influence, communications in general, printed newspapers in particular in Mekong Delta provinces have been increasing its impacts positively to help local communities enhance their awareness and change their behaviors so as to adapt to CC. Nevertheless, CC messages in newspapers remain specific limits, resulting in the communication unable to reach its ultimate effectiveness. This article points out the reality and some recommendations related to the adjustment of content and form of CC articles in printed newspapers in Mekong Delta to raise the impact to the public in the future.

Key words: *climate change; local printed newspapers; Mekong Delta; messages*

1. Introduction

The Mekong Delta of Vietnam contributes 18% to the national GDP, with 90% contribution to the export rice, 60% of aquaculture products, and 70% of fruits. According to CC scenarios, by the end of the 21^{st} century, the annual average temperature in Vietnam increases by 2 to 30 degrees Celcius, and the sea level is 75 cm to 1 meter higher than it was in the period of 1980 – 1999. By that time, there will be 40% of the total area of the Mekong Delta being flooded, and 35% of the population badly affected by complex weather. In reality, recent weather conditions in the Mekong Delta have shown several abnormal signs, and drought, saline intrusion, flooding, etc have become more serious, threatening livelihoods of local communities as well as the regional sustainability. The importance of the Mekong Delta to the whole country and the risks and dangers from CC encountered by this land requires its communities to have appropriate awareness, knowledge, and skills to proactively adapt to CC. This very much depends on the messages local people receive from the media, among which is the printed newspapers. Are local newspapers in the Mekong Delta doing well in their roles of social orientation in building and transferring CC information to the public in a scientific, diverse, objective, systematic, and easy-to-understand way? From the survey of 3 printed newspapers in the region – An Giang, Ca Mau, and Can Tho newspapers from 2017 to June

2019, this article will provide the reality of CC messages and some recommendations to enhance the message quality so as to improve the influence effectiveness of CC communications by printed newspapers in the Mekong Delta.

2. Literature Review

In this article, the definition of CC is understood in accordance with Article 3, Clause 13, Vietnamese Law of Meteorology and Hydrology in 2015 "CC is the change of climate in a long period of time due to the impacts of natural conditions and human activities. Currently, CC is expressed in global warming, sea-level rise and the increase of severe meteorological and hydrological phenomena".

A message is a fundamental factor of a communication process, "the information given from the source to the receiver. The message includes thoughts, emotions, aspirations, requests, opinions, understanding, living experience, scientific and technological knowledge, etc which are coded in accordance with one particular symbolic system. This system must be agreed by both the source and the receiver, and contains a common way of understanding, in other words, being able to decode. Speech, handwriting, signals, pictures, and human expressive gestures are all used to transform messages." (Dung and Hang, 2012, p.13)

Messages in printed newspapers are core information forming meanings of the text. On the article perspective, each one contains a message (the target message the newspaper is aiming for) formed by detailed messages (parts) and they may be relevant or completely independent with messages in other articles of the same publication. On the publication perspective, a message of an article on a particular issue is a part message, contributing to the forming of the target message on that issue, which the newspaper wants to convey to the public.

3. Method

To evaluate the CC messages in Mekong Delta newspapers, the author has carried out the quantitative and qualitative research via 3 main methods:

Study the content: among 2,037 publications from 2017 to June 2019 of 3 representatives, An Giang (648 publications), Ca Mau (499), and Can Tho (890), 1,290 articles have been selected as they satisfy one of the following criteria:

- The article directly mentions the phrase "CC".

- The article has words relevant to CC expressions - such as: atmosphere warming (or global warming), polar ice melting, sea-level rise – or words of typical expression of CC impacts in the Mekond Delta – such as: storm, flood, inundation, drought, landslide, land subsidence, land erosion, tornados, heatwave, irregular rain or abnormal intensity rain – as well as El Nino phenomenon, saline intrusion, biodiversity loss.

These articles are analyzed mainly in two aspects: message content and form.

Questionnaires are also used to survey public opinions on their assessment on CC information provided by the local newspapers, as well as information demands of the public in this matter. Questionnaire respondents are also asked if they have any suggestions for their local newspapers to improve the quality and effectiveness of CC messages. In each province of the surveyed area (An Giang, Ca Mau, and Can Tho), 150 questionnaires are collected.

4. Results

With 1,290 articles containing CC messages among 2,037 publications, it can be seen that CC is concerned by local newspapers in the Mekong Delta. However, among these articles, there are only 462 having content primarily about CC, while in the remaining 828 articles, CC messages are part messages, not primary content that the article is aiming at. These indicators have shown that although the frequency of CC messages in total surveyed publications is quite high, the actual in-depth articles with primary content of CC are not many in local newspapers in the Mekong Delta.

4.1. Message content

Goals of the CC communication campaign are the public is able to identify CC expressions, understand impact and forming procedures of the expressions, current development, tendency forecast in the future, as well as proactive solutions for prevention and adaptation. In line with these goals, CC messages are considered in 4 aspects, including: (1) messages on CC expressions, (2) messages on CC impacts, (3) messages on the causes of CC, and (4) messages on CC adaptation. Results show that the number of articles mentioning CC expressions is the highest, with 943 articles accounting for 73.5% of the total surveyed publications. The runners-up are on CC adaptation (66.4%), and CC impacts (64.6%), while the causes of CC is the least mentioned content, with only 14.1% figure.

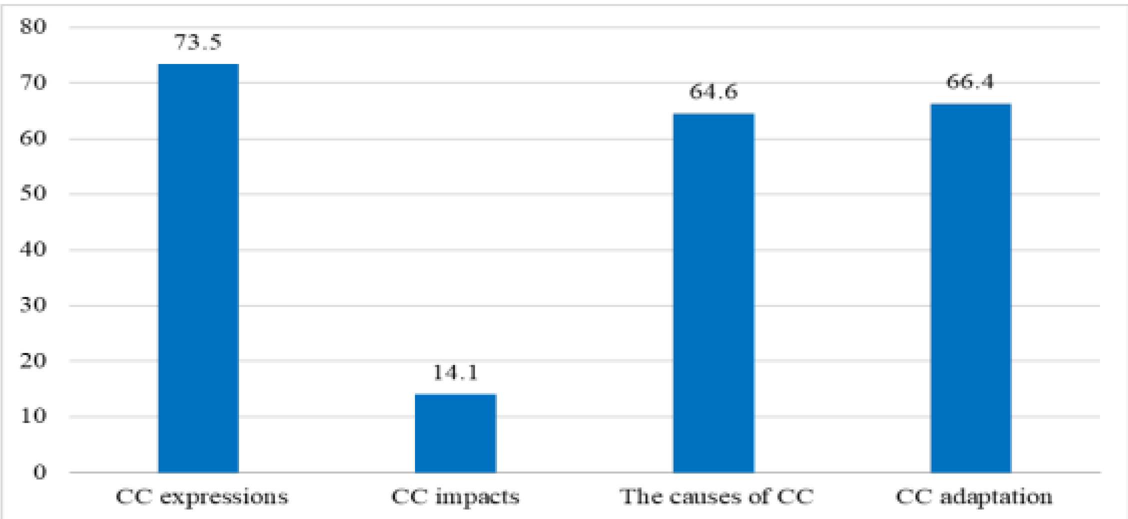

Figure 1: Aspects of CC messages in Mekong Delta newspapers

(Source: Surveyed newspapers in An Giang, Ca Mau, and Can Tho from 2017 to June 2019)

- Messages on CC expressions

Messages on CC expressions are shown in descriptive articles on one or more expressions of CC, with a particular time and locations occurring the expressions, data on frequency and intensity of the expression, as well as forecast on following happenings, and consequences of the expression. Messages on CC expression are particularly meaningful in helping the public to identify symbols and progress of the epxressions, as a result, to have attention and concern to know about abnormal symbols.

CC expressions are the content that appears most among the four CC message contents which this article surveys. All three newspapers are concerned of providing information in a timely manner and reflecting the correct reality of CC expressions to warn local people, and help them to have proper activities. The frequency of CC expressions mentioned is compatible with the happening and frequency of these expressions in reality in the Mekong Delta recently. Moreover, the focus is on riverbank landslide and coastal erosion, which are occurring in a complicated way. Besides, drought and saline intrusion are having more impacts on livelihood and socio-economic development of the region. Nevertheless, information on the expressions is mainly descriptive and not having forecasting information for local people to prevent proactively. Furthermore, newspapers pay much attention on direct and visible expressions; they do not have sufficient reflection on severe and secretive CC expressions usch as subsidence and loss of biodiversity. This will lead to the fact that local people will be slow in identifying the problem and awareing risks from such CC expressions. Therefore, it is less feasible for the citizens to adjust their behaviors to mitigate negative impacts of these expressions.

-Messages on CC impacts

This message helps the public to be aware of the impacts that climate change has on human life, thereby taking practical actions to deal with this issue. Statistics on surveyed articles with CC messages showed that 64.6% (833) articles mentioned the impacts of climate change.

The survey shows that articles on the impacts of climate change are published in the Mekong Delta with high frequency. However, the vast majority of these articles see climate change as a negative issue, while the positive side of climate change is rarely mentioned. The scope of reflection is mainly local. The areas affected by climate change mentioned are quite diverse, but the most are still observable consequences, especially physical factors such as houses, roads, dikes, money, crops, number of people injured or killed... but less focused on clarifying the psychological consequences and long-term health impacts of climate change on humans. Likewise, vulnerable groups such as children, the elderly, women and the poor - who are most affected - are also rarely mentioned in the messages on the impacts of climate change.

- *Messages on CC causes*

Information on the causes of climate change is one of the important contents of communication on climate chang because clarifying the cause with deep, scientific analysis, from highly reliable sources will help the public to properly understand the reason for the increasing climate change. It also has the effect of "waking up", helping the public to review and adjust their behaviors. On the contrary, superficial information on the basis of the author's prejudiced thinking or from inaccurate and unreliable sources will lead to misunderstandings about climate change, or less convincing the media public.

However, information about the causes of climate change requires a high degree of expertise, not everyone can arbitrarily make judgments, but it is often spoken by knowledgeable people such as experts and scientists. In addition, the process of analyzing, dissecting and explaining the causes of climate change expressions requires the use of many scientific terms that are not easy to understand; this forces journalists to thoroughly understand the problem and be able to express in popular terms, close but accurate. Therefore, information on the causes of climate change is a group of content that is rarely mentioned in articles on climate change in the Mekong Delta newspapers, accounting for only 14.1%, with 182 articles.

Content analysis shows that most of the articles explaining the causes of climate change are articles that cover the entire topic of climate change and often refer to the chain of causes rather than just one single cause. In particular, the group of human causes is mentioned more than the group of natural causes. However, there are few messages that "show face and name" groups of people in specific areas. Instead, the articles do not refer to the subject performing the behavior or describe it with the generic nouns, such as "human", "farmer", etc., therefore, it is difficult to make the subjects perceive their behaviors to adjust as well as create a flow of public opinion in order to condemn wrongdoings and violations of the law, affecting the environment and social life. In addition, information on these aspects is highly specialized, while most reporters do not have expertise in the field of climate change, so their handling of specialized terms is not flexible. Therefore, many messages about the causes of climate change still contain many technical words and phrases that have not been popularized, making it difficult for the public to understand.

- *Messages on CC adaptation*

Climate change is an existential threat to the goal of sustainable development and poverty reduction of the country, with an increasing level of loss and disadvantage, requiring urgent actions to promptly mitigate the harmful damages. Facing that alarming situation, finding and providing solutions to adapt to climate change is something that the society is extremely interested in. With the press in general, and the local print press in the Mekong Delta in particular, the content of solutions to climate change adaptation is also focused with many rich and diverse expressions. There are 711 articles containing the message of solutions to adapt to climate change with contents referring to the guidelines of the Party, the policies of the State and the implementation of those policies of the political system at all levels, accounting for 55.1%. The order of the remaining contents is Application of advances in science and technology - 24.6%, Education and communication to change awareness and behavior -17.4%, International cooperation - 8.6% and Self-referencing experience/skills -7.8%. In addition, there are 10 articles mentioning Other solutions -1.2%.

These messages have shown the public the decisions and efforts of the whole political system; bringing to the public valuable knowledge and experiences on climate change adaptation, in which many experiences have been formed and drawn from practice... thereby contributing to forging more trust and motivation for the public. However, there is a significant imbalance in the content of messages about solutions to climate change, as most of the messages focus on information about conferences, reports and activities and direction of leaders, rather than finding and introducing effective models and ways of doing things from practice. The proposed solution messages to mobilize and educate people to understand and adjust their behaviors accordingly are still general, not directed at specific target groups, so it is difficult to create behavior changes in the desired target audience.

4.2. Form of the messages

To express the content of the message, it is necessary to find the tone, words, illustrations... that are reasonably consistent, helping to describe and express the content accurately, vividly and attractively. No matter how meaningful and novel the content you want to convey is, but the form of delivery is not consistent, it will not create a clear, valuable and effective message. Therefore, evaluating the value of journalistic works in general and press messages in particular, besides the content, it is necessary to consider more about the form as an inseparable whole. The form of the message in the article is considered in two main criteria: structure (genre, capacity, language) and how to organize the message (frequency, posting location, author).

Statistical results of 1,290 surveyed works show that the type of journalism that expresses climate change messages in printed newspapers in the Mekong Delta has not been diversified. News groups, news articles (including all kinds of news, news articles, reports, reflections, interviews, reports, investigations, etc.), account for the majority with 1,195 works (92.6%). Among which, news and articles are the most used by newspapers. This is also understandable because news and articles have the strength of being able to act quickly, succinctly and meet current requirements. However, due to limited capacity, there are many articles in the 3 surveyed newspapers published with very brief content, with a reception nature; a lot of information is exploited from old reports, but little information is newly discovered. Articles belonging to the political group such as commentaries, treatises, systematically analyzing and explaining problems with strong arguments are often highly persuasive but did not appear much in the newspapers during the survey period – only 8. Articles translated from foreign newspapers or international organizations are 85, accounting for 6.6%, only appearing in An Giang and Can Tho newspapers. During the survey period, only 8 articles were in the treatise category (0.6%) and all 3 newspapers and no article were in the infographic category.

Information on climate change needs to be stated accurately, from clear sources, so the information is mainly expressed in scientific language style. The results of the qualitative analysis of the articles in the survey also show the style of scientific language, such as using many scientific terms, using only one meaning, not using rhetorical devices; tight, coherent sentences, standard syntax; sentences are neutral… However, in some articles, there are still too many technical terms or confusing terms used. Qualitative analysis also shows, to describe climate change , there are words/phrases repeated many times in articles such as: "global danger", "top danger", "humanity's greatest danger", "disaster", "problem", “irreversible”, “than one would expect”, “utterly bad”. Talking about the impacts of climate change, words usually are "horrifying", "terrible", "severe", "catastrophic"... The frequent use of such “shocking” language may lead the public to think that climate change is a problem beyond human control and that there is absolutely no way to prevent it. The use of non-literate languages to express messages about climate change in Mekong Delta newspapers is also very limited, monotonous, and images are the main type of non-literary language. Out of 787 articles with accompanying images, there are 419 articles (54.7%) with images of climate change taken directly from the scene where the phenomenon occurs, 42 images of climate change (5.3%) for illustrative purposes and 40 % other images (in articles where climate change content is mentioned very little). The images of the scene increase the persuasiveness of the information by the readers such as "seeing with their own eyes" the events and models that the article mentions. Besides, images help to add information, create "highlights" for the article. However, the images used in some articles are still limited, such as: the image quality is not good (the image is too dark or blurred); the layout of the image does not highlight the content or the content of the image does not match the content of the article. The improper placement of images and text makes the form of the article unattractive. In addition, some images have a not-so-beautiful layout, are not in the style of press photos, and some illustrations are not suitable for the content of the article...

Analysis of posting frequency shows that the number of articles containing messages about climate change in 2017 is the highest, 610 articles. In 2018 there were 442 articles and the first 6 months of 2019, there were 238 articles. Although the information flow is still guaranteed, the number of articles on climate change in local newspapers is often unstable and varies with the number and extent of events on climate change organized and impacts of climate change locally. This can, in some cases, affect the effectiveness of the communication campaign against the target audience it is targeting.

All three survey newspapers do not have a climate change column as well as a fixed page for this content. Regarding posting position, 42.2% of articles are introduced on page 1 and more than 50% of articles are published on important pages (pages 2- 3, color pages). Articles posted in important positions, easy to impress the public and easy to read will help the message reach and spread more easily.

The collaborators are "eyes and ears", helping the editorial office to promptly detect and provide information on the changes and impacts of climate change, the implementation of climate change policies, etc., ensuring profound practicality. It is both a feedback channel to evaluate journalistic work - an important measure of the quality of the newspaper. However, the survey results show that the local newspapers in the Mekong Delta have not done well in building and developing a team of collaborators for articles on climate change. The authors of these articles are mainly journalists (96.7%), The number of articles written by experts, scientists, informants, collaborators... is only 3.3%.

4.3. Successes, limits, and solutions to enhance quality of CC messages in Mekong Delta newspapers

4.3.1. Successes and limits

Surveyed data reveal that Mekong Delta newspapers have much effort in building and carrying out articles on CC, contributing considerably in the provision of information, knowledge, and action orientation to cope with CC for local communities. Systematic and rather comprehensive information have brought useful and multifaceted knowledge for the public, helping them identify CC expressions and impacts, as well as causes, especially causes by human beings, so that they can change their habits and behaviors to reduce negative influences of CC. Many messages contained in the articles of Mekong Delta newspapers introduce and explain the policies, meanwhile promote and guide citizens for their understanding, supporting, and abiding by such policies. On the other hand, the public understands and approaches rapidly with the CC mitigation policies that are applied by the State, has better awareness on rights and responsibilities. From that, governmental regulations on CC are concretized and merged to the reality. By continuously informing activities of local authorities, updated technological solutions, and lessons learnt from the public experience, newspapers and media have helped the public to learn new knowledge, gain more experience and skills with high applicable values, contributing to the creative capability for coping with CC.

Valuable messages have helped the public to aware of the reality and severe impacts of CC on the livelihood of Vietnamese people and the world, especially people in the Mekong Delta. Results of the questionnaires show that 92.2% readers of Mekong Delta newspapers have concerns and high concerns on CC; 92.1% readers are aware that CC is causing huge impacts on livelihood. 100% readers know about typical expressions of CC in Mekong Delta; 74% readers express their belief and ultimate belief in the victory of humans over CC in the future if we are determined and agreeing on changing daily and production behaviors.

These figures are important illustrations for the impacts of CC messages in Mekong Delta newspapers in helping the public to gain their knowledge and participate more in the mitigation and adaptation of CC, a journey that the whole country is putting its best to achieve.

- Besides the successes, the complexity of CC and unfavorable factors of resources, both objective and subjective reasons have made it hard for local newspapers to accomplish what they want. As a result, information quality and value of CC message in newspapers in general and Mekong Delta newspapers in particular are affected.

On the content aspect, CC messages in Mekong Delta newspapers lack an overview and mention too much on CC expressions and consequences as well as activities coping with CC of local authorities. They do not cover enough articles on scientific information, and forecast of CC progress. Information on CC is biased, with the focus on negative impacts rather than on highlighting positive impacts of the changes of climate factors at one particular time and different geographies. Several articles contain severe pessimism; hence, they do not stir up beliefs and promote the community to act together. The communication of policies is mainly propaganda, with a focus on introducing, explaining, and encouraging the public to follow. It is rare that there are critical articles on the logic and appropriateness as well as the feasibility of CC policies in reality, stating inadequacies of economic development and CC targets so that the authorities must pay attention to have an adjustment of current policies. The situation of "reporting" the articles is quite common.

The ratio of CC messages with reflecting scope outside the Mekong Delta is quite modest (11.3%). Articles translated from foreign press are only 6.6%. As for Ca Mau newspaper, there are no translated articles, nor does it have any article on CC with the scope outside the country. This fact limits the public knowledge on CC; the public is not aware that coping with CC is a common effort of all human kinds and that it requires the participation of each individual. Needless to say, in front of the vital requirement of mitigating negative impacts of CC, many non-governmental organizations and international financial corporations have had supporting plans and programs to encourage sustainable economic development, with the scope to household level. Citizens would skip invaluable opportunities if they do not know about such information. Moreover, the effectiveness of mobilizing financial and technical resources from international organizations and countries to cope with CC may be minimized.

On the aspect of form, type diversity is an important requirement to ensure freshness and attraction of a newspaper message. Nevertheless, most articles containing CC messages in Mekong Delta newspapers are descriptive and narrative articles. Treatises to analyze and explain an issue thoroughly are very rare. Infographic is not exploited ultimately by reporters, expressing during the preparation of the article message.

The processing of specialized words in some CC articles in Mekong Delta newspapers is not flexible; many terminologies are not explained, making it hard for the public to understand. CC is a scientific area requiring preciseness in wording; however, the language used in many articles is from the subjective guess of the writer, not based on scientific foundation. In addition, it is quite popular to have the "exaggeration" of words on CC impacts in a intimidating and severe way.

The fact that there is no column on CC is a huge limit in creating favorable conditions for CC messages conveyed to the public. Having a regular column helps readers to follow information, have a continuous insight on a specific topic, and create an intensive spread of the information. As Mekong Delta newspapers have no CC column, CC articles are scatterly published on many columns and pages, making it hard for the public to follow, feedback, and provide information and comments to the publishers.

4.3.2 Solutions to enhance quality of CC messages in Mekong Delta newspapers

Through the questionnaires, most feedbacks from the public are that CC information in Mekong Delta newspapers satisfy only a part of their demands (63.4%), while 12.2% respondents think that they are not satisfied; only 24.4% choose that they are satisfied. The result shows that CC messages in Mekong Delta newspapers need some changes to fit the reality and information demands of the public.

- On content: Articles in Mekong Delta newspapers need more diverse information from different aspects of CC with different approaching angles. The newspapers also need to increase the number of articles analyzing the causes of CC, stating the relevance between the increase of CC expressions, symbols, and impacts and bad rituals and habits in production, daily life, and bahaviors related to unsustainable exploitation of natural resources. It is also suggested that further information on negative impacts of CC is added so that the communities can learn that CC does not only bring about threats but also opportunities for economic transformation, breakthrough development, as well as competitiveness.

In order to enhance depth and applicable value for the messages, Mekong Delta newspapers with CC messages need to have more critical articles, avoiding biased and imposing information. Besides, it is required to refresh the thinking of topic selection, renovate the approach, and analyze the problem from fundamental level and from the real-life aspect. In particular, the focus should be on damages, expectations, and emotions of vulnerable groups from the unmeasurable impacts of CC. Internal conflicts of the society in the multifaceted impacts of CC, if initiated by reporters, using the power of the media to make it pressing public opinion for the intervention of the authority, the value brought about is not only for the reflected object, but also faith for the newspaper agencies, trust and agreement of the citizens and the authority.

Furthermore, it is recommended that CC information scope is increased, so as to provide the communities with a comprehensive outlook of CC in the world, helping the public learn experience on CC adaptation that international counterparts are implementing. At the same time, more information on reality and achievements of CC adaptation of Vietnam should be promoted for the international communities to know more about what our country is doing. As a result, it will be easier to call for other countries and international organizations to come to Vietnam for studying solutions and financial support for Vietnam to cope with CC.

- On form, currently, CC articles in Mekong Delta newspapers are mainly reflective ones. Other strengths of printed newspapers such as reports, commentaries, and treatises are quite rare. Consequently, it is necessary to diversify the forms so that interested readers feel less boring upon receiving the information, at the same time promote the content effectiveness in some specific circumstances. In addition, having articles in infographic form requires more attention, as this is one of the latest forms of expression, reducing monotony for both the article and the publication.

It is appropriate that Mekong Delta newspapers are using mostly scientific language to convey CC information. However, scientific terminologies need to be processed more flexibly. Articles' writers should choose simple, easy-to-understand words and avoid academic phrases when describing CC. Moreover, it is recommended that non-writing forms of language are used more often, such as graphic and charts, etc. in order to make the article livelier. Pictures should have good quality, with a clear structure, and proper aesthetic and information values to the article.

Mekong Delta newspapers should prepare plans on CC communication annually for a continuous flow of information about CC in the news. Based on current item distribution of the surveyed newspapers, the author suggests "Climate change" column, located on middle pages (pages 6-7 of An Giang and Ca Mau newspapers, pages 8-9 of Can Tho newspaper). These pages are printed in color, so it is feasible to design attractive articles to catch the attention of readers.

To improve the current situation of few collaborators, Mekong Delta newspapers should have encouraging policies to attract experienced reporters and prestigious writers to participate in CC topic. Newspaper agencies should frequently organize trainings on article writing, as well as seminars for collaborators to reward and present active individuals, and create the close relations between the newspapers and their collaborators.

5. Conclusion

The Mekong Delta is one of the three most vulnerable deltas in the world from CC and sea-level rise. Local newspapers have been endeavoring to convey information to the public with diverse messages so that they can have knowledge and clear awareness on CC impacts, leading to the changes of behaviors and adaptation to CC. Nonetheless, the communications of CC in local newspapers still have several limits, for example, the messages do not cover CC aspects, information is biased, negative content outweigh positive ones. In addition, message forms are por in categories, and words used are hard to understand. These drawbacks may have bad influence on the public, resulting in incomprehensive awareness and passive psychology. Besides, anxiety and fear of long-term impacts may erode the willingness and faith of the communities to their behavior changes to reduce the threats.

In the context of CC continueing its complex progress and impacts, in the upcoming years, CC adaptation needs to be enhanced, and the media in general, Mekong Delta newspapers in particular have to maintain their crucial roles in implementing the task. Therefore, some recommendations on content and form have been suggested to raise the message quality. The author believes that they can help to increase the effectiveness of communication, making a strong impact to contribute to the change in awareness and behavior of the communities in a positive way./.

ASSESSMENT THE IMPACT OF A NATURE RESOURCE MANAGEMENT PROJECT ON THE LOCAL LILIVEHOOD IN RURAL AREA

Dr. Nguyen Thi Thanh Ha

hanguyen@tnut.edu.vn

Faculty of Industrial Economics, Thai nguyen University of Technology, Thai Nguyen, Vietnam

Abstract

The study provides evaluation method assessing the impact of a natural resource management project on the target group and respective natural resource base. The study was conducted in Backan province to evaluate livelihood changes of target groups on selected project sites and key indicators identified. Livelihood changes were specifically related to the impact of a natural resource management project and separated from outside influences. The project's impact was proven to be of substantial support by the livelihood pathway approach, while common repetitive household questionnaires did not produce significant results. Moreover, the impact of 'development-and-conservation' schemes by an improved utilisation of non-timber forest products was demonstrated to be unsuccessful, but successful by project activities like provided on-farm activity support.

Keywords: *Impact assessment, Natural Resource Management, Livelihood.*

1. Introduction

With each passing year, more forests, wetlands, and species come under threat from escalating pressures of exponential increases in human populations and the inevitable associated development. Every year, billion of dollars are spent on so-called 'conservation-and-development' projects intended to mitigate those pressures [1]. Whereas eco-centric project approaches intent 'to protect those last precious few natural treasures' while attempting to 'satisfy the livelihood demands of the people who depend on the resources those treasures offer'; more ethno-centric approaches focus on improved management and utilisation of natural resources for an enhanced productivity by basically incorporating sustainability and resource protection as a basic requirement [3]. A balance between those trade-offs in the use of natural resources for conservation and development 'win-win' purposes often enough is hard to be determined as the critical interlinkages are rarely identified. It is of fundamental importance to identify and describe the impact of a natural resource management project along the livelihood pathway of a target group or community [4]. Only by the assessment of the target group's genuine motivation and development interests, and the impacts of project interventions on the specific livelihood pathway, it is possible to determine those critical interlinkages of a specific conservation and development project. By that, the methods allow the identification of potential triggering points or recommendable adjustments within the active time of a project [6],[7].

The specific aim of the research was to test the method assessing the impact of a natural resource management project on the target group and respective natural resource base.

2. Method

Located in the Northeast region, due north of the capital Hanoi, Bac Kan is the only town of the province which is the capital of the province and is a municipality. The province covers an area of 4,859.4 square kilometres and as of 2019 it had a population of 313,905 people [2]. It is a mountainous terrain with rich natural resources of minerals and forests. It has numerous mountains, rivers and lakes which are very scenic. Ba Be National Park and Ba Be Lake lie within its borders.

With the success of the pilot project on allocating land and forests to the community for management, experts believe that the “community forest” is really the good mechanism for sustainable forest management. Bac Kan province proves to be one of the first localities applying the model on a trial basis, which has been allocating land and forests to local residents for management for the last few years. Under the mechanism, local authorities assign the task of managing and protecting the land and forests to local residents and pay for the management. The model not only has helped residents settle down in their land, heighten the awareness of protecting the land resources, but also created a premise for the sustainable forest management.

In Bac Kan, the model has been applied in the communes of Ban Thi and Xuan Lac in Cho Don district, and four hamlets belonging to Van Minh commune of Na Ri district. In Ban Thi and Xuan Lac, where the model of community forest management developed by CARE has been implemented, and nine teams in charge of managing and protecting forests have been established [5]. The members of the teams attended the training courses to improve their capability, and they were introduced how to build up the action plans and operation regulations (the regulations were recognized by the district authorities).

After three years of implementing the mechanism, in 2006-2009, under the project, nearly 1000 hectares of forests have been allocated to local residents, who will protect and cultivate for five years. Meanwhile, in Van Minh and Lang San communes, under the project funded by AusAID for three years 2007-2010, four hamlets could build up the models of “nursery gardens” at hamlet and village levels. The most outstanding outcome of the project is that the illegal exploitation has been eased significantly. The satisfactory result has been explained by the reasonable management mechanism, under which, the effectiveness in forest management is always associated with the benefits of managers and protectors.

Especially, the Na Ri district's authorities have granted local residents the certificates on the land use right on the forest area put under their management. A forest fund management with the initial capital of 13 million dong has also been set up in the communes, which have been used to pay for the forest patrolling, equipment purchases and to lend to local residents at preferential interest rates.

In 2020, the research team organised a comprehensive questionnaire for assessing baseline information within 3 villages in Van Minh commune, Na Ri district, aiming on two goals: Firstly, to enable the comparison of the current situation to the baseline information, secondly, to gain more specific data about socio-economic backgrounds. The questionnaire comprised 30 structured questions on the household, income and employment situation, the use of natural resources and awareness of the conservation status relating to nature resource management activities. This questionnaire was carried out in the same project and control villages like the previously described indicator assessments.

3. Results

The quantitative assessment with 80 households within three villages (two 'treatment' and one 'control') in Na Ri District were assessed for this study as described in Table 1. The incidence of poverty is determined by the Vietnamese Government, while a self-evaluation must be considered with more care as 'poverty' underlies to a certain extend individual and subjectively rated parameters. According to Table 1, the control village comprises relatively more 'poor' households (54.2 %) than the project villages (44.6 %). As the study aims on improving livelihood, this could be taken as an indication of project success. In this light, Table 1 are reflecting the downside of an evaluation by quantitative data, especially in the situation of evaluating only a small subpopulation within the formerly evaluated households.

Table 1: Characteristics of study households involved

	Treatment	Control	Total
Number of villages	2	1	3
Number of households (hh)	56	24	80
Number of ethnic minority households	13	7	20
Number of poor households	24	14	38
Ethnic minority hh as % of total households	46.4	41.7	44.1
Poor households as % of total households	44.6	54.2	49.4

In fact, neither is a statement on an improvement or worsening of the income situation acceptable, nor is a change to be related towards project activities. On top of that, changes on the monetary income or the living conditions are hard to be recognised within several years of project activity. Table 2 reflects the impact of the establishment of the nature resource management towards related changes on the monetary income and the living conditions. Table 3 illustrates the sources of income as recorded by the respective inventories.

Table 2: Impact of the establishment of the resource management project on the monetary income and the living conditions of assessed households within Na Ri District in 2020

	Income (%)		Living conditions (%)	
	Treatment	**Control**	**Treatment**	**Control**
Increased	23.2	12.5	41.1	29.2
Unchanged	48.2	62.5	39.3	45.8
Decreased	28.6	25.0	19.6	25.0

Table 3: Sources of income (VND per year) in the project villages (2020)

Sources of income	**Khuoi Tuc (treatment) Million VND**	**%**	**Na Deng (treatment) Million VND**	**%**	**Na Muc (control) Million VND**	**%**
Agricultural activities	2.36	6.7	0.71	2.9	2.28	8.1
Forestry-related activities	23.04	65.4	14.92	61.1	12.54	44.5
Employment	7.60	21.7	6.62	27.1	9.47	33.6
Other sources	2.17	6.2	2.14	8.9	3.89	13.8
Average total	35.17	100	24.38	100	28.17	100
SD	13.84		4.29		4.72	

Here again, the results of the study questionnaire do not reflect an clear tendency: While the first project village (Khuoi Tuc) does have an average income clearly above the district's average of 2020, the second project village (Na Deng) reveals an average income of below that 2020 average. On top of that, the average income for Khuoi Tuc is even smaller than the non-project village's (Na Muc). Again, in this line the quantitative data alone are not suitable for indicating an improvement of the income conditions between 2018 and 2020. Nevertheless, it must be emphasised again that this result may as well be based on the fact that the data can actually not be rated as being representative for comparing an average of 421 villages (Survey in 2018) with a small subpopulation in 2020.

Figure 1 pictures the income sources by forest products and forest-related activities in 2020 and 2018: Here again, the indication of a more diverse forest product utilisation could reflect an impact of the resource management project activities. But it can not explain why the project villages are utilising more different forest products than recorded in 2018.

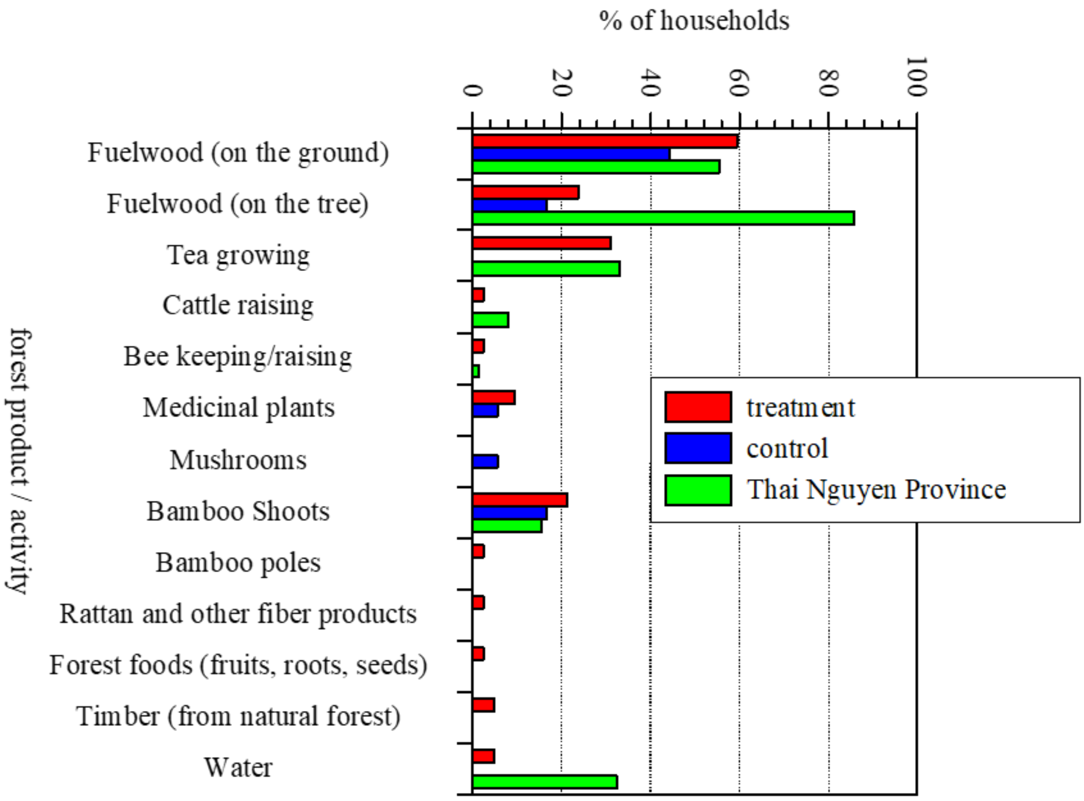

Figure 1: *Income sources by forest products and forest-related activities in 2020 (treatment and control villages) and in 2018*

Table 4 indicates the different expectations of project and non-project village and communities' environmental situation in 10 years from 2010. Those answers reflect the awareness-rising activities of the resource management project: The project villages are obviously expecting an improvement of the conditions due to the resource management project, as well as a worsening of the communities' environmental conditions due to environmental pollution and over-utilisation of natural resources (the reasons for the expected changes were assessed but are not illustrated in the Table).

Table 4: Households awareness of resource management project condition and environmental condition in 10 years (%).

	Resource management project condition in 10 years		Environmental condition within the community in 10 years	
	Treatment	**Control**	**Treatment**	**Control**
Better off	60.7	29.2	16.1	29.2
No change	14.3	20.8	12.5	25
Worse off	17.9	33.3	67.9	45.8
No idea	7.1	16.7	3.5	0

4. Discussion and Conclusion

From these results, it is obvious that an evaluation by quantitative data (a repetition of the household survey carried out in 2018) did not produce comprehensible and convincing figures on the impact of the the resource management project on the livelihood of the target group. Nevertheless, it must be considered that this is based on the specific evaluation procedure and shall not be used for valuing the approach and success of a the resource management project like project in Bac Kan.

In addition to that, the pilot study did demonstrate the impact of 'conservation-and-development' approaches, like the improvement in non-timber forest products business, as a model based on the labour opportunity costs and forest product value assessed within the study area. According to the specific conditions within the study area, it was proven that such non-timber forest products business improvement did rather harm than help forest-dependent households as well as the conservation aims. Here again, the resource management project approach of improving on-farm business possibilities instead off, was proven to be beneficial to the target group of that specific activity as well as to the conservation aims of the project.

Summarising those results, it can be stated that the impact of the resource management project is not easily to be assessed by conventional methods within a short project term, but can be judged by the 'livelihood pathway approach' as being fairly successful. More detailed investigations in the same line, especially in a larger extend within the the resource management project project area are recommended. Further field studies are planned in 2021 and 2022.

Abstract

Extended Producer Responsibility (EPR), implies that producers take over the responsibility for collecting or taking back used goods and for sorting and treating for their eventual recycling. Such a responsibility may be merely financial or organizational as well. Implementing an EPR system enhances the interactions between different stakeholders, as well as assigning them new responsibilities. The precise nature of these responsibilities varies to reflect the institutional landscape in each individual country and exactly how the EPR system operates in practice.

In Vietnam, EPR has stipulated in the Law on Environmental Protection (LEP) 2020. Learning from the experience of implementing EPR in some countries around the world, models for producers to carry out their responsibilities in waste collection, recycling and treatment have been proposed. The identification of stakeholders, their roles and responsibilities, and specific requirements for a transparent EPR system should be clarified in the Decree guiding the implementation of EPR regulations in Vietnam.

Key words: *Extended Producer Responsibility (EPR), Producers, Waste management*

1. Concepts of Extended Producer Responsibility (EPR)

The rising consumption of a range of complex durable goods over the years has resulted in a serious environmental problem. This is experienced in the form of a large quantity of worn out or end-of life products. Proper management of the waste thus generated has been a matter of serious concern for policy makers. In the 1990s, increasing public perception against the common disposal methods of landfill disposal and incineration led to the formulation of new policies in the Organisation for Economic Co-operation and Development (OECD) countries. Focus shifted to the diversion of wastes towards recycling and reuses (Ferrão et al., 2008).

Extended Producer Responsibility (EPR) is based on the polluter-pays principle (PPP), but emphasises life-cycle impact of the products and internalization of the externalities related to the end-of life products and also encourages environmentally friendly design of the products (Ferrão et al., 2008; Kibert, 2004; Nnorom and Osibanjo, 2008). EPR is an efficient resource management tool whereby producers take over the responsibility for the end of life management of their used products. This can include collection, sorting and treating these for their recycling and recovery. Its basic feature is that actors across the product value chain (manufacturers, importers and retailers) assume a significant degree of responsibility for the environmental impact of their products throughout their life-cycle. This includes products' 'upstream' impact linked to the selection of materials, product design and production processes as such, as well as 'downstream' impact relating to the products' use and disposal.

The OECD defines EPR as "an environmental policy approach in which a producer's responsibility for a product is extended to the post-consumer stage of a product's life cycle" (OECD, 2001). The responsibility of the producer can be physical, financial and/ or informational. There are four main objectives EPR, namely: source reduction (resource conservation/ natural materials), waste prevention, design compatible products more environmentally friendly, as well as using closed loop approach to promote sustainable development. There are two related features of EPR policy: (1) shifting of responsibility (physically and/ or economically; fully or partially) to the upstream producers and away from the municipality and general taxpayer, and (2) to provide incentives to producers to incorporate environmental considerations in the design of their products (OECD, 2001).

EPR requires manufacturers to finance the cost of waste collection and recycling of designated products (Nahman, 2010; Nash and Bosso, 2013). The main function of the EPR is to shift financial management responsibilities and/ or physical waste from local government authorities and the general taxpayers to producers. Environmental costs of treatment and disposal could then be incorporated into the cost of the product. This creates the settings to get the existing market, so it truly reflects the environmental impact of products, as well as where consumers can make choices as they wish based on environmental price signals (OECD, 2001). Internalization of external environmental costs is considered a fundamental aspect of environmental policy design and more specifically of EPR and these tenets have now been formally included into the EU Waste Framework Directive (OECD, 2019).

EPR aims to shift the financial or physical responsibility for ending the life of the product to the beneficiary of the product, so an increase in producer have incentives to provide environmentally friendly products with efficient use of materials containing less hazardous materials (Jacobs and Subramanian, 2012). Intensive use of EPR is expected to improve the design of environmentally friendly products, their prevention and recycling (Rotter, 2011).

2. Roles and Responsibility of Stakeholders in EPR System

In many countries, the management of municipal solid waste is the responsibility of the state, and is usually carried out at municipal/ local authority level. The waste is either directly collected by the relevant state authority or by private companies working on the state's behalf. The costs of such systems are borne by the local authorities and/or national government, with citizens contributing financially through their municipal solid waste fees or taxes.

Producers of products/ goods and other stakeholders along the product value chain are only held responsible for ensuring their products meet certain health and safety standards.

In such systems, funding often only covers the collection of municipal solid waste, transport and disposal at landfills or open dumpsites. Local authorities frequently lack expertise and resources. Recycling often relies on the informal sector, within which multiple stakeholders collect, sort and recycle materials with a sufficiently high material value, often under inadequate welfare and environmental conditions. Transitioning towards sustainable waste management and a circular economy therefore requires a new approach, one that involves all stakeholders at every stage of the product value chain.

The EPR system involves several stakeholders: producers and importers of EPR products, Producer Responsibility Organizations (PROs), distributors of products covered under EPR, waste facilities companies dealing with collection, treatment, recycling or disposal of wastes), municipalities, state authorities (central environmental authority, local environmental authorities, state supervision bodies, police, customs, etc.).

Producer/ importer sells products to consumers through his distributors/ retailers. Consumer after the life cycle of the product has the possibility to deliver the waste product to the distributor which may provide a take-back system (when selling a new product to take over the waste product on one-to-one basis), or consumer can utilize the municipal waste collection system to deliver the waste product directly to the waste facility operating in the municipality.

The distributor in cooperation with the relevant entity of the EPR scheme delivers waste products to waste facility which provides for environmental sound management of waste products and has the permit for these activities from the state authority. How the take-back is organized depends on the scheme that the respective producers of the products have set up.

Producers can take care of their end-of-life products through a third-party organization taking care of waste management on behalf of the producer, a so-called Producer Responsibility Organization (PRO); or individually following the principle of Individual Producer Responsibility (IPR) stipulating that a producer himself takes care of the (end-of-life) products that he has put on the market; or a government-run EPR Centre that organizes end-of-life product collection and management for all producers covered under EPR legislation.

Producer by the means of his EPR scheme (PRO / IPR / EPR Centre) has the responsibility for a functional system and is obliged to finance the system.

The producer gives the information on amounts and types of products put on the market in dedicated period, usually once a quarter to the relevant entity in the EPR system. In case of using a PRO the producer informs the PRO which informs the relevant public authority and the waste management company that he has contracted. If a producer fulfils his EPR obligation through IPR he himself informs the relevant public authorities and waste management companies.

The relevant institutions of the EPR system (PRO, producers themselves, EPR Centre) communicate with the state authority (usually Ministry of Environment) on different issues: the relevant actor initiates the registration of producers in central registers and reports the amounts of products put on the market as well as the amounts of wastes collected, treated and recycled. Often the central state authority asks for other information (e.g. on financing of the system…).

The distributor may be obliged to implement take-back system and communicates with the relevant entity of the EPR system (PRO/ producer/ EPR Centre) on conditions of transport of collected waste to waste treatment facility. The producer communicates with distributor on recycling contribution which is included in the product price. The relevant actor of the EPR system (PRO/ producer/ EPR Centre) communicates with waste facility dealing with transport of waste products, as well as with waste treatment and/ or recycling facility. If the waste products are collected in the system of separate collection of wastes in municipalities, municipalities communicate with the relevant entity of the EPR system (PRO/ producer/ EPR Centre) to provide for transport of waste products to waste treatment facility. Producer is obliged to supply information on product design and content of hazardous materials to waste treatment facility in order to ensure environmentally friendly treatment of wastes.

Figure 1: Stakeholder and Their Responsibilities With Respect To EPR Mandate

Arcording to Prevent Waste Alliance (2019), implementing an EPR system enhances the interactions between different stakeholders, as well as assigning them new responsibilities. The precise nature of these responsibilities varies to reflect the institutional landscape in each individual country and exactly how the EPR system operates in practice. As EPR schemes only cover part of the total volume of municipal solid waste, they need to be integrated into broader waste management and circular economy policies.

Roles and Responsibility of Producers

Obliging producers to assume responsibility for their product waste forces them to take on a new role in the value chain. The term 'producer' refers to any company that introduces their products/ goods for consumption to a national market. Also, the product will be discarded in the same national market. It is irrespective of whether the product is produced domestically or imported. This definition helps to maintain a level playing field between companies importing products (importers) and companies that produce/ package their products within the country concerned (domestic producers).

The producers' responsibility within an EPR scheme may be defined as:

'Simple' financial responsibility: Producers have no obligation but to finance the existing waste management channels. Studies show that schemes using this model have few other incentives to improve waste management, apart from the financial incentive.

Financial responsibility through contracts with municipalities: Producers establish contracts with municipalities to collect and manage waste. The producers' motivation to improve waste management depends on the type of contract and on the dialogue with municipalities. The financial contribution of producers can be conditioned to quantitative results reached by municipalities (in terms of collection or recycling rate), quality check, or requirements on the type of collection and treatment schemes to be implemented.

Financial responsibility and partial organisational responsibility: Some activities are kept under the responsibility of municipalities (e.g. collection whether implemented directly by public waste collection operators or contracted to private companies), backed financially by producers, whereas some other activities (e.g. sorting, recovered materials reselling) are under the responsibility of producers.

Financial responsibility and full organisational responsibility: The producers subcontract activities to professional waste collection and treatment operators, or even own part of the collection and treatment infrastructure.

As these companies are obliged to assume extended responsibility under the EPR system, they are referred to as the ‘obliged companies’ within the system. A suitable legal framework should be drawn up to underpin the EPR system and make it mandatory for obliged companies to ensure compliance, including appropriate monitoring mechanisms and enforcement powers.

The change in the role fulfilled by the obliged companies has a knock-on effect on the roles and responsibilities of the other stakeholders right along the product value chain. This is why a successful EPR system needs the active participation of all stakeholders (Prevent Waste Alliance, 2019).

Defining roles and responsibilities is a political process involving multiple stakeholders. The specific roles and responsibilities assigned to each stakeholder always depend on the circumstances at play, including the applicable legal and institutional frameworks. Responsibilities also have to be consistent with the structures of the existing or planned EPR system and its various components, since the way systems are set up and operate in practice vary between countries.

Although operational EPR systems vary significantly between countries, all EPR schemes should be designed to strike a balance, simultaneously managing producers’ obligations at the same time as ensuring that environmental policies are implemented as appropriate and in line with the ‘polluter pays’ principle. Accordingly, the basic principles of EPR systems are almost the same in every country: (1) Every producer pays a fee when introducing a packaged good into the market. This fee is proportional to the amount of packaging being introduced; (2) The fee covers the collection, sorting and recycling of the packaging waste; (3) Collection, sorting, and recycling or energy recovery of waste remains the responsibility of the producer(s) concerned. However, the activity required to exercise this responsibility can be delegated to other companies or organisations. EPR systems can be implemented based on individual responsibility, collective responsibility, or a mixture of the two. The decision as to the most appropriate model for an individual system should be discussed as part of a political, multi-stakeholder dialogue, and the exact details of the model agreed upon should be clear to all stakeholder (Prevent Waste Alliance, 2019).

3. Waste Generation and Management in Viet Nam

Viet Nam is a developing country with rapid urbanization, industrialization and population growth with a growing middle-income class and changing consumption patterns. With this, the volume of Vietnam's solid waste has increased. The Vietnam Environment Administration found that the extent of municipal solid waste generation in the country increases by 10 – 16% every year. The generated waste volume will then increase in future and is estimated to reach a total of around 91 million tons in 2025 (Figure 2). Besides that, there is a threat of illegal import of waste from other countries to Viet Nam under "scrap import". Furthermore, new waste types such as e-waste, C&D waste, food waste, and disaster waste will emerge as new issues that need to be resolved.

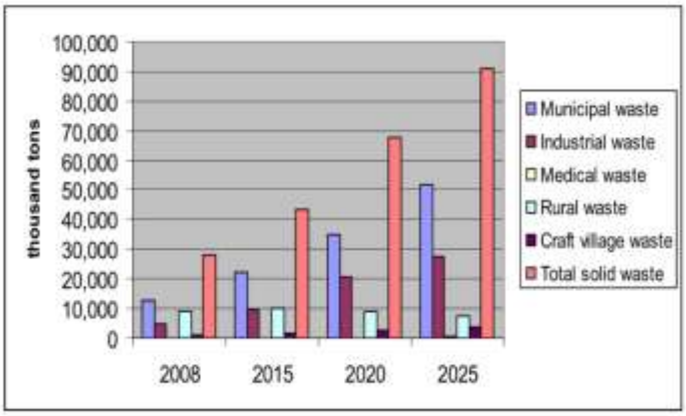

Figure 2: Waste generation projection in Viet Nam by 2025

Source: MONRE, MOC, 2009

According to a study conducted by the Viet Nam Economics and Policy Research institute (VEPR) in 2015, waste management flow can be described in figure 3.

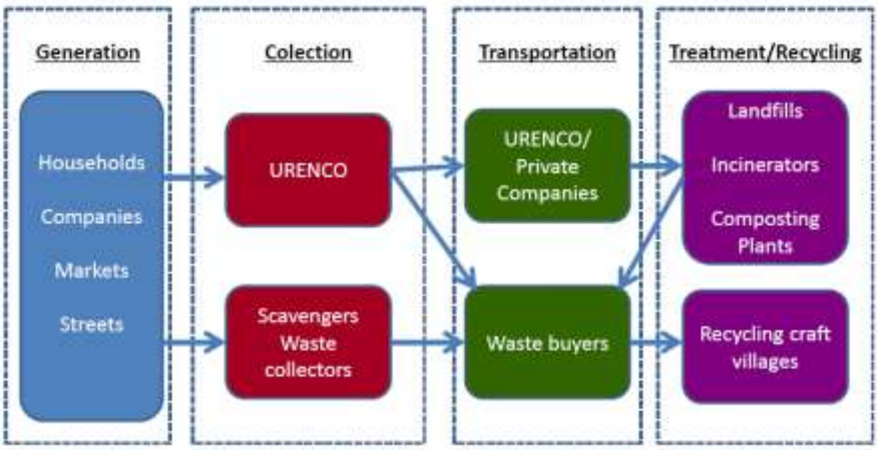

Figure 3: Scheme of waste management in Viet Nam

Source: VEPR, 2015

Currently, about 85% of the waste generated in Vietnam is being buried without treatment in landfill sites, 80% of which are unhygienic and pollute the environment. The national 3R (Reduce, Recycle, Reuse) campaign gained momentum with wastes being dumped into the nearest landfills. Majority of the companies in Vietnam's solid waste management industry are state-owned with the technologies provided by the foreign countries, few of them are large multinational companies and have subsidiaries in Vietnam. Most of the technology providers are from Singapore, China, USA and European countries. However, adoption of technologies in the country is lower and is mainly focused on the hardware products.

Waste prevention and reduction have not been paid enough attention in Viet Nam in both production and daily life. There have not been any incentive policies or compulsory measures for households to reduce their solid waste generation. With regards to industrial waste, most recyclables are sorted right from where they are generated for reuse and recycling. As a result, recyclables will be used as materials for production in the industries themselves. Other scraps which are non-reusable for such production processes but could possibly be used for secondary production will be gathered and sold to recycling units. The rest will be moved to the waste storage of companies or collecting units to transport to treatment facilities.

4. EPR Legal Framework in Viet Nam

EPR has stipulated for the first time in the Law on Environmental Protection (LEP) 2005 with regulations on recall and treatment of waste products and is specified in Decision No. 50/2013/QD-TTg on August 9, 2013 of the Prime Minister.

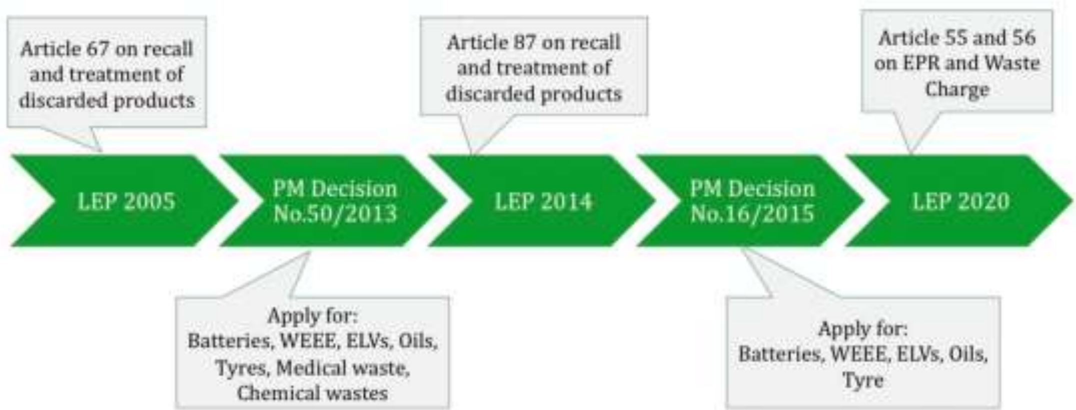

Figure 4: Policy Evolution on EPR in Viet Nam

Source: Nguyen Hoang Phuong, 2020

After that, EPR is further inherited and stipulated in the Law on Environmental Protection 2014 with the responsibility for recall and disposal of waste products and is specified in Decision 16/2015/QD-TTg on 22/5/2015 of the Prime Minister.

However, due to various reasons, EPR has not been implemented in practice in Vietnam.

On November 17, 2020, the National Assembly passed the new Environmental Protection Law, which stipulates Extended Producer Responsibility for businesses in Viet Nam in Articles 54 and 55. This means that businesses and producers now bear the responsibility for the waste stage of their products.

There are 6 groups of products and packaging subjected to the recycling responsibility of producers and importers: food and beverage packaging; waste from electrical and electronic equipment (WEEEs); tires; batteries; lubricants; and end of life vehicles.

The items under producers' responsibilities for collection and treatment of wastes include: packages for pesticides and chemicals; chewing gum; napkins; cigarettes; industrial products made of plastic and its packing materials.

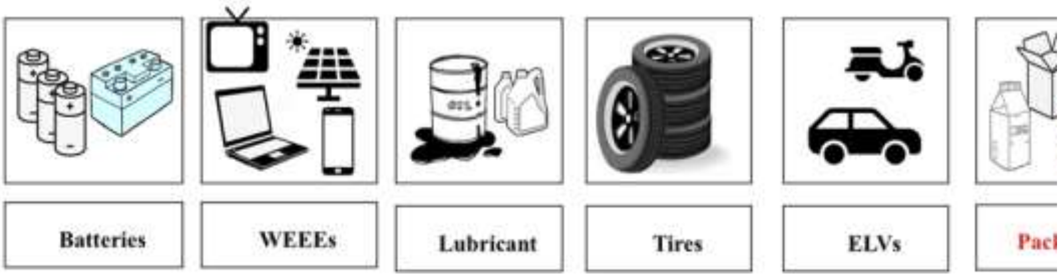

Figure 5: Products and packaging to be recycled *(Article 54 of LEP, 2020)*

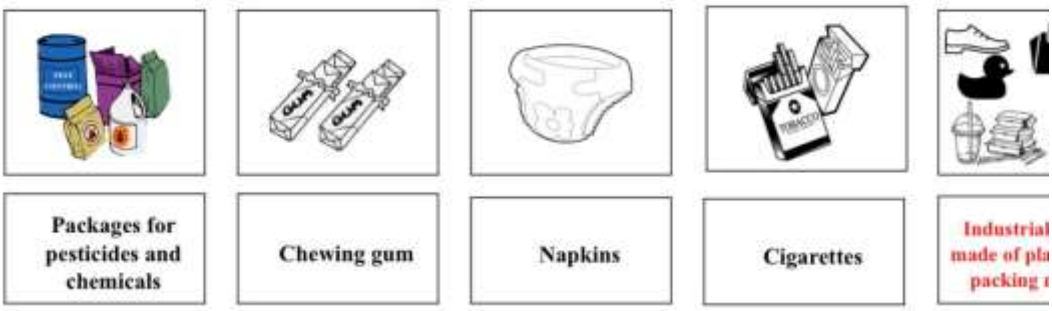

Figure 6: Products and packaging to handle *(Article 55 of LEP, 2020)*

5. Proposed Roles and Responsibility of Stakeholders in Vietnam's EPR System

Roles and Responsibility of Stakeholders in Waste Recycling

Article 54 of LEP 2020 regulates that:

1. Organizations and individuals that manufacture or import recyclable products and packages must recycle in accordance with the required recycling rate, methods, and standards, except for exported, temporarily imported products and packages, re-exported, manufactured, or imported for research, study and testing;

2. Organizations and individuals may choose to recycle products and packages in one of the following forms: (a) Organize the recycling of products and packages; (b) Make a financial contribution to Vietnam Environment Protection Fund to support product and packaging recycling;

3. Organizations and individuals defined in this Article must register their recycling plans and report annual recycling results to the Ministry of Natural Resources and Environment (MONRE).

Producers have important roles and responsibilities in this EPR system. However, that responsibility cannot be fulfilled without the effective role and participation of other stakeholders. Model of stakeholders' roles and responsibilities in recycling is proposed in figure 7.

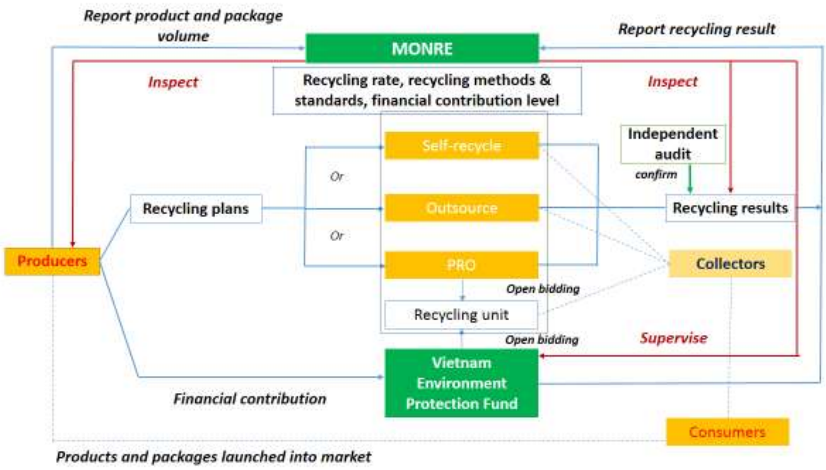

Figure 7: Stakeholders' roles and responsibilities in recycling

Producers can implement EPR in one of three ways: (1) Carry out the recycling by themselves; (2) Do recycling through a third-part, that is Product Recycling Organization (PRO); and (3) Make a financial contribution to the Viet Nam Environmental Protection Fund (VEPF). In other words, producers can participate in EPR either individually or collectively under the PRO or the VEPF. To avoid free-riding problems, producers who do not adopt EPR are subject to fines. Producers that recycle themselves or do so via a third party will have to report through a national EPR data portal managed by MONRE. If a producers that does the recycling itself fails to reach the recycling target over 3-5 years in a row, it will be forced to participate in one of the other two mechanisms. A producers that refuses to choose any mechanism will be fined; if it exceeds its recycling target it can sell credits to other businesses through a tradable credits system. Producers who fail to perform or fully performs the compulsory recycling responsibility, in addition to receiving administrative punishment, must also pay twice the amount required to handle the remaining required proportion in correspondence with the level of contribution to VEPF.

There are requirements for self-recycling producers or recycling units hired by producers: (1) Being a legal entity; (2) Having recycling function and capacity (technology, finance); (3) Having an environmental license in accordance with the law; and (4) Not violating the law on the environment. Recyclers that do not qualify or pollute the environment cannot join the EPR system.

The PRO or third party authorized by producers to organize the recycling must satisfy the following conditions: (1) Have legal status and is established in accordance with law; (1) Be a non-profit organization; (3) Does not directly recycle and has no ownership relationship with any recycling unit in connection with the authorized scope; and (4) Be authorized by at least 03 producers to organize the recycling; those recycling packages must be authorized by at least 10 producers or importers. The third party authorized by producers to recycle must be registered for operations, must be verified by Vietnam EPR Office prior to operations, and is responsible before the law and producers under the authorized scope.

Mandatory recycling rates and projected financial contribution rates over a 3-year period will be proposed by the inter-sectoral committee and approved by the MONRE Minister. A multi-stakeholder council including representatives from MONRE, General Department of Tax, General Department of Customs, PROs and CSOs, will approve the recycling targets and fees payable to VEPF.

Vietnam EPR Office selects and signs contracts with recyclers in accordance with the provisions of the law on bidding or in the form approved by the National EPR Council to recycle for producers. VEPF is responsible for paying recycling units the recycling cost under the signed contracts and responsible for publicizing the contributions received from producers and the results of using the annual contributions.

Roles and Responsibility of Stakeholders in Waste Collection and Treatment

Regarding hard-to-recycle or hazardous waste such pesticides, chewing gum, napkins, tobacco, and single-use plastics, producers have to pay the VEPF to handle collecting and treatment. This funding will be allocated by MONRE to local authorities. VEPF will be responsible for monitoring implementation while producers will report to MONRE the quantity and volume of products sold on the market.

Figure 8: Stakeholders' roles and responsibilities in waste handling

According to Article 55 of the LEP 2020, responsibilities for collection and treatment of wastes are as follows:

1. Organizations and individuals that produce and/ or import products and packages containing toxic substances, which are difficult to recycle or cause difficulties for the collection and disposal must contribute financially to support activities (except for products exported or temporarily imported for re-export or produced or imported for the purpose of research, study or testing): a) Collect, transport, and handle solid waste discharged by households and individuals; b) Study and develop technology, techniques, and initiatives for household solid waste treatment;

c) Collect, transport, and handle packages containing pesticides.

2. Organizations and individuals defined above make financial contributions to the VEPF; the financial contribution level is determined by volume or unit of product or packaging.

Manufacturers who fail to perform or fully perform its responsibility to provide the funding to support the waste treatment in addition to receiving administrative punishment must also pay an amount equal to 30% of the payable amount and an additional 10% if failing to make payment in the next period. Late payment will be subjected to an interest of 0.03%/day based on the overdue amount.

Agencies, organizations and communities wishing to receive funding support for waste treatment activities as specified in Article 55 of the LEP shall make a dossier requesting support and submit to the Vietnam EPR Office for selection and approval. EPR Office gathers dossiers requesting support and organizes the verification of the funding request of the organizations or individuals specified to submit to the National EPR Council for consideration and approval. Then National EPR Council discusses and approves funded projects. Vietnam EPR Office publicly announces the funded projects to agencies, organizations and communities. VEPF signs sponsorship contracts with agencies, organizations and communities whose projects are funded according to the provisions of VEPF. Funded projects are activities that directly serve the community's interests and do not aim for profits. VEPF is responsible for publicizing the total contribution amount and the results of using the annual contribution.

6. Conclusion and Recommendations

As stated by Prevent Waste Alliance (2019), the most common difficulty in establishing an operational EPR scheme, containing clear roles and responsibilities, is reaching an unambiguous agreement as to which companies are, and are not, obliged under the system. This requires a clear definition of what constitutes an obliged company, as well as cooperation between multiple ministries and/ or agencies to identify the companies concerned. Implementing an EPR system enhances the interactions between different stakeholders, as well as assigning them new responsibilities. The precise nature of these responsibilities varies to reflect the institutional landscape in each individual country and exactly how the EPR system operates in practice. As EPR schemes only cover part of the total volume of municipal solid waste, they need to be integrated into broader waste management and circular economy policies.

The identification of stakeholders, their roles and responsibilities, and specific requirements for a transparent EPR system should be clarified in the Decree guiding the implementation of EPR regulations in Vietnam.

Abstract

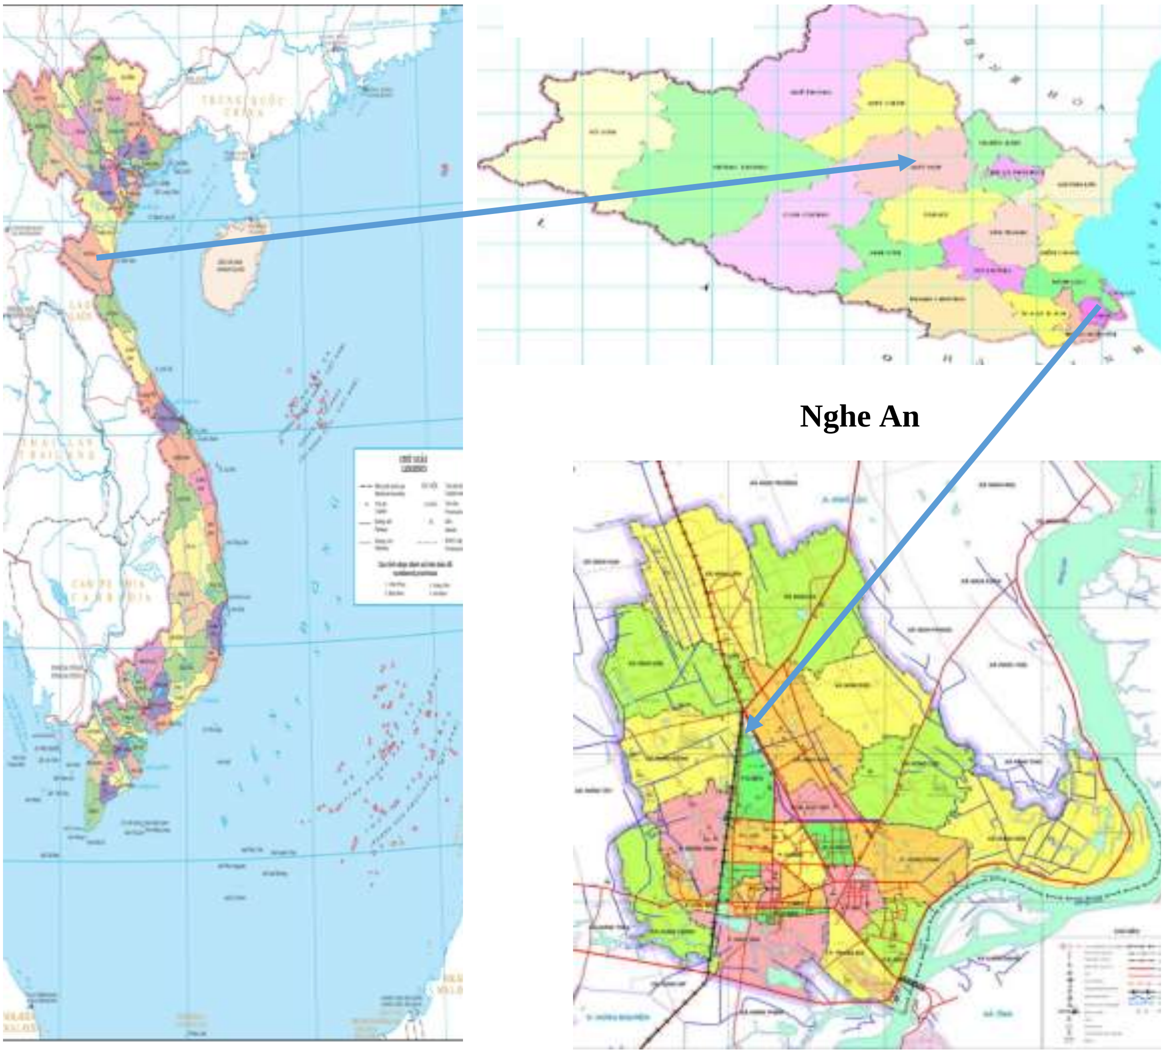
The study aims to assess the impact of the urbanization process in the period of 2008 - 2019 in Vinh city, Nghe An province on land management and use. The study uses methods of collecting secondary and primary data, methods of data processing, analyzing and comparison. Vinh city had an urbanization ratio of 68.30%, an urbanization rate of 102.94% in the period 2008-2019. Financial management of land and land prices is the most affected by urbanization, followed by land dispute resolution; resolve the complaint report; registration of land, preparation and management of cadastral dossiers, issuance of land use right certificates; management of compensation, support, and resettlement upon land recovery; management of land allocation, land lease, land recovery, change of land use purposes. The area of non-agricultural land in 2019 was 5556.48 ha, an increase of 611.23 ha compared to 2008 due to the change of land use purposes, mainly from agricultural land and partly from unused land. In order to strengthen land management in the urbanization process, it is necessary to focus on solving the issues of land management in order of priority, based on the degree of impact of the urbanization process.

Keywords: *Impact, land use, management, urbanization, Vinh*

1. Introduction

Urbanization is an inevitable social development process that has been taking place strongly in many countries, including Vietnam (Hoang Ba Thinh & Doan Thanh Huyen, 2015; Nguyen Huu Doan, 2009; Tran Thi Lan Anh, 2014). Before 1990, the urbanization process in Vietnam was slow, so by 1990 there were only 500 urban areas with an urbanization ratio of about 18% (Dao Duc Huong et al, 2018). From 1993 up to now, the urbanization process has been faster, by June, 2020, there were 833 urban areas with an urbanization ratio of 39.3% (an increase of 0.5% over the same period in 2019). Urbanization has an impact on many aspects of the socio-economy, living environment, economic structure, and land management and use. Urban revenue sources contributed about 70% of the total national budget revenue, economic growth in urban areas reached an average of 10-12%, 1.2 - 1.5 times higher than the national general average (Bich Ngoc, 2020). Besides the achievements, the urbanization process of Vietnam still has some shortcomings that need to be overcome, such as the inadequate development of the urban system between quantity, scale and quality; Many planning projects had unsuitable visions and solutions; Urban infrastructure had not met the needs of the people; Management capacity had not kept pace with development reality; Land management also had many shortcomings (Bich Ngoc, 2020).

Vinh city (Figure 1) is the central city as the political, administrative, socio-economic center of Nghe An and the center of the North Central region (Prime Minister, 2015). Like the whole country, Vinh city is in the process of strong urbanization and especially since 2008, when the city was recognized as a grade I city directly under the province (Prime Minister, 2008). The non-agricultural production, business, and service increased rapidly, so every year the city had contributed about 33.52% of the total budget revenue of Nghe An province; Domestic revenue in 2019 reached 2,327.8 billion VND (Vinh City People's Committee, 2020). Like other urban areas in the process of expansion, the demand for land increased, land acquisition, land allocation, and land lease in particular, and land management in general were complicated, causing an impact to the lives of people whose land is acquired, security and order in the city. The question is how was the urbanization situation of Vinh city in recent years? What is the impact of urbanization on land management and use? What are the positive and negative impacts on land management and use? What solutions are needed to manage and use land more effectively and speed up the urbanization process. To answer these questions, research on urbanization and land use and management in Vinh city, Nghe An province, Vietnam is necessary and has practical significance.



Nghe An

Vietnam Vinh city

Fig. 1. Geographical location map of Vinh city, Nghe An province

2. Methods

2.1. Study scope

Studying the impact of urbanization on land use and management over a period of 10 years (2008-2019) since Vinh City is recognized as a urban type I.

2.2. Data collection methods

- *Collection of secondary data:* Secondary data on natural, socio-economic conditions of Vinh city in the period 2008-2019 were collected at the Statistical Office of Vinh city and at the People Committees of wards and communes of Vinh city. Data on land management and use were collected at Department of Natural Resources and Environment, Office of Urban Management, Department of Statistics, Department of Finance, Center for Land Fund Development, Land Registration Office of Nghe An province and at the People Committees of wards and communes of Vinh city. Theoretical and practical bases related to research were collected from domestic and foreign research results published in scientific articles, books, reports ... Data collection through meeting directly with people with information related to the topic, look up information available at the library, on the internet.

- *Collection of primary data:* To evaluate the impact of urbanization on land management in Vinh city in the period of 2008-2019, the study was conducted using printed sheets for officers and public employees directly related to land management in Vinh city with 67 questionnaires (Table 1).

Table 1. Numbers of investigated cadres, officers, and public employees

Work unit	Position	Number

Land Registration Office of Vinh city	Official	03
Center for Land Fund Development of Vinh city	Leader	01
Center for Land Fund Development of Vinh city	Official	05
Total		**67**

According to the 2003 Land Law, state management on land has 13 contents, and according to the 2013 Land Law, state management on land has 15 contents (2 additional contents). Because the study was carried out during the period when both land laws were in effect, the study assessed the impact of urbanization on 15 contents.

To assess the impact of the urbanization process on the contents of state management of land in the questionnaire, there are 15 contents of state management on land and 5 levels of impact, respectively. Likert scale (very affected - 5 points; quite affected - 4 points; average affected - 3 points; less affected - 2 points; very little affected - 1 point). The total score affected by the contents of state management of land is determined by the following formula:

$$T\text{Đ}_k = \sum_{k=1}^{m} \sum_{z=1}^{p} y_{kz}$$

In which:

$TĐ_k$ - Total assessment score affected by urbanization of the content of K land management;

k - order of land managent content

m - Total content of state land management (n = 15);

z - Order of people answer

p - Total number of people answer (p = 67);

y_{kz} - Assessment point of people z about the impact level of land management content k.

The content with the highest total score is the content affected by urbanization the most, followed by the content with the second highest total score and the content with the third and fourth highest score ... with the lowest total score is the content least affected by urbanization.

2.3. The method of determining the ratio and the speed of urbanization

- The urbanization ratio is determined by the formula 3.2.

TLDTH = 100xDSP/TDS (3.2.) (Ministry of Construction, 2009)

Where:

TLDTH - urbanization ratio (%);

DSP - Population of wards in city (people);

TDS - Population of city (people).

- *Urbanization speed is determined by the formula 3.3.*

TDDTH = ((DSP$_{ht}$ – DSP$_{ss}$)/DSP$_{ss}$)x100 (3.3.) (Ministry of Construction, 2009)

Where:

TDDTH - *Urbanization speed* (%);

DSP$_{ht}$ - Current population of wards in city (people);

DSP$_{ss}$ - compared year's population of wards in city (people).

2.4. Method of data aggregation and processing

Using Microsoft Office Excel 2013 to aggregate, process collected data.

2.5. Method of analysis, comparison, and assessment

Analyze the advantages and limitations of the urbanization process and its impacts on land management and use. The comparative method was used to compare the urbanization ratio and urbanization rate of Vinh city in the study period, as well as to compare the structural change of each land type under the impact of the urbanization. Evaluate the process of urbanization and the impact of urbanization on land management and use according to criteria such as urbanization ratio, urbanization rate, level of urbanization impact on each land management content, change of land structure, area of land types ...

3. Results

3.1. Some theoretical issues about urbanization and land management and use

3.1.1. Urbanızatıon

Urbanization is understood in many ways. According to World bank (2011), Urbanization is the change in the size of the urban population and the quality of life of the urban population. According to Nguyen Thi Thoa (2014), urbanization is an economic process that eliminates the historical opposition - the gap between the city and the countryside and leads to unified forms of residence with economic access. In other words, urbanization is the process of centralized non-agricultural functions, in-depth investment and diversification, the universality of the mode of production and the developed urban residence, the development of exchange of human types and urban cultural forms. Urbanization is also understood as the expansion of the urban area calculated as a percentage of the urban population or the urban area over the total population or the area of a region (called the level of urban area or the rate of increase of 2 factors over time (also known as the rate of urbanization) (Ngo Thuy Quynh, 2016; Pham Ngoc Tru, 2015).

From the above concepts, the most general understanding of nature, urbanization is the increase of the urban population over time and is calculated as a percentage of the urban total population (the population belongs to wards, towns) per total population (the total population of wards, communes and townships) (the so-called urbanization ratio) or the increasing rate of urbanization over time (called the rate of urbanization). The urban population in the process of urbanization can increase naturally and mechanically. Urban natural population growth is the increase in population generated by the birth process. Mechanical population growth is population growth due to the movement of the non-urban population into the urban area. The non-urban population is the population coming from a rural or other area and engaged in off-farm activities (Luu Duc Hai, 2011; Vuong Dien Phuong & Luu Sister Kiet, 2014).

The feature of urbanization is that the population tends to increase. The population is concentrated in big and very big cities; At the same time, to widely develop the urban lifestyle expressed through population, population density, quality of life (Quang Nguyen & Doo-Chul Kim, 2020; Aggrey Daniel Maina Thuo, 2013). Urbanization makes people's lives more and more change, the formation and development of many cities geographically close to each other and closely related due to the division of labor has created urban areas (D. Da Mata et al., 2005; Duranton & Puga, 2004). Urbanization leads to an increasing trend in the urban population due to the process of rural-urban migration, changing the correlation between the urban and rural population, increasing the proportion of the urban population in the total population (Park et al., 2011; Vu & Kawashima, 2019). Urbanization represents the level of social development in general, but has specific characteristics for each country. For developed countries, urbanization has taken place in depth, quality of life in cities has been increasingly improved. In developing countries, the rate of urbanization is very high, especially in recent decades, the process of urbanization taking place in a wide range is posing many difficult problems to solve such as land problems, unemployment, poverty, environmental pollution and social evils.

3.1.2. Land management and use

Land management and use focuses on land and how land is used for production and conservation purposes. Land use and management requires decision making and is determined by the purpose of its use, for example: food production, housing, entertainment, mining ... and is determined by the nature and value of the land. In the past, land use and management focused mainly on agricultural land. Today, land management also faces issues of industrialization, urbanization, conservation, and mining. Land use management is a combination of all the tools and techniques used by the government to manage how land is used and developed including: land use planning, legislation , land use rights, land pricing and real estate information (Nguyen Khac Thai Son, 2007). In the context of this study, land use management is understood as the process of combining all the tools and techniques to ensure the law for the use, exploitation and development of land funds, and the settlement of disputes related to land. The main contents include: promulgating and organizing the implementation of legal documents related to land use; formulation and management of land use plannings; allocation and management of the exercise of land use rights; land pricing and real estate information...

3.2. Urbanization and Land use and management in Vinh city, Nghe An province

3.2.1. Overview of natural, socio-economic conditions of Vinh city, Nghe An province

Vinh city, Nghe An province, about 300 km north of Hanoi capital is the political, economic - social, cultural - educational, physical training - sport center of Nghe An province, and is the center of North Central region in the fields of finance, trade, tourism, science - technology, information technology, high technology industry, health, culture, sports, education - training. Vinh city has 25 administrative units of communes and wards, including 16 wards and 9 communes with the natural area of the whole city from 67.53 km2 increased to 104.96 km2 (an increase of 1.6 times since 2008 to 2019), in which the urban area is about 36 km2. The population of the city in 2019 was 317,643 people, of which the urban population was 216,965 people (accounting for 68.3% of the total population) and the rural population was 100,678 people (accounting for 31.7%). The production, non-agricultural business and service increased rapidly, so every year the city has contributed about 33.52% of the total budget revenue of Nghe An province; Domestic revenue in 2019 reached 2,327.8 billion VND. The growth rate in 2019, compared to 2016, reached 13.55%, the industrial production value in 2019 reached 12124.12 billion VND (Vinh City People's Committee, 2020).

3.2.2. Urbanization characteristics in Vinh city, Nghe An province

Over 200 years of establishment and development (1804 - 2019), from being a town of Nghe An, an urban area under the monarchy, Vinh became an industrial city, a traffic hub (railway, road, river, sea, air route), a large commercial center and exchange place for many cultural regions in the country and the whole region. The imprint of Vinh city in Nguyen dynasty, Vinh town, Ben Thuy, Truong Thi, Vinh - Ben Thuy city under French rule and also construction works by experts and engineers from the German Democratic Republic (East Germany) left in the years 70 - 80 of the previous century has been accompanying on the step of integrated development of Vinh city today (Nguyen Quang Hong, 2003). Vinh city has a ratio of urbanization increased nearly 2 times (from 37.21% to 68.30%), rapid urbanization rate (102.94%) in the period 2008-2019 (Table 2). The increase in urban population is mainly mechanical (65.32%), the rest is natural increase (34.68%). Vinh urban space has expanded much more in both axes: East - West and North - South of the City.

Table 2. Ratio and rate of urbanization of Vinh city in the period of 2008-2019

Year	City population (people)	Wards' population (people)	Urbanization ratio (%)	Urbanization rate (%)
2008	287319	106913	37.21	102.94
2019	317643	216965	68.30	

(Vinh City People's Committee, 2020)

Vinh city has been implementing many projects to build new urban areas; resettlement area; industrial zones and clusters and public works to create a new face for the city and improve the quality of life of the people. At present, inner Vinh city includes 16 wards, the urban land area is 3,521.66 ha, accounting for 33.55% of the total natural area. Infrastructure system has developed rapidly such as traffic, electricity, water supply and drainage, commerce, post - telecommunications, services, tourism, restaurants, hotels, sports - culture... With residential land, now the city has a number of old dormitories, over the years these houses have been invested and renovated, so they have partly improved in terms of infrastructure. In addition, the city has also built a number of new urban areas with the appearance of modern urban areas, suitable for architecture and urban landscape.

3.2.3. The impact of urbanization on land management and use in Vinh city, Nghe An province

3.2.3.1. The impact of urbanization on land management

The results of processing survey data showed that there are 5 issues most affected by the urbanization process. Specifically, financial management of land and land prices suffered the most from urbanization with the highest rating of 872 points, followed by land dispute resolution; settle complaints and denunciations in land management and use; registration of land, preparation and management of cadastral dossiers, issuance of certificates of land use rights, ownership of houses and other land-attached assets; management of compensation, support, and resettlement upon land recovery; management of land allocation, land lease, land acquisition, change of land use purpose with assessment points 605, 296, 255 and 245 respectively (Table 3). Land prices were most affected because in the urbanization process, the demand for land increases, transactions of land use rights also increase, and these transactions involve land finance and land prices. In particular, land prices are the basis for calculating land use fees, land rentals, fees, charges or taxes related to land ...

Determining land prices when land compensation money is the most complicated, most difficult issue and affects the progress of site clearance compensation. In addition, due to the increasing urbanization rate, the increasing demand for land use increases the value of land use rights, so there are often disputes over land use rights between people sharing land use rights or between people who have contiguous land use rights or complain about or appeal against administrative decisions related to land. The urbanization process is always associated with land acquisition and has a direct impact on the rights and interests of land users, so complaints and grievances also increase. The content of land law dissemination and education is the smallest impact of the urbanization process.

Table 3. Results of the assessment of urbanization impacts on the contents of state management on land in Vinh city

Land management contents	Total points	Impact level
Financial management and land prices	872	1
Settlement of land disputes; settle complaints and denunciations in land management and use	605	2
Land registration, preparation and management of cadastral dossiers,	296	3

issuance of certificates of land use rights, ownership of houses and other land-attached assets		
Manage compensation, support, and resettlement upon land acquisition	255	4
Management of land allocation, land lease, land recovery, and change of land use purposes	245	5
Managing land service activities	243	6
Managing land use planning and plans	232	7
Land statistics and inventories	226	8
Surveying, measuring, making cadastral maps, land use status quo maps and land use planning maps; investigation and assessment of land resources; land price construction investigation	224	9
Promulgating legal documents on land management and use and organizing the implementation thereof	212	10
Inspection, examination, supervision, monitoring, and evaluation of the observance of the land law and handling of violations of the land law	209	11
Determining administrative boundaries, making and managing administrative boundary records, making administrative maps	192	12
Building land information systems	186	13
Manage and supervise the performance of rights and obligations of land users	168	14
Disseminating and educating about land law	130	15

3.2.3.2. The impact of urbanization on land use

In the period 2008 - 2019, due to the rapid urbanization rate after Vinh city was recognized as a class I city in Nghe An province, many new buildings related to land use changed the structure of land groups (Figure 2). The area of agricultural land decreased by 474.66 ha, of which the area for annual crops and perennial crops was the largest. Annual crop land decreased by 220.49 ha, perennial crop land decreased by 258.85 ha due to being converted to residential land, land for construction of non-business works, public works and most of all, to residential land by implementing planning zones, subdivision, sale of land, construction of apartment buildings.

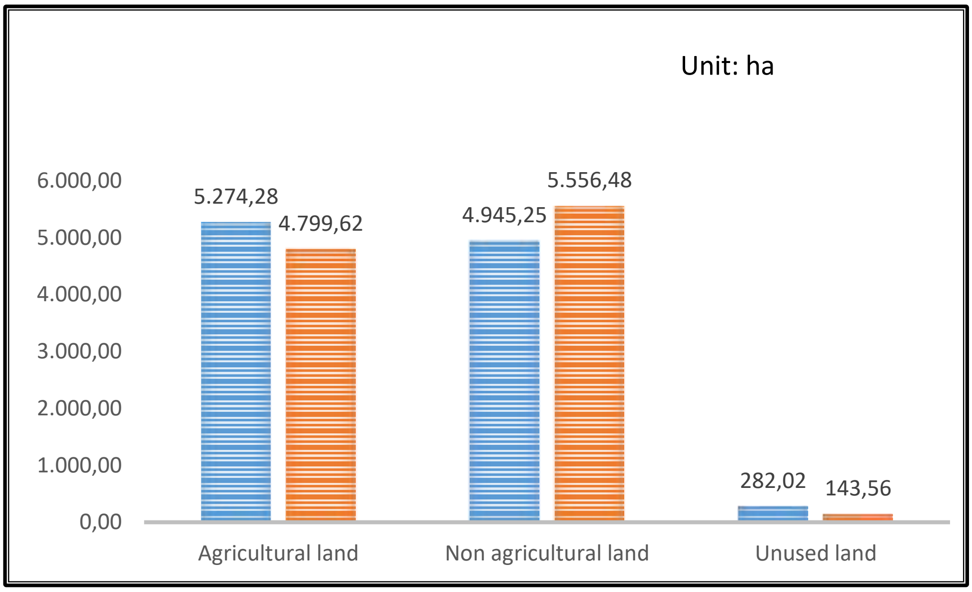

Figure 2. Changes in area of land groups in the period 2008-2019

The area of non-agricultural land in 2019 was 5556.48 ha, an increase of 611.23 ha compared to 2008 due to the change of land use purposes, mainly from agricultural land and partly from unused land. The non-agricultural area increased mainly from industrial parks, land for infrastructure development, and rural residential land. Urban residential land increased by 221.95 hectares, rural residential land increased 213.65 hectares compared to 2008, serving the needs of living land of wards and communes in the city and at the same time increasing due to land statistics and inventory to each land parcel when applying new technology (Table 4).

Table 4. Land fluctuations in Vinh city, 2008-2019

No.	Land use purpose	Code	Year 2008 Area (ha)	Year 2019 Area (ha)	Change
	Total nutural land area		10,501.55	10,499,96	- 1,59
1	Agricultural land	NNP	5,274.28	4,799.62	- 474.66
1.1	Agricultural production land	SXN	4,674,98	4,195.63	- 479.36
1.1.1	Annual crops land	CHN	3,333.28	3,112,79	- 220.49
1.1.2	Perennial crop land	CLN	1,341.70	1,082.85	- 258.85
1.2	Forest land	LNP	109.14	108.91	- 0.23
1.2.1	Protection forest land	RPH	109.14	108.91	- 0.23
1.3	Aquaculture land	NTS	478.87	391.51	- 87.36
1.4	Other agricultural land	NKH	11.29	103.87	92.58
2	Non-agricultural land	PNN	4,945.25	5,556.48	611.23
2.1	Residential land	OTC	1,409.00	1,844.60	435.6
2.1.1	Rural residential land	ONT	524.00	737.65	213.65
2.1.2	Urbanresidential land	ODT	885.00	1,106.95	221.95

2.2	Specialized land	CDG	2,785.42	2,919.5	134.08
2.2.1	Land for headquarter. career works	TSC	55.18	44.43	- 10.75
2.2.2	National defence land	CQP	210.68	278.31	67.63
2.2.3	Security land	CAN	21.42	25.45	4.03
2.2.4	Non-agricultural production land	CSK	549.26	469.84	- 79.42
2.2.5	Public purpose land	CCC	1,948.87	1,759.85	- 189.02
2.3	Religion land	TTN	11.26	16,48	5,22
2.4	Cemetery	NTD	157.62	148,51	- 9.11
2.5	River and water surface	SMN	581.66	627,38	45.72
2.6	Other non-agricultural land	PNK	0.29	0,29	0
3	Unused land	CSD	282.02	143.56	- 138.46

(Vinh City People's Committee, 2020)

The unused land area in 2019 was 143.56 ha, a decrease of 138.46 ha compared to 2008 due to being used for other uses such as specialized water surface land and other annual crop land.

3.2.3.3. Limitations and reasons

In addition to the positive impacts of urbanization in the city, there are still negative impacts on land management, especially with respect to the five contents indicated above. As follows:

- Land price used for calculating compensation for land when the State recovers land for defense and security purposes; Because the national and public interests in many projects are still lower than the market price of land, the people whose land is acquired do not agree, make complaints and lawsuits causing confidentiality, order, security and society. In particular, land prices as a basis for calculating financial obligations that economic organizations have to perform are lower than market land prices, resulting in a loss of budget revenues in the city and Nghe An province (Vinh City People's Committee, 2020). The main reasons that the land price bracket issued by the Government is not consistent with the market land price, information on land prices is insufficient, not updated, does not reflect the actual land price transaction, land valuators have limited force. In addition, the auction of land use rights to determine land prices upon land allocation and land lease also has limitations and shortcomings.

- Although the rate of issuing land use right certificates is high, administrative procedures have been reformed, but the processing time is still long, people have not done administrative procedures online, so it is very time-consuming, effort, travel expenses. Registration procedures for changes are cumbersome and not well controlled, underground transactions are still many, and the issuance of certificates of home ownership associated with urban land is complicated.

- Settlement of land disputes and complaints and denunciations about land still has many backlogs, failing to meet the needs of the people due to the large number of cases, land-related documents of many cases are not full enough, not updated, inaccurate, human resources to deal with lack of cases, legal understanding of a part of the people and limited awareness of law observance.

- Land acquisition in many projects is still behind schedule due to inadequate land prices for calculating compensation for land, determining conditions, subjects, and areas to be compensated and supported are facing difficulties. Due to insufficient or inaccurate information on the land user, land type, land area and boundary. The time for land acquisition to be assigned to investors in many projects is short while the human resources for implementing land acquisition procedures are lacking in both quantity and quality.

3.3. Some solutions to strengthening land management and use

In order for the management and use of land in Vinh city to be more complete under the impact of the urbanization process, it is necessary to implement some solutions to overcome the above mentioned limitations.

3.3.1. Solution to land price

In order for the land price to be equal to the market price, the regulations on land pricing need to be changed. Specifically, the land price in the land price bracket issued by the Government every 5 years indicates the reference land price when localities decide on a specific land price. Land valuation must be carried out by independent land pricing organizations through bidding. The Bidding Council must be prestigious experts in both professional ethics and ethics. In addition, land valuators must also meet higher professional qualifications. Land prices used as a basis for determining transacted land prices should be publicized on the internet every day, and financial obligations when land transactions are made between land users and land users are calculated according to the land price. Land prices stated in the contracts so that people do not declare tax lower than the prescribed land prices and the State can grasp the real land prices so that there is an accurate basis when determining land prices. In order for the auction-winning land price to properly reflect the supply and demand of the land market, to limit possible negatives, it is necessary to organize an online land auction, keeping secret information on quantity and identity of auction participants. and announce the auction results automatically as soon as the bid ends.

3.3.2. Solution to settling disputes, complaints and denunciations about land

In order to limit land disputes, complaints and denunciations, it is necessary to complete the land registration, issue the land use right certificate, and completely settle backlogged dossiers in the certification of land use rights. Strengthen the propaganda and dissemination of the land law on the mass media, at cultural houses of neighborhoods so that land users know and abide by the exercise of their rights and obligations. In addition, it is also necessary to ensure sufficient personnel to resolve disputes, complaints and denunciations to be resolved on time and in accordance with the provisions of law.

3.3.4. Solution to land registration, land use right certificate

Shorten the time for processing applications for land certificates and land registration at the same time applying information technology, perfecting the land database, linking relevant agencies to land users. can file with the least amount of documents attached to reduce time, effort and travel costs while limiting the possibility of negative effects when performing direct procedures at state agencies. At the same time, it is necessary to check the payroll, the need to solve the work to have a plan to foster qualifications and increase or decrease the processing in the departments accordingly.

3.3.4. Solution to land acquisition

In order to recover land smoothly and hand over land to land users on schedule, it is necessary to have a feasible land recovery plan, ensuring sufficient time, human resources and finance to pay compensation, support, construction of resettlement areas. At the same time, well perform the task of identifying the subjects to be compensated, supported and resettled on the basis of completing the land registration, issuing land use right certificates and determining the land prices for compensation according to the principle of ensuring equal to the market land price, at the same time allowing people, when disagreeing with the land price to be compensated, can hire an independent land valuation organization to re-determine the land price to submit to state agencies for review, or take action to court.

4. Discussion and Conclusion

Vinh city is in the process of urbanization with an urbanization ratio of 68.30% and an urbanization rate of 102.94% in the period 2008-2019. The process of urbanization has the strongest impact on the five contents of state management on land (land price; land registration, certification, settlement of land disputes, settlement of complaints and denunciations; land acquisition). Under the impact of urbanization, the area of agricultural land decreased by 474.66 ha, of which the area for annual crops and perennial crop land accounted for the largest percentage. By 2019, the area of non-agricultural land in 2019 was 5556.48 ha, an increase of 611.23 ha compared to 2008 due to the change of land use purposes, mainly from agricultural land and partly from unused land. Financial management of land and land prices is the most affected by urbanization, followed by land dispute resolution; resolve the complaint report; registration of land, preparation and management of cadastral dossiers, issuance of land use right certificates; management of compensation, support, and resettlement upon land recovery; management of land allocation, land lease, land recovery, change of land use purposes. The content of land law dissemination and education is the smallest impact of the urbanization process. In order to strengthen land management in the urbanization process, it is necessary to study in depth the contents of land management according to the degree of impact of the urbanization process such as the contents of land prices; complaints, denunciations, and disputes over land; land registration, land use right certificate; compensation, site clearance ...

THE IMPACT OF FOREIGN DIRECT INVESTMENT (FDI) ON ECONOMIC GROWTH THROUGH THE INVESTMENT CHANNEL IN THE SOUTH CENTRAL COAST AND QUANG NAM

PhD Candidate. Nguyen Tan Van
nguyentanvan1974@gmail.com
University of Economics, The University of Danang, Da Nang, Vietnam

Abstract

Due to a relatively small economic scale in the South Central Coast and low internal accumulation capacity of developing countries, foreign direct investment (FDI) is always an indispensable supplement for this economy. This paper uses a combination of qualitative and quantitative analysis methods to examine the impact of FDI on economic growth the South Central Coast in the period 2009-2019. The qualitative results show that the role of FDI in the economy is significant and FDI has a positive effect on economic growth in provinces in the South Central Coast but the level of this effect is different between these provinces and this capital flow do not overwhelm domestic investment.

Keywords: *3SLS, Economic growth, FDI, FDI and growth, Quang Nam, South central coast.*

1. Introduction

Theoretical basis for the empirical studies related to the impact of FDI on economic growth through the investment channel are neoclassical growth theory and endogenous growth theory. These theories have shown how investment creates the output of the economy. In the both models, FDI can have a direct effect on the output because it increases capital accumulation. Growth factors are endogenous and FDI is seen as a set of capital and technology (Balasubramanyam, 1996). FDI affects and contributes to the country’s economic growth through channels such as capital accumulation, technology transfer.

Agama (2010) examines the impact of exports and FDI on the economic growth of South Asian countries: Bangladesh, India, Pakistan and Sri Lanka. This research found that the positive effects of exports and FDI are both statistically significant. Agrawal et al. (2011) studies the impact of FDI on the economic growth of China and India during the period 1993-2009. The results show that a 1% increase in FDI results in 0.07% increase in China's GDP and 0.02% increase in India's GDP. The authors also find that China's growth is more affected by FDI than India's growth. Yilmaz Bayar (2014) evaluates the effect of FDI and domestic investment on Turkish’s economic growth in the period 1980-2012. This study indicates that FDI has a negative effect on economic growth, while domestic investment has a positive effect on economic growth.

Pegkas (2015) examines the impact of FDI on economic growth in 18 countries in the European region in the period 2002-2012. The study uses the panel data and OLS, FEM and REM estimation methods on the regression model: $L(GDPit) = \beta 0 + \beta 1FDIit$. The results show that FDI plays an important role and positively affects the economic growth of these countries in the long run. The study also states that these countries need a macroeconomic stability to create a good investment environment in order to attract the FDI inflow, which is a necessary condition to promote economic growth. Carkovic and Levine (2005) applies GMM estimation method for the panel data of 72 countries (including the developed and developing countries) and find a similar result that there is a positive impact of FDI on the economic growth in these countries.

Hoa and Hemmer (2002) found the impact of FDI inflow on Vietnam's economic growth through the investment channel. FDI affects indirectly and promotes Vietnam’s economic growth through human capital. Similarly, Hung (2005) uses OLS estimation method to examine the effect of FDI on Vietnam’s economic growth. The result shows that FDI has a positive impact on economic growth, which is shown by the increase in living standards, technical progress and productivity. Lan (2006) uses the data of 61 provinces in Vietnam to examine the relationship between economic growth and FDI in the 1996 - 2003 period. The result indicates that FDI has a positively and statistically significant effect on economic growth. Moreover, exports, the growth of labor and human capital promote the economic growth in Vietnam.

Also, Thu et al. (2010) studies the impact of FDI on economic growth in Vietnam and found a significantly positive effect of FDI on economic growth in Vietnam. FDI inflow does not affect economic growth through the interactive effect of FDI on human capital and trade.

Bao et al. (2020) analyzes the relationship between FDI and economic growth in Vietnam in the period 1990-2019. The empirical estimation results from the VAR and ARDL - ECM models show the positively effect of FDI on Vietnam's economic growth both in the short run and long run. However, the relationship between FDI and economic growth is nonlinear. FDI has a positive impact on economic growth in the present period, but tends to be negative in the next period before recovering to a positive state. This nonlinear trend is also true for the effect of FDI on Vietnam's exports. Furthermore, the empirical results also show the effects of FDI inflow on interest rates, inflation and exchange rates in Vietnam’s economy.

Mai and Thuy (2016) uses the secondary data and applies VAR model and Granger causality test to examine the relationship between FDI and economic growth in Khanh Hoa province in the period 1995 – 2014. The results show that the impact of FDI on economic growth is not statistically significant, but economic growth has a positive impact on FDI. However, the limitation of this study is that it does not explain these results. This means that this study does not find out the necessary conditions for FDI to positively contribute to the local economic growth.

There are many studies examining the impact of FDI on economic growth through the investment channel. Most studies affirm the positively effect of FDI on the host country's economic growth through investment. In addition, most studies show the role of FDI in economic growth through spillover effects such as the impacts of technology transfer, employment, poverty reduction and economic restructuring.

2. Method

Qualitative analysis method. (i) Descriptive statistical analysis: the study will conduct the statistical analysis of economic growth trends, the situation of foreign direct investment in the South Central Coast and the relationship between FDI and economic growth. Thus, the direction of this relationship will be considered. (ii) The expert method: A method of gathering qualitative information but is useful for in-depth understanding through text analysis and discussion. This method is done through in-depth interviews with experts, managers and other stakeholders by questionnaires. This method will help the process of gathering information more thoroughly and understand more deeply some aspects of the impact of FDI on economic growth through investment.

Quantitative analysis method

Ba et al. (2006) uses a Cobb-Douglas production model and a perfectly competitive economy to assess the impact of FDI on economic growth in Vietnam. Markiw et al. (1992), Borensztein et al. (1998) and Thu et al. (2010) bases on neoclassical and endogenous growth theoretical models to create a model examining the impact of FDI on economic growth in Vietnam and use the provincial panel data for analyzing. These studies use the expanded production function model and then logarithm the variables over time in order to have a linear model of the factors affecting GDP. From the above studies, this study will propose the production model analyzing the impact of FDI based on the provincial data in the South Central Coast:

$$Y = AI^{\beta 1}\ F^{\beta 2}\ L^{\beta 3}\ H^{\beta 4}\ (1)$$

Where Y is Gross Domestic Products (GDP); L is labor; H is human capital; I is domestic investment; F is foreign direct investment; A is total factor productivity (TFP).

Take the logarithm and the derivative of the model over time:

$$gy_t = \beta_1 gI_t + \beta_2 gF_t + \beta_3 gL_t + \beta_4 gH_t + \varepsilon_t\ (2)$$

In which gy is GDP growth, gI is domestic capital growth, gF is FDI growth, gL is labor growth and gH is human capital growth. With the data from the provinces in the South Central Coast, here will rewrite the equation (2) is rewrite by provinces and time as the equation (3) below:

$$ggrdp_{it} = \beta_1 gdominve_{it} + \beta_2 gfdi_{it} + \beta_3 gl_{it} + \beta_4 gh_{it} + \varepsilon_{it}\ (3)$$

In which: $ggrdp_{it}$ is the GRDP growth rate; $gdominve_{it}$ is the rate of domestic capital growth; gfdiit is the FDI growth rate, gl_{it} is the labor growth rate and gh_{it} is the increase in the rate of trained labor; i is the province and t is the year.

The research uses the fixed and random panel data regression and 3SLS - GMM methods. Although in the the panel data regression method, the study used Two-Stage least squares (2SLS) regression analysis to overcome the endogenous phenomenon of the variable gfdi. In addition, in order to examine the differential effects of FDI on the economic growth of the provinces, the equation (3) will be added dummy variables, in which D1 is Da Nang, D2 is Quang Nam; D3 is Quang Ngai; D4 is Binh Dinh; D5 is Phu Yen; D6 is Khanh Hoa.

Data collection: (i) Primary data is collected through interviews with some experts in foreign direct investment management and leaders of business associations in provinces in the South Central Coast regarding the impact of FDI on the economy of these provinces. (ii) Secondary data for the study is collected from the statistical yearbook of provinces in the South Central Coast.

3. Results

3.1. Introduction to the natural and socio-economic conditions of the South Central Coast

The central coast in this study includes Da Nang city and Quang Nam, Quang Ngai, Binh Dinh, Phu Yen and Khanh Hoa provinces. The population of the region is about 7.5 million people, accounting for 7.7% of the population of Vietnam and more than 5 million labors. This region covers an area of 3.3 million hectares, accounting for 10% of the country's area and is connection location between the northern and southern regions with a coastline of about 1,000 km.

3.2. Economic growth in the South Central Coast

The period 2009-2019 is the period between two cycles of economic fluctuations (two shocks - World financial crisis in 2009 and COVID 19 pandemic at the end of 2019). In this time, the Vietnam’s economy and provinces in the South Central Coast grew rapidly. The GRDP of the South Central Coast (constant 2010) was more than 140 trillion VND in 2009 and more than 307 trillion VND in 2019, an increase of nearly 2.2 times and the average growth rate of about 7.7%, which is higher than the average growth rate of Vietnam during this period. However, the economic growth fluctuated with the highest growth rate of 11% in 2010 and the lowest growth rate of 5% in 2012. The quality of growth has improved significantly thanks to the contribution of technology, higher labor productivity, and the non-agricultural economic sector. In the economy of the South Central Coast region, the urban economy has played an increasingly important role in recent years. The proportion of the urban economy in the GRDP of the South Central Coast provinces tends to increase. The urban economy accounted for 78.6% in 2009 and 83.2% of the economic size of the provinces in 2019 (this indicator of Vietnam is 83.1%), increased by 4.6% during this period. The proportion of the urban economy of the South Central Coast to the size of Vietnam's urban economy has gradually increased and now accounts for nearly 8.4%, which is higher than the GRDP rate of the South Central Coast provinces to Vietnam's GDP (only 6.95%).

The economic structure of the South Central Coast has changed positively. The construction industry has increasingly asserted its main driving force role. The proportion of this area accounts for about 38% in 2019, in which provinces such as Quang Nam, Quang Ngai account for about 50% (excluding taxes and subsidies). The service sector has also grown rapidly. The proportion of this area in the GRDP is nearly 40% in 2019, and tourism is gradually becoming a spearhead industry for this region. The agricultural sector continues to develop, but the proportion has decreased significantly and only accounts for about 20% of the GRDP of the South Central Coast, in which Da Nang City only accounts for nearly 4% of the GRDP of the South Central Coast. The South Central Coast also formed a territorial structure with clearer division of labor and industrialization thanks to the formation of urban areas and centers of the service industry in the East.

The economy of the South Central Coast has a mechanism to mobilize and allocate resources for its growth which has been improved more and more clearly. In the 10 years since 2010, this economy has mobilized 1236,221 trillion VND at 2010 prices, and nearly 148 trillion VND in 2019, incresed 1.92 times higher than in 2010. This investment resource is allocated to the non-agricultural sector, especially to develop infrastructure for the economy. The total number of employees was mobilized into the economy about 49,208 million in 2009, and more than 4.2 million in 2019, increased 1.12 times.

Management mechanism and competitiveness of the provinces in the South Central Coast also improved much. The provinces are trying to reform and improve their competitiveness. Currently, the competitiveness of provinces is in the good group according to the assessment of the Vietnam Chamber of Commerce and Industry. .

3.3. Foreign direct investment situation in the South Central Coast

Total foreign direct investment capital in the South Central Coast increased gradually from 2009 to 2019., The total FDI at 2010 prices was over 4.3 trillion VND in 2009, and then increased to nearly 8.5 trillion VND in 2015 and over 13.8 trillion VND in 2019. From 2009 to 2019, FDI increased 2.9 times and the ratio of FDI to total investment rose from 3.1% in 2009 to nearly 9% in 2019. There are currently over 1000 investment projects operating in the provinces in the South Central Coast. The scale of each project is on average about 20 million USD or equivalent to about 460 billion VND. The number of projects and the amount of capital in some provinces are impressive. Provinces of Da Nang, Quang Nam, Quang Ngai and Khanh Hoa has great attraction in attracting foreign investment, currently accounting for more than 80% of projects in the South Central Coast. The industrial and service sectors are considered to be the most attractive and attract the most foreign direct investors. FDI in the industry - construction sector accounts for 35.8% of projects and 55.9% of registered capital.

According to Bui Quang Binh (2019), attracting foreign investment in the Central and Central Highlands of Vietnam has achieved good results in terms of quantity and quality. Attracting foreign investment is easier and tends to focus on regions and localities with better socio-economic conditions. However, the absorption capacity of the economy and conditions for investment implementation is not good, leading to a low disbursement rate and the weak role of foreign investment in the economy.

3.4. The contribution of FDI sector to the economy of the South Central Coast

FDI has greatly contributed to the economic growth of the provinces in the South Central Coast. Firstly, FDI enterprises contribute significantly to GRDP of these provinces, with 16.6 trillion VND in 2019, accounting for 5.4% of the region's GRDP. Although this figure was lower than the average level of Vietnam (19%), in case of difficult conditions of this region this is a significant growth. Secondly, FDI enterprises investing in the industrial sector, especially the industry with high technology, have contributed to economic restructuring. Thirdly, FDI enterprises have contributed to the domestic revenue of the provinces only about 4% of the total domestic revenue (in Vietnam this figure is 14.4% in 2018), in which the highest contribution is about 7% in Da Nang. Fourth, FDI contributes to increasing the scarce investment source for these provinces, currently accounting for nearly 9% of the total investment of the region. Fifth, FDI enterprises also create jobs for this area. The total number of employees in FDI is about 45 thousand employees in Da Nang and 40 thousand employees in Quang Nam in 2019.

3.5. Analyzing the impact of FDI on economic growth through the investment channel in the South Central Coast

Table 1. Descriptive statistics of the variables in the model

Variables	Number of observations	Mean	Standard deviation	Min	Max
ggrdp	66	7.60	0.91	5.79	9.3
gfdi	66	7.82	0.70	6.4	9.2
gdominve	66	11.98	1.28	9.4	15.1
gl	66	1.35	0.37	0.77	2.7
gh	66	1.15	0.33	0.3	1.8
pci	66	61.92	4.27	53.33	70
lny	66	10.45	0.39	9.41	11.14

(Source: Processing from the Statistical Yearbook of the provinces in the South Central Coast)

Table 1 shows the descriptive statistics of the variables in the model. The mean of ggrdp is 7.6, the minimum value is 5.79 and the maximum value is 9.3. The descriptive statistics of the other variables in the model are shown in the table and the data is convergence and can be used for analysis.

Estimated results

First, the study will present the estimation results according to two methods (1) random effects - REM, (2) fixed effects - FEM. However, the data of time series variables will present problems such as lag. When testing the stationarity of the variables, the variables are statistically significant. The results estimated by REM and FEM methods are both statistically significant. Indeed, the hausman test results indicate that using the results in REM method was better than the results in FEM method because domestic investment is endogenous as it depends on the business environment and the size of GDP. Therefore, the study use two-stage least squares (2SLS) regression analysis with REM method and then the 3SLS method and the results are presented in Table 2.

The result shows that FDI has a positive impact on the economic growth of the South Central Coast that is similar to the research results of Pegkas (2015) in the European region, Hoa and Hemmer (2002), Tran Trong Hung (2005). In the provinces in the South Central Coast, this capital inflow is significant in Quang Ngai, Binh Dinh and Phu Yen, but not statistically significant in Da Nang and Khanh Hoa.

Table 2: Estimated results

The dependent variable is ggrdp

Variables	Estimation methods

(Source: Processing from the Statistical Yearbook of the provinces in the South Central Coast)

Domestic investment has a larger and positive impact on the economic growth of the South Central Coast than the impact of FDI on and it seems that in the context of the scarcity of investment capital in the South Central Coast, these two capital flows are complementary. Labor is still a factor that plays a large role in the economic growth and is also the biggest potential in the South Central Coast. Along with investment capital, human capital has a positive impact and is also a factor that helps FDI to promote its role.

The survey results of some experts in the management of foreign direct investment and business association leaders in the provinces of the South Central Coast also support the above analysis. Accordingly, FDI has a positive effect on the economic growth of the South Central Coast through the investment channel with the approval number of 60%. Moreover, FDI did not overwhelm domestic investment with an agreement of 57.1%. The impact of stimulating domestic investment through complementary effects such as creating inputs or outputs, providing services to domestic firms accounts for nearly 63% agreement of respondents. FDI enterprises are taking advantage of the labor when investing in Vietnam, so the level of consensus among experts regarding the contribution of FDI in promoting the labor resource is very high, nearly 70% of respondents' agreement. A 66% of the respondents agreed that the contribution of FDI in promoting the labor resource through direct and indirect job creation. FDI has also contributed to improve the local labor skills with a degree of agree of 60%.

4. Discussion and Conclusion

Firstly, in the process of the economic development of the South Central Coast, although the role of FDI is increasing, it is also weak as compare to other regions in Vietnam. FDI not only contributes directly to the GRDP of the provinces, but also promotes the economic restructuring, increases the investment resource for the economy, creates local budget revenues, jobs, employment, and income for the labor or promotes policy reform of the provinces in the region. Therefore, it is necessary to affirm clear and consistent views on the role of FDI as a part of the Vietnam economy and thoroughly grasp the views in all policies.

Secondly, FDI has a positive impact on the economic growth of the South Central Coast, but the level of impact in different provinces is different. In the present conditions, the FDI attraction policies of the probinces need to define mid- and long-term goals in relation to combined and successive solutions. Foreign investment policy in the coming years will not only focus on quantity attraction but also its additional impact on other factors of production to generate economic growth. It is necessary to pay attention and give priority to attract the large FDI enterprises with financial and technological potentials.

Thirdly, it is necessary to improve the business environment of provinces, increase the attractiveness of investors to enhance the competitiveness. Provincial governments need to create a fair competitive environment, appreciate the role of the economic components, especially the private economy, and determine the function and role of the state economy reasonably. Indeed, the Vietnam government has to formulate the laws and legal documents to create the legal framework for production and business of all economic sectors. Moreover, provincial governments need formulate synchronous policies to mobilize and use resources for the economic sectors. Public administration reform will be one of the important solutions to make the open business environment.

Fourth, provincial governments continue to mobilize the domestic capital source effectively for economic growth. Due to the limited intrinsic accumulation capacity and a decline in government funding, the sources outside the region will be a major source of funding. In addition to improving the business environment, investment attraction policies need focus on the difficulties and disadvantages of investors. Provincial governments need pay attention to supportive solutions both during and after investment.

Finally, provincial governments should mobilize the maximum of labor resource and give a priority for developing vocational training for workers. These governments need ensure the mobilization of the participation rate in economic activities towards full employment, in which job creation and unemployment reduction are basic solutions. These governments should encourage labor-intensive sectors and train qualified laborers who are suitable to the process of economic restructuring and the requirement of investors.

THE IMPACT OF EXPORT ON ECONOMIC GROWTH OF KHANH HOA PROVINCE

Nguyen Thi Hai Anh
anhnth@ntu.edu.vn
Faculty of Economics, Developing Economics Studies, Nha Trang University

Abstract

The objective of the paper is to examine the effect of exports on the economic growth of Khanh Hoa province. The study used table data with secondary sources and applied regression estimation method of table data and 3SLS-GMM. The results show that exports have a positive effect on growth and spillover effects on other economic sectors. Along with that, capital and labor also have positive effects on economic growth.

Keywords: *Export; Economic growth; Khanh Hoa; 3SLS; FEM.*

1. Introduction

Theoretical basis of the study

The theories underpin quite a bit of research. According to the historical course and according to the different approach the role of exports in growth is considered. Classical Economic Theory adopts relative and relative snow advantage across economies to consider export advantage to promote economic growth. The endogenous growth theory holds that the diffusion of knowledge gained from trade in goods and the ability to imitate the products of foreign manufacturers are the driving force behind endogenous growth. Kaldor's Theory of Export-Based Growth: Kaldor (1970) developed an export-driven growth model built on the concept of capital accumulation, taking into account the fact that exports are the main ingredient. of the bridge. This model emphasizes the role of foreign demand growth in stimulating domestic output growth. Taylor's open structure theory holds that an open economic structure encourages international trade to promote efficiency and growth in output. The new economic theory of trade by Paul Krugman (1979) shows that the competitive advantage in international trade is due to industries that allow the efficient exploitation of traditional factors, while at the same time production specialization is required. depth is based on economies of scale. This drives the increase in the export size of that economy and the expansion of the economy.

On the basis of these theories, many empirical studies on the effects of exports have been carried out. The results of the studies have shown evidence of the role of exports in economic growth. Some of the studies are as follows:

Abou-Stait (2005) tested the export-based economic growth hypothesis also by applying the technique of co-ordination and test-causality to Egypt (1977-2003). The results support the hypothesis that exports, imports and GDP do not coalesce, and that exports are causally related to GDP growth. Moreover, the results also show that exports of goods remain an important source of economic growth and that export shocks lead to a significant response in GDP, which also gives confidence in the growth hypothesis, export-based growth.

Aurangzeb (2006) studied the relationship between economic growth and exports in Pakistan based on the analytical framework developed by (Feder, 1982). The author has tested the applications of hypotheses of increased economic growth due to expanded exports using the time series from 1973 to 2005. Research results show that the export industry has potential. Marginal social margins are significantly higher. Hence this study concludes that an export oriented policy and an expansion of international trade are necessary to promote economic growth in Pakistan.

He and Zhang (2010) studied the impact between international trade and domestic supply and demand of the Chinese economy by the input-output (I-O) method. The study also analyzed provincial-level data to examine the causal relationship between the growth of international trade with factors of aggregate demand, and with aggregate factor productivity. The results show that the contribution of exports to the country's economic growth is mainly due to the effect of exports on the growth of aggregate factor productivity in a supply-side approach.

Mishra (2011) examines the relationship between India's exports and economic growth during the period 1970-2009. This result confirms the existence of a long-term equilibrium relationship between India's exports and economic growth. Sahni and Atri (2012) also used time series data from 1980 to 2009 to examine India's export-based growth hypothesis. Research using tissue methods structure to estimate the relationship between gross national product, total export value, processed product exports and investment through a system of 6 equations. The results of the study confirm that the country's growth is export-based. In addition, the results also reveal that investment is not a transmission channel for exports that positively affects economic growth, but that investment has an independent impact on economic growth.

Phan Minh Ngoc et al (2003) conducted a study on the relationship between exports and growth in the case of Vietnam. This study analyzes statistics on exports and GDP of Vietnam during the period 1975-2001. The results show that, despite the fact that the export sector has grown significantly in recent years, there is no reliable econometric basis to confirm that exports are the engine of growth in Vietnam. South as is the case in other Southeast Asian countries. The conclusion of this study may be influenced by the quality of data when the two different periods of the Vietnamese economy are merged. That is before and after the renovation.

Research by Phan The Cong (2011) goes and directly assesses the impact of exports on Vietnam's economic growth. In this study, the author uses the models Feder (1983), Balassa (1978), Granger (1969) and the modified models for the period 1996-2006 with provincial data in Vietnam. The results of the study are a confirmation of the theory of economic growth based on export; At the same time, export plays an important role not only accelerating the economic growth of the country, but also contributing positively to the development of non-export factors (such as infrastructure, electricity, water, processed food ...) of the economy.

2. Method

2.1. Analytical methods

The study uses many different methods:

Econometric model

Based on the equation of national income account of Mankiw (2013), it can be considered that the economy includes the domestic production sector and the export production sector, referred to as the domestic sector (D) and export region (EX). Output in each sector depends on the volume of factors of production such as capital (K) and labor (L). The part of export volume used in the multiplier model stimulates growth (Bui Quang Binh (2012)). In addition, this portion of exports can also create a positive externality for other areas of the economy through the ability to develop effective international competitiveness, use of advanced technology, and training. high quality human resources or development of supporting industries. On the basis of the national income account equation of Mankiw (2013) and the production function model, Bui Quang Binh (2012) built a model to consider the impact of exports on growth when this factor is included into the model as input. Whereby:

Domestic sector: $D = D(KD, LD, EX)$ (1)

Export sector: $EX = X(KEX, LEX)$ (2)

In which D, EX is the output, KD , KEX , LD , LEX are capital inputs (production capital) and labor are used to produce goods and services.

The total amount of capital for production and labor in the economy is:

$K = KD + KEX$ (3)

$L = LD + LEX$ (4)

The output of the economy (Y) is equal to the total output of both regions:

$Y = D + EX \Rightarrow \Delta Y = \Delta D + \Delta EX$ (5)

The productivity of the inputs is its marginal product. So the productivity of the region in the country: $DK = MPKD = \Delta D/\Delta KD$ (6); $DL = MPLD = \Delta D/\Delta LD$ (7). Productivity of the export region: $EXK = MPKEX = \Delta EX/\Delta KEX$ (8); $EXL = MPLEX = \Delta EX/\Delta LEX$ (9)

Productivity in these two areas is different and equal to δ

Or EXK/DK = EXL/DL = 1 + δ (10)

When δ> 0 implies that the exporting sector has a higher input yield than the other region and δ <0 otherwise.

From (1) we have $\Delta D = DK\Delta KD + DL\Delta LD + DX\Delta EX$ (11)

From (2) when we get the differential we have $\Delta EX = EXK\Delta KEX + EXL\Delta LEX$ (12)

The annual investment determines the amount of capital produced because the annual capital production decreases in value (depreciation) and is compensated by the new investment - I (Mankiw (2013)).

Replace (11) to (14) with (5). After we have the results, we replace equations (10) and (12) and then change again, we have

$$\Delta Y = DK.(ID+IEX) + DL.(\Delta LD+\Delta LEX) + \frac{\delta}{1+\delta}.\Delta EX + DEX.\Delta EX \quad (13)$$

From equation (15), combined with I = ID + IEX, $\Delta L = \Delta LD + \Delta LEX$

We report $$\frac{\Delta Y}{Y} = DK.\frac{I}{Y} + DL.\frac{\Delta L}{Y} + \left(\frac{\delta}{1+\delta} + DX\right).\frac{\Delta EX}{Y} \quad (14)$$

Starting from (17), we have:

$$\alpha = DK \Rightarrow DK.\frac{I}{Y} = \alpha.\frac{I}{Y} \quad (15)$$

$$\beta = DL.\frac{L}{Y} \Rightarrow DL.\frac{\Delta L}{Y} = DL.\frac{L}{Y}.\frac{\Delta L}{L} = \beta.\frac{\Delta L}{L} \quad (16)$$

We have: $$\left(\frac{\delta}{1+\delta} + DEX\right).\frac{\Delta EX}{Y} = \frac{\delta}{1+\delta}.\frac{\Delta EX}{Y} + DEX.\frac{\Delta EX}{Y}$$

But $$DEX.\frac{\Delta EX}{Y} = \theta.\frac{D}{EX}.\frac{\Delta EX}{Y} = \theta.\frac{\Delta EX}{EX}.\frac{D}{Y} = \theta.\frac{\Delta EX}{EX}.\frac{Y-EX}{Y} = \theta.\frac{\Delta EX}{EX}.\left(1 - \frac{EX}{Y}\right)$$

$$\left(\frac{\delta}{1+\delta} + DEX\right).\frac{\Delta EX}{Y} = \frac{\delta}{1+\delta}.\frac{\Delta EX}{Y} + \theta.\frac{\Delta EX}{EX} - \theta.\frac{\Delta EX}{EX}.\frac{EX}{Y} = \frac{\delta}{1+\delta}.\frac{\Delta EX}{EX}.\frac{EX}{Y} + \theta.\frac{\Delta EX}{EX} - \theta.\frac{\Delta EX}{EX}.\frac{EX}{Y} = \left(\frac{\delta}{1+\delta} - \theta\right).\frac{\Delta EX}{EX}.\frac{EX}{Y} + \theta.\frac{\Delta EX}{EX} \quad (17)$$

Putting (15), (16) and (17) in equation (14) yields equation (18):

$$\frac{\Delta Y}{Y} = \alpha.\frac{I}{Y} + \beta.\frac{\Delta L}{L} + \left(\frac{\delta}{1+\delta} - \theta\right).\frac{\Delta EX}{EX}.\frac{X}{Y} + \theta.\frac{\Delta EX}{EX} \quad (18)$$

From (18) here we can propose the following analytical model

$$ggdpit = a + \alpha sit + \beta glit + \sigma xxit + \theta gxit + uit \quad (19)$$

In which: ggdp = ΔY/Y, s = I/Y, gl = = ΔL/L, xx = (ΔEX/EX)(EX/Y), gx = ΔEX/EX $\frac{\delta}{1+\delta} - \theta = \sigma$ and u is error.

Other methods

The research also uses other methods such as descriptive statistical analysis, comparison to consider the trend and changes in economic output, export activities of Khanh Hoa.

2.2. Data for analysis

The data used for the analysis are obtained from the statistical yearbooks of Khanh Hoa province and districts from 2010 to 2019, provided by the Statistics Department of Khanh Hoa province. In which economic output is the production value of districts at constant 2010 prices (the district level does not consider GRDP). The data of investment capital is also calculated at constant 2010 prices; Number of employees here is the number of employees working aged 15 and over by district. The export value by district is determined by the province at constant 2010 prices. In addition, the study also uses the population data and the income level of the households in each district for analysis. The province's districts are divided into 5 districts at the district level and include Nha Trang, Cam Ranh, Ninh Hoa, Van Phong (Van Ninh and Cat Lam) and the remaining districts are the other group (Khanh Vinh, Dien Khanh and Khanh Son).

3. Results

3.1 The State of Khanh Hoa's Economic Growth and Exports

a. Economic growth situation

The scale of the economy has been continuously expanded, the growth is quite high, continuous and quite stable compared to the general ground of the provinces of the Southern Oceania. At current prices, the GRDP value in 2010 is VND 28,358 billion, in 2015 it is VND 56,801 billion and in 2019 it is VND 86,121 billion. The scale of GRDP in 2019 is 3.03 times higher than that of 2010. At constant 2010 prices, the GRDP value in these timelines is VND 28,358 billion, VND 38,901 billion and VND 52,296 billion respectively. At constant prices, the GRDP has increased continuously, the annual growth rate has the highest rate in 2014 of 9.3% and the lowest of 4.6%, 10-year average of 7.05%. With such volatility, the stability rate is quite good, the stable rate is around (-34.6%; 32.2%), the average is 0.2%. The most stable period is 2016-2019.

The driving force for economic growth is the service sector and the non-state economic sector and breadth factors. Among the main industries of the economy, in the past 10 years the construction industry has had the fastest growth rate of value added, an average of 9.06% per year, the service industry has had the growth rate of value added. 7.34% and the growth rate of agriculture, forestry and fisheries is 1.4%. From the sector's share in GRDP, it can be seen that Khanh Hoa's GRDP growth is based on non-agricultural sectors, especially services. Compared with other provinces in the Central Coast of America in 2010 and 2019, it shows that Khanh Hoa's position in 2019 is worse than 2010.

b. Khanh Hoa's export situation

Export size and growth

Value export turnover of Khanh Hoa province has increased continuously in the past 10 years, accounting for a large proportion of the GRDP, but growth is slower than economic growth and accounts for a relatively small proportion of Vietnam's export value. The scale of Khanh Hoa's exports at current prices has increased over time. In 2010, the export value was 13,457 trillion VND and accounted for nearly 48% of GRDP; In 2015, it was nearly 23.9 trillion VND and accounted for 42.1% of GRDP and in 2019 it was 34.58 trillion VND and accounted for 40.2% of GRDP.

The province's export growth is quite high but unstable and slower than GRDP growth. In the period 2010-2019, the average growth rate of the economy is nearly 7%, while export growth is close to 8.5%. But the export growth rate is quite volatile, the highest year of growth was more than 10% in 2015 and the lowest was -4.46% in 2017. The reason given is that the nature of the province's exports are commodities, but they are biased towards agricultural products and raw exports. These export products have very volatile markets in terms of both input materials and output. This also requires the locality to choose an appropriate foreign trade strategy to reduce the volatility.

The trade surplus is high and gradually increasing. The rapidly increasing export turnover compared to the general level of the Central region and the import turnover of the province in recent years. the statistics shows that the value of exports is always higher than imports. In 2010, the export value was 13,457 trillion dong while the import was only 7.8 trillion dong, so the trade surplus was nearly 5.6 trillion dong; In 2015, export turnover was nearly 23.9 trillion dong, import was 14.4 trillion dong, and trade surplus was over 9.4 trillion dong; In 2019, these figures are 34.58 trillion dong; 19.6 and 14.9 trillion dong. These developments are explained by the structure of exports, which are mainly agro-forestry products, while imports are mainly raw materials for production such as cashew nuts for export processing, seafood raw materials, and raw materials, materials for tobacco production, machinery and silk thread ...

Although the province's export turnover scale is quite high compared to other provinces in the region, it is still modest compared to the whole country: In 2010, the export turnover of the province was 723.0 million USD, accounting for about 1.01% of the total export turnover of Vietnam, lower than that of Da Nang and higher than the rest of the provinces; In 2015, the export turnover of the province was 1127.3 million USD, accounting for 0.68% of Vietnam and in 2019 these indicators were 1497.1 million USD and 0.567% of Vietnam, still ranked second after Da Nang in the Central region. This shows that the province still needs to make great efforts to promote its potential to expand production for export in the coming years.

3.2. The results of analysis of the impact of exports on economic growth

Model and estimation method

This section will use econometric model (18) to conduct humility. Model (18) is used for OLS estimation, converging table data.

Estimation method: With data that is spatially medium - districts and cities of Khanh Hoa province and over time from 2010 to 2019, tabular data will be established. With this data, we can apply the raw OLS estimation method or method (Pooled OLS). With this method, time factor will be ignored but only pure data observations or cross data is used. The raw estimate is the OLS estimate on the obtained data set of spatial features, so then consider that all coefficients do not change between different objects and do not change over time. This is also a limitation of this method. We continue to use the random effect (REM) and fixed effect (FEM) convergence estimation method for the necessary tests, then use the Hausman test for selection (REM), continue to deal with the endogenous problem of the gex variable. Also here will use the 3SLS - GMM method by adding 1 equation gex = $\beta_0 + \beta_1$ $lnc_{it} + \beta_3$ csoy + uit (19) together with (18) to form a system of equations including (18) and (19) means that the variable gex is endogenous. Here the endogenous variable *gex* is solved through the exogenous variables in Equation 19. In this case, according to Zellner, A & Theil.H (1962), the 3SLS estimation method can be applied.

Metrics and descriptive statistics of the data

The data presented in section 2. With the above data on time series, problems such as the delay of the variable over time arise. However, for a short 10-year period such as this study, latency is not a problem.

Table 3.1: Descriptive statistics of the data in the model

Variables	Mean	Standard Deviation	Minimum Value	Maximum Value
ggdp	6.61	0.43	5.63	7.22
gex	8.48	0.36	7.80	9.30
gl	1.17	0.08	1.0	1.3
s	48.77	0.91	47.0	50.3
xx	230.12	23.22	177.3	276.0
lnc	11.175	0.780	10.28	12.56
csoy	38.490	1.610	34.10	41.20

(Source: processed from the Statistics Directory of localities at district level in Khanh Hoa province).

Table 3.1 shows some basic statistics about the variables in the model. The mean value of the dependent variable ggdp is 6.61, the minimum value is 5.63 and the maximum value is 7.22 (note that this mean is higher than the provincial GRDP growth rate as it uses the value data. production at district level). The mean value of the export growth variable -

gex is 8.48 and the maximum and maximum are 7.8 and 9.3. The baseline statistics for the other variables used in the analysis are shown in this table. The data have demonstrated convergence and can be used for analysis.

Estimated results

Estimated results are presented in Table 3.2. The estimation methods are fundamentally significant and can be used for evaluation.

This result shows that in recent years, export growth has had a positive impact on economic growth and confirmed the above qualitative statements when analyzing the trend of changing exports and the province's GRDP. Labor growth has a positive impact on economic growth, which is also consistent with the province's labor advantages and conditions. This is also the most influential factor. Ratio of investment to output - the rate of saving has a positive effect, which is also consistent with the current stage of development of developing economies like Vietnam. The regression coefficient of variable xx is 0.11, implying that export growth has a spillover effect on all sectors of the economy.

With the coefficients $\sigma = +0.015$ and $\theta = 0.475$ with REM; equal to $\sigma = 0.016$ because $\theta = 0.588$ in 3SLS method, so the coefficient δ can be realized. $\sigma = \delta / (1+\delta) + \theta \Rightarrow \delta < 0$ in both ends. This implies that the productivity of the exporting sector of the province is less than that of the other manufacturing sector.

Table 3.2 Estimates results

	Estimating methods		
	OLS	Random effects (REM)	3SLS
Dependable variable – ggdp			
gx	0.266*** (0.056)	0.475*** (0.135)	0.588*** (0.125)

(Source: processed from the Statistics Directory of localities at district level in Khanh Hoa province)

4. Discussion and Conclusion

4.1. Discussion

Firstly, the economic growth maintained continuously in the past 10 years is quite high and stable. Economic growth is driven by the service sector, the non-state economy and breadth factors (capital and labor). However, the economic growth rate of the province is not commensurate with its existing potentials and strengths; The economic status of the province compared to other provinces in the Central Coast of the Central region has a certain decline.

Secondly, the province's exports have grown continuously but less stable, slower than economic growth and quite small compared to Vietnam's exports. The export of the province is mainly based on the export of goods and on natural scavenging, which has no room for exploitation;

Thirdly, export growth has a positive impact on economic growth, but the impact level is not high and implies that if the export structure changes, it will gradually shift to service exports and exploit dynamic advantages.

Fourthly, the labor productivity of the export sector still has great potential to improve.

4.2. Policy implications

To promote the role of exports in economic growth, the following actions should be taken:

Firstly, the province's economic growth still has a lot of room, especially based on export strategy if it takes advantage of the trend of opening up the economy and exploiting the free trade agreements that Vietnam signed with other countries. and other economies.

Secondly, export has room to promote growth by improving productivity, changing export structure and exporting strategy from raw export to export based on processed goods and services;

Thirdly, improve the productivity of the economy in general and focus on improving the productivity of the export sector.

Fourthly, the export restructuring is associated with economic restructuring, especially the service - tourism sector of the province in order to exploit the advantages of exporting goods and services in the domestic market.

THE IMPACT OF THE POLICY ON THE URBAN COMMUNITY OF HO CHI MINH CITY ON THE CURRENT ENVIRONMENTAL PROTECTION ACTIVITIES FROM A SOCIOLOGICAL PERSPECTIVE

Dr. Nguyen Minh Nhut

nhut227@gmail.com

Deputy Head of Urban Committee, People 's Council Ho Chi Minh City, HCMC, Vietnam

Abstract

Ho Chi Minh City faces many challenges of environmental pollution from economic growth, urbanization and population growth. Since the City Party Committee's directive and the determination of the implementation of the local government, the environmental sanitation situation in the city has improved; Models of community participation in environmental protection were formed, diversified in forms and gradually brought into play effectively, creating a positive change in people's awareness of environmental protection. Although there are still some shortcomings and shortcomings, it can be said that the implementation of the Party Committee's directive has had a great impact on the society, to solve the problem of environmental pollution and indiscriminate littering a job through, long term, requires the participation of the community.

Keywords: *Environmental protection, Ho Chi Minh city, sociology.*

1. Introduction

Environmental protection activities are activities to prevent and limit negative impacts on the environment; respond to environmental incidents; overcoming environmental pollution and degradation, improving environmental quality; rationally use natural resources, biodiversity and respond to climate change (National Assembly, 2020). Along with its achievements in socio-economic development, Ho Chi Minh City faces many challenges of environmental pollution from economic growth itself, urbanization and rapid growth population resistance, leading to great pressure on urban infrastructure, especially the current environmental protection problem.

In order to solve the city's environmental problems, the Party Committee and the city government have issued guidelines and policies to implement many key programs on reducing environmental pollution in the 2016-2020 period to improve the environment and increase the green area; renovate and embellish existing residential areas and build new urban areas with synchronous and environmentally friendly infrastructure; to form centralized waste treatment zones and step by step improve the quality of urban environment in the city.

However, environmental pollution still occurs frequently and alarming in residential areas, construction sites, on the streets and at public works. These restrictions stem from the sense of environmental hygiene of a part of the city population. Therefore, in order to concretize the above key programs with practical actions to propagate and advocate for changes in people's behavior and habits, to limit indiscriminate littering in public places. The Standing Committee of the City Party Committee issued Directive No. 19-CT / TU dated October 19, 2018 on the implementation of the campaign “The people of Ho Chi Minh City do not litter the streets and canals, for a clean and clean city reducing flooding” (Directive 19) (People's Committee of Ho Chi Minh City, 2021). The article aims to objectively assess the current situation and propose solutions to help the government have more scientific basis to improve current environmental protection activities from a sociological perspective.

2. Method

Qualitative data is used by the author and analyzed from documents of agencies and organizations of the City; Quantitative data was collected from sources of the Ho Chi Minh City Party Committee for Propaganda and Education conducted in June 2020 through a pre-designed questionnaire of response options, which was sent to respondents through applications using OTT (Zalo, Viber, Messenger), fanpage pages and handled by docs.google application for surveys and quick polls over the internet.

The survey results have 16,003 turns of respondents with the following characteristics: male rate is 30.6% and female is 69.4%; the young age (from 15-30) accounts for 22.2%, the middle age (31-60) accounts for 72.8%; in terms of education, under university is 27.63%, university is 63.13% and graduate is 9.24%; In the district, it is 86.4% and 15.6% in the district. Thus, more than two-thirds of women surveyed, most of them middle-aged, have a university or higher education, accounting for more than two-thirds and most of them live in the inner districts City of the City. Number of survey samples are selected at random, convenient, ensuring representative for the community.

3. Results

3.1. Comment on the propaganda campaign "City people do not litter the streets and canals, because the city is clean and less flooded"

3.1.1. People's interest in the campaign

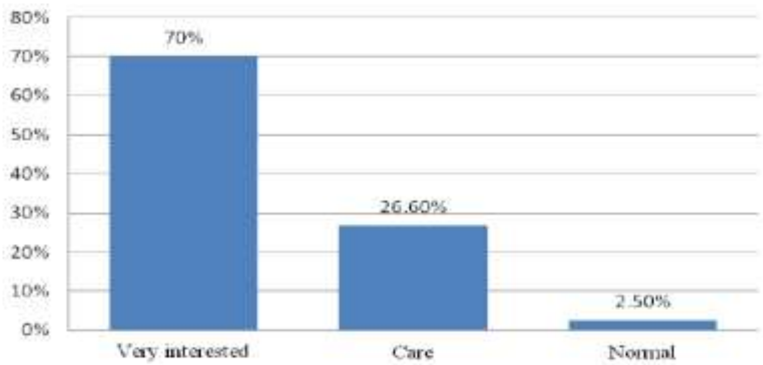

Figure 1. People's interest in the campaign

(Ho Chi Minh City Party Committee Propaganda Department, 2020)

The campaign has a direct and indirect impact on people's perceptions through propaganda channels from the media, local authorities to the Fatherland Front and socio-political organizations the spread of practical values in environmental protection activities of the city people. With the survey results in Figure 1 shows, the percentage of respondents answering "Very interested + interested" reached 96.6%, reflecting the majority of city residents' concern about this campaign. This is a good signal for the local authorities to have the basis to continue implementing environmental protection activities in the new period more favorable.

3.1.2. Local propaganda about the campaign

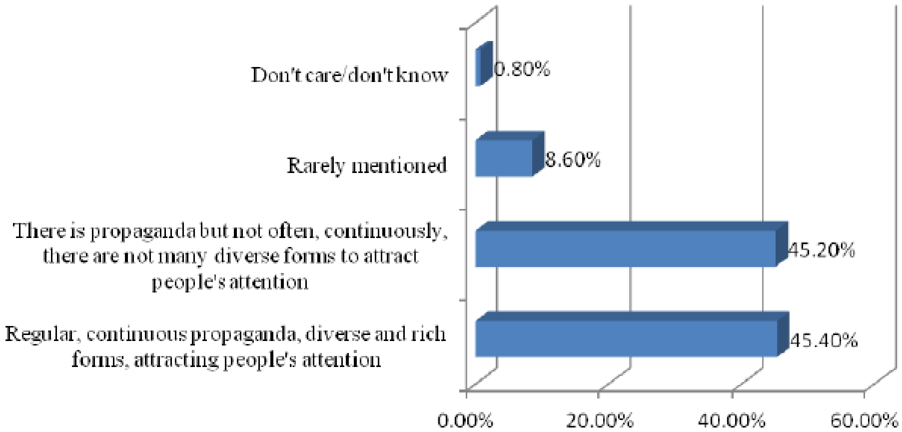

Figure 2. Local propaganda about the campaign

(Ho Chi Minh City Party Committee Propaganda Department, 2020)

One of the key points of the campaign is the local propaganda to help people understand the rights and obligations of individuals, families and communities to environmental protection activities in residential areas and domestic waste management. Survey results in Figure 2 show that the people's perception of local propaganda activities is as follows: nearly half of the respondents said that the locality had "Regularly and continuously propagated, forms are diversified and plentiful, attracting people's attention ”(45.2%). On the other hand, there are also half of the respondents said that “propaganda is available but not regularly and continuously, there are not many diversified forms to attract people's attention” (45.2%). Thus, in general, propaganda activities in localities have not been synchronous, yet effective is not high; In some places, which are interested by local leaders, propaganda regularly, continuously and diversely and richly, but there are places that have not attracted the participation of the people.

The concern or not of local leaders is very important to the success of the campaign. This issue poses for the city's advisory agencies to clearly define the responsibilities, obligations and rights of local leaders; at the same time, specifying the resources for the campaign to go into depth and form the "core" value in people's behavior standards for the protection of the surrounding environment.

3.2. Changes in people's behavior and habits since the campaign is implemented

3.2.1. People's comments on litter situation on roads, canals

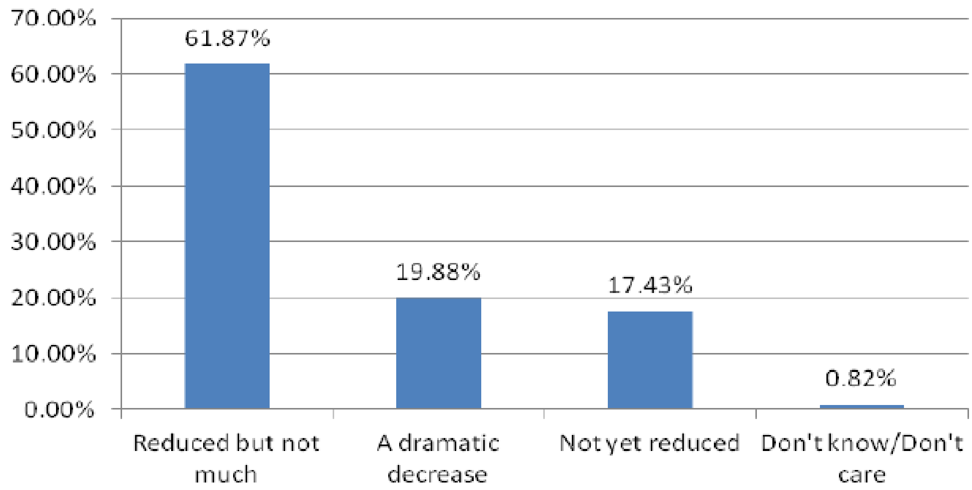

Figure 3. Changes in people's current littering on the street

(Ho Chi Minh City Party Committee Propaganda Department, 2020)

According to people's perceptions, the current change in the situation of people littering on the streets has had many positive changes after two years of implementing the Directive 19. According to the survey results, figure 3: people think that The current situation of littering on the streets "Much reduced" (19.88%), "Reduced but not much", about 3/5 respondents (61.87%) and "not reduced" (17.43 %). Thus, the majority of people affirmed that the current situation of littering on the streets of the city people has decreased, but not much, and a part of the people believe that it has decreased significantly. Although the results are not as expected of the local authorities, but also shows a change in awareness and actions of the city people in a positive direction towards the current environmental protection.

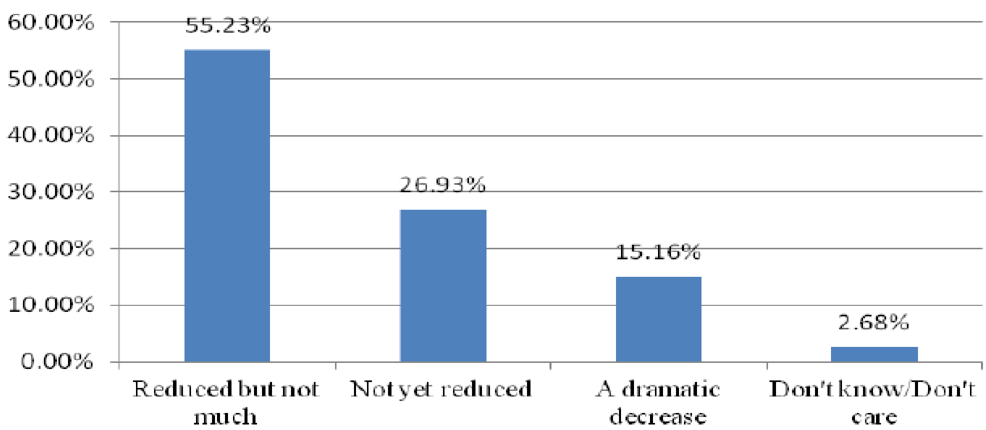

Figure 4. Changes in the current situation of people discharging garbage into canals

(Ho Chi Minh City Party Committee Propaganda Department, 2020)

The survey results of Figure 4 show that: for the change in awareness and action on the current situation of littering into canals, people have noticed: "Much reduction" (15.16%), "Already Decreased but not much "(55.23%), about half of the respondents," No reduction "(26.93%), about 1/4 of the respondents. Thus, the majority of people believe that the current situation of littering into canals in the city tends to decrease, but not yet in the afternoon; The proportion of people agreeing with the point of view "not yet reduced" accounts for a higher rate than the "Much reduction" point of view.

3.2.2. The change of people since the city started the campaign

Table 1. Changes in citizens since the City started the campaign (N = 16,003)

	N	**%**
1. Be more conscious, offload the use of plastic waste.	11074	69,2
2. To put garbage in the right place as prescribed, do not dispose of garbage indiscriminately in public places, residential areas.	9826	61,4
3. Limit the use of plastic bags.	8338	52,1
4. Prioritize the use of environmentally friendly products.	8018	50,1
5. Participate in activities aimed at preserving environmental sanitation, movements to collect and classify used products made from plastic, packaging, and plastic bags.	7041	44
6. Proactively collect garbage after attending activities (watching music, watching soccer, ...) held in public places.	5889	36,8
7. To classify waste into inorganic and organic waste.	5617	35,1
8. Remind others when they see their violations such as not to put garbage in the prescribed place, put garbage in canals, roadbeds, gas tunnels, discharge doors, put garbage at the manholes...	5345	33,4

(Ho Chi Minh City Party Committee Propaganda Department, 2020)

From the people's point of view in Table 1 shows that, since the city started the campaign up to now, the habits and positive behaviors of the people tend to change for the better, specifically: people “Yes be more aware, reduce the use of plastic waste "(69.2%)," Keep garbage in the right place, do not throw garbage indiscriminately to public places, residential areas "(61.4%), "Limit the use of plastic bags" (52.1%) and "Prioritize the use of environmentally friendly products (50.1%). Survey results show that the majority of people have positive changes from awareness, attitude to behavior in environmental protection activities and this is gradually being improved;

Among the comments about the change, the viewpoint "Be more conscious, reduce the use of plastic waste" is highly appreciated by the people, accounting for more than 2/3 of the respondents. This reflects a positive trend of social life into people's perception because of the action of replacing disposable plastic products into those made of glass, natural materials that are easy to digest eco-friendly and destructive is widely available; the activity "Leaving garbage in the right place, not disposing garbage indiscriminately in public places, residential areas" received more attention, about 2/3 of respondents affirmed the practical effect from the replacement people's exchange for this activity;

The remaining activities, according to the survey results, have 4 activities that people have changed since the city started the campaign such as: “Participating in activities to preserve environmental sanitation, collection and classification of used products made of plastic, packaging, plastic bags "(44%)," Actively collecting garbage after attending activities (watching music, watching soccer) ...) organized in a public place "(36.8%)," Sorting waste into inorganic waste, organic waste "(35.1%)," Remind others to see their violations as do not put garbage in the right place as prescribed, put garbage down canals, curb bed, gas tunnel, discharge door, put garbage at the drainage gates ... ”(33.4%). Although these rates are not high, about one third of the respondents, the process of changing awareness, habits and behavior of the people has been marked over 2 years of implementing Directive 19. This is also the case. Cause many thoughts for the city government to consider new and more effective solutions to stimulate the participation of people to join hands with the government to implement well the campaign towards the goal of a clean city. and reduced flooding.

3.2.3. The reaction of people when seeing other people dispose of garbage in the wrong place, litter it indiscriminately

Table 2. Reactions of people when they see other people dispose of trash in the wrong place, litter garbage on roads and canals (N = 16,003)

	N	**%**
1. It is very annoying, frustrating, and immediately reminded when other people have the above behaviors.	9042	56,5
2. Very annoying, pressing, but not reminded and ignored.	2705	16,9
3. To collect rubbish by himself at the right place.	2096	13,1
4. Immediately report to the local authority / hotline / area person... when such behavior is observed.	1264	7,9
5. Normally, this situation occurs every day, so there is nothing frustrating and annoying.	768	4,8
6. Not interested, not paying attention.	128	0,8

(Ho Chi Minh City Party Committee Propaganda Department, 2020)

To measure changes in people's perceptions, behaviors and habits after 2 years of campaigning by measuring people's reactions to seeing other people misplacing trash, littering yards. Survey results in Table 2 showed that more than half of respondents said that "It is very annoying, frustrating, and immediately reminded when they see other people commit the above behaviors" (56.5%). This is one of the great successes of the city government and people, which has created a common standard value of "not indifferent, indifferent to one's own community". That will help change people's bad habits to form new standard values of "community cohesion" and these values are recognized by the society;

For other people's reactions such as: “Very annoying, frustrated but not reminded, ignored” (16.9%), “Waste is collected at the right place” (13.1%). These two companions describe the "indifference, ignorance" characteristic of a part of the people, expressing a lack of faith in the social values of common standards, affected and negatively affected by their lifestyle urban areas, making urban population communities tend to live in closed-loop areas, appear individualism. Although the proportion of people agreeing with this view is not high, it has appeared and existed in the perception and action of a part of the population.

3.2.4 Citizens' perceptions of flooding will decrease compared to before when the city implements measures from the campaign

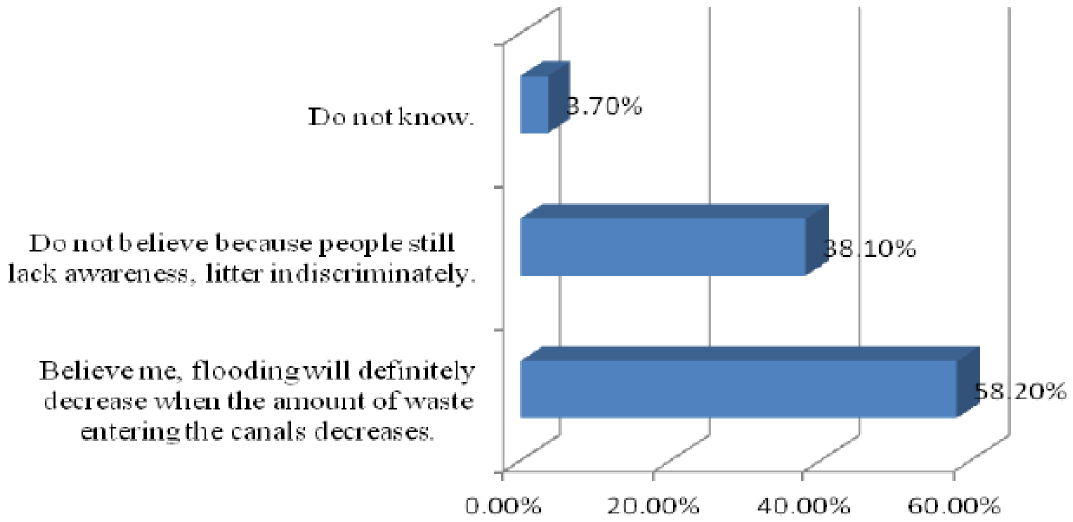

Figure 5. People's perception of the flooding situation compared to the past when the city implemented solutions from the campaign.

(Ho Chi Minh City Party Committee Propaganda Department, 2020)

One of the reasons for the city's waterlogging worsening is the domestic waste filling the canals and drains, making water inaccessible. The campaign for the implementation of Directive 19 has promoted the participation of the entire political system in mobilization to raise awareness; create good habits for people and communities to join the government in environmental protection activities that indirectly reduce flooding compared to the past. Survey results in Figure 5 show that nearly 3/5 respondents affirmed the viewpoint "Trust, surely the flooding will decrease when the amount of waste discharged into the canals decreases";

Besides, there is still a part of the people who feel “Not trusting because they still see lack of awareness, littering indiscriminately” (38.1%), with more than 1/3 of the respondents answered. Although, the amount of domestic waste in the canals and sewer systems is cleaned through mass movements. However, in order to maintain and broaden these movements, it requires the participation and close supervision from the communities in which the people are living, the effectiveness of this action will bring about sustainability.

3.2.5. Comment on the effect of the campaign

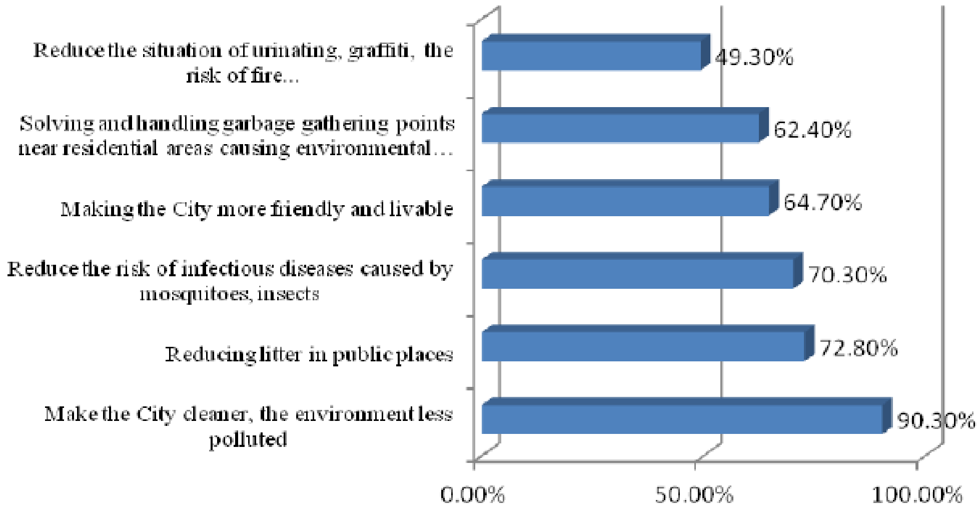

Figure 6. Comments on the effects of the campaign

(Ho Chi Minh City Party Committee Propaganda Department, 2020)

Survey results in Figure 6 show that: most of the people believe that the campaign "makes the city cleaner, the environment less polluting" (90.3%). This statement is also the message that the government has sent to all city residents during the past 2 years and has been spread to all classes of people to join hands to make the city cleaner, environment less. more pollution; On the other hand, the campaign's effect also reduces the number of indiscriminate waste in public places (72.8%), "Reduces the risk of infectious diseases caused by mosquitoes and insects" (70 , 3%). These two comments have a relatively high rate of people agreeing, accounting for more than 2/3 of the respondents. This proves the real effects and benefits from environmental protection activities that people, communities and authorities have done during the past time;

Besides, the effect of implementing the campaign is also significant: "Making the city more friendly and worth living" (64.7%), "Solving and handling gathering points. garbage near residential areas pollutes the environment, causing bad smell ”(62.4%). Both of these statements account for a relatively high rate, with about 3/5 respondents affirming this. The campaign is also an opportunity for people to express their personal views and practical reflections on the surrounding environment so that the government and people work together to commit to effective coordination; Comment on the issue "Reducing the situation of graffiti, graffiti, the risk of fire and explosion, ... (49.3%), nearly half of the respondents. The movement as an invisible life has affected and crept into every corner of the urban environmental protection in the residential area and spread to other fields.

3.3 Evaluate the local government's solutions to the campaign's implementation from the people's perspective

Table 3. Solutions for the campaign to be effective in the coming time (N = 16,003)

	N	**%**
1. Continuing to propagate and mobilize people to have a sense of responsibility in environmental protection	13635	85,2
2. Strictly handle acts of littering into the environment	12546	78,4
3. Arranging and organizing the regular and irregular inspection of garbage gathering points in residential areas to ensure environmental hygiene, urban beauty and synchronous connection of the time of garbage delivery by people - people. collection - a transporter, not to concentrate garbage and scraps and gather many garbage collection vehicles at the same time.	11010	68,8
4. Arranging more garbage cans with the function of garbage classification at public places and residential points.	9858	61,6
5. Praise, reward, and replicate good models and practices of neighborhoods, residential groups ... in implementing the campaign.	9586	59,9
6. Advocating at points of sale, small businesses, consumers ... to limit the use of plastic bags.	9442	59
7. Installing security cameras in combination with monitoring the quality and environmental sanitation in residential areas.	9074	56,7
8. Research and propose products to replace plastic bags and disposable plastic products.	8978	56,1
9. Launch emulation and constitutional movements to protect the environment.	8114	50,7
10. Implement a system to quickly and effectively receive and process people's opinions by many flexible and diversified methods.	7601	47,5

(Ho Chi Minh City Party Committee Propaganda Department, 2020)

For the campaign "City people do not litter the streets and canals, for a clean city and reduce flooding" to be effective in the coming time, it is shown through the question of selecting 10 solutions. Table 3's results show that there are some solutions with high response rates (3/10 solutions), specifically:

- According to the people, in order for the campaign to be effective in the coming time, the local government should "continue to propagate and mobilize people to have a sense of responsibility in environmental protection" (85.2 %). This is one of the solutions to be most appreciated and confirmed by more than 4/5 respondents; When propaganda and advocacy play a key role, it is necessary to have a more rigid support solution, that is "strictly handling acts of littering the environment" (78.4%) more than three-quarters of respondents. This treatment demonstrates the strictness and deterrence of the law to educate people to raise their awareness and responsibility towards the community, society and the surrounding environment, and at the same time helps people to take shape into a good habit; Solution "Arranging and organizing regular and irregular inspections of waste gathering points in residential areas to ensure environmental sanitation, urban beauty and synchronous connection of garbage delivery time of people, Collectors, transporters, do not let the concentration of waste, scrap and many trucks gather at the same time ”(68.8%) had a high response rate but lower than the two solutions before. This solution is related to technical factors and state management of waste gathering point, waste delivery process between people, collectors, transporters. Theoretically, the legal provisions have been clearly shown, but in practice there are still many shortcomings causing environmental pollution and urban beauty loss from these activities. State management agencies need to arrange and organize regular and irregular inspections to reorganize these activities in accordance with the provisions of law;

- Solution "Arranging more garbage cans with the function of separating waste at public places and residential areas" (61.6%) to form a habit of disposing of garbage in the right place and know how to classify Garbage at the people's source is an action contributing to the responsibility of local authorities in environmental protection activities. Therefore, when the local government allocates more public trash, it is necessary to research scientifically to create convenience for people to participate in keeping the general hygiene.

In addition, Table 3 shows that there are 4/10 solutions with the rate of more than 1/2 of the respondents confirmed to be effective in the coming time, specifically:

- Praise, reward, replicate good models and practices of neighborhoods, residential groups ... in implementing the campaign (59.9%); Advocating at points of sale, small traders, consumers ... to limit the use of plastic bags (59%); Installing security cameras in combination with monitoring on the quality of environmental sanitation in residential areas (56.7%); Research and introduce products to replace plastic bags and disposable plastic products (56.1%).

- These solutions aim at activities calling for the participation and promoting the role of the people, the community participating in solving problems related to environmental protection activities in the locality to create motivation sustainable development community. In addition, people propose additional technical assistance solutions from local authorities to improve the effectiveness of the campaign. However, these solutions need to be deployed and coordinated synchronously between state management agencies, people and businesses to achieve the highest efficiency in the implementation process.

On the other hand, the "Launch of emulation movements, constitutional to protect the environment" has about half of respondents agree. This is one of the activities to attract social resources and knowledge teams to contribute to the design of new and effective solutions that contribute to the overall success of the whole community; Besides, "Implementing a system to quickly and effectively receive and process people's opinions by many flexible and diversified methods" (47.5%) is also interested by many people. 1/2 of the respondents confirmed. For this solution to be really useful and effective, the government needs to research it to be convenient and easy to use for everyone.

3. Discussion and Conclusion

Based on the survey and analysis and assessment of the impact of the Policy on the urban population of Ho Chi Minh City on the current environmental protection activities from a sociological perspective, we can see the conclusion. The results are as follows:

The campaign has a direct and indirect impact on the awareness of the people and reflects the majority of city residents' interest in this campaign. Propaganda activities in localities have not been synchronous, effectiveness is not high, in some places are interested by local leaders but also in places that lack attention. Therefore, it is necessary to clearly define the responsibilities, obligations and rights of local leaders and specify the resources for implementation to deepen the campaign and form the "core" value in the standards of conduct people for environmental protection activities.

We see that the relationship between the local government and the people is not really closely linked with each other. The vast majority of people are interested in learning about the activities carried out by local authorities, only a part of the population lacks attention and a few are indifferent to the environmental protection work that local authorities has been and is being implemented; Currently, the change in the situation of people littering the streets has many positive changes. However, the government should consider new and more effective ways to stimulate the participation of the people.

The survey results show that the common standard values in the society appear as "people are not indifferent, indifferent to their own community", this will help change the poor habits of people and forming new standard values to help "bring the community together" in the context of the city's strong urbanization. However, in the urban residential community of the city also appears a part of the population with the attitude of "Indifferent, ignoring", showing a lack of faith in the values of common standards of the society, which are influenced and is negatively affected by the urban lifestyle, making the community more inclined to live a closed individualist life.

The campaign has promoted the participation of the whole political system in public mobilization to raise awareness, create good habits for people and communities to participate in contributing to reducing flooding. On the other hand, the campaign is like an impact wave, creeping into every corner of the urban life in the residential area and the campaign is the message to help spread good values to the people and also opportunities for people to express their personal views and practical reflections on the surrounding environment.

When propaganda and advocacy play a key role, it is necessary to have provisions of law to educate people to raise their awareness and responsibility towards the community and society on security activities environmental protection. In theory, the regulations on environmental protection activities have been clearly shown, but in practice there are still many shortcomings from these activities. Therefore, state management agencies need to organize regular and ad-hoc inspections to reorganize these activities.

Solutions calling for participation, wanting to promote the role of people, communities directly solving problems related to environmental protection combine technical solutions from local authorities to improve operational efficiency and towards sustainable development for the surrounding environment.

A STUDY ON THE ACTUAL COMPETITIVE CAPACITY OF THE SMALL AND MEDIUM TEXTILE AND GARMENT ENTERPRISES IN THE CENTRAL KEY ECONOMIC REGION

MA. Phan Thi Thanh Tam

thanhtamtc@tnut.edu.vn

Faculty of Econimics and Technology, Thai Nguyen University of Technology, Thai Nguyen University, Vietnam

Abstract

The Study evaluates the competitive capacity of the small and medium textile and garment enterprises in the Central Key Economic Region (CKER). The Study also proposes solutions for maintaining and improving competitive capacity of the those enterprises in CKER. The Study utilizes both quantitative and qualitative methods. The outcome is the successful development of the evaluation system of the actual competitive capacity of the small and medium textile and garment enterprises in CKER. Based on the outcome of the study, some factors have been proposed in order to enhance the competitive capacity of the small and medium textile and garment enterprises in CKER.

Keywords: *Competitive, Capacity, Textile and Garment, Central Region*

1. Introduction

The CKER including five provinces and cities under the central government: Thua Thien Hue, Da Nang, Quang Nam, Quang Ngai, and Binh Dinh has been oriented to become a dynamic region which creates jobs, improves the live and literacy of the people and, at the same time, makes a base for the development of the provinces in Cetral Coast Region and Tay Nguyen. In that orientation, the textile and garment industry is one of the key factors for the industrialization and modernization of the local areas. However, the textile and garment industry also have a strong international characteristic and is one of the industries that face increasingly strong competitiveness not only in Vietnam but also worldwide. The existence and development of these enterprises depend mostly on their competitive capacity which is a hot issue that attract attention of the company managers and the local authorities when it comes to enhancing the competitive capacities of Vietnam and local areas. Thus, the question is how to measure the competitive capacity of these enterprises and to find out the influential factors and propose solutions for sustainable competition. The Study is conducted in order to meet the goal of designing a evaluation system to assess the competitive capacity of the textile and garment enterprises that can be applied to the research region which is the CKER. The Study has formed a system of reasonable solutions to maintain and enhance the competitive capacity of the small and medium textile and garment companies in CKER.

Since the theories in economics were studied in a serious and systematic manner, competition has been viewed in a more academic way. Although studies on the competition in the economy in general and among the enterprises in particular have been conducted for quite a long time but the term competitive capacity and its relevant researches are still rather new. A lot of researchers believe that the studies on competitive capacity started as early as in the 70s and that they have only developed strongly since the 90s. Due to the outbreak in the 90s, the studies on competitive capacity have been quite abundant. Through those studies, we can sum up with some of the followings:

* *Levels of the studies on competitive capacity*

In the studies on competitive capacity, the definition of competitive capacity has been studied at three levels: National Level, Sectional Level, and Enterprise Level (and at product level)

At national level, you might encounter the definitions on national competitive capacity, evaluation criteria on national competitive capacity in the Report of the Committee of Industrial Competitiveness by the American president.

At sectional level, countless studies have been released on the Internet. Say for example, the studies by [2]

At enterprise level, you can found the studies by [4]; [3]; [1]

With its research purpose, the Study emphasizes on the competitive capacity at enterprise level.

By a blueprint theory on evaluating the competitive capacity and analyzing the factors affecting the competitive capacity of textile and garment companies, the Study needs to clarify the following matters:

+ the evaluation criteria equivalent to evaluation components: Competitive Outcome and the Competitive Potential that can be used to evaluate the competitive capacity of the enterprises in the study scope is a key economic region. Since the scope of evaluation is quite large, the evaluation criteria must not only reflect the competitive capacity as defined but also ensure the feasibility of the evaluation in reality.

+ The factors among the 6 groups of factors of the Diamond Model are considered to have real impact on competitive capacity of the enterprises in the study scope which is a key economic region. The quantitative importance of the factors are also determined.

2. Method

The Studied is conducted via a collective method: Combining quantitative and qualitative methods

+ Quantitative method: Studying the basic theory and expert interview

+ Qualitative method: using the method of statistics and description on Excel, index method, ANOVA analysis on Excel

3. Results

3.1. Evaluation on Competitive Capacity of the Small and Medium Textile and Garment Enterprises in the Central Key Economic Region

*Here, the competitive capacity of the small and medium ente*rprises is evaluated on two aspects: Competitive result and competitive potential With the competitive result, the evaluation criteria to evaluate competitive capacity consist of: Revenue growth speed, ROE, and average growth per labor (VA/L); on customer satisfaction which is evaluated via market share and on employee satisfaction which is evaluated via average income instead. On competitive potential, competitive capacity will be assessed via indexes of performance, unit labor cost (ULC), unit price and rate of inventory (in total assets) and unit price.

** Evaluation of Competitive Capacity of Small and Medium Enterprises against the Large ones in the CKER*

*** Evaluation of competitive capacity on the aspect of competitive result*

① On financial aspect

Average growth in revenue

Achieving a certain amount of revenue shows the effort of the enterprise on the two aspects: Persuading customers to buy a certain product with a preset price which both show the competitive efforts of the enterprise against its competitors. Expanding the revenue shows the success of the enterprise on those two aspects.

Since the limited data doesn't allow the evaluation of revenue growth of each enterprise, the average revenue will be determined using the following formula:

Average revenue = total revenue / total number of enterprises

Since an enterprise might operate more than one products, only revenue on textile and garment is considered. With the collected revenue, the revenue growth of the small and medium textile and garment enterprises is summarized in Table 1.1

Table 1.1: Average growth in revenue of the textile and garment enterprises in the CKER (based on enterprise's scale) in 2018-2020

Index	Year			Growth rate (%)	
	2018	2019	2020	2019 against 2018	2020 against 2019
Small and medium enterprises					
+ Number	67	63	108		
+ Revenue	118714	142703	477485.3		
+ Average revenue	1771.851	2265.127	4421.16	27.84	95.18
Large enterprises					
+ Number	26	36	40		
+ Revenue	2267672	2891951	7836888		
+ Average revenue	87218.15	80331.97	195922.2	-7.90	143.89

(Notes: The revenue is million Vietnamese Dongs)

(Source: The author used the resources of General Statistics Office of Vietnam)

Thus, as far as revenue is concerned, the average expansion in scale of the large enterprises in 2019 seemed to be less than that of the small and medium ones. However, in 2020, the large textile and garment enterprises made quite a change as they achieved much greater revenue growth compared to that of the small and medium ones.

Return on Equity (ROE)

The assets of enterprise sponsored by owner equity and debt. In 2019, the small enterprises used 111.589 billion Dongs equity for doing business. In 2020, this became 165.2826 billion Dongs While with a much larger scale, the large enterprises invested 661.377 billion Dongs of equity into business in 2020. And this capital of the large enterprises increased rapidly in 2020 which was 1426.863 billion Dongs. However, in both of these years, some of the enterprises had negative equity meaning that their business activities were completely funded by debt due to high ratio of loss in revenue for a long time.

In general, the large enterprises in 2019 and 2020 had better competitive capacity compared to the small ones as far as equity's profitability is concerned and this is shown in Table 1.2.

Table 1.2: ROE (%) of the textile and garment companies in the CKER

(Based on scale)

Some sorted statistic criteria	2019		2020	
	Small and medium companies	Large companies	Small and medium companies	Large companies
Average	-5.32	3.92	3.41	24.43
Minimum	-174.16	-86.76	-185.55	-93.99
Maximum	67.62	121.60	152.94	129.85

(Source: The author used the resources of General Statistics Office of Vietnam)

The above table was conducted based on the sorted data which excluded the spasmodic ones which made the difference in ROE between the enterprises too big. In particular, among the small and medium enterprises in 2019, two companies in Da Nang and Quang Ngai were excluded since their ROE were 848.68% and – 237.05% respectively. Similarly, among the large companies in 2019, the two large companies in Da Nang with ROE of -561.20 and 433.51 and one company in Quang Ngai with ROE of 70200 were not included in the Study. In 2020, one textile and garment in Da Nang was excluded since its ROE, which was -822.97%, was too low. Although some cases were removed, Table 1.2 shows that the enterprises from two groups have great variance when it comes to ROE and high heterogeneity

The Table shows that in 2019 the equity's profitability of the textile and garment enterprises was quite low with an average of -5.32%. Though most of the enterprises in this group have ROE greater than -5.32% (skewness = -2,53) and high concentration (kurtosis>0) , some of them still have extremely low ROE which makes the average ROE go down. Also in this year, the large enterprises had ROE ranging from -86.76% to 121.60%. Some of them had ROE smaller than the average which is 3.92% (skewness = 0,92) and high concentration (kurtosis = 8,10).

In 2020, ROE of both groups increased sharply, especially the large enterprises. With a variable from -185.55% to 310.44%, ROE of the small and medium companies falling around 3,41% , mostly under. Meanwhile with a range form -93.99% to 129.85%, the large enterprises reached a much greater average of ROE: A spasmodic increase of 24.43% due to increase in revenue and funding. However, most of the enterprises in this group have a ROE lower than the average (positive skewness) and a small concentration (positive kurtosis)

ANOVA analysis was used to verify the difference in average ROE between these groups. With a P-value of 0.201, assuming there is no real difference in average ROE between two groups in 2019. However, in 2020, P-value = 0,037 < 0,05 allows the conclusion that the factor of scale has impact on ROE or, in other words, the large textile enterprises has greater ROE compared to the small and medium ones with a mean of 0.05.

Value Added per Labor (VA/L)

With the statistics calculated in Table 1.3, average VA/L created in the large enterprises were greater than that of the small and medium enterprises and this was clearly shown in 2020. Thus, generally, the competitive capacity on value added creativeness of the large textile and garment companies is higher compared to that of the small ones and in CKER.

In particular, it can be seen that the index in the large enterprises has greater variability compared to that of the small and medium ones and the uniformity is also lower. The value of the variables shows that in 2019, most small and medium enterprises has VA/L smaller than 16.179 billion Dongs and less than 28.204 million Dongs in 2020. That also means that some of the enterprises in this group has extremely high VA/L which leaves strong impact on the avarege value. Meanwhile, most of the large companies had VA/L greater than 19.67 in 2019 and less than 41.729 million Dongs in 2020. Similar to the group of small and medium textile and garment enterprises, there were some in the large company group had VA/L much higher compared to others in the same groups.

Table 1.3: VA/L (million Dongs) of the textile and garment enterprises in the CKER.

(Based on scale)

Some sorted statistic criteria	**2019**		**2020**	
	Small and medium companies	**Large companies**	**Small and medium companies**	**Large companies**
Average	16.179	19.267	28.204	41.729
Minimum	-8.251	-41.897	-22.214	-43.963
Maximum	44.567	45.725	73.838	130.732

(Source: The author used the resources of General Statistics Office of Vietnam)

ANOVA analysis with a mean of 0.05, there is no characterized difference between average VA/L between the two groups of different sizes in 2019 (P-value = 0.213). However, this changed in 2020: P-value = 0.001 shows that the larges companies have greater VA/L than the small and medium ones. Thus, the large companies have greater competitive capacity compared to the small and medium enterprises in that aspect, with a mean of 0.05,

② On Customer Satisfaction

As mentioned earlier, based on the general expert interview and based on the real gathered data, the capacity to meet customer satisfaction of an enterprise is shown in the market share that it holds. A simplest way, considering the general demands for textile and garment products made in Vietnam (whether those demands come from Vietnam or internationally) to be met via revenue from selling those products, the market share, in its easiest way to calculate, is the total revenue of textile and garment product of Vietnam that the enterprise holds (Summarized in Table 1.4)

Table 1.4: Market share (‰) of the textile and garment companies in the CKER

(Based on scale)

Some sorted statistic criteria	2019		2020	
	Small and medium companies	Large companies	Small and medium companies	Large companies
Average	0.033	1.160	0.033	1.475
Minimum	0.001	0.064	0.000	0.067
Maximum	0.216	10.206	0.462	24.631

(Source: The author used the resources of General Statistics Office of Vietnam)

The statistics show the ability to gain market share of the large enterprises is much better than that of the small and medium enterprises not only in the scale but also in the ability to expand their market share. More detailed evaluations show that, in 2019, the market share of the small and medium enterprises in the region ranged from 0.001‰ to 0.216‰. Most of the enterprises in this group has a market share of less than 0.003‰ though some actually have a much better figure (skewness = 2,227). Many of them has the market share of approximately 0.003 ‰ (Kurtosis = 5,601). In 2020, the average market share of this enterprise group mostly stayed the same (approximately due to rounding) but the variability was great: from mostly 0‰ to 0.462‰. Most of the enterprises less than 0.033‰. The heterogeneity is also quite high.

Among the large enterprises, the variability of the market share was even greater, from 0,064‰ to 10,142‰ in 2019 and from 0,067‰ to 24,631‰ in 2020. The average market share was1.475‰ but most of the companies in this group had smaller market share that that average figure. And there are some enterprises that have greater market share compared to the rest (skewness = 3,245). High standard of derivation shows that the uniformity among the enterprises of this group is rather low.

However, the question is whether large scale really causes high competitive capacity as far as market share is concerned. The verified result shows that the scale has extremely strong impact on market share (in both two years, P-values are always greatly lower than 0.05) Thus, competitive capacity of the large enterprises is higher than that of small and medium ones when it comes to market share and this superiority has a mean of statistics with a mean of 0.05.

③ On Employee Satisfaction

The criterion used to evaluate the competitive capacity is the average income of workers in a year. The employee's income includes 1) salary and bonuses and 2) insurance. To ensure the accuracy in comparison, the enterprises which have too short time of operation in a year are eliminated. On that basis, the number of enterprises that are studied go lower.

Table 1.5: Average Income (million Dongs) of the Workers of the Enterprises in CKER (in scale)

Some sorted statistic criteria	2019		2020	
	Small and medium companies	Large companies	Small and medium companies	Large companies
Average	17.403	19.839	28.549	33.091
Minimum	10.000	11.690	4.342	13.832
Maximum	35.398	31.588	52.882	61.313

(Source: The author used the resources of General Statistics Office of Vietnam)

The garment industry requires a lot of labor. The most important factor to attract labor is income. On the the hand, the competitive result of a company is viewed in the eyes of the workers mainly through the income that they receive. Under this perspective, generally the large textile and garment enterprises have better competitive capacity than the small and medium one when the average income of the workers is distinctly greater. Table 1.5 shows that many small and medium textile and garment enterprises in 2019 had revenue lower that the average level (positive skewness) but the concentration is mostly that of average (kurtosis = 2,388). The low standard of deviation indicates high uniformity. In 2020 this criterion of the small and medium enterprises was distinct: Most of the enterprises had average income of worker greater than 28.549 million Dongs a year though there exist companies with pretty low income (negative skewness). However, the average income of worker among those enterprises are scattered compared to the average (negative kurtosis). Although there was great improvement but their competitive capacity is still lower that that of the large ones.

In 2019, most large textile and garment enterprises had average income of worker ranged from 11.69 million a year to the average which was 19.839 (positive skewness) and in 2020 many of them had average income of worker from 13.832 million a year to the average of 33.091 million a year but it is scattered compared to the average (negative kurtosis). The highest income of worker was 61.313 million a year.

Based on the ANOVA analyzed result, with P-value of 2019 and 2020 both lower than 0.05 (0.042 and 0.03), we can confirm that the large textile and garment enterprises have greater competitive capacity than that of the small and medium ones as far as the income of worker is concerned. And that's one of the reason why, in reality, the large enterprises find it easier to recruit workers compared to the small and medium enterprises.

The evaluation result of the competitive capacity of the textile and garment enterprises in CKER has been summarized in Figure 1.1. It can be easily seen that the line of competitive capacity of the small and medium enterprises falls within the line of the large ones. This means the superiority in the aspect of competitive result of the large enterprises in the region, especially in 2020.

*** Evaluation of competitive capacity on the aspect of competitive potential*

Competitive potential is evaluated based on performance, unit labor cost, ratio of inventory in total assets and unit price.

<u>Performance:</u>

As described in the analysis of average revenue, in order for the data not to vary too much, the newly operated enterprises and the ones whose data cannot be collected (1 small company in 2020), only 51/63 of the small and medium enterprises, 35/36 of large enterprises in 2019 and 91/108 small and medium enterprises are studied statistically.

Table 1.6: Profitability (million/worker) of the enterprises in CKER

Some sorted statistic criteria	2019		2020	
	Small and medium companies	Large companies	Small and medium companies	Large companies
Average	37.112	60.091	58.851	97.627
Minimum	5.192	11.553	5.036	20.470
Maximum	257.375	329.636	395.923	639.995

(Source: The author used the resources of General Statistics Office of Vietnam)

Table 1.6 shows that in 2019 many small and medium enterprises have performance lower than the average which is 27.112 million (with a high concentration around the average) but there are some enterprises with extremely high performance. However, that average performance is still much lower compared to that of the large enterprises. In this group of enterprises, the performance ranges from 11.555 million Dongs to 329.636 million DOngs and most of the enterprises have their productivity around the average level of 60.091 million Dongs. Among these, there are some enterprises that have extremely high productivity which affects the average performance of the group. In 2020, both of the groups had significant improvement in performance so the balance still remained unchanged. Some enterprises had had significant improvement in performance like 29/3 Textile and Garment Joint Stock Company had increased by 15% in 2020 compared to 2019.

The ANOVA analysis result shows that in 2019 the superiority of the large enterprises was not characterized. But that changed in 2020: With P-value = 0.017 < 0.05, it safe to day that there's difference in performance between the group of large companies and the group of the small and medium ones. In other words, the factor of scale affects the competitive capacity of the enterprises, as far as performance is concerned.

Unit Labor Cost

All garment enterprises who have statistics are put into analysis except for the ones with negative growth in net revenue. The elimination of these enterprises does not leave any effects on the comparison outcome. The result of analyzing ULC of the enterprises in the region is summarized in Table 1.7

Table 1.7: ULC (in Dongs) of the enterprises in CKER

(Based on scale)

Some sorted statistic criteria	2019		2020	
	Small and medium companies	Large companies	Small and medium companies	Large companies
Average	1.317	1.138	1.019	0.821
Minimum	0.453	0.575	0.455	0.326
Maximum	12.167	5.519	5.512	2.420

(Source: The author used the resources of General Statistics Office of Vietnam)

In 2019, the ULC of the small and medium enterprises changed from 0.453 to 12.167 Dongs and the uniformity was not high. Many enterprises in this group have ULC less than the average level which is 1.317 Dongs and a high concentration around this number but some have extremely high ULC compared to others (same skewness and kurtosis = 27.745). In that year, the competitive capacity of the large enterprises are higher appreciated since the ULCs of many enterprises in this group is smaller than the average which is 1.138. This average was affected by a few enterprises with outstanding ULC (same skewness).

In 2020 ULC of both of these groups fell but the large companies still showed better competitive capacity thanks to their efforts in effective use of labor. ULCs of the enterprises in this group fall around the average of 1.019 Dongs and the good thing is the number of enterprises with ULC less than 1.019 are quite many (same skewness) Meanwhile, average

ULC of the large enterprises is only 0.821. Some enterprises even had ULC less than the average level. The ULC concentration around the average level of the enterprises in this group is still high.

The analysis outcomes of the two years show that ULR of the large textile and garment enterprises is smaller than that of the small and medium ones but it doesn't have statistic mean with a mean of 0.05. Meaning to say that the factor of scale does not leave a strong impact on average ULC.

<u>Inventory Rate in Total Assets</u>

In the statistics and accounting figures of the enterprises include the inventory value including finished goods inventory, unfinished materials and products/work. Thus, the inventory rate in total assets reflect the effectiveness of various internal processes of the enterprises (incoming and outgoing logistics, management and production).

Table 1.8: Inventory Rate in Total Assets (%) of the Textile an Garment Enterprises in CKER. (based on scale)

Some sorted statistic criteria	2019		2020	
	Small and medium companies	Large companies	Small and medium companies	Large companies
Average	12.326	14.456	13.125	17.034
Minimum	0.000	0.000	0.000	0.000
Maximum	72.756	46.643	75.385	55.881

(Source: The author used the resources of General Statistics Office of Vietnam)

Table 1.8 shows that although there's a great variability, the small and medium textile and garment enterprises still have lower inventory rate compared to that of the large ones. However, the uniformity between the enterprises is low. In 2019, most of the small and medium enterprises have the inventory rate less than the average level which is 12.326% but there are some with the inventory rate accounting for 3/4 of the total assets making the average quite high. In 2020, since the product consumption of the enterprises in this group faced more difficulties thus the average inventory rate rose quite a bit.

The large enterprises have greater inventory rate comparing with the small and medium ones. The average inventory level was also influenced by only a few enterprises with an extremely high inventory compared to others. However, the analysis result shows that the factor of scale does not affect the average inventory rate with a mean of 0.05. Although the calculated result shows that, in general, the small and medium enterprises have better competitive capacity compared to the large ones, as far as inventory rate is concerned, this difference does not have any meaning for statistics.

Unit cost

As mentioned above, to ensure the comparability when the enterprises do business on many different products, the unit cost is an estimate: The number of Dongs to make a Dong of value added. The statistics of unit cost of the textile and garment companies in the CKER is summarized in Table 1.9

Table 1.9: Unit Cost (Dongs) of the Enterprises in the CKER (in scale)

Some sorted statistic criteria	2019		2020	
	Small and medium companies	Large companies	Small and medium companies	Large companies
Average	2.711	2.711	2.167	2.148
Minimum	0.448	0.847	0.530	0.791
Maximum	14.818	9.001	15.195	7.991

(Source: The author used the resources of General Statistics Office of Vietnam)

Not taking into account the one with negative value (one large enterprise in 2019 and 3 small and medium enterprises and 2 large enterprises in 2020), the calculated figures show that there's no significant difference in average unit cost. However, among the small and medium enterprises, many of them have unit cost higher than the average level in comparison with the large ones (skewness is much higher). The evaluated result also shows that there is no real difference in average unit cost between the two groups of enterprises. The positive side here is the average unit cost of both groups has the tendency to decrease which shows their efforts in cutting costs.

Generally, based on the average value of the evaluation evaluation, the large textile and garment enterprises have higher competitive potential compared to the small and medium ones. The large enterprises seem to show their weaknesses in consuming products and material inventory.

3.2. Some Solutions in order to Improve Competitive Capacity of the Small and Medium Enterprises in CKER.

By studying actual competitive capacity of the small and medium textile and garment enterprises in CKER, the author proposes some solutions to improve competitive capacity of these enterprises as follows:

** Solutions from local textile and garment enterprises*

*** Market diversification and product diversification*

in 2019 and 2020 the Indian textile and garment industry had significant advancement since, in addition to America, EU, Japan which are targeted by most of the textile and garment exporting countries, it had turned to Russia which brought it a high exporting value. Returning to the CKER, many enterprises are lucky enough to achieve good revenue growth with positive ROE since they not only look for new exporting markets like Korea, Cuba, East Europe, South America, Middle East, and so on but also take good care of the domestic market. Obviously, the right decision related to the market is also a solution for enhancing their competitive capacity. Besides, providing the market with suitable products is a way to enhance that competitive capacity.

** the large enterprises focus on the domestic market:

With the domestic market, the large enterprises might apply OBM and ODM methods. They can provide their own branded products to the customers who tend to use Vietnamese products and care about the standard or value of the products.

** The small and medium enterprises who tend to export their products:

With this group of enterprises, the ability to invest on brand and material storage is not that good due to limitation on resources. And the best solution for them is OEM and/or CMT methods.

** The small and medium enterprises who focus on the domestic market:

These enterprises can follow the model of the large enterprises: Making their own branded products (ODM) to attract the customers with low income who choose a more economical products. Besides, they can become the OEMs and CMTs of the domestic textile and garment enterprises. They actually prefer to be OEMs and CMTs.

*** Performance improvement and cost reduction*

With the unpromising predictions on the world's economy in the coming years, the customers in the major markets like EU, America, and Japan seem to tight their budget on many products, including clothing.

** Deduction of lead time

Lead time is the required period from order receival and product delivery. This requirement is increasingly important since the textile and garment industry tends to be associated with the fashion trend.

4. Discussion and Conclusion

In recent years, the development of economy and society in the CKER has always played an important role in the development of the Central Coast Region. The function of the region still remains in the future. In that development, the textile and garment has always held an important role in many local areas. Thus, the competitive capacity of the textile and garment enterprises is not only a hot issue to the enterprises themselves but to the local management. For all of the above-mentioned content, we can summarize some findings of the study as follow:

** The Result of the Study*

+ Choosing a set of criteria to evaluate the competitive capacity and the factors affecting the competitive capacity of the textile and garment which is applicable and suitable with the research scope which is the CKER based on the fundamental opinions of some of the managers of some specific textile and garment enterprises, the governmental officials in the industry and some of the researchers on garment and textile as well as consultation with the authorities on the feasibility of collecting actual data.

+ Proposing approximate evaluation of the actual competitive capacity of the textile and garment enterprises on different aspects with the methods: Based on the characteristic data of different groups of enterprises with distinct features; showing the difference in competitive capacity between the textile and garment enterprises of different scales, different economic sectors and in reference with the similar enterprises in the South Key Economic Region and North Key Economic Region (3 fundamental factors affecting the competitive capacity of the textile and garment enterprises in the CKER). That difference has been verified in a simple way by using ANOVA analysis

LIVELIHOOD DEVELOPMENT OF HANOI SUBURBANITES IN THE PROCESS OF URBANIZATION

Prof. Dr. Ngo Thang Loi
ngothangloiktpt@gmail.com
National Economics University, Hanoi, Vietnam
MA. Nguyen Cong Nam
namnc.vids@mpi.gov.vn
Institute for Development Strategies, Ministry of Planning and Investment, Vietnam

Abstract

The process of urbanization has created a strong impact on the socio-economic development in the peri-urban/suburban (or the edge of the city boundary) areas. Mass agricultural land conversion for urbanization, industries and services purposes have caused noticeable changes in the livelihood of peri-urban residents (or suburbanites). This paper discusses relevant theories in the literature and presents evidence which reflects the updated experienced reality of the livelihood development in the Hanoi's suburbs. This paper presents an original attempt to contribute to providing scientific explanation of the city peri-urban residents' livelihood development as well as proposes some policy recommendations for their livelihood development in the future[14].

Keywords: *Livelihood model, Sustainable development, Urbanization and efficiency*

1. Introduction

In the 2011-2020 period, Hanoi's urbanization process has been rapid in terms of both population and urban land. According to the Hanoi authority for Planning and Investment, Hanoi's population will reach about 11 million by 2045. In addition, the municipal governments have converted approximately 30% inefficient rice cultivation land for non-agricultural purposes (Nguyen Manh Quyen et al. 2019). The rate of urban population raise quickly: 3 from 36.8% in 1999 to 41% in 2009 and 49.2% in 2019 (Hanoi Statistical Office, 2019). The capital's population is expected to increase by about 200,000 people each year, equivalent to a large suburban district (Chau Anh, 2019). Meanwhile, the agricultural land area has been reduced by tens of thousands hectares because of urbanization and non-agricultural development purposes. In this process, tens of thousands labours have lost their agricultural-based jobs and have been seeking non- agriculture work to make ends meet. However, in recent times, this issue has not been adequately studied that practical solutions which can (1) improve the peri-urban people's livelihood development, (2) contributes to effective economic growth in the peri-urban landscape and (3) enhances their

[14] The use of "peri-urban area" and "suburban area", and the use of "peri-urban residents" and "suburbanites" is interchangeable in this article

incomes and standards of living. In this context, this paper provides additional and updated information about livelihoods of peri-urban people in Hanoi.

The article is structured as follows. The second section summarizes the research methods used. The third section provides a comprehensive analysis of the impact of urbanization on suburbanites' livelihood. This section starts with a brief overview of literature related to livelihood and livelihood model of suburbanites before describing the contemporary state and trend of urbanization in Hanoi and its impact on Hanoian suburbanites' livelihoods. Section four recaps the research findings of the paper and some concluding remarks are given in the conclusion.

2. Methods

To get an insight into actual livelihood experienced by peri-urban residents, the approach was simulated from theoretical livelihoods models to aggregate a comprehensive money-earning behaviors by different economic activity sectors. This is done via the Analysis of production efficiency which involves a close look at revenue and costs. Base on the collected data, the general method of production efficiency is used to calculate the livelihood model of Hanoi suburbanites. In addition, policy analysis is conducted and tabulated in table 6 to table 13.

Besides, two qualitative methods were used to highlight specific characteristics that might be omitted from the model which are field survey and expert interview. For field survey: surveys related to livelihood models in the Hanoi' peri-urban areas were conducted in the following fields: co-operative, farms models such as model of growing vegetables and medicinal herbs in Van Duc commune, Gia Lam suburban districts, Khai Thai growing vegetables need water in Phu Xuyen, Hoa Viên Modern Farm growing organic and fruits in Thach That, Thanh Xuan cooperative growing vegetables in Soc Son suburban district, Ba Vi clean food Corporation raises Oc Que pigs and chickens, a model of afforestation and raising honey bees in Ba Vi.

For expert interview, the authors consulted experts who are knowledgeable about the livelihoods of peri-urban people to evaluate the comments and suggestions.

3. Results

3.1. Main theoretical issues about the livelihoods of peri-urban residents

a) Awareness of the livelihoods of the suburbanites in the big city

Livelihood can be understood to consist of "assets capacity, approach (storage, resources, ownership, right-of-use asset) and activities necessary for life. (Chambers, 1983). Nguyen Minh Tien et al defined livelihood as a way of making of living, a process of earning a living and subsistence. It is a combination of use of resources and life-sustaining activities". (Nguyen Minh Tien, 2018). The authors argued that a sustainable livelihood is the ability to continuously maintain or enhance current standards of living without causing damage to natural resources.” (Nguyen Minh Tien, 2018)

The definition above indicates the concern for environment as the source of making a living. Other researchers have also proposed similar definitions of sustainable livelihoods. For example, Hanstad et al. (2004) specifically stated that: “A livelihood is sustainable in case of able response and recovery from effects, or can promote capabilities and assets both now and in the future without destroying the natural resources foundation”.

Koos Neefjes was in agreement with views above. He also believed that a livelihood must depend on capability and wealth (both assets capacity and social resources) and activities are all necessary to making a living. The livelihood of each person or a family is sustainable if they are able to response and recovery from stress and trauma, it has maintenance or enhances residents abilities and possessions in the future without damaging to environmental resources”. (Neefjes, 2000).

In summary, the general consensus on the definition of “livelihood” suggests some characteristics as follows:

- The resident's livelihood is understood as a methods and means of making a living or economic activities to seek jobs and earn money by themselves. Livelihood is always associated with specific situation and specific group of residents. Each individual or a group of inhabitants could have the same livelihood. The development of technological level, the capacity of the local governments, as well as the living circumstances can all equally have effects on resident’s life.

- Livelihood exists in a group of people, not just each individual. Therefore, livelihoods relates to a residential community and local governments.

- Livelihoods is also not constant but changes over time. However, it needs to develop relatively steadily in the period of time.

b) Awareness of suburban prevailing livelihood models in the big city

- Livelihood model can be defined as model of the method of making a living which is allowed by law (having legal status) or accepted by society that each individual or a group of residents use their capital to do economic activities to increase their income, improve standards of living and contributing to local prosperity. Scientists and policy makers use the term “Livelihood model” to reflect the universality of making a living in the research process. Livelihood models are connected with business activities and it is determined by resident’s commitment and investment capital.

- In essence, livelihood model refers to the model of making a living suitable with local context with primary aim to improve the inhabitant’s living standard and contributing to the socio-economic development in the peri-urban areas. Sustainability is necessary for developing the livelihood model. A livelihood model is not time-invariant, but its content and essence exist for a long time relatively. On the other hand, the livelihood model is also the solution to socio-economic development of the residential community or a group of particular residents in the edge of city.

- It is necessary to clearly identify two important aspects: resilience and stability when discussing the development of livelihood model. Resilience refers to the quality that the livelihood model has effectiveness and efficiency in the long-term. Whereas, stability is understood that the livelihood model has effective and promoting relatively stable development, with minimal. Together they indicate that development effectiveness of the livelihood model remained unchanged fairly in a long time, not only improving income for residents who make a living but also contributing to the society and community, as well as supporting the sustainable socio-economic development in the peri-urban area and entire Hanoi city. Sustainability is both development targets and requirement of the livelihood model development.

- Evaluating the results and effectiveness of the livelihood model development in suburban areas is vital. It is necessary to measure the size of the livelihood model by labour, capital-labour ratio, average income per person, the profit margin ratio.... Moreover, the public disclosure of assessment results is also important.

3.2. The contemporary state and trends of urbanization in Hanoi

a) Urbanization

Average urban population increase to 4.15%/year, rate of urbanization in 2030 is about 65 - 68% (Hanoi Statistical Office, 2019). This is a relatively high level of urbanization because the average population grows about 7.2%/year. Hanoi People's Committee has approved a plan to transform Hoai Duc, Dong Anh, Thanh Tri and Dan Phuong rural districts into urban districts by 2025 (Xuan Long, 2019). By that time, rural areas - in terms of both land area and number of districts - will be much narrower than it is today. In comparison, Hanoi’s urbanization rate is higher than the national average and faster than that of some centrally run cities (Table 1)

Table 1: Urbanization rate of some centrally run cities devided into two periods of 5 years

Unit: %

Comparative objects	The period 2011-2015	The period 2016-2019
1.The national average	3,15	2,29
2. Hanoi	6,10	2,31
3. Ho Chi Minh city	1,85	1,65
4. Hai Phong	1,10	0,71
5. Da Nang	3,10	2,01

Source: Hanoi Statistical Office, Yearbook 2019

The number of Hanoi's urban households and citizens increased rapidly. The high urbanization rate and the quick raise of the population and large amount of households lead to sharply effect the suburban Hanoi' s socio-economic development as well as the livelihood development of this area.

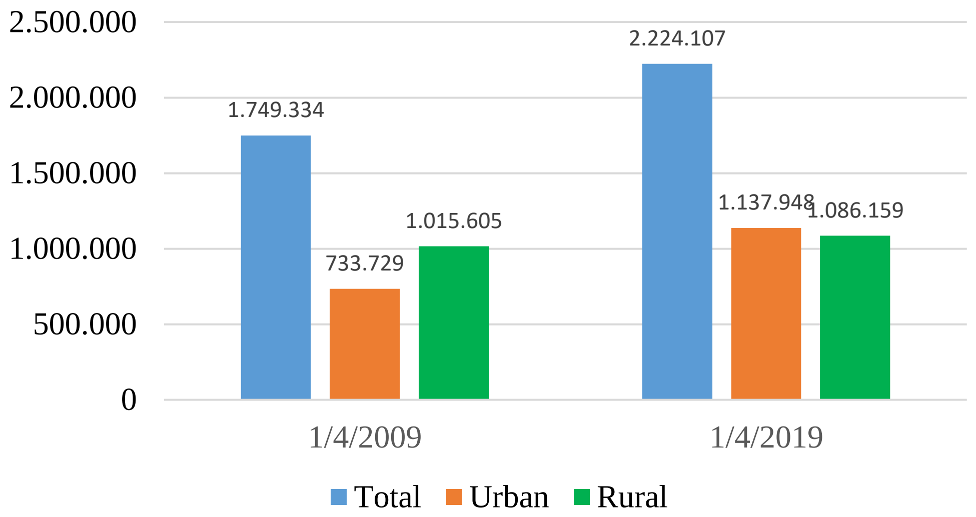
Table 2: The population density in Hanoi were compared to 4 centrally run cities

Unit: person/km²

	The population density in Hanoi	The population density in HCM city	The population density in Can Thơ	The population density in Hai Phong	The population density in Đa Nang
2010	1.962	3.530	854	1.221	722
2015	2.171	3.888	886	1.285	800
2019	2.410	4.385	859	1.302	841

Source: General Statistics office Yearbook 2015 and 2019

Figure 1: The number of households in Hanoi in the 2009 and 2019 Population and Housing Census by urban and rural areas



Source: Hanoi Statistical Office (2009, 2019)

The process of Hanoi's urbanization has been rapid, however the urbanization process has revealed some shortcomings. The most obvious being that the industry contribution shared in GRDP of the whole city is a limited level. Furthermore, high - tech industries is still not enough, even too few.

Table 3: Some indicators of Hanoi's population and GRDP

Indicator	Unit	2010	2015	2019	The average annual growth rate
1. Population	In thousand person	6.630	7.433,6	8.094	2,34
Urban population	In thousand person	2.784	3.650,5	4.000,3	4,15
% of total population	%	*42,0*	*49,1*	*49,4*	
Divide by:					
- Natural growth rate of population	In thousand person	6.576	7.242	7.531	1,145
- Net migration rate	In thousand person	54	148	563	9,5
2. Gross regional domestic product at constant 2010 prices	billions dong	351.571	497.473	660.900	7,2
Gross regional domestic product at current prices	billions dong	513.294	672.949	958.436	-
Gross regional domestic product per capita at current prices- Vietnam currency	million dong	77,4	91,6	118,4	-
Gross regional domestic product per capita at current prices)- Foreign currency (at average exchange rate)	USD	3.980	3.948	5,110	-
3. The industry ratios	%	18,9	20,79	22,77	-
Of which:					
The ratio of manufacturing	%	10,12	13,14	14,01	-

Source: Hanoi Statistical Office, 2015 and 2019

The figures indicates that that livelihood development of Hanoian suburbanites has not benefited significantly from rapid urbanization. The proportion of manufacturing grow slightly (see statistics in the table above); Therefore, high - tech industries has not been applied prevalence.

b) Trends of urbanization impacts on the livelihood of Hanoi suburbanite

In the 2010-2020 period, the process of urbanization in Hanoi city took place rapidly. Especially, after the neighbouring province of Ha Tay was merged into Hanoi, the process of urbanization took place vigorously and altered the socio-economic status of both the inner and the edge of city. According to incomplete statistics, more than 1 million immigrants arrived in Hanoi in 2019. Approximately 65-70 thousand immigrants in the North of Vietnam found jobs in the Hanoi's urban economy in 2019 (Nguyen Manh Quyen et al. 2019). This immigration trend has led to increasing competition for peri-urban residents to find jobs in the inner city. At the same time, the farm land decreased about 7225 hectares to non-agricultural purposes (Chu Phu My et al. 2019) . The agricultural land areas which has been recovered but not used is much larger than that.

Table 4. Some indicators of urbanization in Hanoi and the effect on livelihood development in suburbs

Year	Population (in thousand person)	Urban population (in thousand person)	The ratio of urban population (%)	Urban population growth (%)	Unemployment rate in suburb (%)	The decreased farmland areas, hectares[15]
2010	6617,9	2816,5	42,5	2,4	2,4	-
2011	6779,3	2880,6	42,5	2,3	1,14	629
2012	6957,3	2958,1	42,5	2,7	1,29	425
2013	7128,3	3024,6	42,4	2,2	2,18	632
2014	7265,6	3573,7	49,2	1,8	1,36	670
2015	7390,9	3629,5	49,1	1,6	0,99	780
2016	7522,6	3699,5	49,2	1,9	1,97	895
2017	7661,0	3770,0	49,2	1,9	1,92	898
2018	7852,6	3874,3	49,3	2,8	1,89	994
2019	8094,1	4000,3	49,4	4,15	1,88	1.299

Source: Hanoi Statistical Office. Yearbook 2019.

In 5 years (2016-2020), approximately 10 thousand hectares agricultural land was transferred to non-agricultural purposes. Average farmland areas decreases by around thousand hectares each year. Thus by rough calculation, if an average of one hectare cultivated land demand 4 labours, approximately 10,000 workers will become unemployed due to the loss of agricultural land. These are the group of labours that urgently need new jobs.

Generally, the social labor structure has a slight improvement in recent years, however it does not commensurate with the strengths and requirements of increasing labor productivity in order to rapid growth and sustainable economic development.

[15] *Compiled data from suburban districts*

Table 5: The labor structure in Hanoi by economic sector and by urban and rural areas

Unit: %

Years	Total (Thous. Persons)	Of which			Of which	
		Agriculture, forestry and fishing	Industry and construction	Service	Urban	Rural
2015	3868	19,7	26,8	53,5	44,7	55,3
2016	3900	17,4	29,0	53,6	45,0	55,0
2017	3927	16,6	30,2	53,2	44,1	55,9
2018	3987	14,2	30,9	54,9	43,8	56,2
2019	4049	12,1	32,1	55,8	44,5	55,5

3.3. Summary of the results and effectiveness of the livelihood model development in the Hanoi's suburb area

a) Hanoi People's Committee has paid attention to the development of livelihood's inhabitants and expressed their will illustrates the socio-economic development policies in the peri-urban area

The fact that, diverse spontaneously livelihood models has existed in different sectors in the peri-urban areas of Hanoi city. However, there has not been any particular models of livelihood defined in the peri-urban area, therefore there are no suitable policies for each livelihood model. The author attempted to synthesize different type of business activities in table 6 to table 13:

Table 6. The livelihood models development policies applied in the suburban Hanoi

Orientation and policies of livelihood development	The sustainable livelihood model of cultivation sector	The sustainable livelihood model of livestock sector	The sustainable livelihood model of forestry sector	The sustainable livelihood model of handicraft industry sector	The sustainable livelihood model of commerce sector	The sustainable livelihood model of tourism sector
1. The advantages	- Combine with new rural construction - Associated with organic agriculture	- Combine with new rural construction - Supportive the application of	- Combine with new rural construction - A policy of allocating forest lands to households and	- Combine with new rural construction - Building industrial clusters to attract	- Combine with new rural construction - Developing rural markets and	- Combine with new rural construction -Upgrading and renovating monuments,

	and high-tech	antimicrobial coating	sustainable forest development	investment and developing craft villages	wholesale markets	restoring festivals
2.The disadvantages	In general, it is not specific, or not synchronous (if any)	Local governments have not determined a specific brand names	The governments have not had supportive policies for afforestation and forestry on livelihoods	The city's government has not suitable guide and attraction policies	- Local governments have not had supportive policies for wholesale markets	- Local governments have not had priority credit policies; connecting with the travel agencies

Source: author's survey and suburban districts and commune official's data

In recent years, Hanoi People's Committee has promulgated manifold policies to develop the livelihood model in the suburbs and contributed to certain effect of the results. Nevertheless, it can be said that the policies are not attractive and effective enough to foster resident's livelihoods in the suburban areas.

b) In general, the each production and business activities has a proper livelihood model and lead to positive results

- In term of the cultivation sector

The losing land due to a massive farmland conversion for urbanization, industrialisation, service development ... motivated to seeking of the inhabitant's livelihood. However, the size of the livelihood model has a small-scale at households and co-operative economics.

Table 7. The livelihood models of cultivation sector

Model	The development	The challenges and difficulties encountered
The households and co-operative economics grow organic agriculture	- Growing organic farming (rice cultivation, vegetables, fruits, grapefruit, oranges, guava - Planting flowers in combination with sightseeing tours on a small - scale and spontaneity. There is no successful sustainable livelihood model. - Traditional production method (rice, potatoes ...)	- Basically unorganized. - The large corporations invest in high-tech agricultural development diffidently because of land accumulation. - There is a lack of advanced producing. - It is difficult to sell products due to having no advertising and obvious brand name of the products
Farms and households apply hi-tech agricultural producing	- Ecological farming associated with experience tourism. - In general, it is still small-scale and spontaneously.	- The households lack both funds and detailed information production, lack of an advanced producing; do not

	- Some households apply high technologies in producing (cucumber, tomatoes, grapefruit,..)	closely connected with the travel agencies
The households grow flowers, fruits combined with experience tourism	There are varied households production linked together in Thanh Tri, Chuong My, Gia Lam districts	-The production has not organized into diverse linked chains. - Lack of production orientation and incentive policies

Source: author's survey

- *In term of the livestock sector*

In the Hanoi's suburbs, apart from the livelihood model of dairy farming in Ba Vi and Gia Lam, there is only the production model of pig raising with small-scale slaughter, also mainly spontaneous and low effectiveness. Pig raising is not a high value-added activity so economic efficiency is also limited.

Table 8. The livelihood models of livestock sector

Model	The development	The challenges and difficulties encountered
The producing of co-operatives, farms, households associated with modern production facilities	- Underdeveloped. -The slaughters have not been closely connected with livestock facilities.	- Not organized, lack of the local governments' orientations and low effective management. - The large corporations have not participated production yet; - Lack of geographical indication, traceability and obvious product's brand name lead to sell goods hardly
The production of farms, households associated with slaughter facilities	- Growing spontaneously in several places. - Food safety is not ensured. - The production process has environmental pollution and urgent issues	Lacked the difficulties of state management and without eligible solutions could be methodical organization
Aquatic plant farm	Grew aquatic plant by household in some districts and achieved certain success	However, absence of food safety certification; geographical indication, traceability and obvious product's brand name

Source: author's survey

- *In term of the tourism sector*

Hanoi People's Committee, the district's People's Committee have paid attention to promoting tourism in the edge of city, however, tourism is also spontaneous and ineffective due to numerous issues. Tourism development depends on the travel agencies in the inner city. Suburbanites cannot do it by themselves.

Table 9. Livelihood models of tourism sector

Typical model	Available advantages	The developments
Homestay model is initial associated with craft villages and ecological zones	Human resources availability and the household's facilities	Master plan and support of local government will take shape clusters if this model continues grow
Tourism development model related to agro-ecological zones, ecological farming and experience tourism.	In the suburban area, there are several the agro-ecological zones, ecological forestry where attract traveller with ecotourism and experience tourism.	- Spontaneous development by household or travel agencies companies (For instance, Chimi Farm grow flowers or strawberry garden in the Red River's Stone Garden). Travel companies have not had specific plans to attract visitors - This model can develop vigorously but it is guided and organized by local governments.
Development model of cultural and religious tourism	There are lots of monuments, traditional festivals and cultures (for examples, ceremonial/festival song, a singing party at the songstress house, traditional operetta, modern theatre ...) and pagodas, village communal houses in the suburbs.	- The development model is spontaneous associated with available relics (pagodas, village communal houses, revolutionary war monuments ...) - Relics and tourism activities is not organized and linked together

Source: author's survey

- In term of the Industrial and handicraft industry

It can be said that all government levels has been concentrated on this sector. Hanoi People's Committee has planned 38 industrial zones with a total land area approximately 3776 hectares in the edge of city (Nguyen Manh Quyen et al. 2019). Hanoi Export Processing and Industrial Zones Authority is directly responsible for the efficient running of this industrial zones.

In addition, Hanoi People's Committee also has planned 70 industrial clusters with a total area of around 1400 hectares in the suburban area (Nguyen Minh, 2020). Nevertheless, due to the lack of specific orientation and insufficient guidance, the livelihood models of industrial and handicraft industry grew properly. Inhabitants mainly invested by themselves. The industrial clusters and craft villages model were took notice but residents are still perplexed, so the result of this model has not gotten desired results yet.

Table 10. Livelihood models of industrial and handicraft industry

Model	The development	The challenges and difficulties encountered
Industrial clusters	- By 2019, there are 106 industrial clusters operating in 17 suburban districts, 3864 operating enterprises, creating jobs for roughly 70 thousand workers, contributing to the state budget approximately 1,100 billion VND / year in the edge of city. (Nguyen Minh, 2020)	The master plan has changes, especially in terms of location and orientation priority. Scarcity of investment capital for infrastructure construction projects, absence of orientation information of industrial clusters to attractive companies
Small industry	- There are 261 planned small industrial (in the area of 386 communes) (Doan Mai Huong et al. 2020) but they has not desired effectiveness yet because there are no necessary supportive policies.	Due to absence of supportive policies, so it has not attracted high-values corporation yet.
Craft village	In the suburban area, there are roughly 1350 handicraft (of which approximately 300 traditional craft villages) (Chu Phu My et al. 2019). About 5 craft villages linked together in order to tourism development but their results are not desired effectiveness.	- Lack of geographical indications, communication, linking with travel agencies and obvious product's brand name. - Producing areas are too cramped and causing environmental pollution, thus they are necessity to move out of residential areas
Limited liability company	- Focus on producing stainless steel accessories for making all kinds of door hinges, gates of houses;… - Focus on producing shoes, wooden products, etc. Some associations were established however their activities are low effectiveness	Just small- scale production. Absence of special policies to encouraging business activities in rural areas.
Household's handicraft	Main handicraft products to serve villager life, for instants: making hats, fans, children's toys, making joss paper, producing vermicelli, etc.	Not enough information for producers. Craft production is key. The quality of the production is still low

Source: author's survey

- *In term of the commercial sector*

There is more than 4 million people in the peri-urban area (account for more than 50% of the city's population) (Hanoi Statistical Office, 2019). Although the total of suburbanite's income takes up approximately 70% the city average but if roughly 60% of that money is for consumption - it is quite huge. It means that the demand of exchangeable goods is massive. The livelihood model of commercial development is extremely necessary in the peri-urban area, but recently, it just has been mainly spontaneous.

Table 11. Livelihood models of the commercial sector

Model	The development	The challenges and difficulties encountered
Limited liability company	Little development. There are around 110 companies which have low *productivity* and efficiency in the suburban area.	Lack of investment capital, market information, absence of the local government's development orientation in the locality.
Rural market	There are 454 markets in the city, of which 15 class 1; 59 class 2; 329 class 3. The development of rural markets achieved certain effective, however there are still several problems.	Necessity for long-term orientation, in general, the commune officials have not had proper organization. In many places, the market was built but its activity is little or no.
Households	There are 386 business households in communes or along inter-suburban district and inter-communal roads. This model is quite popular in peri-urban areas, but its small funds and limited efficiency.	- Absence of necessary information, product's brand name. the communication is limited. - Lack of skilled and qualified labor

Source: author's survey

- *In term of the forestry sector*

In the edge of Hanoi city, forest area is small, only approximately 23 thousand hectares that located in mountainous Ba Vi, Soc Son and Son Tay town. Residents were guided how to grow sustainable forestry. Base on forest land allocation, individual households manage their areas and grow new forests where necessary.

Table 12. Livelihood models of the forestry sector

Model	Developments	Limitations and difficulties encountered
Forest households	- The silvicultural households grow forests for environmental protection and sustainable management. - Raising honey bees - Growing medicinal plants	Lack of funds and local government's specific orientation for forest trees.

Source: author's survey

According to the survey of authors and the calculations of official suburban districts, the author initially summarizes the results and the effectiveness of the livelihood model development in the Hanoi's peri-urban areas. Livelihood models of the industrial and handicraft industry, the commercial and the livestock sector are needed a massive funds, however their revenues received are also higher than other livelihood models.

Table 13. Results of livelihood model development in the Hanoi's peri-urban area

Indicator	Unit	Sustainable livelihood model of cultivation sector	Sustainable livelihood model livestock sector	Sustainable livelihood model of forestry sector	Sustainable livelihood models of industrial and handicra ft industry	Sustainable livelihood model of commercial sector	Sustainable livelihood model of tourism sector[16]
1. Average income per capital (per month)	million dong	51,9	62,3	41,2	86,9	75,8	63,1
2. Productivity of employed	million dong	68,4	82,8	54,7	115,6	100,8	83,9
3. The capital-to-labor ratio	million dong	90,9	89,2	58,1	134,5	95,6	77,8
4. The profit margin ratio	%	6,0	6,3	2,7	8,7	12,1	8,8
5. The number of jobs from sustainable livelihood model	In thousan d person	521,4	224,5	12,8	202,0	160,2	39,8
6. The ratio of state budget payment to revenue	%	-	1,5	-	10,8	11,2	2,3

Note: Average income per capital and Productivity of employed at constant 2010 prices

[16] Tourism statistics was calculated in 2019 before happening the Covid -19 pandemic

Source: Calculation from authors' survey and refer to project: Research and building sustainable livelihood model related to the process of urbanization and climate change in the Hanoi rural, 2020 .

In the suburbs, the average labor productivity of the livelihood models is quite low, only around 40% of the average level city. Thus, it can be said that residents' livelihoods are not high-paying jobs in peri-urban areas. It is necessary to focus on this issue in the coming years.

4. Discussion and Conclusion

4.1. Discussion

a). How does rapid Hanoi's urbanization affect the making a living in the peri-urban people areas. Previous studies illustrated several issues to livelihood development of Hanoian suburbanites, nevertheless inhabitant's livelihood has not reach of effectiveness as expected. Livelihood is related to high-paying jobs. All government levels is perplexed, this problem needs to be studied carefully and methodically. How to promote positive impacts and minimize negative effects of rapid urbanization.

b) What should the Hanoi's government do to enhance the making a living in the peri-urban residents areas. Although, Hanoi People's Committee and People's Committees of suburban districts direct their attention to the creation or development of feasible livelihood models, the results are not expected success. In fact that all government levels from the city to the suburban districts, communes play a great role in the inhabitant's livelihood development.

c). It is necessary to find out the reasons of the success and limitations to give suitable solutions that develop greatest livelihoods in the Hanoi's peri-urban people areas.

d). Sustainable and high-income livelihood development could be feasibily solved, nevertheless the effort from both People's Committees (at all levels) and suburbanites together is required to take action expeditiously and effectively in the whole Hanoi city.

4.2. The reasons of the success and the limitations of livelihood model development

a) The reasons of the success of livelihood model development

- The process of urbanization in Hanoi takes place rapidly, so the government officials from city to district level are aware of changes in livelihood for the inhabitant's suburbs. The Hanoi's government has paid attention to livelihood development for the peri-urban people area and promulgated initially supportive policies. The municipal governments are aware of vital livelihood and has promulgated great deal initial decisions implementation such as Hanoi People's Committee published Decision No. 2952/QD-UBND dated June 15, 2018, on the establishment of Phu Yen industrial and craft village cluster in Gie Ha Village, Phu Yen Commune, Phu Xuyen suburban district; or it has recently released the plan No. 99/KH-UBND dated April 12, 2021 on the development of rural careers in Hanoi in 2021. In recent years, the city government has issued multiple decisions on the enhancement of craft villages, industrial clusters, industrial zones as well as the growing organic agricultural products policies associated with experience ecological tourism

- Hanoian suburbanites also have experienced with various lessons spending of compensation by the state and investors because they used to be bankrupt and fell into struggling and sought jobs in the inner city, however the result is not the same as desired. Therefore, they have given much thought to livelihood development in their own homeland.

b) The reasons of the limitations

- A large number of farmers have to change their jobs because of agricultural land that has been converted to urbanization, non-agricultural development purposes and infrastructure construction projects. Therefore, seeking livelihood of peri-urban residents are happening at a relatively massive scale. In fact Hanoi People's Committee has not promulgated master plan for the whole peri-urban area promptly, established a production specialization area so peri-urban residents still face many difficulties.

- Due to the lack of information and lack of awareness about occupation changes, several peri-urban residents used the compensation to indulge in dissipation and became bankrupt, severely hinder their effort to improve livelihoods. Due to absence of a specific skill level, suburbanites could not seek jobs in the peri-urban areas and it is also difficult for them to look for occupations in the inner city. If any, there are simple unskilled employments such as porters, housework, etc with unsteady income or insurance.

- Hanoi People's Committee has not had a practical plan yet as well as sufficient supportive policies that lead to low efficiency of new livelihoods. More specifically, residents are not really interested in investment capital policies because it is just a small funds, required cumbersome and time-consuming process.

4.3. Conclusions

(1) The process of rapid Hanoi's urbanization will be happening fast in the future and greatly affects *the* equitable *development of livelihoods* in the edge of city. A huge number of agricultural workers who lost their land - the means of production need new occupations otherwise they are easy unemployed. The livelihood diversification is an *urgent request* in the Hanoi's suburbs. Making a living of the agricultural sector will have a strong attachment to high-tech agriculture, combine ecological agricultural with ecotourism and experience tourism. Livelihoods of the industrial sector also is required multifarious production and scientifically organized.

(2). Being the fact that sustainable development livelihood models must be associated with clean production and business without polluting the environment. However, the application of science and technological advances is still difficult for companies, co-operative economics and households due to limited funds. All government levels should provide both technical and investment capital as well as accompany in the production and business process.

(3). Making a living and livelihood model development are extremely necessary in the suburban Hanoi. Nevertheless, an effective and sustainable livelihood model development requires innovative approaches which differ from methods in recent years. First of all, all official government levels need determination, particular programs, obvious master plans to guide the inhabitant's production. It is necessary for the city government, the district and commune government to promulgate the special policies to supporting resident's livelihood development. Policies focus on particular business activities and individual people in different circumstances. There should be no general policies, absence of quantitative analysis

Abstract

Socio-economic development of a locality is influenced by many factors, in which land management, especially land use planning is the leading factor and strongly affects all aspects of the economic and social development. To see that impact clearly, a study from 2019 - 2020 in Pho Yen town, Thai Nguyen province used sociological survey method to survey 3 regions of the town with different land users. The research results show that: The level of influence of land use planning on the process of Urbanization and industrialization and the process of infrastructure development is the highest, with the evaluation results reaching the index 3.68 – 4.02 in all 3 regions. Social development indicators such as People's income and living standards, Increasing employment opportunities and Reducing poverty rate are influenced by land use planning at a moderate level. From these evaluation results, it is necessary to have solutions to strengthen land use planning, especially to develop highly feasible plans to better support the process of socio-economic development.

Keywords: *Influence of planning, Socio-economic indicators, Land use planning, Pho Yen*

1. Introduction

Pho Yen town was formed from Pho Yen district of Thai Nguyen province according to Resolution No. 932/NQ-UBTVQH13 dated May 15, 2015 of the National Assembly Standing Committee and was recognized as a grade III city under Decision No. 530/QD-BXD dated June 17, 2019 of the Ministry of Construction.

Pho Yen is a town in Thai Nguyen province, 26 km south of Thai Nguyen city and 55 km north of Hanoi capital. It is one of the gateways of Hanoi capital to the northeastern provinces of Vietnam. The total area of the town is 25,888.69 ha, including 4 wards and 14 communes. Total population in 2019 is 197,088 people.

Since the town's establishment up to now, the economic growth rate and social innovation have made strong development steps. Total production value from 579.1 trillion VND in 2015 to 886.0 trillion VND in 2019. The economic growth rate of the town in the period 2015 - 2019 is very high, from 26.7% in 2015 to 35.2% in 2019.

Socio-economic development is influenced by many factors. External factors are the status and trends of socio-economic development of countries not only in the region but also in the world. The internal factors include: The country's strategic development orientation, the development plan for each year and period, domestic resources, general management policies and sectors.... In which, the activities of land management are considered to be very important. Land management directly affects the socio-economic development of Pho Yen, in which land use planning is the leading factor and has a strong impact on all aspects of economy and society.

To see that impact clearly, a study from 2019 - 2020 used the sociological survey method to survey 3 regions of the town with different land users. The research results will be a database to help policy makers come up with optimal solutions for the socio-economic development of Pho Yen.

2. Method

2.1. Expert surveys and sociological surveys

2.1.1. Survey of experts

- The topic surveyed the opinions of 31 experts, including 21 managers from the town level, departments of the town, People's Committees of communes and wards and 10 scientists on environmental resource management, economic management.

- Survey method: Direct interview according to predefined questions with survey content: Comment on socio-economic development criteria. By giving points in the questionnaire. Survey of experts on the assessment of socio-economic development of the town, as follows:

Rating: 1: Very little important; 2: Less important; 3: Relatively important; 4: Important; 5: Very important

No	**In your opinion, to evaluate the socio-economic development of the town, which of the following criteria are used?**	**Rating level**				
		1	**2**	**3**	**4**	**5**
1	Urbanization and industrialization					
2	Infrastructure development					
3	Attract investment					
4	Formation and development of the real estate market					
5	People's income and standard of living					
6	Increase job opportunities					
7	Reduce poverty rate					
8	Exercising equal rights					

2.1.2. Sociological Investigation

- The basis for selecting the survey sample:

- Criteria for selecting survey households/organizations are classified into 3 regions as follows:

+ Region 1 (Central region): This place has the economic, cultural and political centers of the town. In this region, the economy develops strongly and stably. Region 1 includes 4 wards, choosing 3 wards are Ba Hang, Bai Bong and Dong Tien.

+ Region 2 (sub-central area): is the development planning area. Currently, this place is developing at a moderate rate. According to the planning, this is the area with many key investment projects to develop the economic zone of Pho Yen. This area consists mainly of communes located in Diem Thuy and Sam Sung industrial zones. Select 3 communes: Hong Tien, Trung Thanh and Tien Phong.

+ Region 3 (Suburban area): is an area of socio-economic development in the direction of agriculture and ecology. This region selects 3 communes: Thanh Cong, Tan Phu and Phuc Thuan.

- Number of survey samples:

+ Each commune and ward selects 3 typical villages/groups representing the locality, the total number of households/organizations of 27 villages/groups of 9 communes/wards is 1,350 households/organization.

+ Number of survey samples: According to Slovin (1960; cited by Vo Thi Thanh Loc, 2010), the sample size is determined according to the following formula:

$$n = \frac{N}{1 + N.e^2}$$

Inside:

n: Survey sample capacity

N: Total number of households/organizations located in the survey area; n: number of representative households/organizations

e: 95% confidence level (Tolerable error, usually 0.05)

Applying Slovin's formula, from the number of 1,350 households of 27 villages/organizations of 9 communes and wards, the total number of samples to be investigated is 308,5714. Rounded up is 309 samples – 309 questionnaires.

On the basis of the number of samples to be surveyed as determined above, 103 households/organizations were selected for each region by the stratified random sampling method. Each region surveyed 6 economic organizations, 6 other organizations and 91 individual households.

The content of the questionnaire is as follows:

What is the impact of land use planning on socio-economic development of Pho Yen town?

Rating: 1: Totally disagree; 2: Disagree; 3: Can agree or disagree; 4: Agree; 5: Totally agree

Do you agree with the questions below?	**Rating level**				
	1	**2**	**3**	**4**	**5**
1. Is the land use planning an important basis?					
2. Is the land use plan built in the spirit of democracy?					
3. Is the construction land use planning valid?					
4. Are the land use planning and land use plans realistic?					
5. Is the land use planning done according to the annual plan?					
6. Has the land use plan been adjusted appropriately over time?					
7. Are the order and procedures for land use planning well conducted?					
8. Is the performance of land use planning at a good level?					

2.2. Methods of data processing and evaluation of research results

- The research data is processed with mathematical statistics on the software: SPSS and Excel.

- Using SPSS software in analyzing sociological survey data of Hoang Trong and Chu Nguyen Mong Ngoc (2007). Specifically, the application of IBM SPSS Statistics 20 software for analyzing sociological survey data. Applied to analysis of survey data from 309 questionnaires according to Likert scale to evaluate research results (Do Anh Tai, 2008).

- Rate according to 5-level Likert scale:

1: Totally disagree/very small/very low;

2: Disagree/small/low;

3: Confused/average;

4: Agree/big/high;

5: Totally agree/very large/very high.

- From the Likert scale, the specific rating hierarchy for 5 levels is as follows:

1.00 - 1.79: Very low

1.80 - 2.59: Low

2.60 - 3.39: Average/Medium

3.40 - 4.19: High

4.20 - 5.00: Very high.

3. Results

3.1. Evaluation of socio-economic development indicators of Pho Yen town

From the results of in-depth interviews with experts who are managers and scientists together with discussions to come to conclusions about socio-economic development indicators that are influenced by land management in Pho Yen town.

The data (Table 01) shows that there are 8 main indicators affected. The rating level is from high to very high, 3.39 – 4.39. In which, 6 indicators are highly evaluated, reaching the index 4.23 - 4.39. The other two indicators, namely the formation and development of the real estate market and the exercise of equal rights, are only rated at a medium to high level, 3.39 -3.48.

Thus, there are 6 important criteria selected for evaluation in Pho Yen town: Urbanization and industrialization, infrastructure development, investment attraction, income and living standards of the people, increase employment opportunities and reduce poverty.

Table 01: Summary of expert assessment results on socio-economic development indicators influenced by land management in Pho Yen town

No	Content of Land Management	Assessment	Standard Deviation
1	Urbanization and industrialization	4.36	0.80
2	Infrastructure development	4.39	0.62
3	Attract investment	4.32	0.70
4	Formation and development of the real estate market	3.48	0.68
5	People's income and standard of living	4.23	0.56
6	Increase job opportunities	4.29	0.64
7	Reduce poverty rate	4.23	0.56
8	Exercising equal rights	3.39	0.67

On the basis of expert survey results, the study conducted 309 questionnaires to assess socio-economic development indicators of Pho Yen town. The evaluation results in Table 02 show that:

- In the three contents of each socio-economic development indicator, it is generally assessed with an index from 3.38 to 4.14, reaching the average to high level.

- There are 5 socio-economic development indicators that are highly appreciated, reaching index 3.62 – 4.14. The poverty rate reduction target only reached an average of 3.38, but the index is in the upper bound of the average.

In summary, all six socio-economic development indicators of Pho Yen town are good performance aspects since the town's establishment until now.

Table 02: Evaluation of socio-economic development indicators of Pho Yen town

No	Indicators of socio-economic development	Assessment	Standard Deviation
1	**Urbanization and Industrialization (Overall Average)**	**4.14**	**0.46**
1.1	The process of urbanization and industrialization is concerned	4.16	0.60
1.2	The order and procedures for implementing the process of urbanization and industrialization are appropriate	4.13	0.58
1.3	Good results of the process of urbanization and industrialization	4.15	0.61
2	**Infrastructure Development (Overall Average)**	**4.12**	**0.44**
2.1	Infrastructure development is an important task	4.16	0.59
2.2	The order and procedures for implementing appropriate infrastructure development	4.12	0.58
2.3	Good infrastructure development performance results	4.07	0.58
3	**Attracting investment capital (Overall average)**	**3.74**	**0.39**
3.1	Attracting investment capital for development is an important task	3.81	0.59
3.2	Order and procedures for attracting investment capital for appropriate development	3.76	0.57
3.3	Good performance in attracting investment capital for development	3.65	0.59
4	**People's income and standard of living (General average)**	**3.86**	**0.46**
4.1	Developing people's income and living standards is important	3.80	0.64
4.2	The order and procedures for increasing income and living standards of the people are appropriate	3.89	0.62
4.3	The results of the implementation of increasing people's income and living standards are good	3.90	0.62
5	**Increased job opportunities (Overall Average)**	**3.62**	**0.38**
5.1	Increasing job opportunities is an important policy for social development	3.59	0.55
5.2	The order and procedures of implementation increase suitable job opportunities	3.63	0.59
5.3	The results of the implementation of the policy of increasing good job opportunities	3.63	0.55
6	**Reducing poverty rate (Overall average)**	**3.38**	**0.51**
6.1	Reducing the poverty rate in the society is of concern	3.37	0.56
6.2	The order and procedures for implementing poverty reduction are appropriate	3.38	0.58
6.3	Good results of poverty reduction	3.38	0.59

3.2. Evaluation of the implementation of land use planning in Pho Yen town

The data on the implementation of land use planning in Pho Yen town with 8 contents in Table 03 shows that:

- All 8 contents of the land use planning of Pho Yen town are highly appreciated, at 3.44 - 4.00 and the average index is 3.68.

- Out of 8 items rated at high level, content 8 is that the land use plan is feasible but the index is only 3.44, which is a high level but the lower limit of the high rating.

In summary, in general, the implementation of land use planning in Pho Yen town is quite good and there are many innovations in this work. This evaluation result is also consistent with the study of Vu Thi Kim Hao et al. (2020).

Table 03: Evaluation of the implementation of land use planning in Pho Yen town

No	Evaluate content	Assessment	Standard Deviation
1	The land use plan is built on a full basis	3.48	0.71
2	The land use plan is built in the spirit of democracy	3.64	0.65
3	The land use master plan and land use plan are realistic	3.63	0.66
4	The land use plan is made according to the annual plan	3.82	0.58
5	The land use plan is adjusted appropriately over time	4.00	0.56
6	The order and procedures for land use planning are well conducted	3.87	0.53
7	The performance of land use planning is at a good level	3.57	0.69
8	The land use plan is feasible	3.44	0.77
	Overall Average	**3.68**	**0.33**

3.3. The influence of land use planning on socio-economic development of Pho Yen town

To evaluate the influence of land use planning on socio-economic development of Pho Yen town, IBM SPSS Statistics 20 software supported the analysis of 309 questionnaires in 3 regions with 4 land users. The analysis results are aggregated by 3 regions and by 4 land users.

3.3.1. Evaluate by region

The results of assessing the impact of land use planning on socio-economic development of Pho Yen town in Table 04 show that:

Table 04: Impact of land use planning on socio-economic development of Pho Yen town by region

No	Indicators of socio-economic development	Region 1		Region 2		Region 3	
		Assessment	Standard Deviation	Assessment	Standard Deviation	Assessment	Standard Deviation
1	Urbanization and industrialization	4.02	0.30	3.94	0.24	3.87	0.27
2	Infrastructure development	3.82	0.31	3.76	0.32	3.68	0.28
3	Attract investment	3.41	0.50	3.36	0.49	3.30	0.46
4	People's income and standard of living	3.33	0.40	3.35	0.40	3.32	0.40
5	Increase job opportunities	3.33	0.38	3.32	0.37	3.29	0.36
6	Reduce poverty rate	3.38	0.36	3.38	0.35	3.37	0.35

- Land use planning affects 6 socio-economic development indicators in all 3 regions with an index from 3.32 to 4.02, an average to high rating.

- In region 1, there are 3 indicators of urbanization and industrialization, infrastructure development and investment attraction, reaching a high level, the index is from 3.41 to 4.02. While the other three indicators are income and living standards of the people, increase in employment opportunities and reduce the poverty rate, they are only assessed at an average level, reaching the index of 3.33 - 3.38.

- In region 2, there are 2 indicators, namely urbanization and industrialization and infrastructure development, reaching a high level, the index is from 3.76 to 3.94. While the other four indicators are attracting investment capital, income and living standards of the people, increasing employment opportunities and reducing the poverty rate, they are only assessed at an average level, reaching the index of 3.32 - 3.38.

- In region 3, there are only 2 indicators of urbanization and industrialization and infrastructure development reaching a high level, the index is from 3.68 to 3.87. While the other four indicators are attracting investment capital, income and living standards of the people, increasing employment opportunities and reducing poverty rate, they are only assessed at an average level, reaching the index of 3.30 - 3.37.

In summary: From a detailed assessment of the contents of land use planning that affect the socio-economic development of Pho Yen town by region, the topic is summarized and ranked in Table 05 for each region:

- The degree of influence of land use planning on the process of urbanization and industrialization and the development of infrastructure is the strongest, followed by quite strong on the attraction of investment capital. .

- Socio-economic development indicators such as income and living standards of the people, increase of employment opportunities and reduction of poverty rate are affected to an average extent by land use planning.

- The degree of influence of land use planning on socio-economic development of Pho Yen town also decreases gradually from region 1 to region 2 and 3.

Table 05: Ranking of the influence of land use planning on socio-economic development of Pho Yen town by region

No	Indicators of socio-economic development	Region 1	Region 2	Region 3
1	Urbanization and industrialization	H	H	H
2	Infrastructure development	H	H	H
3	Attract investment	H	M	M
4	People's income and standard of living	M	M	M
5	Increase job opportunities	M	M	M
6	Reduce poverty rate	M	M	M

Note: H: high; M: medium

3.3.2. Assessment by land users

In addition to assessing the influence of land use planning on socio-economic development of Pho Yen town according to 3 regions, the study also assesses by land users.

Summary data on the influence of land use planning on socio-economic development of Pho Yen town by land users in Table 06 gives comments:

- All 4 land users show that land use planning affects 6 socio-economic development indicators with the index from 3.22 to 4.22, the assessment is medium to high and very high.

- All 4 land users show that land use planning strongly influences 2 socio-economic development indicators, namely Urbanization and industrialization and Infrastructure development with the index from 3.57 to 4.22.

- Land use planning has an average influence on 3 indicators of attracting investment capital, income and living standards of the people and increasing employment opportunities in all 4 land users.

Table 06: Impact of land use planning on socio-economic development of Pho Yen town by land users

No	Indicators of socio-economic development	Agricultural household		Non-agricultural households		Economic organizations		Other organizations	
		Assess-ment	Standard Deviation	Assess-ment	Standard Deviation	Assess-ment	Standard Deviation	Assess-ment	Standard Deviation
1	Urbanization and industrialization	3.90	0.27	3.93	0.25	4.22	0.20	4.22	0.29
2	Infrastructure development	3.77	0.29	3.57	0.29	3.85	0.29	4.01	0.37
3	Attract investment	3.32	0.29	3.34	0.51	3.38	0.18	3.85	0.23
4	People's income and standard of living	3.34	0.41	3.32	0.42	3.26	0.29	3.28	0.20
5	Increase job opportunities	3.32	0.39	3.33	0.36	3.22	0.17	3.27	0.20
6	Reduce poverty rate	3.38	0.37	3.40	0.36	3.33	0.24	3.38	0.17

In summary: From detailed analysis of the influence of land use planning on socio-economic development of Pho Yen town by each land user, the topic is summarized and ranked in Table 07:

- The degree of influence of land use planning on the process of urbanization and industrialization and the development of infrastructure is the strongest, followed by quite strong on the attraction of investment capital.

- Socio-economic development indicators such as income and living standards of the people, increase of employment opportunities and reduction of poverty rate are affected to an average extent by land use planning.

Table 07: Ranking of the influence of land use planning on socio-economic development of Pho Yen town by land users

No	Indicators of socio-economic development	Agricul-tural household	Non-agricultural households	Economic organi-zations	Other organi-zations
1	Urbanization and industrialization	H	H	H	VH
2	Infrastructure development	H	H	H	H
3	Attract investment	M	M	M	H
4	People's income and standard of living	M	M	M	M
5	Increase job opportunities	M	M	M	M
6	Reduce poverty rate	M	H	M	M

Note: VH: very high; H: high; M: medium

4. Discussion and Conclusion

- The results of an expert survey on socio-economic development indicators influenced by land management in Pho Yen town have concluded that there are 6 important indicators, which are: Urbanization and industrialization. industrialization; infrastructure development; attract investment; income and living standards of the people; increase employment opportunities and reduce poverty. These are also the main and key socio-economic development development indicators that the State has included in the current national development strategy. Of these six indicators, the first three are about economic development and the last three are about the development of social stability.

- Evaluating the implementation of land use planning in Pho Yen town, the conclusion was drawn: All 8 contents of land use planning in Pho Yen town are highly appreciated, at 3.44 – 4.00 and the overall average is 3.68. Out of the 8 items rated at a high level, the Land Use Plan is feasible but the index is only 3.44, which is a high level but the lower limit of the high rating. This shows that the land use planning, especially the planning, still has many aspects, requiring solutions to overcome. However, in general, the implementation of land use planning in Pho Yen town is quite good and there are many innovations in this work.

- The influence of land use planning on 6 socio-economic development indicators of Pho Yen town:

+ The degree of influence of land use planning on the process of urbanization and industrialization and the process of infrastructure development is the strongest, followed by quite strong on the attraction of investment capital , with the evaluation results reaching the index of 3.68 - 4.02 in all 3 regions. The results of this assessment clearly show that in the process of urbanization and industrialization and the development of infrastructure of a locality, a feasible land use plan is required. That will accelerate the progress of local development.

+ Socio-economic development indicators such as People's income and living standards, Increasing employment opportunities and Reducing poverty rate are influenced by land use planning at an average level. This assessment result is also consistent with reality, which is in land management, land allocation, land lease, and issuance of land use right certificates; Land acquisition, compensation, support and resettlement are the factors that strongly influence the above indicators.

+ The degree of influence of land use planning on socio-economic development of Pho Yen town also decreases gradually from region 1 to region 2 and 3. This is also easy to explain because region 1 is the central area, is the area with the economic, cultural and political centers of the town. In this region, the economy develops strongly and stably.

Regions 2 and 3 are both far from the center, especially region 3, which is a suburb, an area of socio-economic development in the direction of agriculture and ecology.

\+ The influence of land use planning on socio-economic development of Pho Yen town according to land users: All 4 land users show that land use planning affects 6 indicators of socio-economic development with the index from 3.22 to 4.22, the assessment is medium to high and very high. All four land users show that land use planning has a strong influence on two socio-economic development indicators, namely Urbanization and industrialization and Infrastructure development with the same index. 3.57 – 4.22.

From the above evaluation results, it is necessary to have solutions to strengthen land use planning, especially to develop highly feasible plans. This will well support the socio-economic development of a locality.

DEVELOPING MODEL OF TECHNOLOGICAL SCIENTIFIC INTERMEDIARY NETWORK OF VIETNAMESE SCIENCE AND TECHNOLOGY MARKET

Assoc. Prof. Dr. Vu Minh Duc
ducvmneu@gmail.com

Faculty of Marketing, National Economics University, Hanoi, Vietnam

Abstract

This paper studies the current state of technology science intermediary network and propose a model of science and technology inermediary network for Vietnam. By using in-depth interviewing with managers in the system of state management agencies in science and technology, science and technology intermediaries, the research results pointed that a network of science and technology intermediaries has not existing in the science and technlogy market of Vietnam really. The network model of science and technology market could be proposed with the basic elements including the node point and the core point, the connection circuit between the nodal points of the network of science and technology intermediaries.

Keywords: *connection, collaboration and support, science and technology intermediaries, science and technology intermediary network*

1. Introduction

A network is a structure made up of nodes that are linked together by circuits. From that approach, it can be understood that an intermediate organizational network is a structure created by interrelated intermediate organizational nodes. The mediation network structure provides an opportunity for organizations to act as a science and technology intermediary (STI) by bridging structural gaps in the network or connecting different network communities (A. Caloffi, F. Rossi and M. Russo, 2015). Thus, the intermediate network must meet two basic requirements: bridging and connecting between science and technology intermediaries. A good middleman network helps intermediaries not only perform the pure “informants” and “broker” functions, but also perform other important functions such as facilitating relationships between firms by identifying potential partners for innovation projects (Shohert and Prevezer, 1996); information flow coordination (Lynn et al., 1996; Russo and Whitford, 2009) supports innovation processes by helping to encapsulate transferred technology (Watkins and Horley, 1986), selecting suppliers technology components (Watkins and Horley, 1986), adapting technology solutions available on the market according to the needs of the business (Stankiewicz, 1995) and storage operations, possibly offers solutions that incorporate new ideas from existing ideas (Hargadon and Sutton, 1997).

According to Doan X. H. et al (2020), a network of science and technology intermediaries is formed based on the relationships between science and technology intermediaries and the supply and demand sides of the science and technology market (STM) and the relationship between those science and technology intermediaries. In terms of functions, there are 3 groups of science and technology intermediaries, including: the connection mediation group, the cooperation and support intermediary group, and the science and technology service intermediary group.

(1) The connection intermediary group has two main function that are "gatekeeper" and "broker". First, this function is expressed through following activities: Connecting patent suppliers, seekers and stakeholders; building bridges for technology start-up and investment groups; building networks to overcome limitations in technology transfer activities; carry out communication activities and coordinate physical and social resources. Second, meet the need wich is done by: Providing opportunities to find partners; providing resources and participating in projects; providing supporting information and services.

(2) Collaborative and support intermediary group is to perform functions including: (i) Connection and information processing: Integrating knowledge from stakeholders; direct transfer of expert knowledge; research mobilization of universities; (ii) Commercialization: Support marketing, sales and sponsorship activities; commercialization of technologies; (iii) Forecasts and diagnostics: Orientation of social research according to the needs of the industry; provides an interactive model for technology transfer and reception; (iv) Screening and processing information

(3) Scientific and technological service intermediary group provides services on intellectual property, training, testing and evaluation, rules and arbitration.

The formation and development of science and technology intermediary organizations (STIO) of STM (hereinafter referred to as science and technology intermediaries (STI)) is one of the issues that the Government pays attention to and directs. In a short time, science and technology intermediary organizations have been formed, with types such as traditional organizations such as hi-tech parks, software parks, hi-tech agricultural zones, and technology incubators, technology exchanges, supply-demand matching events, business promotion organizations, innovation centers, co-working spaces. According to the regulations and guidance by Circular No. 16/2014/TT-BKHCN of the MOST, science and technology intermediaries have been established and operating in other fields and localities.

In fact, due to many reasons, the number of intermediaries operating professionally is not much. Some STIs were formed in a hurry. On the contrary, the establishment of new science and technology intermediaries faces many obstacles because of the procedures' inconsistency. However, science and technology intermediaries, service organizations in the market (brokerage organizations, consultancy, assessment, evaluation, valuation, testing, verification...) are not operating properly. As results, a lot of science and technology intermediaries has not confirmed the role of connecting, providing services ... to promote the development of the STM. The lack of quantity and weak quality of intermediaries are obstacles to connecting science and technology intermediaries to develop science and technology intermediary networks (STIN) of STMs. Besides, the regulations on the formation and operation conditions of STIs are not clear, so the implementation is not easy. In addition, the inconsistent and unified system of policies are also major barriers and obstacles.

In order to be able to apply breakthrough policy and management solutions to promote the development of STIN of STM, it is necessary to establish a network model of science and technology intermediaries of STM. The objectives of this paper are as follows: (1) assess the current state of the STIN of the STM in Vietnam, (2) propose a network model of STIs of the Vietnamese STM.

2. Method

The data needed for this study include both secondary data and primary data. Secondary data on the number, location, operational capacity,... of science and technology intermediaries is collected from reports and documents of management agencies at all levels, including mainly from the MOST and the Department of Science and Technology of some provinces/ cities. Articles and studies on domestic and foreign intermediary networks related to the subject's research have also been gathered, classified and edited for research purposes of the topic.

Primary data on assessment of the intermediary network of STM is collected through qualitative research by the technique of in-depth interviews with managers in the system of state management agencies in science and technology, science and technology intermediaries in the following industries: fisheries, food/beverage, wood processing, textiles, pharmaceutical chemistry, road construction, building materials and electrical power (solar power, wind power), science and technology experts and science and technology business administrators in related industries. In-depth interviews in each group aimed at the following objectives: First, identify the current network of intermediaries of the Vietnamese science and technology market; second, evaluate the limitations of the current network of intermediaries; third, propose a model of an intermediary organization network of the science and technology market in the near future

In-depth interviews were conducted at the headquarters of selected organizations and businesses in a convenient manner. Specifically, during the period from February 2020 to

June 2020, 56 in-depth interviews were conducted at organizations and enterprises in the North, Central and South of Vietnam. After finishing interview, the in-depth interview tapes are converted to a text format combined with the transcripts during the interview to be used for data editing prior to analysis.

The analysis of secondary data were done by using traditional methods such as statistics, synthesis and inference. Primary data were analyzed with the help of Nvivo11 software.

3. Results

3.1. Current number and structure of science and technology intermediaries

According to statistics of the Ministry of Science and Technology (MOST) updated to December 31, 2018, there are 10 technology exchanges and 1 copyright exchange, 3 technology transaction centers, and 67 technology transfer promotion and support center, 12 intellectual property valuation assistance companies, 10 incubators and business incubators in the whole country. The National Innovation Center was established also in 2019. This center is under the Ministry of Planning and Investment to support and develop a start-up ecosystem, innovate, and contribute to the renewal of the growth model on the basis of science and technology development. In the two years 2019 and 2020, a number of new intermediaries were established and put into operation. In addition to the types of intermediaries mentioned above, it is possible to list some types of intermediaries that exist in the STM, including: science and technology consulting enterprises; organization of standards, measurement and quality; science and technology organizations (in higher education institutions); science and technology enterprises; financial institutions and funds; industry associations (Le T. Th. et al., 2020). According to this approach, the number of science and technology intermediaries by 2019 will reach 1927 organizaions[17]. In the scope of this report, types of intermediaries are listed and classified according to the specific provisions of Circular 16 of the MOST.

Regarding technology exchanges, the country has 16 online and offline technology exchanges (MOST, 2020), Pham X. Ph. (2020). In addition, Thai Binh, Lai Chau, Nam Dinh, Ha Tinh, Quang Nam and Binh Duong are building electronic trading floors and technology exchange. Most technology exchanges are operating as non-business scientific and technological units, with autonomy and self-responsibility under the Departments of Science and Technology, partly covered by the State to maintain regular activity. The main activities of exchanges include: consulting and transferring technology, information technology and organizing events on science and technology. In addition to technology exchanges in the state sector, a number of non-public exchanges have also been established such as the OTC

[17] Incomplete statistics due to lack of data on events (techmart) device markets and regulators on science and technology

Idea Floor of the Business Solution Consulting Joint Stock Company, HCM City and the Copyright Exchange of Vietnam Record Book Center- Vietkings, HCM city. According to Tran V. T. (2018), in spite of achievement in developing the system of science and technology intermediaries, but science and technology intermediaries have not really shown its core role.

Regarding technology transaction centers, all 3 centers in operation are state-owned centers, of which 1 center is under the MOST, 1 center is under the Department of Information and Communication (DIC) Hanoi and 1 center under the DIC of Da Nang. However, both the centers in Hanoi and Da Nang are information and communication technology transaction centers.

Currently, in term of quantity, the centers for promoting and supporting technology transfer activities is largest. There are 67 centers of this type established and operating under different agencies, organizations and in different localities. In which, nearly half of centers are located in Hanoi, 18 centers are under ministries, 16 centers are under DST of provinces, 25 centers are under research institutes, universities and colleges. In addition, there are 8 centers in the non-state sector, including 3 centers belonging to industry associations, 4 centers privately owned and 1 center of a joint stock company.

In fact, the research and technology transfer center has been established and is active in science and technology research institutes, universities, colleges, and science and technology enterprises. For example, Center for Research and Technology Transfer under Vietnam Academy of Science and Technology, ... Up to now, there are no official studies on the number and operation of centers under this group. However, based on the results of the centers' performance in the past time, it can be said that the activities of these centers are limited to serving the technology transfer request of the organization to which it belongs.

Regarding the intellectual property valuation support center, there are 12 organizations that support the valuation of intellectual property, which are price appraisal companies out of a total of 298 companies are operating in the field of appraisal of prices in Vietnam (Ministry of Finance, 2020). All of these organizations are non-state companies, existing as independent companies, operating in the field of valuation, only engaged in providing intellectual property valuation services.

Regarding technology incubators and science and technology business incubators, according to the incomplete statistics of the MOST and Le Nguyen. D. Kh. research (2015), the number of nurseries and establishments Science and technology business incubation in Vietnam is quite modest, concentrating mainly in Hanoi and HCM City.

Some of technology business incubators and nurseries were formed quite early as the Hi-Tech Agricultural Enterprise Incubation Center in Ho Chi Minh (HCM) City in 2002 and FPT - Bach Khoa Business Incubator in 2004. However, the majority of technology business incubators and incubators that were established in 2006 and up to now, are in the early stages of development. Some nurseries have been operating effectively such as Phu Tho Technology Business Incubator (HCM City University of Technology), Hoa Lac Hi-Tech Enterprise Incubation Center.

In term of geographic location, science and technology intermediaries are concentrated mainly in two big cities, Hanoi and HCM. Specifically, nearly half of the centers for promoting and supporting technology transfer are located in Hanoi and more than 10% are located in the HCM city. Two-thirds of technology transaction centers are located in Hanoi. Most technology business incubators and intellectual property valuation support organizations are located in Hanoi and HCM. These two cities are also the two largest and most powerful science and technology centers in Vietnam today. With a high degree of concentration in the two cities of intermediaries, detecting and identifying nodes and circuits in the network of STIs presents certain difficulties. This situation poses challenges to the strategy of building and developing an intermediary network in the future.

In terms of ownership of science and technology intermediaries, it can be seen that the presence of non-state intermediaries is still very modest. Specifically, 100% of the intellectual property valuation support organizations are non-state companies, and more than 10% of technology transfer promotion and support centers are non-state organizations. All technology exchanges, technology transaction centers and incubators and technology incubators and technology businesses, and nearly 90% of technology transfer promotion and support centers are state-owned.

For state-owned intermediaries, most of these organizations are public science and technology non-business units under the direct management of the line ministry or the governing department (at the provincial/ city-level). Despite of having certain degree of autonomy, these intermediaries basically depend on the state budget as well as the decision of the governing body on personnel mobilization and the appointment of intermediaries' leaders.

3.2. The formation of a network of science and technology intermediaries

(1) Identify the junction, node, and core point of the intermediate organization network

Regarding the connection circuit between individual intermediaries, the relationship between the intermediaries is formed in the process of providing STI services to the parties in the market. In terms of horizontal relation, the relationship is formed and established through cooperation and coordination between intermediaries operating in the same locality, a certain area. There are no intermediaries in the building materials industry that are related on an industry-based basis because intermediary organizations are affiliated units of the industry (Vu T. T. and Le H. T., 2020). However, intermediaries in the same industry tend to operate relatively independently for example, intermediaries in the wood processing industry (Vu M. D., 2020). To a certain extent, the horizontal relationships between intermediaries can be considered as the horizontal link of the network in a given industry, region or locality.

The vertical relationships between the intermediaries are established mainly based on the vertical relationship from the governing body to the affiliated organizations and units. This relationship is more “administrative” than cooperative or coordinate relations. However, in reality, the vertical relationship in the network of science and technology intermediaries has not clearly formed.

The majority of science and technology intermediaries have just been established in the past 10 years. STI has operated in condition of weak resources, limited connection and cooperation. It could be said that the intermediary organization of the STM has played bridging between the supply and demand sides in the STM. But it has not yet the role of the “midwife” of technical and technological solutions, inventions, innovations. However, a number of STIs that have had quite effectively. They are technology exchanges and technology incubators and science and technology businesses such as Hai Phong Technology and Equipment Exchange, CRC – TOPIC (Hanoi University of Science and Technology), Technology Business Incubation Center, HCM city Nong Lam University.

(2) Connection between network members

Interconnect internally and locally within the network of intermediaries based on industry and local relationships. Each intermediary within industry, technology clusters and higher education institutions are relatively independent, self-contained. Moreover, the low number of intermediaries combined with the uneven distribution are factors that negatively affect the linkages and cooperation between the intermediaries of the STM.

At the level of interdisciplinary, inter-regional and regional, there has not been any connection activity between intermediaries. One of the factors hindering the connection and linkage between the intermediaries is the overlap in the functions of the intermediaries. The functions and duties of each type of intermediary organization have been identified by Circular 16. However, intermediaries has registered to carry out similar activities such as brokerage, connecting supply and demand, supporting science and technology transfer. In particular, the technology transfer promotion and support centers in the provinces perform many tasks overlapping with other types of intermediaries.

4. Discussion and Conclusion

From the above assessments, some comments on the current state of STIN could be taken as follows:

Firstly, science and technology intermediaries are not evenly distributed, leading to an imbalance in term of location. There is a high concentration of the number of intermediaries that could be seen in Hanoi and HCM City. However, even in these two cities, the number of intermediaries is not much and it is only concentrated in a few key technology fields. In the management aspect, although it is in the early stage of the formation process, there is a fragmented situation, many intermediaries managing the intermediary organization. Currently, at least two ministries are involved in the management and coordination of intermediaries. Specifically, the National Innovation Center belongs to the Ministry of Planning and Investment by decision of the Prime Minister. Meanwhile, the innovation centers at the provincial and city levels are under the Department of Planning and Investment in the provinces and cities. Furthermore, in each province, there exists a Center for Science and Technology Progress Application under the DST, which performs the tasks of information, consulting, linking technology supply - demand and transferring technology.

Secondly, the tasks and functions of the intermediary organization are not clearly defined, there is even an overlap in functions and tasks among the intermediary organizations of different types. Even in the articles of Circular 16, the functions of intermediaries have overlapped because some intermediaries in this type are allowed to perform the activities of intermediaries in other types. Specifically, according to the provisions of Article 3, Circular 16, the technology trading floor has the function of coinciding with functions of technology transaction centers, centers for promoting and supporting technology transfer activities, intellectual property valuation aid organizations and innovation support centers. A technology trading center has the same function as an exchange, an intellectual property valuation support organization, and an innovation support center. Similarly, the center for promoting and supporting technology transfer activities has the same function as the function of the intellectual property, the intellectual property valuation support organization and the innovation support center.

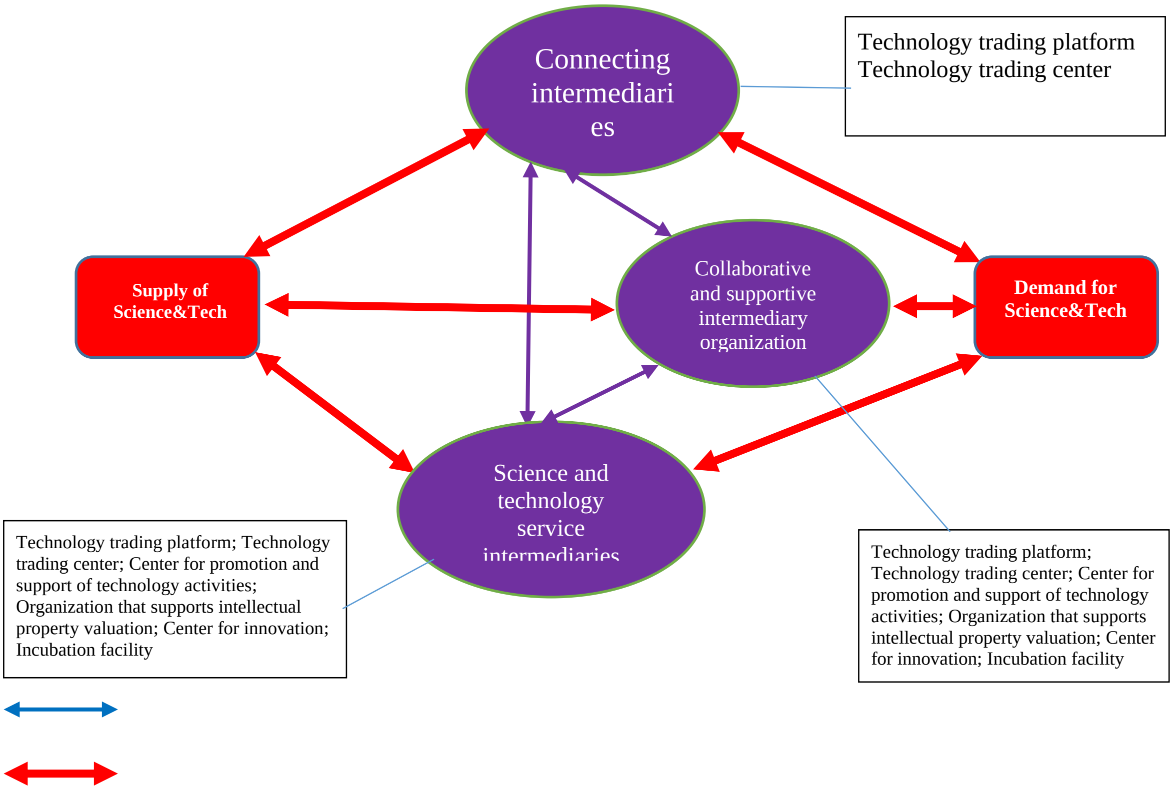
In the context of the need to innovate and apply technology that are not high, many intermediaries operate in moderation and do jobs that do not belong these organization. In contrast, on the demand side, enterprises cannot find an intermediary to connect with suppliers of equipment and technology. The redundancy and lack of science and technology intermediaries shows that the establishment and operation of the current intermediaries are not entirely due to the needs of the parties in the STM. Some centers for promoting and supporting technology transfer activities only exist formally, carry out movement work and are still heavily influenced by the centralized administrative mechanism.

Thirdly, the connection circuits between intermediaries have not yet formed. There is no connection and linkage between intermediaries of different types. Essentially, the intermediaries operate in isolation. In some cases, the intermediaries are connected and coordinated, but the connection has not been maintained regularly and sustainably. Single-connection circuits showing single relationships still exist quite commonly. Another aspect that needs to be clarified is the linkages and connections between more administrative science and technology intermediaries rather than professional connections. The connection and linkage activities between domestic intermediaries and with international intermediaries are still limited. Trading through technology exchanges and science and technology intermediaries accounts for a small number and only accounts for about 5% of the total technology transactions on the STM (Pham T. T. L., 2020).

Fourthly, the activities of intermediaries are fragmented, and duplicated. Each intermediary organization itself has not yet understood the needs for provision and transfer of science and technology of enterprises. This is combined with the lack of orientation in the operation and the overlap in the functions and tasks of each intermediary organization, making fragmentation tend to increase. Therefore, it is difficult to find a key intermediary organization that have strong resources, high quality and reputable enough to connect and coordinate among intermediaries of different types. In currently, the MOST has directed the DST in provinces and cities to review centers to promote and support technology transfer activities, innovation centers and research centers and technology transfer to assess the degree of functional overlap. In some provinces/cities, centers with overlapping functions have been merged into one center; unnecessary centers were dissolved. However, the fragmentation of distribution, overlapping in operational functions, ambiguity in tasks in STIO has not been overcome basically.

Finally, lack of focus, unification on direction and management along the current vertical system of intermediaries. In terms of the state management of the intermediate organization, no specialized division for the STI has been set up in the organizational structure of the MOST.

From the current status of the network of science and technology intermediaries as described above, it is necessary to establish a network model of science and technology intermediaries. The formed network must represent the organizational structure of the system of science and technology intermediaries and also show the relationship and connection between STIs in that system. Based on the approach, the network model of STM could be proposed with the basic elements including the node point and the core point, the connection circuit between the nodal points.



The connection between intermediate organizations

Liaison between intermediaries and supply-demand side

Source: *developed from Lopez-Vega & Vanhaverbeke, 2009; Doan X. H. et al., 2020*

Figure 1: General model of the network of intermediaries of Vietnam's STM

1) The nodal point of the mediation network is each individual intermediary institution. Intermediaries are classified and grouped into three groups: connection intermediaries, cooperation and support intermediaries, and science and technology service intermediaries.

Connecting intermediaries connecting the supply and demand sides in the STM and brokerage to help the supply and the demand side in science and technology find and meet the right partners, match the demand. demand and supply. According to Circular 16, a technology trading floor and a technology transaction center are two organizations that perform the connection function.

Collaborative and supportive intermediary organization has the function of connecting, screening and processing scientific and technological information, assisting parties in marketing, sales and sponsorship activities, and commercialization of technology; research and diagnose trends of innovation and technology transfer.

Science and technology service intermediaries providing intellectual property consulting services, intellectual property management; training, diagnosis, analysis and testing; consulting on standards and building standards.

2) Circuit connection: horizontal relationship, vertical relationship

Horizontal circuits are the horizontal relationships between intermediate organizations in the same group and the network. Connections are established and maintained through information exchange, cooperation, association and coordination in support projects and programs. Each intermediate organization can have many horizontal relationships at the same time. These relationships can be permanent or just temporary. One-one relationships between two intermediaries could be common. However, the connectivity of the network of intermediaries will be maintained and enhanced when the intermediary has a cooperative relationship with many other intermediaries. A network of intermediaries is well connected when it is set up and oriented to meet the needs of brokerage, connection, and assistance in technology transfer and transfer of the parties in the STM. Instead of formally forming an intermediary organization with common, ambiguous and overlapping common tasks and functions, professional intermediaries need to be formed. In the condition of uncompleted and developed STM, intermediary organizations should be built on a multi-functional model. Along with the development of the STM, intermediate organizations will gradually shift towards specialization.

Longitudinal circuits - vertical relationships: vertical relationships exist between science and technology intermediaries due to the existence of a regulatory relationship by industry. Another form of longitudinal circuit will be established when some types of intermediaries have formed including: National Technology Exchange, Center for Promotion and Support of Operations. National Science andTechnology and National Innovation Center. The national intermediaries play the leading role to direct, coordinate and connect the intermediaries at the sectoral, local level, not performing administrative management tasks.

3) The core point - that is, the key intermediaries have a central role in connecting, coordinating and coordinating activities between the intermediaries. In a network of intermediaries, national and regional technology exchanges, national innovation centers, and national technology transfer promotion and support centers are central intermediaries. In addition to national level science and technology intermediaries, intermediaries have outstanding competencies in performing the functions of connection, cooperation and support, and science and technology intermediation services in industrial clusters, industry and local can also be considered as the core intermediaries of the network local, industry, and industrial clusters.

In conclusion, the model of a network of intermediaries of the Vietnamese STM has been proposed with network components including science and technology intermediaries, and interconnections. The vertical relationship represents the management and direction relationship between the upper and lower intermediate organizations. At the same time, this relationship also includes relations of cooperation, connection and support between intermediary organizations at different levels. At each level, horizontal linkages between intermediaries are established, demonstrating a relationship of cooperation and support, connecting science and technology mediation in science and technology transfer projects. technology, innovation and application of science and technology in certain enterprises, industries and localities. The proposed model of a science and technology intermediary organization network is the basis for perfecting the intermediary organization system in terms of selecting key members to join the network, proposing mechanisms and policies to promote push participation, solutions to link space organizations and solutions to connect and share databases among intermediaries in the Vietnamese STM.

This research, as other studies, has some limitations. Firstly, the results are based on opinions from representatives of a small number of organizations and business. Secondly, the research used in-depth interview in collecting data which might be different from focus group interviewing in this case. Future research should develop the model by collecting data from a big sample and using focus group interviewing.

TRAINING THE AGRICULTURAL HUMAN RESOURCES IN HANOI CITY IN THE CONTEXT OF THE FOURTH INDUSTRIAL REVOLUTION

Can Anh Vu
ngocvu9091@gmail.com
Academy of Politics, Hanoi, Vietnam

Abstract

In the economic structure of Hanoi city, although the productive value of the agricultural sector is not high, but it plays a very important role in agricultural development. This is the strategic foundation that contributing to the successful achievements of the industrial and modern process in Hanoi capital. At present, the context of globalization and international integration is going on over the world, especially the effects of the fourth industrial revolution have gotten both many chances and challenges in Hanoi agriculture. Actually, the evolution of this revolution has brought about a deep change in current background. Therefore, managers need to establish the overall solutions to promote Hanoi's agriculture to develop comprehensively follow the modern direction and the sustainable development. Therein, training human resources in agricultural sector plays the essential and urgent role. This article generalizes about the state of agricultural production; analyzing and clarifying the current situation of training the agricultural human resources in Hanoi city. Thence, proposing a number of recommendations to improve the quality of training of agricultural human resources in Hanoi city to meet the requirements of the Fourth Industrial Revolution.

Keywords: *Training, human resources, agriculture, Hanoi, the Fourth Industrial Revolution.*

1. Introduction

Hanoi is a special urban area of the country, but agriculture still plays a very significant role.It is the strategic foundation contribute to ensuring food security, maintaining socio-political stability, preserving and promoting cultural characteristics; creatingthe chances of employment and protecting the ecological environment. Hanoi is the largest central city in the country since the merge of Ha Tay province, the natural area of Hanoi city is 3,328.89km2. It consists of 12urban districts, 17 rural districts and 1 district-leveled town, therein the suburban agricultural and rural areas account about 60 percent of the population and 50 percent of the city's workforce.

Hanoi city’s Party and people are profoundly aware of the role of agriculture in the industrialization and modernization, so Hanoi city’sleadershaveproposed many guidelines and policies for agricultural and rural development and achieved the important results in recent years. However, Hanoi city's agriculture is also coping with many difficulties and challenges in the current context,such as: rate of the rapid urbanization lead to the area of agricultural production to shrink and fragmentation; applyingthe high technology to production is limited; productivity and quality of agricultural products are low; polluting theecosystems; the change of climate and epidemics impacted more complexly and seriously; the quality of agricultural and rural human resources is limited, the shortage of employment and the proportion of unemployment of rural workers are increasing; the quality of life and income of thesuburban Hanoi's people are still slow. Therefore, Hanoi City needs to combine the numerous elements to establish and develop a modern agriculture and civilized rurality in the context of the Fourth Industrial Revolution, therein training the high-quality human resources play the first essential role in a strategy of agricultural development.

2. Methods

The article used anoverall and comprehensive approach to collect and summarizethe last studies and reports that related to this topic. The source of the secondary data was used such as: Decisions, Reports and Projects of the Hanoi City Party Committee, The Hanoi municipal People's Committee, Department of Agriculture and Rural Development; Hanoi Department of Statistics. Besides, databases also were collected via the internet, newspapers, magazines ... as a basis for analyzing the state of agriculture and agricultural and rural human resources in Hanoi at present.

3. Results

3.1. Some of generalizations about agriculture in Hanoi at present

In recent years, Hanoi agriculture has achieved the important results contribute to the economic growth of the whole city. Agricultural production has gained the significant achievements, the value of production has continuously increased over the years. According to the report of The Hanoi municipal People's Committee, the total value of agricultural, forestry and fishery production in 2018 reached 35,959 billion VND (compare in 2010) increasingabout 13.08% compare in 2014. Growth rate of value added in agriculture in the period of 2014-2018 has increased on average about 2.32%, the growth in the value of agricultural, forestry and fishery production were 3.35%, wherein the cultivation,livestock and aquaculture were 2.4%, 4% and 6.06% respectively[18]. Moreover, many co-operative models and productive teams were formed and promoted effects thatcontributed to the development of suburban agriculture to meet the new requirements at present.

[18]*Ha Noi Department of Agriculture and RuralDevelopment (2018),* Results of the performance of tasks in *2017,*tasks and solutions*in 2018, Hanoi.*

The structure of agricultural production has transferred follow the positive direction that has formed many areas of the concentrated agricultural production contribute to improvethe high economic efficiency such as high-quality rice areas, fruit trees areas, livestock breeding areas and aquaculture areas. Some of the specific methods have been conducted, such as: promoting the conversion of inefficient rice land to other crops for higher economic efficiency, the value increased from 3 to 8 times compared to rice cultivation; building about 101 the concentrated productive areas of safe vegetable with a scale of over 20 hectares harvest about 400 - 500 million VND/ha /year of the productive value; developing about 50 productive areas of flower harvest about 0.5 - 1.5 billion VND/ha/year etc. Moreover, Hanoi city has built about 15 large-scale concentrated livestock areas outside residential areas that a value gained about 1-2 billion VND/ha/year; building about 12 collective brands for agricultural products... At the same time, the material and spiritual life of people is constantly improving, the income of people in rural areas reaches over 38 million VND/person/ year, increasing about 58.3% (compared in 2014).

However, the scale and growth rate of agriculture in Hanoi are not appropriate with the potential and strengths reality; it has not met the needs of the internal city and external provinces. The quality of Hanoi's agricultural growth is still low because the infrastructure of agricultural production are still small and fragmented units, so gaining the low efficiency. The state of small scale andbackward technology lead toHanoi’s facilities of the agricultural process have not linked between production and processing. Some essential services are limited (organizing the consumption of products, preserving and processing of agriculture, sylviculture and aquiculture etc.); sharing of responsibilities and benefits between agricultural provider and producer has not gained the high efficiency which affected negatively to Hanoi agricultural development.On the other hand, transferring of the agricultural economic restructuring in Hanoi is still slow. Both of the productivity and quality of food products are not high, safety and hygienic, so it has not met the needs of the Hanoi’s people. The forms of productive organizations have achieved initially the successes but many activities have not gained the positiveachievements, especially the co-operatives models with small scale and lack of government funds.

In brief, the above findings identify importance of the requirements of sustainable agricultural development, but the transference of Hanoi’s agricultural structure is still not really suitable and appropriate with Hanoi capital’s potential and advantages.

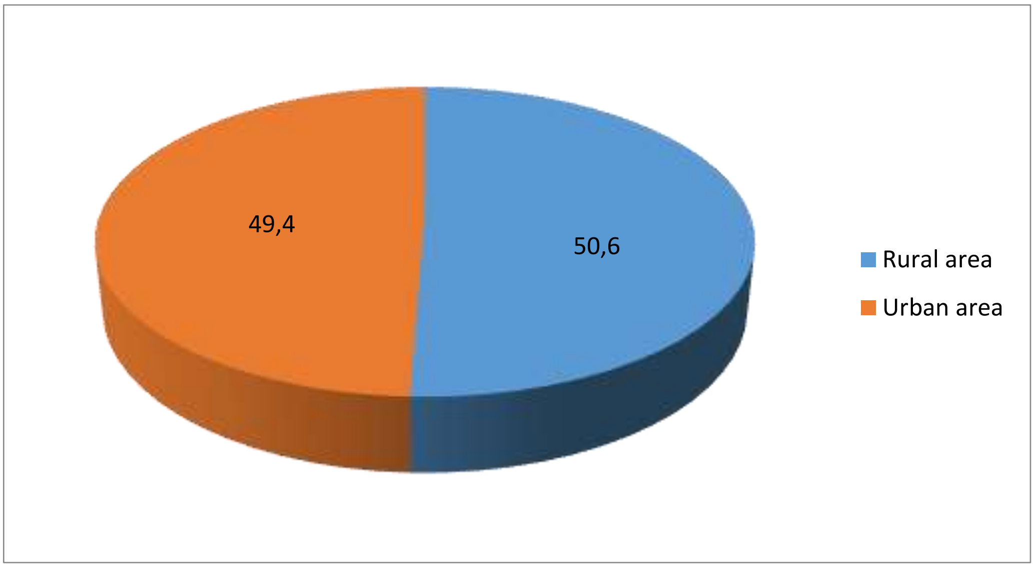
3.2. The state of training human resources inagriculture in Hanoi City at present.

According to the Hanoi Statistical Year-book, Hanoi’s the average population was estimatedat 8,093.9 thousand inhabitants in 2019, increasingabout 179.4 thousand inhabitants that was equivalent to 2.3% (compared withresult in 2018). Therein, the urban population is

4,000.3 thousand inhabitants that was equivalent to 49.4%; the population of rural areas is 4,093.6 thousand inhabitants that was equivalent to 50.6% of population in the entire city.

Table 1: The average population of Hanoi city in 2019

Unit of measurement: %



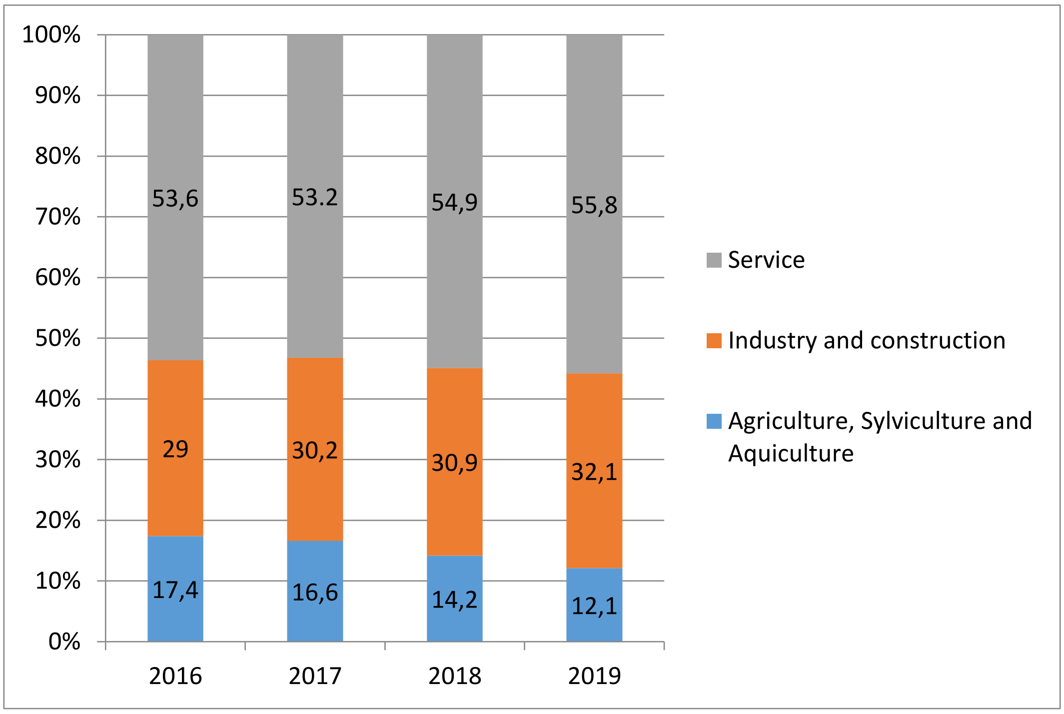
(Source: Hanoi City Statistical Year-book 2019)

In 2019, Hanoi's workforce (age of 15 years and above) was 4,122 thousand people (accounting for 50.9% of the population), therein, the labor force in Hanoi’s rural areas accounted for 51.6% compare with the labor force in whole city. Rural workforcesfrom age of 15 years and abovethat are working in the economic sectors in 2019 were 2,247 thousand people that was equivalent to 55.5% of the total number of workers fromage of 15 years and above[19]. The state of above population found that Hanoi's agricultural and rural areas are place where have theabundant human resources for socio-economic development in general and agriculture in particular. However, the process of industrialization and modernization create many opportunitiesfor employment, incomes and living conditions. These lead to increase the proportion of migrants from suburban areas and other provinces into Hanoi city that createthe serious pressure for Hanoi capital ’s the socio-economic development.

[19]Hanoi Bureau of Statistics (2019), *Hanoi Statistical Yearbook 2019,* Hanoi.

Table 2: Labor structure distribute on economic sector of Hanoi city for the period 2016-2019

Unit of measurement: %



(Source: Hanoi City Statistical Yearbook in 2016, 2017, 2018, 2019)

The labor structure of Hanoi city is transferring towards reducing the proportion of labor in the agricultural sector, increasing the proportion of labor in industry, construction and services. Currently, the labor structure distributed towards the economic sector, the proportion of agricultural labor was 12.1%, the proportion of industrial - constructional labor was 32.1% and the proportion of service labor was 55.8% in 2019.

Table 3: Percentage of employees from age of 15 years and above working in economicsector that trained in the period 2015-2019

Unit of measurement: %

Year	Total	Urban	Rural
2015	53.2	68.5	36.7
2016	56.9	71.9	40.2
2017	60.7	75.6	44.3
2018	63.2	76.2	47.2
2019	67.5	79.6	54.8

(Source: Hanoi city Statistical Yearbook in 2019)

Results of table 3 revealed that the quality of labor resources in Hanoi's the agricultural and rural areas of is gradually being raised. In 2015, the proportion of workers thattrained from the training facilities in all level (primary workers, vocational skills, vocational certificates under 3 months) only reached 36.7%, but this proportion of workers was 54.8% that increasingapproximately 18.1% in2019. However, the proportion of employees that have the agriculture's technical qualifications is still low when people compared to the labor market's needs.

Surveying from state of vocational training and creating chances of employment for rural employees are still limited, especially lack of employment in places where agricultural land is recovered for other purposes, the unemployment rate in rural areas was 1.4%, number of people lack of employment was 0.3%. Most of Hanoi employees still have a picky mentality in choosing their employment and income. The proportion of the sustainable employments increases slowly, the part -time and temporary employment is quite highand theincrease of young workforce tends to go away the agriculture and rural areas.

The process of industrialization, modernization and urbanizationnot only createsthehug demandsabout labor but also improve the productivity of agricultural laborthat led to the number of workers of this industry transfer to non-agricultural industries more and more. The limitations of the qualifications of agricultural workers in Hanoi directly obstructed to the transition and application of achievements of modern science and technology into production.

At present, in the context of globalization and international integration, especially the development of the fourth industrial revolution, it is necessary to have policies that create the chances for employment. Besides, managers also need to have the specific strategies in restructuring the agricultural workforce such as reducing the proportion of simpleworkforces, increasing the proportion of professional workforces who have certificated fromthe universities and colleges.

In recent years,perceiving precisely about the importance of training to improve the quality of human resources,Hanoi city is interested in the occupationaltraining for agricultural and rural human resources. Hanoi City's Party Committee grasped thoroughly and implemented the Prime Minister's Decision No. 1956/QD-TTg, 27 November 2009about the project "Occupational training for rural workers to 2020". Therefore, focusing on occupational training meet the demand of local human resources is themissionand vision of Hanoi's Party and people in next years. At the same time, implementing the programs and objectives build the new rural areas; the projects and plans about socio-economic development will be adjusted flexibly base on the reality of each locality.

Since 2010 to present, the whole city has opened over 6,000 classes about occupational training for nearly 220,000 rural workers. Completing many long and short training courses, over 80% of rural workers have had employment or they are working the old occupation but they have achievedthe higher productivity and quality. This result contributes to increase the proportion of trained workers in the city from 34.8% (results in 2010) to 70.2% in 2020.

However, the implemental process of the project also revealed many limitations. In some places, the organization of training is still formal without associated between training and the social needs; the effectiveness of these programs is not high and appropriate with the investment.

The high rate of workers who have not trained, the number of trained workers is a low level, while lack ofthe professional workers who can meet the requirements of modern agricultural production. In addition, the system of occupational training institutions and resource of professional teachers is also limited. Therefore, Hanoi City needs to have the effective solutions improve the quality of human resource training for agriculture and rural areas at present.

3.3. Some recommendationsimprove the quality of training for agricultural human resources in Hanoi City at present

First, Hanoi City needs to establishing overall plan, finalizing the mechanisms and policieson training human resourcesfor agriculturean druralareas. Training human resources is an important and long-termstrategy, itmusthavealong-termvisionand the appro priateguidelines. The system of mechanisms and policies play savery important role impact directly orindirectlyto the training and development of agriculturalandrural human resources. Training must be associated with appropriate use and remuneration that create motivation for agriculturalandrural human resources to develop comprehensively. In fact, many new mechanisms and policies have a positive impact on the quality of the agricultural and rural human resourcestraining. However, there are many limitations in the implemental process. Therefore, it is necessary to regularly adjust, supplement and improve the mechanisms and policiesin accordance withthe impact of the fourth industrial revolution, facilitating the training of agricultural and rural human resources.

Second, innovating the contents, programs and methods of training agricultural and rural human resources in accordance with the context of the fourth industrial revolution. Focusing on investing in material facilities, advanced documentsabout agriculture and rurality in the world. Especially, improving abilityofforeign language and soft skills, applyingabout information technology in teaching and educational management. Expanding international cooperation to approach science and technology shorten the duration of internationalintegration.

Third, coordinating closely with the agricultural universities and colleges to link training andtransferringthe agriculturalknowledge to farmers. The training institutions should organize regularlythe practical sessions improve practical knowledge, so that learners will propagate their knowledge to farmers increase the effect of agricultural production. Therefore, managers need to increasethe investable funds in education and vocational guidance from high school in rural areas and establish the favorable conditions to attract the professional and enthusiasticteachers for agriculture and rural areas.

Fourth, solving employment for workforce in rural areas. It is necessary to transfer restructuring of rural economy and developing infrastructure. Besides,promotingthe local advantages to develop tourism and trade to transfer the economic structure follows the modern way, diversifying the production and business forms. Increasing the support for farmers about fund, knowledgeabout market and integration so that farmers can produce items according to the needs of the market promote the production of goods.

Fifth, promoting the generalpower of organizations and forces for the training of agricultural and rural human resources. Training and development of human resources in general, agricultural and rural human resources in particular. This is an important mission of the whole political system in Hanoi capital's all levels, branches and people. Therefore, it is necessary to promote the role of many subjects, creating a general power for the training of agricultural and rural human resources.

Sixth, regularly evaluating, summarizing and replicatingthe advanced models in accordance with the transfer of technical advances in agricultural production. At the same time, investigating about the training programs at training institutions thatare suitable forpracticalproduction. This result will support to adjust the training program in accordance with the requirements of modern agricultural production.

4. Discussion and Conclusion

Currently, the fourth industrial revolution is going on strongly andopening up huge developmental opportunities for all of sectors, especially socio-economic domain. For agriculture, this is a specific domain that was affected by this revolution, it will gradually transfer from traditional agriculture to hightechnology and smart agriculture. Therefore, managers have to have the special strategies to improve the quality of training of human resources to adapt and get the best opportunities from the Fourth Revolution. Accordingly, Hanoi city needs to improve the system of mechanisms and policies for the training of this human resource; the training institutions need to innovate programs, contents and methods in accordance with the requirements of the Fourth Industrial Revolution. At the same time, promoting the role of organizations and forces that participate in the training of agricultural and rural human resources contribute to improve the quality and efficiency.

Abstract

Based on Barney's Resource-Based Theory of the firm and uses data on enterprises from official sources provided by the General Statistics Office namely annual enterprise survey data (period 2011-2018), the Provincial Competitiveness Index (PCI) by VCCI Vietnam, this article analyzes and clarifies the current situation of enterprise development of domestic private enterprises in the North Central region focusing on the following indicators and criteria: number of enterprises, structure enterprises by geographical areas, fields, capital and employment size; business efficiency via ROA and ROE targets; PCI index. Thereby highlighting the hindrances, limitations, and problems of enterprises in the domestic private sector in the North Central region and proposing suitable solutions in the years to come.

Keywords: *Enterprise, private economy, North Central Region, efficient operation*

1. Introduction

Since the 6th National Congress (1986), with comprehensive reforms, the Congress has set out policies for multi-sector economic development. After the 7th (1991), the 8th (1996), the 9th (2001), the 10th (2006), the 11th (2011), and especially the 12th National Congress (2016), our Party determined "The private economy is an important driving force of the economy". This is an important step in the Party's awareness regarding the position of the private economy in Doi Moi period, from recognizing private sectors to creating conditions for the development of the private economy. And after 35 years of innovating, the private economy has made great contributions to socio-economic development and brought about remarkable success. The private economy quickly affirmed its position and role in each stage of the country's development. The private sector accounted for the largest

GDP share during the period 1995-2017, ranging from 38-43%. However, in recent years, the proportion has decreased, from 43% (1995), to 39% (2010) and 38% (2017).

However, in Resolution No. 10 - NQ/TW of the 12th Central Committee of the Party, it was pointed out that "the private economy has not yet met its role as an important driving force of the economy" and the private sector is also facing many difficulties and limitations. Therefore, a proper assessment of the current situation, influencing factors, and problems on the development of the private sector, with a focus on domestic enterprises, from which to make recommendations on policies and solutions are needed. And development issues of the private sector need to be considered and evaluated for each economic region or specific localities.

The North Central Region is one of the seven economic regions of Vietnam, an important connection point in the strategic development axis of the Vietnamese economy, and a bridge between the key economic regions of the North as well as the South, an area linking Vietnam with Laos and Cambodia. The North Central Region consists of 6 provinces: Thanh Hoa, Nghe An, Ha Tinh, Quang Binh, Quang Tri and Thua Thien Hue; with an area of 51.5 thousand km2 (16.5% of the whole country), a population of 10.6 million people (15% of the whole country). However, the proportion of enterprises to the total population of the region is only 5.5%, illustrating that the development level of enterprises in this area is only 1/3 of the national average. Even though the number of enterprises compared to the whole country is modest, the natural resources of this area are quite diverse, rich, and outstanding in terms of sea, islands, deep-water bays, hills, lakes, waterfalls, cultural and historical heritages, border, etc., these are favorable conditions for the development of a general economy with many key industries such as tourism, health care, education, manufacturing, and organic agriculture. The North Central economic region has had many important shifts in economic structure and development orientation, which is industrial development in the direction of increasing the proportion of trade - services, together with high-tech agriculture, and forming a consumption supply chain, the industrial sector focuses on attracting high-tech production, energy development and deep processing. However, all localities have a low starting point compared to other economic regions, the quality of regional economic growth is unsustainable, insignificant, the economic restructuring remains slow, the industry is ineffective and unsustainable, the growth engine of the region is weak and unsustainable. The development institution has not been synchronized, the marine economy has not been determined based on the region's comparative advantages. Enterprises remain weak. Regional linkage, which placed the enterprises in the central position, is weak and yet to be connected.

With the potential for economic development, together with the context of integration and the era of connection and sharing, the industrial revolution 4.0, to develop the North Central Region sustainably, the participation of many economic sectors, including the core role of enterprises in the private sector is required. Therefore, assessing the situation of enterprise development in the domestic private sector in association with the sustainable economic development of the North Central Region, finding out the bottlenecks and problems from which to propose solutions are: meaningful, necessary, and is the purpose of the article.

Theoretical framework

The theoretical foundation used in this study is Barney's Resource-Based Theory. According to the resource-based theory of the firm (RBF), the birth and development of firms are explained through the question of how the firm generates resources, including: (i) Physical resources; (ii) Human resources; and (iii) Organizational resources. In RBF theory, the determinants of business development include: i) Valuable; ii) Rare; iii) Difficult to imitate.

Enterprise development is affected by internal factors such as existing resources (physical resources, human resources, organizational resources) and this is proven by the research of Barney and his partners (Barney, 1991; Barney et al., 2007, 2011). In addition, enterprise development is affected by external factors such as guidelines and policies of the Party, the State, economic regions, production organization factors, market factors, capital, ... this is proven in the studies of Garofoli (1994), Mathew Philip (2010), Sharmilee Sitharam, Muhammad Hoque (2016) …

In fact, the enterprise development level of the whole country and each locality is assessed through a set of indicators namely: the number of enterprises; labor development level; investment and finance attractiveness; investment and development of science and technology; business strategies, market development, brand building; environmental protection; results and efficiency of business development (revenue, income of employees, added value, profit, budget contribution ...) (In Decision 1255/QD-TTg dated September 26, 2018) of the Prime Minister). The level of enterprise development has an impact on the socio-economic development of each locality, region, and the whole economy.

In addition, the article also uses several arguments of institutional economics, which emphasizes the role of the institutional environment in the development of enterprises in general and private enterprises in particular.

Literature review

There are many different theories explaining the birth and development of firms. Popular studies explaining the birth and development of firms include approaches from behavioral and management perspectives (Baumol, W., 1959; 1962; Williamson, O., 1967), from a modern organizational perspective (Tirole, J., 1988), from the perspective of property rights (Williamson, O., 2002; 2009), and most recently, the work of Barney, J. B. (1991) and the studies that followed Barney's were approached from the perspective of mobilization and use of resources (Resource-based Theory of the Firm). Such resources can be divided into three groups: (i) Physical resources (inheriting Williamson, O. 1975); (ii) Human resources (inheriting Becker, 1964); (iii) Organizational resources (inheriting Tomer, 1987). Such physical resources includes: “machinery, plant, production site and access to raw materials (inputs of production)”. The studies of Darroch (2005), Mathew Philip (2010), Sharmilee Sitharam, Muhammad Hoque (2016) focused on internal and external factors affecting the development of private sector enterprises.

Vietnamese studies such as Nguyen Thien Phong (2007); Nguyen Quang Thai, Vu Hung Cuong et al (2010, 2016); Nguyen Xuan Khoat (2010); Nguyen Tu Anh et al (2015); Quan Minh Nhut et al (2009, 2012) focused on studying the current situation and analyzing the contribution role on some specific aspects of firm development in private sector, thereby pointing out the external barriers and internal limitations of private sector enterprises.

However, research on the development of domestic private sector enterprises in the North Central Region has not been studied and discussed in depth in previous studies. This research focused on determining the quantitative and qualitative indicators of firm development, determining the influencing factors, thereby finding the hindrances and bottlenecks in the development of domestic private enterprises in the North Central Region.

Research objectives: On the basis of research on the theory of resource-based enterprises, the study clarifies the current development state of domestic private enterprises in North Central region, highlights the hindrances, limitations, and problems of enterprises in the domestic private sector in the North Central region. Thereby, proposing suitable solutions.

2. Method

The article uses data on enterprises and business environment from official sources provided by the General Statistics Office namely annual enterprise survey data (period 2011-2018), national statistical yearbook, provincial statistical yearbook, to sketch a picture of the enterprise development in the North Central Region based on the theoretical framework presented above. In addition, the article uses the Provincial Competitiveness Index (PCI) by VCCI Vietnam. Calculation of indicators to evaluate the development of enterprises is done using the set of criteria approved in Decision 1255/QD-TTg dated September 26, 2018.

Statistical analysis is the main method used in the article in the statement of problem. Besides, comparative and synthetic analyzes are used interlaced to clarify the limitations and problems in the development state of domestic private enterprises in the North Central region.

Scope of study:

- Research subjects: Within the framework of this study, the research team classified the economic sectors by ownership including the public sector and the private sector, in which the private sector consists of the domestic private sector – also known as the non-state sector (including collective economy, individual economy, private economy) and foreign direct investment (FDI) sector.

- Research content: analyzing the current situation of enterprise development focusing on the following indicators and criteria: the number of enterprises, the structure of enterprises by geographical areas, fields, capital and employment size; business efficiency via ROA and ROE targets.

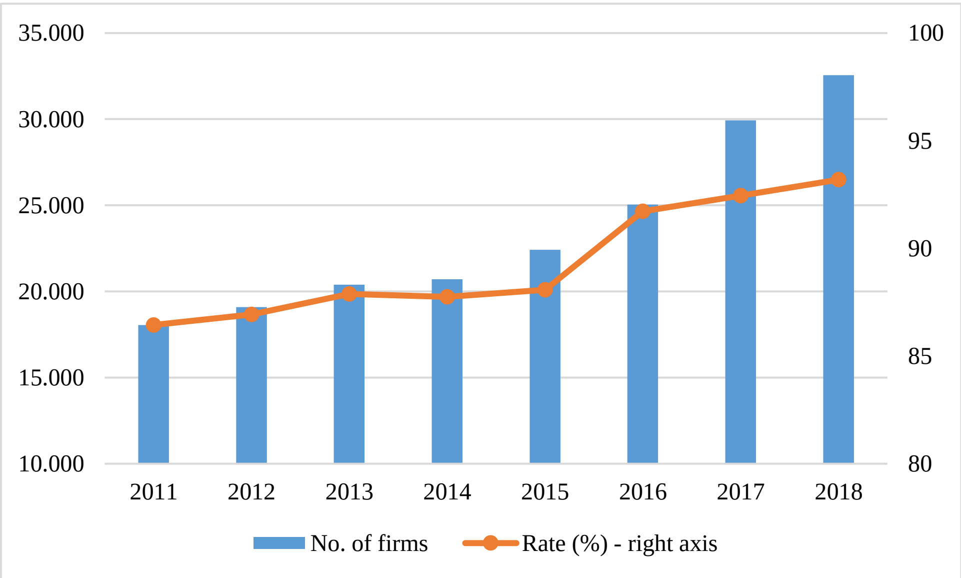
- Time: the 2011-2018 period

- Space: 6 provinces in the North Central Coast (Thanh Hoa, Nghe An, Ha Tinh, Quang Binh, Quang Tri, Thua Thien Hue)

3. Results

Firstly: The number of domestic private enterprises in the North Central region is increasing, accounting for a large proportion of the total number of active enterprises, but remains unbalanced in terms of location, size, and fields.

Figure 1. Number of domestic private enterprises in the North Central region in the period 2011-2018



Source: Calculation from the enterprise survey data collected between 2011 and 2018 by General Statistics Office

Calculation results from the enterprise survey data set period 2011-2018 show that enterprises in the domestic private sector are the core force with overwhelming numbers, accounting for more than 85% of the total number of active enterprises in the North Central region (2018), with an increasing proportion and by the end of 2018, this sector accounted for more than 93% of total enterprises. If including cooperatives and unions of cooperatives, domestic private enterprises account for more than 98% of the total number of active enterprises in the North Central provinces.

In terms of absolute number, in the period 2011-2018, the number of domestic private enterprises increased rapidly with an average rate of 9%/year from 18.059 enterprises (2011) to 32.555 enterprises (2018).

Considering each locality in the region, Nghe An has the largest number of domestic private enterprises in the region with 9.894 enterprises (2018) - accounting for more than 30% of the total number of private enterprises in the region. Next is Thanh Hoa with 9.552 enterprises, accounting for 29% of the total. Quang Tri is the province with the lowest number of enterprises in the region, accounting for only 6,8% (details in Table 1). Thus, it shows that private sector enterprises focus on provinces with favorable development conditions, the uneven development situation among provinces creates an imbalance in resource allocation and a development gap among provinces in the region.

Table 1. Number of active domestic private enterprises by provinces in the North Central region 2011-2018

Year	Thanh Hoa	Nghe An	Ha Tinh	Quang Binh	Quang Tri	TT. Hue
2011	4.447	4.967	1.981	2.103	1.548	3.013
2012	4.669	5.347	2.188	2.212	1.749	2.927
2013	5.128	5.628	2.364	2.262	1.969	3.037
2014	5.203	5.732	2.555	2.392	1.895	2.935
2015	5.570	6.384	2.929	2.601	2.000	2.941
2016	6.613	7.456	2.943	2.727	2.060	3.250
2017	8.494	8.800	3.652	3.250	2.190	3.552
2018	9.552	9.894	3.926	3.305	2.217	3.661

Source: Calculation from the enterprise survey data collected between 2011 and 2018 by General Statistics Office

Regarding the structure of enterprises by size, economic sector, and type: Calculation results show that the majority of domestic private enterprises in the region are micro and small-sized enterprises, accounting for 98% of the total number of active enterprises. Medium and large enterprises account for a very modest proportion and tend to decrease (Table 2). By the field of operation, the majority of private enterprises are operating in trade and services - accounting for over 62%, followed by industry and construction - accounting for about 35%. the rest are enterprises in the fields of agriculture, forestry, and fishery (Table 3). By type of enterprise, non-state limited liability company (LLC) is the most common form and accounts for an increasing proportion of figures. In the period 2011-2018, the number of limited liability companies increased from 52,1% (2011) to 64,2% (2018). Next are joint-stock enterprises (without state capital) and private companies. While the group of joint-stock companies kept the proportion at about 25% of the total number of active private sector enterprises, the proportion of private companies decreased sharply from 22,1% in 2022 to 10,6% in 2018 (Table 4).

This situation shows that the number of large enterprises in the region is too small. The problem is that there are no large enterprises to take the role of the driving force, leading, and pulling other enterprises in the region to develop. Besides, medium-sized enterprises account for a small proportion, therefore, it's difficult for them to develop into large enterprises. At the same time, they are unable to take on the role of a bridge and link with large and small-sized enterprises to create a foundation for development. This emerges as a difficulty for investment in technological innovation and participation in production value chains for businesses in the region.

Table 2. Structure of enterprises in the domestic private sector in the North Central region in the period 2011-2018 by employment size

Year	Micro-sized enterprises	Small-sized enterprises	Medium-sized enterprises	Large-sized enterprises
2011	60,8%	36,1%	1,8%	1,3%
2012	61,7%	35,2%	1,8%	1,3%
2013	63,7%	33,3%	1,7%	1,3%
2014	64,5%	32,6%	1,7%	1,2%
2015	66,1%	31,0%	1,7%	1,2%
2016	66,8%	30,4%	1,6%	1,2%
2017	71,5%	26,2%	1,3%	1,0%
2018	74,0%	24,1%	1,1%	0,9%

Source: Calculation from the enterprise survey data set collected between 2011 and 2018 by General Statistics Office

Secondly: Firms in the domestic private sector in the North Central Region have a rapid increase in capital, but a decrease in the employment size.

In the period 2011-2018, firms in the domestic private sector in the North Central Region experienced rapid growth in capital of all sizes. The group of micro and small-sized enterprises had capital growth (on average) of up to 80%, while medium- and large-sized enterprises had a more modest increase of 52% and 34,6%, respectively. (Table 5).

Table 5. Average capital size of enterprises in the domestic private sector in the North Central region between 2011 and 2018 (Unit: million dong)

Period	Micro-sized enterprises	Small-sized enterprises	Medium-sized enterprises	Large-sized enterprises
2011-2014	3.068	15.025	69.871	346.852
2015-2018	5.583	27.078	106.294	466.717
Compare 2 stages	182,0%	180,2%	152,1%	134,6%

Source: Calculation from the enterprise survey data set collected between 2011 and 2018 by General Statistics Office

In terms of business fields, the agriculture, forestry, and fishery sector is the industry with the largest average capital size, followed by the industry and construction sector, meanwhile, the service sector accounts for the smallest amount of capital. In particular, the industry and construction sectors have the fastest capital growth rate. A typical industrial and construction enterprise increased its capital by 70,3% in the period 2015-2018 compared to that of the period 2011-2014. In contrast, agriculture, forestry and fishery enterprises have the slowest capital growth rate. However, in general, private enterprises have growth in capital size in all three areas. (Table 6)

Table 6. Average capital of enterprises in the domestic private sector in the North Central Region by sector

Period	Agriculture, forestry and fisheries	Industry and construction	Service
2011-2014	40.674	14.704	9.698
2015-2018	50.082	25.043	13.387
Compare 2 stages	123,1%	170,3%	138,0%

Source: Calculation from the enterprise survey data set collected between 2011 and 2018 by General Statistics Office

In terms of locality, enterprises in Nghe An have the largest average size in the region, followed by Thanh Hoa. In the period 2015-2018, the average capital size of each enterprise in Nghe An and Thanh Hoa was VND 5,6 billion and VND 5,2 billion, respectively. This is about 10% higher than that of the 2011-2014 period. In the opposite direction, Quang Tri and Thua Thien Hue are the two localities where enterprises have the smallest size in the region with an average capital of VND 3,6 billion and VND 3,9 billion respectively. (Table 7)

Table 7. Average capital size of domestic private enterprises in the period 2011-2018 by locality in the region

Year	Thanh Hoa	Nghe An	Ha Tinh	Quang Binh	Quang Tri	TT. Hue
2011-2014	4.728,4	5.066,8	4.499,4	4.425,6	3.245,1	3.366,4
2015-2018	5.213,3	5.617,7	4.902,8	4.809,3	3.650,5	3.978,0
So sánh 2 giai đoạn	110,3	110,9	109,0	108,7	112,5	118,2

Source: Calculation from the enterprise survey data set collected between 2011 and 2018 by General Statistics Office

With the above capital size, the problem is for regional enterprises to invest in technology and equipment innovation, improve production and business efficiency, which is limited due to the small investment capital. It will be difficult to develop the business force of the region.

Regarding the employment size of enterprises, in contrast to the capital size, the average number of employees of enterprises tended to decrease gradually in the period 2011-2018. Table 6 shows that the employment size of private sector enterprises has decreased at all sizes. Specifically, in the period 2011-2014, each large private sector enterprise had 214 employees, but in the period 2015-2018, there were only 154 people. Similar to the group of small and medium-sized enterprises, according to calculations from the survey data for the period 2015-2018, there were only 81% and 64% of employees compared to that of the previous period (Table 8).

Table 8. Average labor size of enterprises in the domestic private sector in the North Central region in the period 2011-2018

Unit: mil. VND

Period	Small-sized enterprises	Medium-sized enterprises	Large-sized enterprises
2011-2014	14	102	214
2015-2018	11	65	154
Compare 2 stages	81%	64%	72%

Source: Calculation from the enterprise survey data set collected between 2011 and 2018 by General Statistics Office

Thirdly: The production and business efficiency of domestic private enterprises is much lower than that of SOEs and FDI enterprises in the North Central Region.

Limited capital and employment size compared to state-owned enterprises and FDI enterprises make the revenue of domestic private enterprises significantly lower. In the period 2015-2018, each domestic private sector enterprise in the North Central Region achieved an average revenue of VND 14,4 billion, an increase of more than 19% compared to the 2011-2014 period. However, this is much lower than the 39% increase of SOEs and 68% of FDI enterprises (Table 9).

Table 9. Average revenue of enterprises in the North Central Region in the period 2011-2018 by ownership

Period	**State enterprises**	**Domestic private enterprises**	**FDI enterprises**
2011-2014	222.330	12.065	283.086
2015-2018	309.077	14.405	475.780
Compare 2 stages	139%	119%	168%

Source: Calculation from the enterprise survey data set collected between 2011 and 2018 by General Statistics Office

Capital size is a major factor affecting the business results of domestic private enterprises. Table 10 shows that, while large enterprises tend to increase, small and medium-sized enterprises have a decrease in revenue.

Table 10. Average revenue of enterprises in the domestic private sector in the North Central Region in the period 2011-2018 by capital size

Period	Small enterprises	Medium-sized enterprises	Large enterprises
2011-2014	5.751	62.469	264.269
2015-2018	5.499	54.050	287.223
Compare 2 stages	96	87	109

Source: Calculation from the enterprise survey data set collected between 2011 and 2018 by General Statistics Office

Evaluating the performance of enterprises based on two indicators, return on total assets (ROA) and return on equity (ROE), shows that domestic private enterprises are much worse than SOEs. and FDI enterprises in the period 2011-2014; In the period 2015-2018, domestic private enterprises still did not have an improvement in efficiency index. However in the same period, while SOEs and FDI experienced a sharp decline in ROA and ROE, the results of domestic private enterprises are positive. (Table 11)

Table 11. Return on total assets (ROA), on equity (ROE) of enterprises in the domestic private sector in the North Central region

Index	Period	2011-2014	2015-2018
ROA	SOEs	0,013	0,006
	Private enterprise	0,002	0,002
	FDI	0,018	-0,012
ROE	SOEs	0,029	0,018
	Private enterprise	0,006	0,005
	FDI	0,027	-0,031

Source: Calculation from the enterprise survey data set collected between 2011 and 2018 by General Statistics Office

In terms of localities, Nghe An and Thua Thien Hue are the two provinces where businesses operate more efficiently in the period 2015-2018 than in the period 2011-2014. In the opposite direction, Ha Tinh, Thanh Hoa, Quang Binh and Quang Tri are the localities where the efficiency of enterprises decreases (Table 12).

Table 12. Return on assets (ROA) and equity (ROE) ratios of domestic private enterprises in the North Central region by location

Province	ROA		ROE	
	2011-2014	2015-2018	2011-2014	2015-2018
Thanh Hoa	0,005	0	0,012	0
Nghe An	-0,002	0,006	-0,005	0,019
Ha Tinh	0,005	0,001	0,013	0,001
Quang Binh	0	-0,008	0	-0,026
Quang Tri	0,006	-0,002	0,017	-0,006
Thua Thien Hue	0,005	0,006	0,012	0,017

Source: Calculation from the enterprise survey data set collected between 2011 and 2018 by General Statistics Office

In terms of fields, agriculture, forestry and fishery; industry and construction have better profitability in the period 2011-2018, while the service industry has the opposite trend. Specifically: ROE for agriculture in the period 2011-2014 is -0,119, for the period 2015-2018 is 0,032, ROE for the construction industry in the period 2011-2014 is 0,009, in the period 2015-2018 is 0,012, and ROE in the field service period 2011-2014 is 0,012, in the period 2015-2018 is -0,006. (Table 13)

Table 13. Return on assets (ROA) and equity (ROE) ratios of domestic private enterprises in the North Central region by fields

Index	Period	Agriculture, forestry and fisheries	Industry and construction	Service
ROA	2011-2014	-0,060	0,004	0,004
	2015-2018	0,010	0,005	-0,002
ROE	2011-2014	-0,119	0,009	0,012
	2015-2018	0,032	0,012	-0,006

Source: Calculation from the enterprise survey data set collected between 2011 and 2018 by General Statistics Office

Regarding the income of workers, there is a big difference between domestic private enterprises and state-owned enterprises and FDI enterprises (Table 14). This is a challenge for private enterprises to attract qualified, skilled and senior workers because it is difficult to compete with SOEs and FDI enterprises.

Table 14. Average income of employees in enterprises in the North Central Region by ownership

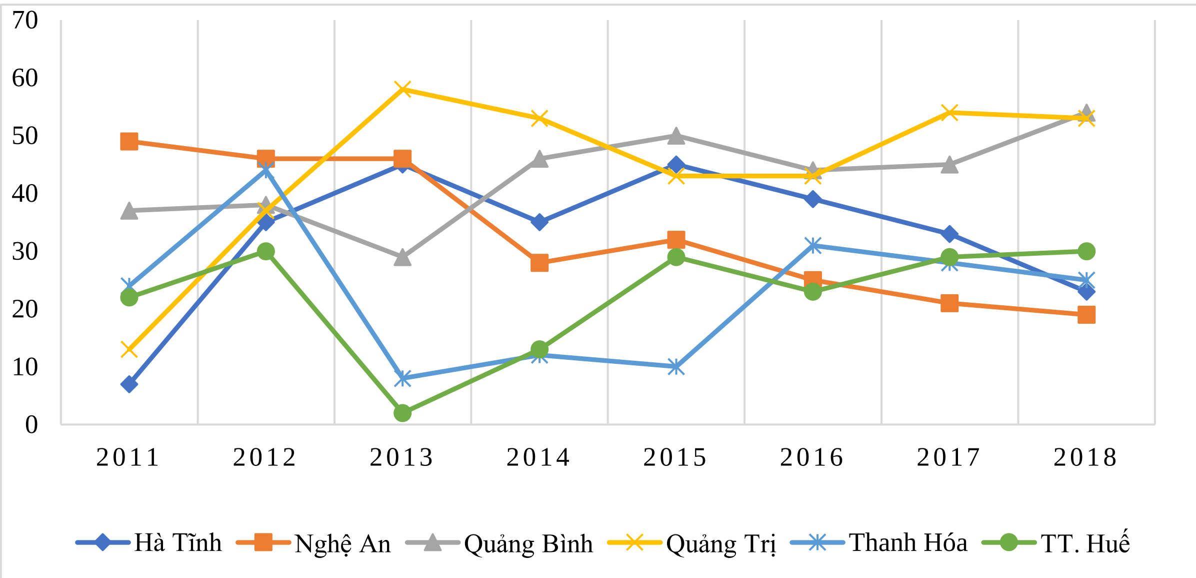
Period	State enterprises	Domestic private enterprises	FDI enterprises
2011-2014	4,6	3,3	5,8
2015-2018	5,0	3,9	6,0
Compare 2 stages	109	116	103

Source: Calculation from the enterprise survey data set collected between 2011 and 2018 by General Statistics Office

Fourthly: The business investment environment through the PCI index of provinces in the region has improved, but there are relatively clear differences between localities in the region.

The PCI index of the North Central provinces falls into group 3 (good) and group 4 (moderate). In which, Nghe An and Ha Tinh provinces have significantly improved in 2014, Nghe An ranked the 28th, increased to 19th in 2018; Ha Tinh ranked the 35th in 2014 and ranked 23rd in 2018. Meanwhile, there are 2 provinces in which the PCI index has not improved and is ranked in the middle group, namely Quang Binh and Quang Tri (in 2018 Quang Binh ranked the 54th and Quang Tri ranked the 53rd). And among the sub-indices, provinces have low indicators of fair competition, informal costs, land access and provincial government dynamism. Thereby, indicating the problem in creating conditions and business investment environment and attracting investment enterprises in limited areas.

Figure 2. PCI ranking of the provinces in the North Central region



4. Discussion and Conclusion

Through the results of research and analysis, it shows that there are many problems of enterprise development in the private sector in the North Central region. With small and micro-enterprises accounting for the majority, the field mainly focuses on services and commerce. The private economy is not large enough to reach out to foreign provinces and abroad. The number of manufacturing enterprises is small, the rate of technological innovation is very low, while a number of priority areas for development of the North Central region require association with high technology and modern technology. Labor qualifications and employment size for each type are limited. Production and business efficiency are low, making it difficult to compete, accumulate capital and expand production and business. This triggers the risk of lagging businesses in the region when facing the current integration and the 4.0 technology revolution.

The number of large enterprises in the region is too small, the problems is that there is no large enterprise to take the role of a driving force, a leader, a locomotive to pull businesses in the region to develop, besides that medium-sized enterprises account for a small proportion, so it is difficult to develop into large enterprises and at the same time unable to take the role of a bridge and the link between large and small enterprises to create a foundation for development. And this is a difficulty for investment in technological innovation and participation in production value chains for businesses in the region when the reality of capital size is low. When the business environment is not equal, it is impossible to create links, without a chain or network of business links, it is difficult to create a business force. Besides, businesses do not have a business strategy. Too few innovative start-ups.

With the above issues, business development of the private sector in the North Central Region should pay attention to: (1) Strengthening research and development capacity, technological innovation, creating conditions for mechanisms and policies to develop innovative start-ups. (2) Enterprises are interested in business models, business culture and application of corporate governance technology and actively participate in linkages between enterprises in the region. (3) For industries and products in which localities and regions have strengths, develop mechanisms and policies to encourage the development of associated industry clusters, value chains, and build product brands according to the region's advantages. (4) Support training in management skills for entrepreneurs of the business sector to form a team of entrepreneurs with enough reach to lead businesses participating in the chain. (5) Promote the development of business associations, industry associations with extensive participation of businesses in the private sector.

Abstract

This study uses statistical data of 63 provinces and cities in Vietnam for the period 2011-2018 and employs the ordinary least square method (OLS) to investigate empirically the impact of foreign direct investment on urbanization in Vietnam. The study finds that foreign direct investment has played a significantly positive role in the level of Vietnam's urbanization. Apart from research results, the study proposes practical and feasible solutions for promoting positive impacts and restraining negative ones of foreign direct investment on Vietnam's urbanization.

Keywords: *Foreign direct investment, urbanization, Ordinary least squares, Vietnam*

1. Introduction

Foreign direct investment (FDI) brings into a host country a package of capital, technology and other specific intangible assets from the firm's investing process, and therefore, it is expected that FDI will play a positive role in the economic development process of a host country. According to the data on the urbanization rate calculated by permanent population, Vietnam has experienced a significantly increase in the level of urbanization that increased from 13,1 percent in 1955 to 37,7 percent in 2020 with an urban population growth rate of 3,4 percent on average (United Nations, 2020). Nevertheless, Vietnam's urbanization level still relatively lowers than developed countries' one. Therefore, as far as socio-economic development in Vietnam is concerned, accelerating the transfer of surplus labour from rural areas to cities and increasing the urbanization rate are still the important tasks in long run.

According to the data from General Statistics Office of Vietnam, foreign direct investment plays an important role in the Vietnam economy when the FDI's contribution to GDP increased from 10,3 percent in 1998 to 19,6 percent in 2017 and the recorded investment proportion of the FDI sector in GDP fluctuated around 23.5% during the period from 2015 to 2018 that has reinforcing the important role of FDI in developing and maintaining economic conditions in Vietnam (General Statistics Office of Vietnam, 2019).

While FDI has significantly contributed to Vietnam's economic development, has it also contributed to the level of urbanization in Vietnam? In recent years, there have been a number of studies which focus on assessing the attraction and the implementation of FDI inflows or analysing its impact on aspects of socio-economic development. With theoretical and methodological bases from published studies, a number of domestic studies indicate two transmission channels through which FDI has been improving the efficiency of the host country's development activities are technology transfer to and technology spillover effects on domestic enterprises. However, researching the impact of FDI still has some deficiencies in methodology and practical issues. There are no domestic studies using quantitative data analysis methods to invesigate the impact of FDI on urbanization in Vietnam, no studies with comprehensive approaches of impacts of FDI on the process of urban development as well as studies on the scope of metropolitan areas and coastal urban ones. Accordingly, the research team proposes the research topic "The impact of foreign direct investment on urbanization in Vietnam" with the aim of specifying the impact of FDI on the urbanization process in Vietnam and offering reasonable solutions to Vietnam's urbanization strategy. This study will answer some following main questions: Does FDI have an impact on urbanization in Vietnam? Does FDI have a positive or negative impact on the urbanization process in Vietnam? Which solutions promote the positive impacts and limit the negative ones of FDI on urbanization in Vietnam?

2. Literature Reviews

In abroad, some studies have affirmed positive relationship between foreign direct investment and urbanization. For example, Tam Bang Vu, Byron Gangnes & Ilan Noy (2008) indicated that FDI has played a positive and statistically significant role in economic growth, and through interactions between FDIs inflows and labour resources, the impact of FDI has the huge difference among economic sectors, in which are mostly concentrated on secondary sector. When Yan Wu and Chunlai Chen (2016) used a city level panel data containing 262 cities for the period 2004-2012, they found that FDI on average has played a significantly positive role in China's urbanization. However, the impact of FDI on urbanization contribute greatly to the difference of urbanization rates between coastal and inland regions in China. The study found that FDI has a positive and significant impact on urbanization in the coastal region but has no impact on urbanization in the inland region. Concerning the data of 262 China's cities during the period from 2004 to 2013, in the following study, Yan Wu and Chunlai Chen (2017) also found that FDI has a positive and significant impact on urbanization in the coastal region but has no significant impact on urbanization in the inland region. These studies indicate that FDI inflows not only concentrate in coastal regions but will also tend to contribute to industrial and service sectors. Moreover, concerning the impact of FDI on urbanization in African countries, Carl Grekou and Ferdinand Owoundi (2020) found that urbanization appears as a corollary to economic development to which FDI inflows contribute significantly to developing countries, especially in Africa.

In Vietnam, the impact of foreign direct investment on urban development in Vietnam has been paid attention in the last few years but with limitations. For example, when building theoretical framework for the impact of FDI on urbanization in PhD thesis, Nguyen Thi Hoa (2014) only focused on proposing viewpoints, orientations, and solutions to promote positive influences and limit negative effects on FDI on urbanization on a sustainable manner in Da Nang towards 2025. Another example is the Tran Kim Cuong (2015) 's research paper on the relationship between foreign direct investment and economic growth, the study based on the data from national level of 44 countries which are mostly developing countries, especially the countries received the most FDI including Vietnam, for the period of 1995-2012 to estimate the impact of FDI on economic growth through the GMM estimation method, and to compare with the result of the OLS regression method. The result shows that urbanization plays an important role in promoting the spread of FDI in the host country, leading to an increase the number of urban areas with highly qualified human resources and large consumer demands , and attracting the investment from FDI enterprises.

In contrast, some negative impacts of foreign investment on urbanization are shown in some recent works such as the study of Cao et al (2015), when analysing the relationship between FDI and the level of urbanization in the coastal areas in Jiangsu and Guangdong provinces of China, study showed that FDI has a negative impact on the GDP growth in urban areas, the high level of correlation is not recorded in Jiangsu while recorded the negative correlation in Guangdong. Additional, A study by Wanshu Wu and Kai Zhao (2017), concerning the effects between FDI and urbanization, showed that FDI is an exogenous force for the new process of urbanization and this process strongly supports attracting foreign capital inflows. However, this study also showed that concentrating FDIs inflows on surrounding areas would restrain the process of local urbanization and increasing urbanization in surroundings would restrict FDIs inflows in the local area.

3. Method

Research methods

The study uses descriptive statistics and quantitative research to investigate the impact of FDI on urbanization. Descriptive statistics are used to describe the basic features of the data in a study. They provide simple summaries about the sample and the measures. Together with simple graphics analysis, descriptive statistics form the basis of virtually every quantitative analysis of data. With the help of the quantitative research combined with panel data models, it helps to design quantitative observations of variables, analyse quantitative data, and explain the relationships between variables by quantitative relationships.

Data collection methods

The data in this study are cited from publications of the General Statistics Office of Vietnam such as Socio-economic statistical data of 63 provinces and cities in 2015-2018 periods, Statistical yearbook from 2011-2018, annual reports on economic development, ... Moreover, these data are also in the process of collecting additional information, collating approximate figures, and supplementing missing ones from World Bank reports.

Methods of data processing

The dependent variable is the urbanization rate, the ratio of urban population to their total local population, can reflect the changes of urban population what are affected by economic factors, so it is a more accurate indicator of the urbanization rate in Vietnam. To investigate the impact on FDI on urbanization, we use the ratio of foreign direct investment to Gross regional domestic product (*FDI/GRDP*) that the calculation of this ratio has several steps. Firstly, the annual US dollar value of FDI inflows was converted into Vietnamese dong value by using the current exchange rate. Next, the ratio of foreign direct investment to gross regional domestic product of each city is calculated. Therefore, we expect that the variable of the ratio of FDI to GRDP (FDI/GRDP) to have a positive impact on urbanization.

Moreover, based on the collected data, we pay attention to the following variables which are expected to have impacts on urbanization. The economic structure of a city has an important impact on the level of urbanization, so we use the share of primary sector in GRDP (*PS/GRDP*) to control for the economic structure of a city. It is expected that the higher share of the primary sector in GRDP, the lower the urbanization level of a city will be. In addition, the value of per capita GDP (*PGDP*) also reflect the level of economic development and we expect the variable of per capita GDP to have a positive impact on urbanization. The value of assets and long-term investment (*FAI*) is concerned. In fact, FDI in public utilities and transportation infrastructure is essential for the urban development and the flow of labours, goods and information between urban and rural areas to facilitate the development of urbanization. Moreover, the size of population or the total population (*POP*) in each city could also reflect its urban development in the future therefore have to add to model.

Model specification

In overall, there is no standard theoretical framework to lead the empirical studies on the relationship between FDI and urbanization at national level in Vietnam, so we establish an experimental model based on Yan Wu & Chulai Chen 's empirical model which estimates the impact of FDI on urbanization in China. Therefore, we estimate the impact of FDI on urbanization in Vietnam by using the following experimental model:

$$UR_{it} = \beta_0 + \beta_1 {*} UR_{it-1} + \beta_2 {*} FDI/GRDP_{it-1} + \beta_3 {*} PS/GRDP_{it} + \beta_4 {*} lnPGDP_{it} + \beta_5 {*} lnFAI_{it} + \beta_6 {*} lnPOP_{it} + u_{it}$$

Table 1: the explanation about variables in our experimental model

Biến	Explanation
UR_{it}	The urbanization rate at city *i* and in year *t*
UR_{it-1}	The urbanization rate at city *i* and in year *t-1*
$FDI/GRDP_{it-1}$	The ratio of FDI to GRDP at city *i* and in year *t-1*
$PS/GRDP_{it}$	The share of primary sector in GRDP at city *i* and in tear *t*
$lnPGDP_{it}$	Natural logarithm of per capita GDP of city *i* and in year *t*
$lnFAI_{it}$	Natural logarithm of the value of assets and long-term investment of city *i* and in year *t*
$lnPOP_{it}$	Natural logarithm of total population of city *i* and in year *t*
u_{it}	Random disturbance term

Source: Author team

When establishing the experimental model, we consider the major aspects that based on assumptions in the empirical model of Yan Wu & Chulai Chen (2016). They explained about their variables that past urbanization influences the present urbanization process because of inertia (Zang and Wan, 2013) and FDI has an impact on urbanization on the assumption that there will be a time lag before FDI works.

In this study, we use the method of estimation of regression coefficients that is the ordinary least squares method (OLS) to investigate the impact of FDI on urbanization in Vietnam. In this model specification, the variable of our interest is *FDI/GRDP*. If the coefficient of β_2 is positive and statistically significant, then FDI has contributed to increasing urbanization in Vietnam. In contrast, if it is negative and statistically significant, the FDI has contributed to reducing urbanization in Vietnam.

4. Results

Descriptive statistics of the variables in the model

Table 2: Descriptive statistics of the variables

	N	Min	Max	Mean		Std. Deviation	Skewness		Kurtosis	
	Statistic	Statistic	Statistic	Statistic	Std. Error	Statistic	Statistic	Std. Error	Statistic	Std. Error

Regression results and explanations

After completed the estimation of regression coefficients, the regression results of the specified model are reported in Table 3.

Table 3: Estimation of regression coefficients in the model

Dependant Variable: UR
Method: Least Squares
Date: 04/06/21 Time: 09:04
Sample (adjusted): 1/02/2011 3/04/2018
Included observations: 497 after adjustments

Variable	Coefficient	Std. Error	t-Statistic	Prob
C	-0.487740	2.251349	-0.216643	0.8286
UR(-1)	-0.006170	0.044902	-0.137409	0.8908
FDI/GRDP(-1)	1.771967	0.814185	2.176369	0.0300
PS/GRDP	-0.804975	1.350008	-0.596274	0.5513
LnPGDP	0.454774	0.303299	1.499424	0.1344
LnFAI	0.001918	0.129768	0.014777	0.9882
LnPOP	-0.094867	0.245718	0.386081	0.6996

R-squared	0.021938	Mean dependent var	0.415736
Adjusted R-squared	0.009962	S. D. dependent var	2.960312
S.E. of regression	2.945530	Akaike info criterion	5.012439
Sum Squared resid	4251.312	Schwarz criterion	5.071715
Log likelihood	-1238.591	Hannan-Quinn criter.	5.035705
F-statistic	1.821777	Durbin-Watson stat	2.035958
Prob(F-statistic)	0.091089		

The results show that there is only a variable of ***FDI/GRDP(-1)*** which is statistically significant (***p_value*** = 0.0300 <0.05) and there is enough evidence to remove the variables including ***UR(-1)***, ***PS/GRDP***, ***ln(PGDP)***, ***ln(FAI)***, and ***ln(POP)*** because they have not statistical significance. The reduced model has the following form:

$$UR_{it} = \beta_0 + \beta_1 * FDI/GRDP_{it-1} + u_{it}$$

Table 4: Estimation of regression coefficients in the reduced model

Dependant Variable: UR
Method: Least Squares
Date: 04/06/21 Time: 09:21
Sample (adjusted): 1/02/2011 3/04/2018
Included observations: 501 after adjustments

Variable	Coefficient	Std. Error	t-Statistic	Prob
C	0.3000510	0.140592	2.137463	0.0330
FDI/GRDP(-1)	1.835808	0.809101	20268947	0.0237

R-squared	0.010212	Mean dependent var	0.415212
Adjusted R-squared	0.008228	S. D. dependent var	20948551
S.E. of regression	20935395	Akaike info criterion	4.996227
Sum Squared resid	4302.587	Schwarz criterion	5.013059
Log likelihood	-1249.555	Hannan-Quinn criter.	5.002831
F-statistic	5.148121	Durbin-Watson stat	2.008094
Prob(F-statistic)	0.023698		

We now consider the regression results based on the reduced model. The results show that ***p_value*** of the variable of the ratio of FDI to GRDP (*FDI/GRDP*) is lower than 0.05, indicates that this variable is statistically significant; and R_squared coefficient has not significant difference between the specified model and the reduced model, so the model could be accepted after reducing the variables which are not statistically significant. In addition, the regression results show that the regression coefficient of *FDI/GRDP* has positive value, implying that the higher level of FDI presence in a city, the higher the urbanization level of that city will be. This finding provides strong evidence that FDI has played a positive role in promoting the development of urbanization in Vietnam.

5. Discussion and Conclusion

Discussions of the results

When compared with the research results of Yan Wu & Chunlai Chen (2016), after the authors used the research data of 262 Chinese cities in the period 2004-2012, their results showed that FDI has a positive impact on promoting urbanization both in the overall data of 262 cities as well as in the data of coastal areas. The research results can be explained by reasons that the coastal area is the main destination for FDI inflows, attracting about 80% of total FDI into China (Yan Wu and Chunlai Chen, 2016); at the same time, FDI also plays a significant role in the process of job creation, income enhancement, and economic development, thereby facilitating changes in the regional economic structure and attracting a large number of labours to urban coastal areas that is the leading force in increasing urban population. With the similarity in geographical location when 28 out of 63 provinces and cities of Vietnam are in coastal areas within 19 coastal economic zones (as of 2020), investment capital inflows, especially foreign investment, will play a crucial role in the goal of forming dynamic economic zones and promoting multi-sectoral development in Vietnam. The above explanation reinforces the expectation as well as the analysis results of the author team that FDI will have a positive impact on urbanization in Vietnam, increasing the contribution of FDI will increase the level of urbanization in the localities received this capital.

Recommendations

Throughout estimating the impact of FDI on urbanization, the study proposes two groups of solutions to promote the positive effects and limit the negative effects of foreign direct investment on urbanization in Vietnam.

(i) The group of solutions promote the positive effects of FDI on urbanization:

Firstly, it is necessary to prioritize the careful selection of FDI inflows that based on types of sectors to be appropriate to the requirements of socio-economic development in Vietnam in each period, and to limit oversea investments to domestic enterprises' strong fields.

Secondly, when the country's internal resources are still limited, it is important to promote the attraction of FDI destinations where FDI plays a leading role in contributing to economic development through creating an open business environment, building an attractive investment mechanism, and implementing investment support activities in duration of project planning as well as the project implementation.

(ii) The group of solutions limits the negative effects of FDI on urbanization:

Firstly, to minimize the environmental consequences caused by the development and urbanization process, authorities must carefully inspect FDI projects, tighten up licensing conditions, and careful select investment projects with the commitment on environment regulations.

Secondary, to limit the potential risk of becoming a destination for outdated technologies, it is necessary to have legally binding agreements and inspection activities on the process of transferring machinery, equipment, and operating technology and manufacturing that must take steps to ensure the quality of technology, properly assess the effects of these technologies on other economic sectors, carefully consider investment projects using technology in lines, and promulgate policies to encourage enterprises to innovate technology.

Thirdly, to limit inequality in front of the impacts of FDI on the economic structure in urban areas, it is necessary to appraise and evaluate FDI projects on the basis of object judgments, approve FDI projects in accordance with development context , and also implement support activities to improve the capacity of both labours and domestic firms by creating learning environment for labours and establishing mechanisms to support business activities, thereby increasing adaptability as well as enhancing competitiveness.

Conclusion

The main purpose of the study is to investigate the impact of FDI on urbanization in Vietnam. The study is based on the theoretical and methodological basis to identify the aspects of urbanization, to estimate effects of FDI on the socio-economic development that have mentioned in other studies. In this study, we consider research models that investigate the impact of FDI on urbanization in the world to reinforce theoretical foundations and to establish the empirical model that is appropriate to the socio-economic conditions in Vietnam. Based on previous studies, the study establishes the empirical model with a panel dataset including data from 63 provinces and cities of Vietnam during the period from 2011 to 2018 and uses OLS regression method to investigate empirically the impact of FDI on urbanization in Vietnam. Besides, the study presents the socio-economic situation of Vietnam from 2011 to 2018 as well as observable positive and negative effects of FDI on urbanization. The results of the study on the relationship between FDI and urbanization show that FDI has a positive impact on the process of increasing urbanization in Vietnam. The study creates a premise for attracting more FDI inflows to Vietnam in order to develop and maintain socio-economic conditions of the city. At the same time, the study proposes several solutions for urban authorities to increase the positive effects and limit the negative effects of FDI on urbanization in Vietnam.

IMPACT OF CONDOMINIUM MANAGEMENT SERVICE FACTORS ON SATISFACTION OF RESIDENTS IN VIETNAMESE CITIES

MBA. Le Va Xi
levaxi@yahoo.com
Faculty of Marketing, National Economics University, Vietnam

Abstract

The development of apartment buildings is an inevitable trend of Vietnamese cities. Sustainable apartment development depends on the quality of apartment operation management services to ensure that the needs of residents are met. This research paper surveyed a sample of 255 residents living in a number of apartment buildings in Hanoi and Hai Phong to assess the satisfaction of residents and measure the impact of service factors on the building operation management of apartments to the satisfaction of residents. The study identified 6 groups of service components that have a decisive impact on the satisfaction of residents with the quality of management services of apartment operation management boards, thereby proposing some key implications and policies to improve the satisfaction of residents living in apartments.

Keywords: *Residents' satisfaction, service quality of operation management, utility management, management policy, apartment repair and maintenance, security, cleaning, landscape and entertainment*

1. Introduction

Vietnam is a developing country, the process of urbanization is taking place rapidly, the dense population concentration has created a huge demand for housing in urban areas. The demand for housing has increased, the land fund has narrowed, leading to the development of high-rise apartment buildings as an inevitable trend in Vietnam's urban areas. Housing businesses have been developing many multi-owner apartment buildings, including utilities to maximize human life. By 2020, 34.4% of the total population of Vietnam will live in urban areas. The population density in big cities like Hanoi is up to 9,343 people/km2. Preliminary statistics so far, the country has about 5,000 apartment buildings; in which concentrated mainly in Hanoi and Ho Chi Minh City. However, the process of residents moving into apartment buildings has generated many inadequacies, affecting residents' confidence in the apartment living environment.

The satisfaction of residents living in high-rise apartment buildings is not just about their apartments. Satisfaction depends on the provision of services and utilities such as water supply, electricity, access roads, drainage systems, waste treatment facilities as well as attention to prompt repair and maintenance, etc. depends on the management and operation of the apartment building. The reality of apartment management in Vietnam over the past time has shown that there are still many shortcomings in the management and operation activities of apartment building management organizations. Organizations that manage and operate apartments also face the problem of increasing number of residents' complaints and disputes as well as other dissatisfaction issues.

Therefore, measuring the satisfaction of residents in high-rise apartment buildings has received attention from housing policy makers and housing businesses. With the potential controversy often occurring around the management activities of apartment buildings, there have also been studies on people's satisfaction focusing on the quality of housing services in general. However, to ensure the satisfaction of residents living in apartment buildings, it is necessary to pay attention to the quality of services that apartment management organizations provide in more detail. The evidence to date shows that there is a lack of in-depth studies on the apartment services provided by apartment management organizations and the satisfaction of residents with the services they receive.

The quality of apartment building operation management services is very important to maintain the operation of the building. That must be ensured through the commitment and efforts of the apartment management board in regularly reviewing the quality of building operation services, in order to bring satisfaction to residents. Therefore, the requirement to improve the provision of apartment building management services to support and maintain the general activities of the apartment complex becomes increasingly urgent. The reality of apartment building management poses an urgent need to study and assess the satisfaction of residents with the quality of apartment building operation management services in Vietnamese cities in order to improve management activities. apartment buildings, improving the quality of apartment services for residents.

2. Literature Review

The satisfaction of people living in the apartment is the satisfaction of the place to live and the living environment in the apartment. Researchers agree that occupant satisfaction is a multidimensional concept that reflects residents' aggregate assessment of the apartment living environment. The assessment of residents' satisfaction with the elements of apartment building operation management services helps apartment management organizations understand the needs of residents and improve the quality of apartment operation management services. (Abolade et al., 2014). Therefore, measuring resident satisfaction with apartment operations management services plays an important role in improving the performance of apartment management (Abolade et al., 2014).

The available studies show that the quality of apartment building operation management services directly affect the satisfaction of residents. The service elements of apartment operation management include housing management policy, repair and maintenance, security, cleaning, landscaping and entertainment, management of utilities. These six groups of operational management service elements are the basic causes of residents' satisfaction/dissatisfaction. Below is the relationship between these factors and the satisfaction of apartment residents.

Utilities management is an important component of apartment management, including all utilities serving the population, such as energy services, water supply, telecommunications, gas supply and use. These services are guaranteed by service companies based on contracts signed with residents. The apartment service management organization coordinates with other providers to ensure the functionality of utilities and interacts with residents to ensure that residents receive these services smoothly. Availability of basic services, such as electricity, water supply and drainage in an area that is well linked to other parts of the city, infrastructure, and guaranteed ownership are considered indicators. number of good quality accommodation (Ibem, 2011). Therefore, it is necessary to study the quality of management of utilities and it is necessary to identify this as an important variable affecting the satisfaction of residents.

Hypothesis H1: The quality of utility management has a positive impact on the satisfaction of residents for apartment building management and operation services.

Several existing studies have examined the impact of apartment management policy on resident satisfaction (Paris and Kangari, 2005; Gurstein and Small, 2005; James et al., 2009). Management policies are considered an important part of the apartment environment (Ahlbrandt and Brophy, 1976; Sadacca et al., 1974; Bechtel 1973;). Researchers have shown that resident satisfaction is positively correlated with apartment management's certainty in enforcing the rules and management's ability to respond to residents' needs. These studies point to the direction of improving apartment operations management services as a way to increase resident satisfaction (Ahlbrandt and Brophy, 1976). After that, a large number of studies on housing management, which emphasized the importance of management policy for resident satisfaction (Ariff and Davies 2011; Pfrang 2015; Boyne and Walker 1999).

Hypothesis H2: The quality of housing management policy of the apartment building management board has a positive impact on the satisfaction of residents about apartment operation management services.

Apartment buildings also require adequate and effective repair and maintenance to avoid damage, affecting people's health and life (Ishak et al., 2007). Building maintenance is defined as work "in addition to daily and regular cleaning, necessary to maintain the performance of the building structure and its services" (BSI 1986, cited in Wood 2009). Alternatively, Wood proposes a shorter definition for building maintenance as "the sum total of all the work that keeps the building running efficiently" (Wood 2009). Maintenance and repair play a role. management of apartments and residents' satisfaction in Scotland (Croal et al., 2003) It is clear that maintenance is a factor that has a strong impact on overall apartment satisfaction. Therefore, it is necessary to study the factors related to maintenance contractors that affect the satisfaction of residents.

Hypothesis H3: Service quality of facilities management, repair and maintenance has a positive impact on residents' satisfaction with apartment operation management services.

Security needs for people, and families or society is a natural and important need. Apartment buildings must always be safe and well protected. Security is one of the apartment building management services that has become important for any apartment complex. Apartment service management companies have found that in addition to their core business, non-core activities (such as cleaning and security) are part of their efforts to provide occupant satisfaction (Razali et al., 2007).

Hypothesis H4: Security service quality has a positive impact on residents' satisfaction with apartment building operation management services.

Cleaning service is an essential service in apartment buildings. Cleaning the apartment environment is considered a core activity of housing service management organizations (Binder, 1992; Park, 1998). Cleaning is a key function of apartment building management organizations to ensure the health of residents. Today, clean facilities are very important to health care and occupant satisfaction, and it is also one of the most expensive services when operating a building (Klungseth and Blakstad, 2016; May and Pitt, 2012). Therefore, the standard of environmental cleanliness will have a direct impact on resident satisfaction.

Hypothesis H5: Cleaning quality has a positive impact on residents' satisfaction with apartment operation management services.

Recreational activities and physical activity are indispensable requirements of the residential community in the apartment complex. There have been a number of studies on recreation and landscape sectors to assess their impact on resident satisfaction (Mahdavinejad et al., 2012; Lai and Yik (2011). Landscape and recreation is one of the main areas of apartment operation management services. Lai (2012) identified a number of factors related to landscaping and recreation, including aesthetics and tidiness of crops, pest control, environmental protection measures, recreational facilities (e.g. play equipment), and recreational facilities.

Hypothesis H6: Landscape and entertainment have a positive impact on residents' satisfaction with apartment building operation management services.

Combining the independent and dependent variables, we have a research model as follows

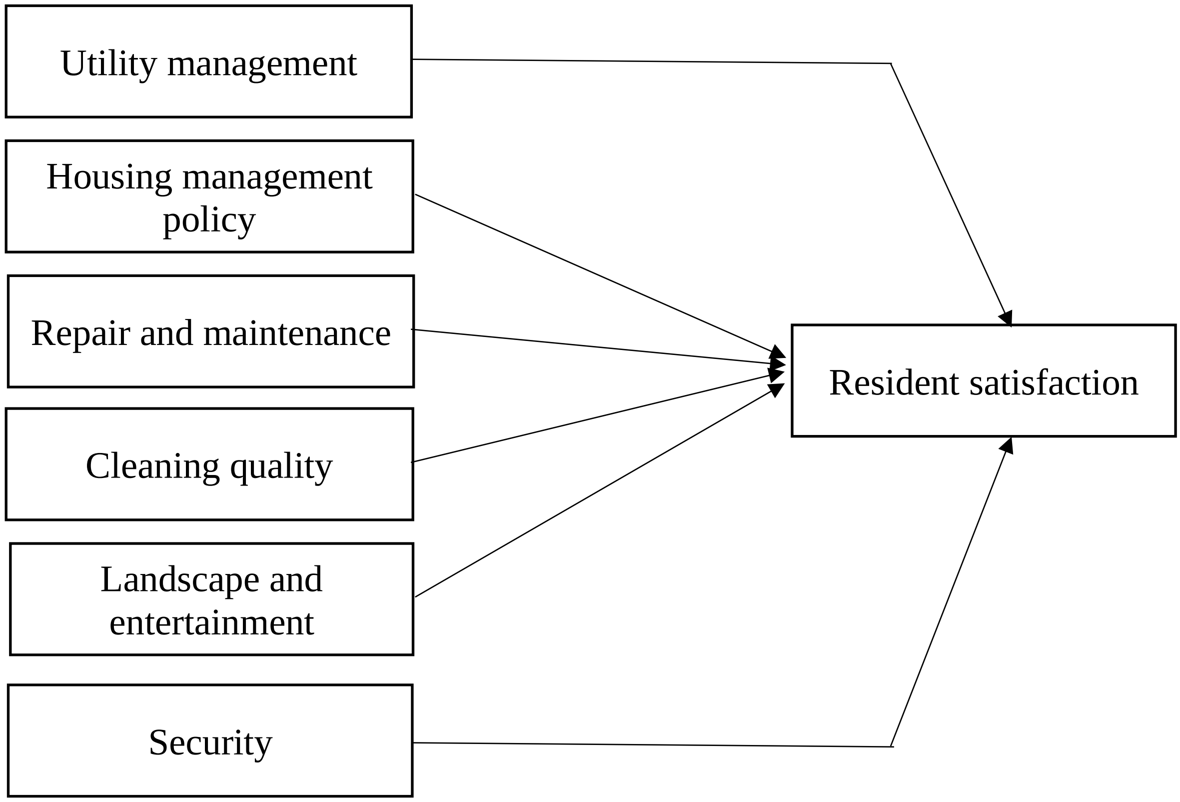

Figure 2.6: Research model of apartment building operation management service factors affecting the satisfaction of apartment residents

3. Method

In order to carry out the research objective of assessing the impact of apartment operation management service factors on the satisfaction of residents, the research process has been conducted through two phases, including qualitative and quantitative research. In phase 1, conducting qualitative research by directly interviewing a sample of 15 residents living in the apartment and 6 apartment managers to determine the components measuring 6 independent variables and dependent variable. The author used a semi-structured questionnaire to collect information for the identification of observed variables measuring factors in the research model to design the questionnaire. The Likert scale from 1 to 5 points (1: strongly disagree – 5: strongly agree) was also applied to measure observed variables.

Table 1: Observed variables measuring the independent variable

Independent variable	Observed variable	Code
Utility management	Clean and odorless drinking water	TI1
	Fresh air and proper airflow	TI2

Independent variable	Observed variable	Code
	Elevator and clear instructions system	TI3
	Good soundproofing system, no noise	TI4
	I can easily use gadgets when I need it	TI5
	Diverse utilities are provided 24/24 and are fixed immediately when there is a problem	TI6
Management policy	Building service charges are completely reasonable	CS1
	The notices of the building management are always transparent, clear and easy to understand	CS2
	The process of handling dispute and resolving complaints is specific, scientific, and fast	CS3
	The building management board always resolves disputes and complaints in a fair, civilized and reasonable manner	CS4
	Knowledgeable, courteous and attentive building management employees	CS5
Repair and maintenance	I see the building is under regular maintenance	SC1
	I found the maintenance and repair process to be very quick	SC2
	After maintenance and repair, the utilities work very well again	SC3
	I find the repair and maintenance employees friendly and polite	SC4
	I found the building maintenance employees to have good skills	SC5
Cleaning	I found the common areas to be very clean	VS1
	The cleaning employees completes the entire job	VS2

Independent variable	Observed variable	Code
	The cleaning employees is polite, considerate and attentive.	VS3
Landscape and entertainment	Green space is suitable	CQ1
	Fresh and pleasant air	CQ2
	I find it easy to move to different locations or move around in the apartment complex	CQ3
	The entertainment areas in the apartment are very diverse	CQ4
	The entertainment areas have modern facilities and serve my needs well	CQ5
Security	All areas in the apartment such as elevators, foyers, basements for parking, etc., all have strict security systems and surveillance cameras	AN1
	Polite and friendly security employees	AN2
	Security employees are well trained	AN3

In phase 2, direct quantitative survey of residents living in apartment buildings. The survey sample size is 255 residents living in some typical apartment buildings in two cities, Hanoi and Hai Phong such as Time City, HH Linh Dam, Golden Tower in Hanoi and SHP Plaza, Bac Son, Vincity in Hai Phong. Data were analyzed by SPSS software including descriptive statistics and multiple regression equations to test the research hypotheses.

Table 3: Demographic characteristics of the study sample

Personal characteristics	Respondents	Quantity	Rate (%)
Time living in apartment	Less than 1 year	64	25.1
	1-2 years	99	38.8
	3-5 years	55	21.6
	6-8 years	24	9.4
	9-10 years	7	2.7
	From 11 years or more	6	2.4
Academic level	Below high school	4	1.6
	High school	11	4.3
	College	34	13.3
	University	182	71.4
	Postgraduate	16	6.3
	Doctor	8	3.1
Income	Under 5 million	41	16.1
	6-10 million	34	13.3
	11-15 million	39	15.3
	16-20 million	57	22.4
	21-30 million	23	9.0
	Over 30 million	61	23.9

4. Results

4.1. Testing model and research hypotheses

Analysis of the reliability of the scales

The scales are evaluated through reliability testing using Cronbach's Alpha coefficient and calculating the total variable correlation coefficient. Then the retained variables will continue to be analyzed using the exploratory factor analysis (EFA) tool. Use Cronbach's Alpha reliability coefficient method before analyzing EFA factors to eliminate nonconforming criteria because these nonconforming criteria (junk) can create spurious factors (Nguyen Dinh Tho, Nguyen). Thi Mai Trang, 2009). The Cronbach Alpha reliability coefficient only indicates whether the criteria are related or not, but does not indicate which criteria should be removed and which observed variables should be kept. Then, the calculation of the correlation coefficient between the total variable will help to exclude those criteria that do not contribute much to the description of the concept to be measured (Hoang Trong, Chu Nguyen Mong Ngoc, 2008).

The minimum condition to test the reliability of the scale using Cronbach's Alpha coefficient is that each factor in the research model must have at least 2 observed variables. All 9 variables in my research model meet this requirement.

Table 4: Cronbach's Alpha coefficient of each variable

Variable	**No. of observed variables**	**Cronbach's Alpha coefficient**
Complaint	7	0,924
Time for problem solving	3	0,781
Utility management	6	0,825
Management policy	5	0,852
Repair and maintenance	5	0,880
Cleaning	3	0,901
Landscape	5	0,866
Security	3	0,889
Overall satisfaction	4	0,912

Source: Collected by Author

According to (Nunnally, J., 1978), all the observed variables have the total correlation coefficient (Corrected Item - Total Correlation) >= 0.3, then the variable meets the requirements. In addition, the value of Cronbach's Alpha coefficient ensures the standard from 0.6 or more (Hoang Trong, Chu Nguyen Mong Ngoc, 2008). In addition, for the highest reliability, the value of Cronbach's Alpha coefficient when removing the variable needs to be smaller than the total Cronbach's Alpha coefficient. The results show that all 9 factors give Cronbach's Alpha coefficient > 0.6. At the same time, the observed variables of each scale have a total correlation coefficient >= 0.3, showing that all observed variables meet the standards (Nunnally, J., 1978).

Table 5: Cronbach's Alpha coefficient of each variable after adjustment

Variable	No. of observed variables	Cronbach's Alpha coefficient
Complaint	7	0,924
Time for problem solving	2	0,852
Utility management	6	0,825
Management policy	5	0,852
Repair and maintenance	5	0,880
Cleaning	3	0,901
Landscape	5	0,866
Security	3	0,889
Overall satisfaction	3	0,914

Source: Collected by Author

Factor analysis

Exploratory factor analysis (EFA) for independent variables

After verifying the reliability of the scale, the factors affecting the satisfaction of residents in the operation and management services of the apartment building are considered factors of utility quality, management policy, repair and maintenance, landscaping and recreation, cleaning, security as original. The author continues to perform exploratory factor analysis with the remaining 27 variables on SPSS software.

According to (Kaiser, H.F., 1974), to meet the requirement that EFA can be performed, the KMO > 0.5. The KMO value in this case is 0.861 > 0.5, which shows that the data is suitable for factor analysis, and Sig. Bartlett's Test = 0.000 < 0.05, which states that the observed variables are correlated in the population. In addition, According to Hair et al. (1998, 111), factor loading is an indicator to ensure the practical significance of EFA.

With a sample number of 255, the load factor is greater than 0.35, the EFA is sufficiently meaningful. So with the above variables I am qualified to do EFA.

After conducting EFA analysis with the above 36 observed variables, I found that the observed variables all belong to the groups suitable for the Rotated Component Matrix as follows:

Table 6: Rotated Component Matrix of Independent Variables

	Component							
	1	**2**	**3**	**4**	**5**	**6**	**7**	**8**
SC4	0,792							
VS2	0,775							
VS3	0,765							
SC3	0,730							
VS1	0,713							
SC5	0,694							
SC1	0,650							
SC2	0,591							
TI3	0,531							
CS5	0,497							
KN2		0,840						
KN4		0,829						
KN1		0,825						
KN6		0,819						
KN3		0,808						
KN7		0,799						
KN5		0,760						
CQ4			0,831					
CQ5			0,740					
CQ1			0,568					
CQ2			0,556					
CS1				0,691				
CS4				0,585				

CS3				0,582				
CQ3				0,492				
TI6					0,794			
TI5					0,557			
TI4					0,477			
AN3						0,682		
AN2						0,640		
AN1						0,553		
CS2						0,533		
TG2							0,887	
TG1							0,825	
TI1								0,749
TI2								0,700

Source: Collected by Author

According to (Hair, 1998) factor loading >= 0.35 to ensure the practicality of EFA. I found that all 36 observed variables satisfy this condition. Finally, the author obtained the extracted variance = 75,560% and the Eigenvalues index is 1,115, ensuring that the results of the analysis of exploratory factors are only accepted when the extracted variance is > 50% and Eigenvalues > 1. Thus, the independent variable including observed variables belonging to 6 groups of factors explains 75.560% of the dependent variable.

Exploratory factor analysis EFA for the dependent variable

Based on theories and related models in the above chapter, the dependent variable in the topic is defined as "Resident satisfaction" which is evaluated based on 4 observed variables. I conducted exploratory factor analysis EFA for the dependent variable on SPSS software. The results of the KMO and Barlett's test for the dependent variable show that the KMO value in this case reaches 0.746 > 0.5, which shows that the data is suitable for factor analysis and the Barlett's Sig = 0.000 < 0.05 says that the observed variables are correlated with each other. So I am qualified to do EFA for the dependent variable. The results of performing EFA show that all observed variables converge at 1 factor. At the same time, the extracted variance = 85.651% > 50% and the Eigenvalues index = 2,570 >1 ensure that the factor analysis results are accepted. Thus, the dependent variable consists of 3 observed variables belonging to 1 factor, which explains 85,651% of the variables.

Component	Initial Eigenvalues			Extraction Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	2.570	85.651	85.651	2.570	85.651	85.651
2	268	8.934	94.585			
3	162	5.415	100.000			

4.2. Regression model and conclusions about research hypotheses

The model's adjusted R2 squared value of 0.657 shows that 65.7% of the variation in the variable "Resident satisfaction" is explained by the variation of 6 independent variables ("Repair and maintenance", "Security", "Utility management quality", "Landscape and entertainment", "Cleaning", "Building management policy"). Durbin – Watson value = 1,845 ≈ 2 shows that there is no first order series correlation in the model and the collected data is good.

Next, testing the hypothesis about the overall fit of the model shows that the F-test value in the ANOVA table is equal to 82,162 and the Sig value of the test F = 0.000 < 0.05, shows that the R squared of the population is not 0. That means that the linear regression model built is suitable for the population.

Table 11: Regression analysis

Model		Unstandardized coefficient		Standardized coefficient	t	Sig.
		B	Standard Deviation	Beta		
1	(Constant)	-0.362	0.199		-1.818	0.070
	Utility management quality (QLTI)	0.098	0.045	0.105	2.199	0.029
	Repair and maintenance (SCBT)	0.176	0.076	0.149	2.324	0.021
	Management policy (CSQL)	0.168	0.068	0.142	2.481	0.014
	Security (AN)	0.181	0.062	0.179	2.926	0.004
	Landscape and entertainment (CQGT)	0.352	0.055	0.354	6.346	0.000
	Cleaning (VS)	0.084	0.040	0.087	2.087	0.038

Source: Collected by Author

The result shows the Sig value of all factors are less than 0.05, so the control variables are significant for the dependent variable and no variable is removed.

We have the regression equation:

*HL = 0.105*CLTI + 0,149*VSSC + 0,142*CSQL + 0,179*AN + 0,354*CQGT + 0,087*VS*

The equation helps to determine the degree of influence of the factors, thereby assessing the influence of each factor in the model on the dependent variable, which is the level of satisfaction of residents with apartment operation management services.

The results of assessing the influence of factors on the dependent variable are as follows: "Landscape and entertainment" has the greatest impact with an impact level of 0.354; followed by the factor "Security" with an impact level of 0.179; "Repair and maintenance" with an impact level of 0.149; "Management policy" with an impact level of 0.142. The two factors with the least impact are "Utility management quality" and "Cleaning" with levels of 0.105 and 0.087, respectively.

Table 12: Conclusions about research hypotheses

Hypothesis	Content	Conclusion
GT1	Good quality of utility management increases resident satisfaction	Approved
GT2	Good management policy increases resident satisfaction	Approved
GT3	Good maintenance and repair increases resident satisfaction	Approved
GT4	Good cleaning increases residents' satisfaction about apartment management and operation services	Approved
GT5	The more the entertainment and landscape ensures, the more satisfied residents will be	Approved
GT6	Good security increases residents' satisfaction about apartment operation and management services	Approved

5. Discussion and Conclusion

5.1 Policy implications for Apartment Management Board

Based on the research results, the author proposes a number of solutions for organizations providing apartment building operation management services, as well as for other stakeholders such as local authorities and apartment maintenance contractor.

Firstly, there should be a quick, reasonable, convenient and timely complaint handling process for residents. Based on the actual situation, the management of many apartments does not have a transparent and clear handling process for residents, causing frustration and reducing the satisfaction of residents living in the apartment. The time to handle urgent issues needs to be shortened by having a timely support unit right at the apartment building or members of the Management Board need to have high expertise and quick judgment to respond and handle any situations. In addition, taking advantage of technology, the Apartment Management Board should invest in equipment to monitor, anticipate and promptly support residents via hotline, website, fanpage, .. Based on these technological platforms, residents can directly contact the building managers when there is a problem and get immediate answers.

Second, the construction of a safe and healthy living space should be promoted for all residents living in the apartment. A safe, healthy living space includes quality entertainment landscape, cleaning service and a strict level of security. The management unit needs to actively renew entertainment facilities, aiming for diversity and high quality services to satisfy the needs of residents. In addition, the trend of green living is increasingly popular. The management needs to actively create a living space around the apartment building with a green park for residents to relax on holidays or in their free time. For security, improve the professionalism of the security system, assign guarding areas, reasonably protect, and ensure the security of residents' assets. For example, access to buildings requires resident cards (the number of cards is issued per household), the parking basement needs to be zoned for different vehicles, and staffs need to be on duty 24/24. In terms of hygiene, quality of cleaning services should be improved to ensure ventilation and proper airflow; common spaces and sewers should always be clean.

Third, focus on providing and optimizing utilities at the apartment, focusing on personalization and ease of use. The quality of essential utilities is one of the influential factors for residents' satisfaction with apartment management and operation services. With a diverse system of utilities, in order to maximize customer experience and increase satisfaction, the Management Board needs to regularly add, renew, repair and maintain them to ensure facilities quality. The facilities here include elevators, soundproofing systems, fire extinguishers, and etc. Residents need to be trained in the safe and proper use of utilities to be able to access and use them promptly when needed.

Fourth, regular monitoring and inspection should be focused. Inspection stage includes during, before and after service provision. This helps the management board to monitor and timely calculate possible problems, thereby having a timely plan to support residents, reducing complaints and unwanted dissatisfaction from residents. The inspection unit can carry out inspections in irregular or periodic occasions and with a person in charge, drawing repair experience after the inspection.

Fifth, human resources should be improved. The unit can implement human resource development activities by recruiting, training, and motivating employees. Businesses should establish a process and plan for employee management. Employees here include maintenance and repair staffs, cleaning staff, security staff, resident support staff such as the front desk department, etc. When employees are well trained and a comfortable working conditions, they will have a better working spirit and complete the assigned tasks with higher quality. In addition, it is necessary to consider correcting the current staff in terms of attitudes and ways of working with residents to increase professionalism and courtesy. Recruiting a new human resource team needs to be evaluated based on educational qualifications and practical experience as well as soft skills because apartment operation and management services require high customer contact.

5.1. Conclusion

This study examines the relationship between residents' satisfaction about the quality of apartment building operation management services with related factors including quality of utilities, security, cleaning, repair and maintenance, etc. The basic research hypotheses are given at the beginning with a positive relationship between the factors and proven in the above research results.

Through the research process, there are 6 factors that explain up to 65.7% of residents' satisfaction about apartment operation and management services, including “Repair and maintenance”, “Security”, “Utility management quality”, “Landscape and entertainment”, ““ Cleaning”, “Building management policy”. All factors have a positive correlation with “Resident satisfaction”. In particular, the factor “Entertainment and landscape” has the greatest influence on people’s satisfaction about apartment operation and management services. Then followed by are “Security”, “Repair and maintenance”, Management policy”, “Quality of utility management” and finally “Cleaning”.

Good “repair and maintenance” can increase residents’ satisfaction with apartment operation management services. However, residents have not yet appreciated this factor because most of the apartments are newly built, so this problem is not serious but the building management does good repair and maintenance. This result is different from some studies in developing countries that show that this is the most important factor determining the life cycle of an apartment building.

The “landscape and entertainment” with the biggest influence can be understood that the living space in the apartment is highly valued by residents. The greener and more natural the living space around the apartment is, the more diverse the entertainment facilities are, the more it will satisfy the needs of residents. For some families with young children, such as green parks, swimming pools or children's play areas are absolutely necessary. In fact, in

Hanoi and Hai Phong due to limited land fund, there are too few apartment buildings with landscape and entertainments to meet the requirements of residents.

In fact, the response and handling of complaints from residents of the apartment building management board is still slow, there are more than four complaints about the same problem. This can come from a complex service delivery process. In fact, the complaint handling process has many steps, which wastes time and creates difficulties when residents do it.

Overall satisfaction in terms of trust, understanding and service support should also be improved and promoted. The negative feedbacks of residents may come from the attitude, working style and qualifications of the building management employees.

The quality of utility management of the apartments has not really satisfied residents with an average score of 3.52/5. The cause may come from the long time of using and putting the utility into operation, the apartment has not been replaced and repaired and maintained regularly; or there is maintenance but the results after maintenance are not good, making residents unhappy.

FAITH IN THE ECONOMIC SECTOR IN CENTRAL VIETNAM - SITUATION AND SOME SOLUTIONS FOR MANAGERS

Assoc. Prof. Dr. Doan Trieu Long
trieulong1503@gmail.com
Academy of Politics Region III, Da Nang, Vietnam

Abstract

Human history in the development of nations has shown that, when the ruler understands the people's hearts and is trusted by the people, that country will mobilize the people's strength and all resources in the society. On the other hand, when people do not have faith in the government, in the law enforcement apparatus, then the society is always at risk of instability and conflict. Thus, trust plays a very important role, not only in politics but also in the economic field. The article focuses on analyzing and clarifying the current state of trust in the economic field in the Central region. From there, point out the opportunities and challenges for management as well as propose some solutions to strengthen and increase the trust of the people in this area.

Keywords: *Central, Economy, Management, Trust.*

1. Introduction

In recent years, research on beliefs in general and research on beliefs in the fields of social life in particular has been receiving research attention from domestic and foreign scholars with different aspects of approach. The results from the research process of scientists have shown the urgency of clarifying the role, position and impact of beliefs on people's lives. Therefore, the article will focus on analyzing and evaluating the reality of trust in the economic field in the Central region; points out opportunities and challenges as well as proposes some solutions to help managers consolidate and increase confidence in this field.

2. Method

The two main methods used in this study are qualitative (focus group, interview, observation...) and quantitative (investigation, processing of collected data). Besides, the article also uses other complementary research methods such as analysis, comparison, contrast..., in order to properly assess the current state of trust in the economic field in the Central region, as well as Identify opportunities and challenges for management.

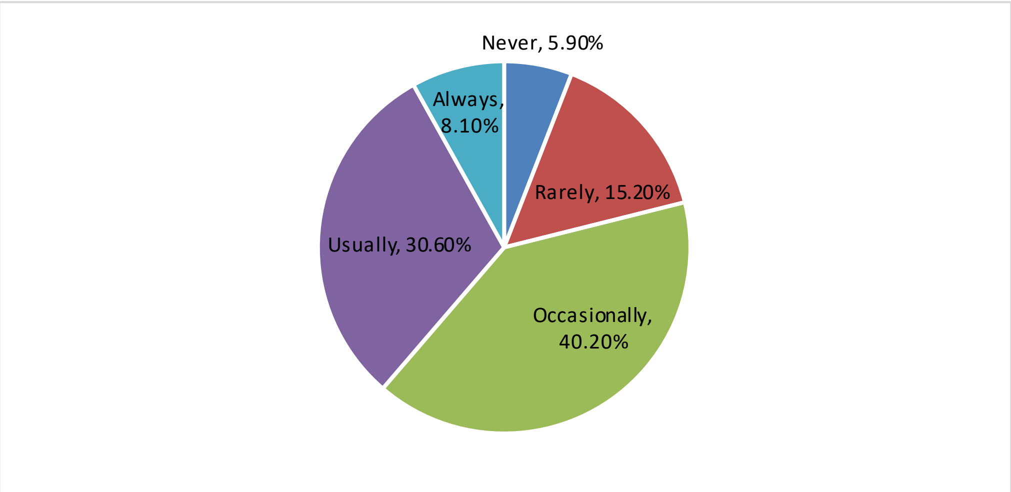
3. Results

3.1. The current state of confidence in the economic field in the Central region

Researching the level of impact of the "economic" factor on social trust according to the rural/urban slice in the Central region shows that, between the city group and the rural group, there is a difference in mean scores. each other is 0.113 (3.981 - 3.868 = 0.113). Visually, this difference is not large. However, through the T-Test correlation between this mean score, it shows that there is a correlation (F = 3.412, Sig = 0.015) [5, p.181-182]. Thus, the "economic" factor has a fairly large impact on the social beliefs of people in the Central region (M= 3.91), and this factor's impact in urban areas is more pronounced [5, dependent Appendix 13]. The survey results show that the majority of respondents at the level of "*yes*" are interested in the economic field, specifically economic activities in their locality at different levels (*alway*, *usually*, *occasionally*, *rarely*). Only 5.9% of respondents answered "*never*" interested in the economic field.

Chart 1: Interest in the economic sector

Unit: %



Source: Processing from the results of the sample survey of the topic "Social trust in the face of challenges of development and integration in the Central region"; Code: KX.01.42/16-20

By gender, at each level, there was not much difference in the rate of recognition between the male and female groups (31.1% and 30.0%, 5.8% and 6.0%), respectively. By occupation (occupational group) also gave similar results: the difference was not large enough to conclude the correlation between occupation variable and the level of economic interest (p=0.155) [5, p.183].

The current biggest pressures and worries for people in the region are issues related to income, spending, their children's future and rising prices. Quang Ngai is a locality with up to 78.3% of people sharing their pressure, their biggest worry now is the future of their children, followed by Thanh Hoa (77.6%), the third is Thua Thien Hue province (76.3%). The second worry is related to income and expenditure: Up to 78.0% of respondents in Binh Thuan expressed this concern, followed by Khanh Hoa with 71.7%, Thanh Hoa with 71.6%. Khanh Hoa is the place with the highest rate of people's anxiety about rising prices up to 61.7% [5, p.184]. Regarding the factors and issues that people think can hinder the development of the country today, the survey results show that the highest problem is corruption (72.2%), social evils (39.8%), unsatisfactory staff qualifications (37.4%), degraded social morality (25%), unstable world and regional situation (20.6%) , ... (these are the 5 problems with the highest selection rate). Those are also the main reasons for the decline in social trust [5, p.184].

In the limited scope of research, we only choose to analyze some social beliefs before the challenge of developing marine economy in the Central region. That is the people's trust in the Party and State's leadership on the marine economy and maritime sovereignty. Regarding the belief of people in the Central region in the ability to solve the limitations that the country is facing: 18.1% of the respondents said that they strongly believe, 59.2% believe, 19.8% feel trust at a normal level, the rate of distrust and very distrust is only 2.8% [5, p.186]. It can be seen that, although the majority of people have confidence in solving the problems that the country in general and the Central region in particular are facing, there is still a part of people whose faith has decreased. Some phenomena of confidence decline in the process of implementing development and integration policies related to sea and islands, through marine economic sectors, such as fishing industry, aquaculture industry, seafood processing industry, sea tourism, coastal economic zones.

In the fishing industry

Determining marine economic development as a priority area, over the past time, the Government has issued many Decrees and Decisions to greatly support fishermen in sticking to the sea [7]. These policies and decrees have created a great motivation for fishermen to feel secure and continue to stick to the sea in Vietnam's fishing grounds. According to the results of the group discussion and in-depth interviews, many fishermen affirmed: “We are really happy and grateful for the policy of the Party and the State in the face of the current difficult fishing situation. With this support, we have an additional cost to go to sea to offset the current decreasing reserves” [5, p.185].

The investment in equipment such as communication equipment, marine safety equipment, and fishing support techniques has not been paid attention by fishermen, so the fishing efficiency is not high. Therefore, the state also issued Decree 26/ND-CP on regulations on the installation of cruise monitoring equipment for fishing vessels. Accordingly, some localities have installed GPS-enabled devices for free for all fishermen in the area (such as Da Nang city), thereby helping fishermen to sail safely and more efficiently. Obviously, the Government has issued policies and decrees that are very practical to the lives of fishermen, completely satisfying the people. However, according to the results of in-depth interviews at some research sites, fishermen have reflected that policies and guidelines are good, but the implementation process is sometimes negative and limited: “We do So we know that, there are people who come back, don't know the sea profession, but still receive funding to build ships according to the policy of the State. And they can add up the cost of building the ship, but in reality, that money is enough to build more nest houses. Boats sometimes don't go for a few years, sometimes they leave" [5, p.185]. Thus, in addition to the confidence and enthusiasm in implementing the State's development policy in fisheries, there is still a phenomenon of decreased confidence, when people see that in the implementation of the development policy, there is a Wrong person, wrong job.

Currently, in some sea areas, there is still a situation of using explosives, sweeping nets, flying rake nets, which have seriously destroyed the ecological environment of coastal areas. In addition to the fishermen who catch fish according to the requirements of sustainable development, there are still fishermen and workers in the fishing industry who have not been trained but mainly catch traditional fish. Many captains and chief engineers only receive accelerated training to obtain a practicing certificate. If fishermen continue to fish in this way, one day not far away, there will be no more seafood sources to exploit. This situation requires the state to quickly come up with solutions to protect aquatic resources at sea and strengthen people's confidence. According to the survey results, the belief of some fishermen in the implementation of the State's current policies to protect the environment and the ecosystem is not good. Since then, the implementation of coordination between fishermen and the State in ecological protection of the marine environment has not been effective. “*The state calls for fishing far from the shore to protect fish resources, but in fact, the big fish, the mother fish is often far away. After catching the mother, how can the fry come closer to the shore? Ninh Thuan waters are often the place where fish come to spawn, but there are shallow water, many reefs, ships cannot enter, and on the other hand, they use mines to catch fish, which is the reason why seafood is increasingly rare. The State needs to have appropriate sanctions*” [5, p.185].

The process of economic development in general and the development of the fishing industry in particular create many opportunities and challenges for the fishing community and businesses in the Central region. There are some fishermen who seize the opportunity to build new ships with large capacity, they have the conditions to reach out to sea and get rich from the sea; But besides that, there are also many fishermen who abandon ships, abandon the sea, and do not want themselves or their children to follow this profession anymore. These changes are due to social beliefs that have adapted to the new context in the process of development and integration. There can be a number of reasons that cause fishermen to lose confidence in the fishing industry and not continue to stick with the profession, including:

First, production costs increase, profits decrease. Fishery resources are increasingly depleted, so fishermen have to regularly go out to catch long-term fishing at sea, increasing the cost of each time they go out to sea to exploit. Fuel prices are high while seafood prices are unstable, affecting the income and life of fishermen. Most of the seafood caught after each fishing trip must be brought to the mainland for sale, so there is an additional cost of each time going to the mainland, an additional cost of about 10-15 million VND.

Second, the consequences of climate change increase storms and tropical depressions, increasing the risk of accidents at sea, causing loss of life and property of fishermen.

Third, the security situation and sovereignty over the sea and islands. In recent years, in the East Sea area, especially in the Hoang Sa and Truong Sa archipelagoes, the political situation has always been very complicated. Sovereignty disputes between countries are the risk of conflicts, especially China's groundless claim of sovereignty over the Paracel Islands, and increased military activities to tense situation in this area. In fact, there have been some cases of fishermen operating normally in Vietnamese waters but being chased away by boats of other countries, even Vietnamese fishermen were arrested and confiscated property, boats and fined and imprisoned fishermen. Besides, the strict implementation of regulations on the extent of territorial waters, so the fishing ground of fishermen going far away also decreased.

Fourthly, due to the policy of developing other marine economic sectors such as marine tourism, coastal economic zones have changed, the range of coastal fishing of fishermen has been narrowed, and at the same time, the policy of relocating some communities has changed. The fishing community is far from the water, so it is difficult for them to follow the sea profession.

Fifth, the change of a part of fishermen due to subjective reasons of individuals, such as health situation, job opportunities, do not want to live away from their wives and children for a long time, so they changed jobs.

These reasons have partly affected the decline in confidence of some fishermen today, so it is necessary to have solutions and policies to further strengthen the social trust of the fishing community.

Aquaculture industry

Over the years, the aquaculture industry has made great strides. In the three provinces of Binh Dinh, Phu Yen and Khanh Hoa alone, the aquaculture area has reached more than 9,500 hectares...; Quang Nam has 7000 hectares of water surface area for aquaculture, the largest in the South Central Coast region; Thanh Hoa is 19,500 hectares... Song Cau is known as the "lobster metropolis" of the country. After more than 10 years of implementing the aquaculture planning, the whole town now has about 600 hectares of ponds and lagoons; aquaculture production reaches more than 2,300 tons, and lobster is still one of the main livestock, with an output of 1,200 tons/year. Khanh Hoa province is the place to produce many types of aquatic products such as tiger shrimp, white leg shrimp, sea fish; molluscs, sea crabs... so the ability to supply aquatic breeds is very good. The development of mariculture on seas and islands helps organizations and people have the opportunity to invest in development, contribute to adjusting coastal fishing by manual means to marine aquaculture, protect and develop aquatic resources. Marine aquaculture also helps people to increase their income, eliminate hunger and reduce poverty, and change the economic structure; contribute to the protection of security of seas and islands. According to the results of group discussions and in-depth interviews, many fishermen confirmed: "*Thanks to the supportive policies of the local government and dedicated technical guidance in aquaculture, the fishermen believe that the their lives will be better in the future, their children will have more opportunities to learn than themselves*" [5, p.185]. Besides, a large part of fishermen still complain, they really want the government to control the price and quality of food, because the price is too high now. In addition, the water environment is seriously polluted, plus the seed has too weak resistance and many diseases cannot be cured, such as white spot syndrome in black tiger shrimp (WSSV) yellow head syndrome or Taura syndrome in white leg shrimp, neurovirus... and even the consumer market is facing great difficulties. This causes the income of fishermen to decrease, even losing all their properties if the disease occurs in about 2 cases. "*We really hope the government has a solution to solve the difficulties for our fishermen, so that we can continue farming. If we lose a few more crops, our family will have to sell our house to pay the debt"* [5 , p.187]. This is also a difficulty that many shrimp farming households face and earnestly wishes to have the State's support and assistance to solve it.

Seafood processing industry

Export processing is a fast-growing sector and can be considered as a driving force for growth and structural transformation in fishing and aquaculture. The quality and competitiveness of seafood products in Vietnam in general and the Central Coast in particular have been continuously improved, creating a great reputation in the world market. It can be said that seafood processing enterprises and establishments are mainly concentrated in the Central region, a few in the Southeast and the Mekong River Delta. Up to now, out of a total of more than 570 seafood processing enterprises, 248 enterprises (accounting for nearly 53%) have been recognized by the European Union to be eligible to ensure food safety and hygiene. exported to the EU market - the most demanding market today. In addition, there are more than 300 business establishments that have been recognized by Korea for quality standards... This shows that our seafood products have been raised to the level and have the ability to compete in the international market. Since then, people's confidence in the "Vietnam" brand is present all over the world and competitiveness in the international market has increased. The results of in-depth interviews with seafood processing enterprises and people said, "Vietnamese seafood products are competitive in the world and Vietnam's seafood products will grow strongly in the coming time. , on all continents" [5, p.187]. This has proved the people's great belief in Vietnamese products, as well as Vietnam's mechanisms and policies in cooperation to bring Vietnamese products to the international market. That belief gradually turned into actions for the seafood processing industry to develop more and more.

Sea tourism industry

Central region is the region with the largest potential for sea tourism in Vietnam. The provinces and cities in the region are bordered by the sea and have many cultural heritages and famous scenic spots. A number of heritages are recognized by the United Nations Educational for Science and Culture Organization (UNESCO) in the Central region, such as: Phong Nha - Ke Bang National Park - a world natural heritage (Quang Binh); Hue Royal Court Music - Intangible Cultural Heritage (Thua Thien Hue); Hoi An Ancient Town - World Cultural Heritage, My Son Sanctuary - World Cultural Heritage, World Biosphere Reserve Cu Lao Cham (Quang Nam)... Besides, Thua Thien Hue has Bay Lang Co is the "*world's most beautiful bay*" voted by the World's Most Beautiful Bays Club (Worldbays). Da Nang has My Khe Beach which is one of the 7 most beautiful beaches in the world voted by Forbes... In front of the rich, diverse and attractive tourism and beach tourism potential, many localities in the region are typical such as: Khanh Hoa, Da Nang have chosen tourism as a key economic sector, in order to increase income sources and create jobs. This is also the driving force promoting the development of economic, investment, trade, cultural and social sectors. The development orientation of the marine tourism industry has contributed to strengthening confidence in economic development, improving people's living standards, and also creating new challenges for social trust in the Central region.

Developing marine tourism increases cultural exchanges and acculturation, strongly influencing the social beliefs of local residents in the Central region. The marine tourism industry is increasingly diversified, not only limited to the type of resort, but also expanding to tourism combining traditional historical culture, sports, conferences, seminars, and events. more tissue. The source of international arrivals by sea is increasing. In the near future, there will be more international cruise lines coming to our country, of which Saigontourist has signed an agreement with a large cruise line in the United States to open sea tours following the North - South route. This is the success of expanding international cooperation in many aspects, in addition to domestic tourists, the number of international visitors to the Central region is increasing, helping the tourism industry to grow strongly, affecting confidence in international integration and cooperation. The development of tourism has created conditions and opportunities to develop the urban economy, improve living standards and have a great impact on the way people think and act. A part of urban residents who previously only worked in agriculture or fishing, now boldly invests in business services to serve the tourism industry, tourists such as: Hotel business, restaurant, food service; products and services for tourism, entertainment and recreational activities. In addition, with the development of tourism, the ongoing integration, and the strong impact on industries, people also have to adapt to that demand and have grown taller and more professional, such as developing Homestay tourism model. They know how to combine tourism through tourism to restore and develop traditional occupations that were almost lost in the past, such as Tra Que vegetable village tourism - Hoi An city, pottery village... Small business activities have gradually been replaced by larger and more professional services to better meet the needs of tourists, such as the formation of restaurant chains, hotel chains, and restaurant chains. coffee, beverage, transport enterprises. Therefore, it can be said that tourism development has made people bolder, more confident and brave, more dynamic and creative. Lifestyle, communication, and daily behavior have changed a lot. People are more polite and civilized in communication and behavior, thinking more quickly, with a more attentive and professional service attitude.

Besides the positive impacts, tourism also has some negative impacts on the local urban culture. Through tourism activities, tourists, cultural flows, dress styles, behaviors, and lifestyles that are not suitable from the outside have the opportunity to enter, partly affecting the lifestyle of residents. people, changing the traditional cultural identity, customs and habits of the city. Some evils also arise from tourism activities, such as begging, stalking tourists, street vendors, drugs, prostitution, etc., which affect people's perception. Since then, a small part of the population said, "*Due to the development of tourism, it has a negative impact on their lives, they even think that their children are demanding and damaged because tourism develops, due to the influence of Western culture, due to integration*" [5, p.188]. The negative side of tourism development also has a negative impact on the lives of local residents, negatively impacting and reducing trust. Stemming from the above fact, we need to take note in the implementation and implementation of policies so that people's confidence does not decline in a negative direction, but on the contrary, trust must be increasingly strengthened.

Coastal Economic Zone Development

In order to strengthen the potential for marine economic development, the State has invested in developing industrial parks and coastal economic zones in recent years. Chu Lai economic and commercial zone was first established in 2003, so far the Central region has had many more coastal economic zones: Nghi Son (Thanh Hoa), Southeast Nghe An (Nghe An), Vung Ang (Thanh Hoa). Ha Tinh), Hon La (Quang Binh), Southeast (Quang Tri), Chan May - Lang Co (Thua Thien Hue), Chu Lai (Quang Nam), Dung Quat (Quang Ngai), Nhon

Hoi (Binh Dinh), Van Phong (Khanh Hoa) and Nam Phu Yen (Phu Yen). The total area of the economic zone in the whole region is 317,761 ha, of which, Van Phong economic zone is the largest, with a total area of 150,000 ha. Regarding projects, economic zones in the region attract about 743 domestic and foreign investment projects with a total registered capital of more than 70 billion USD, production and business projects in the economic zone have filled 40%. total land area for agricultural production, industry, tourism and services in the coastal economic zone [2]. In which, there are a number of large and important projects in economic zones such as: Oil refineries in Nghi Son and Dung Quat economic zones; shipyards in Nghi Son and Dung Quat economic zones; Quang Lien steel factory, Son Duong iron and steel complex and deep-water port, Doosan heavy mechanical factory, thermal power plants in Nghi Son, Vung Ang, Dung Quat and Dinh An economic zones. These projects contribute to local economic growth in the region, create jobs for people, improve people's living standards, thereby increasing people's confidence and peace of mind in the economic development policies and guidelines of each locality, each region and the State..

However, there are also some problems that cause people's loss of confidence. The implementation of resettlement migration to build economic zones has caused some communities to change their livelihoods, change culture, disturb traditional space... That challenge increases the distance gap between the rich and the poor, reducing the relative stability of coastal village communities. The environmental problem is being seriously polluted from economic zones, making many people unhappy with this place and ready to go to another place if the working environment is better and less polluted. In fact, there has been a serious environmental pollution incident. Notably, the discharge of waste by Formosa company caused mass fish deaths in 4 provinces from Ha Tinh to Thua Thien Hue in 2016. The above environmental incident has greatly affected the social trust of the community and the regional ecosystem sea of 4 provinces in particular, of the Central region and Vietnam in general. After the above event, the State quickly made adjustments to the problem of environmental pollution in the operation of economic zone projects more efficiently and safely. Because if this problem is not solved thoroughly, at some point people's confidence in the policy will be reduced.

3.2. Some solutions to strengthen and increase confidence in the economic field for managers

Firstly, it is necessary to take care of the economic life of the residents in the Central region in a timely manner. This is shown first in the role of the Party, State and authorities at all levels. That is the construction and completion of mechanisms and policies to promote comprehensive economic development in the Central region. This is the key to building and developing economic confidence today. In recent years, the Central region's economy has had remarkable growth, but the growth rate is still not high and not really stable. Therefore, in order to promote the Central region's economy in the coming periods, it is necessary to maintain the stability of the macro-economy, renew the growth model, and restructure economic sectors. Improve the efficiency and management capacity of the State and authorities at all levels. This is the most important and basic measure and requires the Party, State as well as authorities at all levels to always implement it continuously and effectively. Stable and sustainable economic development is the basis for enhancing the potential of the region, thereby building a cultural life, developing trust for people, and effectively protecting territorial integrity. . In addition, the development and completion of mechanisms and policies to improve the economic life of the people is also the best solution to affirm the capacity and effectiveness of managers. This will strengthen the public's confidence in the Party and State as well as in the renovation and development of the country in the coming periods.

Along with the general development strategies, the Party and State also need to have specific strategies for the Central region such as: continue to research and perfect policies and laws on investment, to serve as a basis for accelerating the progress of projects and encouraging the mobilization of capital for socialization in investment in transport infrastructure; propose a plan to improve the coordination mechanism for key economic regions to promote the initiative and creativity of localities in the region, in which clearly defines responsibilities and strengthens coordination among ministries, branches and localities in the region. Completing regulations on methods of exploiting infrastructure assets; lease the right to exploit the property, transfer for a definite time the right to exploit the property; Fees for using infrastructure, post-investment fees, are regulated by the State in compliance with market principles, ensuring publicity and transparency. At the same time, research and develop policies for mountainous people, especially ethnic minorities in extremely difficult areas in order to gradually stabilize production and people's lives. Implement synchronously, comprehensively and effectively programs and projects on hunger eradication and poverty reduction; creating opportunities for poor households to access support policies on land, credit and vocational training; support and create conditions for poor households to develop production, increase income to escape poverty sustainably; effectively implement policies to attract enterprises to invest in agriculture and rural areas, agricultural insurance policies, agricultural extension policies.

Attention should be paid to speeding up the formulation of national and regional plans, taking the sea and coastal areas as the center for development; To build modern coastal urban areas, construction planning must go first, identifying the sea as the center to calculate the coastal urban construction planning. Continue to improve the investment environment, creating conditions to attract more domestic and foreign resources. Diversify investment types, promote investment in the form of public-private partnership (PPP) to focus on developing the socio-economic infrastructure system. There are policies to support capital for the key development of economic zones. Make the most of ODA and FDI capital and effectively use ODA capital to invest in the development of key large-scale technical infrastructure projects. It is necessary to pay attention to policies for the development of works for prevention, control and mitigation of harms of natural disasters. Complete the North-South transport system and the East-West cross-road system connecting seaports and coastal provinces with the Central Highlands. Strengthen linkages between regions and central provinces with the Central Highlands, cooperate for mutual development.

Second, promote the economic strengths of the region, and at the same time, maintain a stable level of traditional occupations of the Central Coast resident community. The strength of the Central region is in the marine economy and tourism. Therefore, promoting the strengths of these fields will help people be more confident in local economic sectors. Since then, people quickly stabilized their lives and limited migration to big cities. In order to promote the advantages of the marine economy in the Central region in the coming years, the Party and State as well as the Party committees and authorities of the provinces and cities need to perfect the system of policies and laws on the sea towards sustainable development. , ensuring feasibility, synchronism, uniformity and conformity with legal standards and international treaties to which Vietnam is a signatory. Create a favorable legal corridor to mobilize domestic and foreign resources for investment in infrastructure construction, development of science, technology, human resources and transfer of marine knowledge. Actively participate in and actively promote the formation of global and regional mechanisms related to seas and oceans. Consolidate the system of state management agencies in charge of the sea from the central to local levels, ensuring it is modern and synchronous; build a contingent of highly qualified and professional staff. Improve the efficiency of coordination between agencies and between the central and local authorities on sea and island affairs. Strengthen the inter-sectoral coordinating agency to direct and unify the implementation of the strategy for sustainable development of the marine economy. Consolidate the organizational model, improve the management capacity of islands, archipelagoes and coastal areas. Implement the population arrangement on the islands in association with transforming the production organization model towards being friendly with the sea and marine environment. Reviewing, supplementing and developing synchronously new strategies, master plans and plans related to sea and islands in the direction of integrated management, suitable to the marine ecosystem, ensuring the harmonious coherence and harmony between the conservation and development of land areas, coastal zones, exclusive economic zones and continental shelves. Expeditiously develop marine spatial planning, master plan on exploitation and sustainable use of coastal resources. To step up the attraction of resources from all economic sectors, especially the private sector and foreign-invested economy. Actively attract large investors with source technology and advanced management level from developed countries. Prioritize state budget investment for the development of island districts and communes of Tien Tien and offshore islands; to socialize investment in marine and island infrastructure, economic zones and coastal industrial zones. To encourage the development of enterprises of all economic sectors, marine economic groups boldly engage in production and business activities at sea, especially in offshore waters. Continue to restructure state-owned enterprises in marine economic sectors, ensuring to improve governance capacity, production and business efficiency and competitiveness.

The marine economic development in the Central region must focus on 5 pillars: Fisheries must focus on farming, catching and processing seafood, this is a strength not all regions have; Tourism should focus on developing sea and island tourism and exploiting the strengths of tourism in the central provinces; developing seaports associated with logistics services; develop manufacturing and processing industries associated with seaport advantages; develop renewable energy such as wind power, solar power and research other forms of energy.

In addition to promoting the advantages, ensuring a stable economic environment is also necessary to maintain the stability of people's lives. For the Central region, the main economic sector is still agriculture. However, the weather conditions of the region are very harsh. In addition to drought, this area also suffers from many different storms every year, not to mention salinization, water pollution is taking place very seriously in many localities. Therefore, one of the positive directions in building people's confidence to live by agriculture is the problem of overcoming the consequences of natural disasters and ensuring the infrastructure, especially irrigation. Governments of provinces and cities need to pay attention to building development visions and scenarios on the basis of considering impacts from climate change, impacts from development activities, and dealing with extreme impacts such as drought and drought. drought, water shortage, saltwater intrusion, pollution, water degradation. Agricultural planning closely follows the transformation requirements of economic restructuring; solutions for planning irrigation associated with irrigation, saving water, reusing water, creating water sources, storing, regulating, transferring and connecting water sources by pipes, bringing water to coastal areas; research on irrigation solutions to supply water to areas where droughts, water shortages and saltwater intrusion are frequent. Develop investment plans to develop agricultural infrastructure with focus and focus in the direction of synchronization, modernity, application of new technologies. In which, continuing to invest in the new rural program, ensuring to meet the needs of socio-economic development, combating natural disasters and stabilizing people's lives. Investing in construction of irrigation works to supply water for irrigation and daily life in ethnic minority areas, mountainous areas, areas with extremely difficult socio-economic conditions, areas affected by climate change climate, drought, saltwater intrusion...

Third, strengthen linkages between the Central region and other regions in the country and expand international cooperation. To promote the ability to integrate into the market economy of the Central region, thereby mobilizing capital as well as the investment process of domestic and foreign companies and enterprises. Governments of the central provinces need to promote economic restructuring according to regional advantages, in association with the implementation of the *Strategy for sustainable development of Vietnam's marine economy to 2030, with a vision to 204*5. Brand building and national products by industry and region's advantages, new products, high added value. To soon build, complete and share a common database system on localities in the Central region, economic sectors, social fields, progress of key projects deployed in the area, serving construction develop and coordinate regional linkage activities. Accordingly, prioritizing the State's resources for investment and development of inter-regional transport infrastructure. Along with that, the provinces and cities in the region need to actively mobilize a variety of resources, combine capital sources between the central and local governments, and take advantage of ODA, private capital and other lawful capital sources to develop the project. implementing key projects, of a breakthrough nature, creating regional linkages. Consider mobilizing the business community, entrepreneurs and all economic sectors to participate in activities to carry out the task of coordinating socio-economic development of the region. The Ministry of Planning and Investment also proposed to assign the Ministry of Finance to develop mechanisms and policies to create a source of income for a number of large provinces and cities, playing the role of a locomotive of economic growth of the country. Focus on building a complete infrastructure system in the region, with a focus on the Central Key Economic Zone. Speeding up the completion of projects, especially the system of connecting framework infrastructure connecting the Central provinces with the Central Highlands provinces, with Laos, Cambodia and Northeast Thailand; system of coastal roads, highways, airports; renovate and upgrade existing railway lines to ensure normal traffic during the rainy season, etc. to connect with neighboring areas.

4. Conclusion

It can be seen that confidence in the economic field in the Central region is going along two main trends: development and decline. The positive development trend of trust comes from the effectiveness of economic-related mechanisms and policies issued by managers as well as the growth of economic sectors in the region during the period. past time. The trend of declining confidence stems from the negative effects of the market mechanism, the instability of weather conditions, climate and even unhealthy business psychology of some businesses and individuals.. Trust in the economic field plays a very important role, not only regulating the development ability of the country's economy or the region, but it also affects many different areas of social life. Therefore, it is necessary to pay special attention to the issue of consolidating and increasing confidence in the economic field in order to create for the region and the country a stable development.

SESSION 6:

LAWS AND INSTITUTIONS

COMPLETING THE LEGAL FRAMEWORK FOR SOCIAL ENTERPRISES IN VIETNAM

Tran Trung Vy
trantrungvy1971@gmail.com
Ha Long University, Quang Ninh, Viet Nam

Abstract

Social enterprises are a new trend emerging in Vietnam. Social enterprises is formed to address social issues or specific environments through models of business truly sustainable, not just to maximize profits for owners or investors invest. The provisions of the law on social enterprises are an important legal framework in encouraging social enterprises to develop. For the first time in the history of Vietnamese business law, social enterprises were recognized as a new business model in the Law on Enterprise 2014. After that, the Government introduced This form of social enterprises is in Decree No. 96/2015/ND-CP of October 19, 2015. Currently, the law on social enterprises in Vietnam is relatively new both in terms of theory and practice. law enforcement. The paper examines the laws and practices that apply the laws governing social enterprises, proposes solutions to improve the law and improve the performance of the social enterprise model in Vietnam today. The author tries to clarify some theoretical issues about social enterprises, analyze legal provisions on models, assess the situation and propose solutions to improve the law on social enterprises in Vietnam.

Keywords: *Social enterprises; Law on Enterprise; Enterprise.*

1. Introduction

Social enterprise is a new legal term appearing in Vietnam and recently, social enterprises are receiving the attention of policy makers, as well as French scientific researchers. physical. Currently, the legal status of social enterprises is prescribed in Article 10 of the Law on Enterprise 2014 and Decree No. 96/2015/ND-CP , generally the legal corridor on social enterprises in Vietnam is still very primitive and needs to be further improved. The article provides some theoretical issues about social enterprises under Vietnamese law to contribute to a clear description of the nature of social enterprises in order to develop appropriate adjustment policies and raise common awareness. about social enterprise.

2. Research method

Specific methods used to study this topic "Improving the law on social enterprises in Vietnam" are as follows:

- *Method of interpretation*

This method is applied to study the basic theoretical issues that govern the social enterprise legislation in Vietnam.

- *Methods of analysis, comment*

This method is applied to present the specific provisions of the Vietnamese international legal system of social enterprises in Vietnam.

- *Systematization and synthesis method*

This is the research method used to generalize and draw conclusions and basic proposals about the author's new contributions to the completion of Vietnamese law on social enterprises.

3. Research questions and research results

3.1. Research question

Research questions 1. What is the legal nature of social enterprises in Vietnam?

Research questions 2. What is the solution to perfect the provisions of the law on social enterprises in Vietnam?

3.2. Research results

3.2.1. Social enterprises are enterprises registered under the Law on Enterprise 2014

The Law on Enterprise 2014 does not provide a definition of social enterprises but there are criteria for identifying social enterprises in Article 10. From this provision, we can understand that a social enterprise is an enterprise. established under the Enterprise Law, with the purpose of operating to solve social and environmental issues for the benefit of the community, which uses at least 51% of the total annual profit to reinvest in order to achieve the goal. society and environment.

According to Point a, Clause 1, Article 10 of the Law on Enterprise 2014, a social enterprise whose first criteria is an enterprise registered to establish under the provisions of this Law. Thus, the Law on Enterprise 2014 does not consider social enterprises a particular type of enterprise, but like ordinary businesses, social enterprises still organize and operate under one of the business types: Joint-stock companies, limited liability companies, partnerships and private enterprises [1].

Because it is also an enterprise, in order to establish a social enterprise or a social entrepreneur (the person who invests capital to establish a social enterprise, the author uses the term "social entrepreneur") to carry out the procedures. The common legal framework for establishing a business is one of the types of businesses designed by the Law on

Enterprise 2014. This criterion shows one of the basic characteristics of social enterprises, similar to ordinary businesses, that is having business activities. Accordingly, business is the continuous implementation of one, some or all stages of the investment process, from production to sale of products or provision of services on the market for profit-making purposes. From the definition of enterprise, business law of enterprise and according to the traditional conception in legal science in Vietnam, it is the factor "aiming at profitability" which is the basic and decisive factor to the birth. and business activity, "an inseparable attribute of the enterprise" [2] and "the ultimate destination of business" [3]. From that, it can be understood that the main purpose of starting a business is to create profits for investors in the business, while solving social issues for the benefit of the community is not the main goal. of business. Therefore, there is a view that the business definition in Vietnam is too emphasizing the idealism, the legislators have not generalized businesses not for profit-seeking purposes [4].

On the other hand, also taking into account the definition of "enterprise", the purpose of establishing a business is to carry out its business function, the main objective is to make a profit for investors in the enterprise, provided in Article 75. The Civil Code 2015 was classified as a commercial legal entity. Meanwhile, according to Article 76 of the 2015 Civil Code, a social enterprise is a non-commercial legal entity, "it is possible to seek profits but it is not the main goal and it is important if it is beneficial. Profits are not distributed to members "[5]. According to the Law on Enterprise 2014, social enterprises fall under the category of "enterprises", according to that logic, social enterprises must be a commercial legal entity, but the Civil Code did not follow that direction. It seems that in the spirit of the 2015 Civil Code, social enterprise is a category outside the business concept, which created a contradiction with the Law on Enterprise 2014.

Currently, the procedures for establishing a social enterprise are stipulated in the Law on Enterprise 2014 and the Government's Decree No. 96/2015/ND-CP dated October 19, 2015 detailing a number of articles of the Law on Enterprises. (Decree No. 96/2015/ ND-CP). Like every other business, social entrepreneur also has its own name. Based on the standards of enterprise name prescribed by law, social entrepreneurs will actively decide on naming for social enterprises. According to regulations from Article 38 to Article 42 of the Law on Enterprises 2014, there is no specific regulation on naming of social enterprises. Under Clause 2, Article 4 of Decree No. 96/2015/ND-CP , the phrase "social" may be added to the proper names of social enterprises. Regulations can add the phrase "society" to the private name of a social enterprise is an arbitrary norm, decided by the founder of social enterprise. However, both the Law on Enterprise 2014 and its implementing regulations do not provide for the prohibition or restriction of investors from using the phrase "social enterprise" or the abbreviation "Social Enterprises" in the name of the enterprise. ordinary karma. Consequently, investors may take advantage of these terms in naming their businesses so that the State, the public and partners may confuse the entity for unhealthy business. Therefore, the law of Vietnam needs to prohibit the use of the words "social enterprises" or the abbreviation "Social Enterprises" in the names of ordinary businesses, this is also consistent with the provisions of the law. United Kingdom and South Korea.

3.2.2. Social enterprises have operation objectives aimed at solving social and environmental issues for the benefit of the community

According to Point b, Clause 1, Article 10 of the Law on Enterprises 2014, social enterprises have an operational objective to solve social and environmental issues for the benefit of the community. Social, environmental and community issues such as protecting the environment, protecting and responding to basic human rights through job creation activities for those who are difficult to integrate and vulnerable trade, provision of health services, education, clean water supply, waste treatment, pollution... These social goals have become the motivation for social entrepreneurs to establish social enterprises. and using business options to solve social problems. Legally, Clause 1, Article 5 of Decree No. 96/2015/ND-CP stipulates that social enterprises must notify their commitment to social and environmental objectives to business registration agencies, to be public. on the National Business Registration Portal when establishing a business or in the course of its operation. Through this legal act, an ordinary enterprise will wear a social enterprise shirt, from which the State and society can recognize the legal status of social enterprises, accompanied by rights and obligations of social enterprises. This criterion contributes to give us a basis to distinguish social enterprises from ordinary businesses. Specifically, in conventional businesses, investors rely on the market to find out the needs of customers, thereby planning, investing strategies, producing and trading in goods, providing services and through a series of business activities regulated by the rules of the market economy to achieve the ultimate goal of profitability. In other words, it is profit that becomes the motivation for investors to decide to find business solutions, best meet the needs of customers and maximize their profits, get profits, or investors. was successful.

Meanwhile, for social enterprises, the factor "profitability" is not a decisive factor to the birth of enterprises, but from the existing problems in society. Social issues become the motivation for social entrepreneurs to find and decide the appropriate business model, after all, social entrepreneurs use business methods to solve the social problems that they have. discovered. When the social problem is solved, the purpose of social enterprise is achieved, although it may not be profitable, even at a loss.

Thus, ordinary businesses are social enterprises that operate under the market mechanism, that is, must have revenue and profit, but they are different in nature and destination, so there is a view. argued that: "social enterprises can be profitable, even need profits to serve social objectives but not" for profit "but" for society "[6].

In fact, social enterprises are often confused with corporate social responsibility (Corporate Social Responsibilities) [7]. Business is a commitment to improve the quality of life of the community through the business process and voluntary contributions of businesses [8]. The nature of social enterprises is to recognize the voluntary commitment of enterprises to implement ethical and social standards for human goals and sustainable development, which is an additional activity of enterprises, corporate social responsibility is still the ordinary business with the purpose and nature of seeking profit. Meanwhile, the principle, purpose and the whole operation of social enterprises are to solve social or environmental issues identified right from the inception and maintained throughout the operation process, which can If the social enterprise has changed or terminated its social objectives, then the social enterprise must notify the state agency of the current status. authorization.

3.2.3. Social enterprises use most of their profits to reinvest in order to realize social and environmental objectives

A social enterprise, when its profit generating business is not distributed like normal businesses. Profits that enterprises gain from production and business activities are used to reinvest in enterprises with the aim of solving the social issues that social enterprises are pursuing. The criterion of using profits to reinvest in serving social objectives is the distinction between social enterprises and ordinary enterprises, clearly showing the criterion "for society". According to Point c, Clause 1, Article 10 of the Law on Enterprises 2014, social enterprises must use at least 51% of the total annual profit to reinvest in order to achieve the registered social and environmental objectives. The 51% figure is intended to create favorable conditions and opportunities for social enterprises to mobilize business capital from other investors, members and shareholders by ensuring a certain dividend for investors. This circular, thereby contributing to the sustainable development of social enterprises [9]. This criterion contributes to a clear and specific quantification of social goals of social enterprises and social enterprises.

The goal of solving social and environmental issues and bringing benefits to the community is the noble mission of social enterprises, which makes social enterprises different from ordinary businesses and is not the same. with charities. Social enterprises have the characteristics of "hybrid" between ordinary businesses and charities [10]. On the one side are enterprises operating for the purpose of maximizing financial profits, and on the other side are non-governmental organizations established to pursue purely social benefits. Therefore, social enterprises are a model that harmoniously combines both form and content of these two entities to take business as the main field of activity, but not for profit but to solve problems. specific society, so most of the profits are used to serve the society and the environment.

In addition, social enterprises also have some similarities with public enterprises, both of which are aimed at serving the needs of society, may both provide products that are nature-based services. serving the common interests of the society such as providing clean water, cleaning up waste, protecting the environment ... [11] To a certain extent, these enterprises may be grouped into groups of enterprises with the same purpose. main activities [12]. However, the nature of social enterprises is established voluntarily by social entrepreneurs, social enterprises are stable and consistent, determined by social goals, regardless of the nature of the social enterprises. products and services that businesses provide. Meanwhile, public utility enterprises are established by the State to produce and provide public products and services according to the mode of task assignment and enjoy special privileges [13].

3.2.4. Rights and obligations of social enterprises

Social enterprises differ from ordinary businesses in the purpose of distributing and using profits. Therefore, in addition to the rights and obligations of enterprises in general, social enterprises also have specific rights and obligations corresponding to the objective of solving social problems under Clause 2, Article 10 of the Law on Enterprise 2014. Important rights and obligations of social enterprises include:

Firstly, social enterprises must maintain the objectives and conditions for profit distribution throughout the operation process. As analyzed above, the legal characteristic to distinguish social enterprises from ordinary businesses is in the profit distribution conditions and conditions, so social enterprises must maintain these criteria throughout. submit your activities. Enterprise law prescribes mechanisms to ensure the compliance with social and environmental objectives of social enterprises.

Secondly, social enterprises are allowed to mobilize and receive funding. According to the research and assessment of the Central Institute for Economic Management, social enterprises in Vietnam are still quite young, established primarily from individual ideas, with initial investment. most of it is capital contributed by founding members on a small scale. Social enterprises are typically not for profit, doing business in markets with high risks, low financial yields, which are not attractive to commercial investors, along with investment costs. privately owned, the management of social enterprises is larger than average [14]. Therefore, social enterprises are facing many difficulties in financial matters, so the contributions and grants from other organizations and individuals to partially offset the management and operating costs of is very necessary.

Thirdly, social enterprises must not use the mobilized grants for purposes other than to offset management and operating expenses to solve social and environmental issues that they have registered. Based on the objective of addressing social and environmental issues for the benefit of the community, social enterprises can mobilize funding sources, and the donors when sponsoring into commune enterprises. The Association wants the grant to be used for the right purpose and effectiveness. In essence, the funding raised by a social enterprise is not an asset owned by the social enterprise, so the decision to use it is limited. Therefore, Point d, Clause 2, Article 10 of the Law on Enterprise 2014 stipulates that social enterprises can only use grants to cover management and operating expenses to solve social and environmental issues. that the business has registered. Social enterprises that violate this obligation will be sanctioned for administrative violations according to the Government's Decree No. 50/2016/ND-CP of June 1, 2016, on sanctioning of administrative violations. field of planning and investment.

Fourthly, the State has policies to encourage, support and promote the development of social enterprises. With the ability to detect and solve problems of social security needs, to serve the needs of the poor, the weakest and the largest in society. This is a group of people who have long been sponsored by the state policies, in other words, this is the "burden" of the state budget [15]. Social enterprises share responsibility with the State, greatly contributing to creating jobs, incomes and opportunities for this group of people to be confident and integrated, thereby helping them to have a more stable life. . Social enterprises are trying to solve problems in society that the State does not bring about, the value that social enterprises bring to society is great. Therefore, the State needs to consider social enterprises as their companions in resolving social issues and formulating policies to enable social enterprises to develop.

In general, although the Law on Enterprise 2014 is specifically stipulated by the Government in Article 10 of the Law on Enterprise 2014, including incentives and support policies for social enterprises, Decree No. 96/2015/ND-CP has no specific regulations on this issue. This can be explained by the fact that Decree No. 96/2015/ND-CP is a guiding document of the Law on Enterprise 2014, so that incentives for social enterprises need to be regulated in France. Specialized laws (such as laws on investment, taxes, education, health ...), thereby contributing to the unity in the legal system.

Social enterprises under Vietnamese law are a special subject, an enterprise that operates but is not for the purpose of maximizing profits for investors but most of the profits of social enterprises are served for community. Therefore, the adjustment of laws for social enterprises needs to take into account the specific factors of this model, in order to contribute to creating a good ecosystem and create conditions for social enterprises to develop as many countries. in the world.

3.2.5. Improve the law on social enterprises in Vietnam today

3.2.5.1. Limited law enforcement

Many businesses do not know the concept of "social enterprises" is included in the law, and the law does not have specific policies for social enterprises agreed in specific documents. Social enterprises in Vietnam are still quite young, established mainly from individual ideas, so the initial investment capital is mostly self-contributed capital, ability to raise capital, access to commercial investment. usually very limited. As a business, the social enterprise model guarantees profitability and lofty community obligations that challenge social entrepreneurs. There are businesses that operate rightly for social and environmental purposes, but there are still many cases of taking advantage of the disadvantaged and disabled to call for funding. Currently, the contribution of social enterprises to the country is low because the products or services of social enterprises are still simple, do not use much technology, and the price of products made by businesses. The society produces is much higher than the price level of ordinary products. The social entrepreneurs who wish to set up social enterprises are rooted in social and environmental goals, so many social business owners are not well-trained, lack of business thinking and management skills. treatment. From the side of consumers when using products with the psychology of giving, accepting poor quality products, this reduces the motivation for the development of social enterprises.

3.2.5.2. Limitations in the management and supervision of corporate social opportunity

In order to strengthen the management of business registration, in Vietnam, it is now implemented under the policy of strengthening post-inspection. However, when implementing this policy, many localities have not really done well, so the situation of law violations in business registration takes place every year. Many local officials at the place where the enterprise is headquartered do not know the provisions of the law on the social enterprise model, causing difficulties in business registration as well as administrative management in the process of operation. activities. The control of competent State agencies still faces many difficulties, the authorities are still passive only when there are requests from related individuals and organizations when exercising their rights. I am new to the investigation and supervision. The research, understanding and application of regulations in the legal documents of the National Assembly, the Government, ministries and central branches in some localities are still weak.

3.2.5.3. The need to improve the system of social legislation on legal letter Vietnam Nam

The law is an effective tool to implement the government's policies and protect consumers, but the incomplete system of legal documents will not effectively implement the social enterprise model. Therefore, it is necessary to ensure the legal system so that social entrepreneurs can trust the State, need timely sanctions and management tools to master the state management function. Perfecting the comprehensive and sustainable legal system in various fields of law from the central to local levels to ensure stability and economic development. We need to clearly define the business model that is distinct from corporate social responsibility. Perfecting the legal system to ensure citizens' freedom, democracy and equality.

3.2.5.4. Solutions to perfect the law on social enterprises and improve the efficiency of law enforcement on social enterprises in Vietnam today

Regarding the solution to complete the law, the most important thing is to specify the provisions of the legal documents, simplify the registration procedure, specify the cases where the commitment to social objectives must be reported., environment. Next is to change the way of monitoring; identify commercial or non-commercial legal entities for social enterprises; uniform regulations on incentive regime for social enterprises. And finally, it is strict and strict in using the sanctions applied to the violations of social enterprise law.

3.2.5.5. Solutions to improve the efficiency of law enforcement

In order to effectively apply the provisions of the law on social enterprises, there should be specific solutions to guide the development of social enterprises, that is, effective coordination between competent agencies; raise awareness about social enterprises; incorporate a social enterprise model into the higher education system ; improve the quality of products and services; improve the efficiency of financial funds; have a long-term strategy in formulating and implementing social and environmental goals of social enterprises ; incentive model, effectively bringing thoughts communal households.

4. Discussion and Conclusion

In order for social enterprises to have an effective legal and business environment, appropriate legal frameworks are needed to overcome the difficulties of social enterprises today. Demand for tissue formation of social enterprises bring huge benefits to society, thus encouraging the development of social enterprises, overcoming weaknesses and outstanding for corporate social associations have a role very important.

Currently, Vietnam has hundreds of social enterprises officially registered and thousands of other enterprises intend to become social enterprises. Implementing the work of perfecting the legal system of social enterprises helps the State reduce social burdens when implemented by social enterprises and bring significant impacts. Therefore, focusing on completing the provisions of the law plays a huge role.

CURRENT SITUATION AND DIRECTION TO COMPLETE LEGAL REGULATIONS ON STATE MANAGEMENT FOR FOREIGN NON-GOVERNMENT ORGANIZATIONS IN VIETNAM

MA. Tran Doan Quan

doanquantran@gmail.com

Political Academy of People's Public Security, Hanoi, Vietnam

Abstract

In recent years, the charity, humanitarian aid, and development assistance activities of foreign non-governmental organizations have become quite important factors contributing to the stability and socio-economic development of Vietnam. Although legal regulations governing these organizations have created the necessary legal framework for management, there are still several shortcomings that need to be carefully studied and evaluated. In this article, the author presents the practical situation, urgent problems and proposes solutions to improve the law in service of state management towards non-governmental organizations in Vietnam.

Keywords: *Legal regulation, State management, non-governmental organization, Vietnam.*

1. Introduction

- Rationale of the study

"Non-governmental organization" is a term used to refer to an organization, association, socio-cultural committee, charity commission, non-profit corporation or other legal entity that does not belong to the State sector and does not operate for profit.

According to Decree No. 12/2012/NĐ-CP dated March 1, 2012, of the Government on registration and management of activities of non governmental organizations in Vietnam, organizations under the governing of the Decree include non-governmental organizations, non-profit organizations, social funds, private funds or other social or non-profit organizations, which are established under foreign laws and carry out development assistance and humanitarian aid activities not for profit or other purposes in Vietnam [1].

NGOs in Vietnam have been implementing diverse programs and projects related to the fields of culture, health, education, environment, conservation, charity, relief, rehabilitation and reconciliation, etc. In particular, many programs, projects and aid of NGOs in Vietnam focus on operating in poor, remote and isolated areas and increasingly emphasized fields in accordance with priorities and directions of sustainable development of Vietnam. Therefore, in order for the activities of NGOs in Vietnam to be conducted under the provisions of Vietnamese law, the State must perform well the role of state management over this type of organization, especially in the issue of building and promulgating legal regulations on state management for NGOs to ensure synchronization, consistency, and efficiency.

- In terms of theory: At present, domestic and foreign works have not mentioned the theory of perfecting the law on state management for NGOs in a systematic way; if so, it is only an introduction to aspects without a specific approach. The theoretical contents on state management for NGOs have not been mentioned or mentioned but have not been clarified. Theoretical issues of state management for NGOs in Vietnam have not been compared deeply with reality, and have not mentioned new-formed theoretical issues that need to be added in the current period.

- Literature reviews: Through statistical reports on Foreign Non-Governmental Aid in Vietnam (2011-2019), the author has analyzed and evaluated the achieved results limitations of state management for NGOs in Vietnam, as well as gave directions and solutions to improve the legal regulations on state management for NGOs in the future.

- Research objective: The goal of the article is to propose basic solutions to improve legal regulations on state management for NGOs in Vietnam.

2. Method

The article uses the methodology of Marxist - Leninist philosophy to study specific contents. The author exploits the positive values of historical materialism and dialectical materialism. Besides, methods of analysis, synthesis, statistics, and comparison are also used thoroughly. The above methods are applied synchronously with relative independence and combination. The methods are used suitably with each part of the research to ensure scientific and logical character.

The document research method is used thoroughly in the survey of relevant legal documents and Party documents.

Analytical and synthesis methods are exployed throughout the article to synthesize data and knowledge for the purpose of assessing the current situation, giving explanations, comments and proposing solutions to complete legal regulations on state management for NGOs in Vietnam.

The author uses statistical and comparative methods in the part of actual situation to clarify data on the activities of NGOs and the state management of NGOs in Vietnam over the past years (data on organizational structure, staff, results of work handling, operating rules, rules on the management and use of NGOs’ aid...).

3. Results

3.1. Current situation of legal regulations on state management for foreign non-governmental organizations in Vietnam

Implementing guidelines and policies of the Party and the State of Vietnam on expanding foreign relations in the direction of diversification and multilateralization, facilitating for NGOs to operate effectively and bring practical benefits. The State has issued legal documents to create a legal basis for individuals and organizations to participate in NGO's activities, as well as promulgated numerous policies to facilitate NGO's operation. Thereby, contribute to maintaining political stability and socio-economic development of the country. Specifically:

- *Organizational apparatus*

Decision No. 765/QĐ-TTg, dated May 22, 2013 of the Prime Minister on consolidating the Working Committee on NGOs (replacing Decision No. 59/2001/QĐ-TTg) has adjusted and added member of the Working Committee on NGOs. [2] The Ministry of Home Affairs appoints the Deputy Minister as a member; added the Vice President of the State Bank of Vietnam as a member.

Working Committee on NGOs has the task of cooperating with the Ministry of Foreign Affairs in building and submitting to competent agencies for the promulgation of legal documents on the operation of NGOs in Vietnam. Besides, there are still some limitations such as:

+ The cooperation among central ministries when introducing NGOs or implementing projects in localities is still loose. In many cases, ministries implement projects in the localities but do not communicate and coordinate with local authorities which cause difficulties for state management.

+ Lack of synchronization in the local management apparatus. Applying different models by localities is to suit the actual conditions in different localities, but in general, the inconsistency also leads to many difficulties for both manager and managed objects. For example, the same NGO operates in different provinces and cities, but they have to work with different agencies in terms of level, authority, and function. This will inevitably lead to complications in cooperation between the two sides. A document issued by the superiors covers the same management issue, but each locality does it differently, leading to warping in its application and implementation.

+ The specialized agencies of the localities are organized according to the inconsistent model, so the work of consulting and handling issues related to NGOs is still embarrassing. Leaders of provinces and cities have not been informed in time, leading to inadequacies in direction and administration. Some localities have not fully exploited the potential of NGOs to serve the local socio-economic development. Many localities have only one or two officials in charge of NGO work. These people have to take responsibility for advisory and management duties towards NGOs, which causes obstacles for both state management and the operation of NGOs in the locality. In many localities, leaders of specialized units concurrently carry out the task of professional leadership and management of NGOs' operations. For example, in Dak Nong province, the specialized agency is the Department of Foreign Affairs, led by 01 Deputy Chief of the Office of the People's Committee and 03 assistants. In Ha Giang, this task is assigned to the Department of Planning and Investment, and is concurrently held by the Director and Deputy Director of the Department. In Ho Chi Minh City, the Union of Friendship Organizations was assigned this task [3].

- *Operating rules*

+ Decree No. 12/2012/NĐ-CP dated March 1, 2012, of the Government on Registration and Management of Activities of Non Governmental Organizations in Vietnam (annulling Decision No. 340/TTg).

+ Circular No. 05/2012/TT-BNG dated November 12, 2012, of the Ministry of Foreign Affairs, guiding the implementation of Decree No. 12/2012/NĐ-CP dated March 1, 2012, of the Government on registration and management of activities of non governmental organizations in Vietnam. After more than 9 years of implementation, Decree No. 12/2012/NĐ-CP has revealed certain limitations and is no longer appropriate, requiring timely amendments to catch up with actual requirements, and new guidelines or policies of the Party and State.

For example, the licensing procedures and processes for NGOs still have several unpractical regulations, the implementation process often takes more time than the rule, and the application of information technology in work handling is not much. Decree 12 and Circular 05 remain some overlap in functions, tasks, which increasing the intermediary stage and prolonging the time of receiving, appraising and approving applications for registration certificates to NGOs. The time of issuing registration certificates does not meet the regulations due to the time required for checking and processing at other relevant agencies and localities, which wasting time and causing troubles for organizations. The mechanism is not tight enough to monitor the implementation of NGOs' projects after being licensed. Inspection and supervision are not really close and intensive. Monitoring activities have not been carried out regularly and fully on all contents. Sanctions for violations are not actually strict, leading to the lack of serious implementation by legal entities.

Several ministries and localities have not strictly grasped and complied with legal documents on managing the operation of NGOs. Although operating regulations of NGOs have been built, some localities still welcome some organizations operate without license.

In some provinces, the People's Committee and their local specialized agencies are not even aware of the existence of Decree No. 12/2012/NĐ-CP and Circular No. 05/2012/TT-BNG. Therefore, they still accept projects from organizations that have not been licensed or have not been allowed to operate in the locality. Those local authorities have not yet instructed NGOs to carry out the procedures for receiving permit or have not checked the permits of NGOs when coming to operate in their localities.

- Regulations on management and use of aid from NGOs

+ Decision No. 1225/QĐ-TTg, dated September 17, 2019, of the Prime Minister on “promulgating the national program on strengthening cooperation and mobilizing aid from FNGOs in the period of 2019 - 2025”.

+ Decree No. 80/2020/NĐ-CP dated July 8, 2020, of the Government on management and use of grant aid not in the form of official development assistance of foreign agencies, organizations, and individuals for Vietnam. The Decree clearly states the principles of aid management and use; prohibited acts in using aid; approval procedures and authority for grant aid of different nature. Provisions of this Decree have overcome the shortcomings of Decree No. 93/2009/NĐ-CP and are more suitable to the actual requirements in managing and using grant aid today.

The new Decree has helped to closely and comprehensively manage, and effectively implement programs, projects from grant aid not in the form of official development assistance of foreign agencies, organizations, and individuals for Vietnam. At the same time, these projects contribute to conduct well purposes of economic, social development, non-profit and commercial humanitarian assistance.

Besides the achieved results, the practice still shows some limitations such as:

+ Firstly, we have not fully exploited the potential in attracting aid capital from NGOs. Although it has taken advantage of a large amount of aid from NGOs, compared to the total value of aid funds from NGOs in the world, aid to Vietnam is still low. For example, in 2011, the total value of non-governmental aid in the world was estimated at USD 32 billion (according to OECD statistics); however, the aid of NGOs in Vietnam was equivalent to 0.95%. In 2019, the aid of NGOs in Vietnam was nearly USD 400 million, accounting for 0.55% of the total aid of NGOs (including ODA disbursed through NGOs) [4]. In addition, if calculating the value of aid from NGO per capita, this value in Vietnam is only equivalent to 25% compared to Laos and 20% compared to Cambodia. Thus, the environment to attract and take advantage of NGOs’ aid to support the socio-economic development of Vietnam is very large.

+ *Secondly*, contrary to the trend of previous years, aid from NGOs to Vietnam in the last 2 years has decreased slightly. In 2016, the value of aid disbursement by NGOs reached USD 297 million (down over 2% compared to 2015). In 2019, the value of aid disbursement by NGOs was nearly USD 280 million (decreased over 5.7% compared to 2015, reduced 8.2% compared to 2011 and 2014 - the years with the highest aid value [5].

+ *Thirdly,* in some cases, the effectiveness of NGOs' aid is not truly high. Sources of aid from numerous NGOs (especially organizations with small budgets) are still spreading in many localities with large administrative costs. For example, some NGOs have aid budgets in Vietnam of less than USD 100,000, but have financed projects in dozens of provinces and centrally controlled cities of Vietnam. Aid budgets for each project and each locality are therefore very small, while the staff of these organizations has to travel many times to survey, test and evaluate, resulting in high rates of loss. This leads to a very high ratio of administrative expenditure to aid value.

+ *Fourthly,* the inspection and supervision of NGOs' aid budgets by functional agencies, ministries, localities and organizations of Vietnam are still limited and have not been able to make effective use of the aids. According to current regulations of Vietnam, functional agencies, ministries, localities and organizations of Vietnam that cooperate with or receive funding from NGOs must regularly inspect, monitor and evaluate aid budgets and use of NGOs' aids. However, the failure to inspect, monitor and evaluate NGOs' aid sources and the use of aid, along with the lack of a supporting system of monitoring and evaluation, makes it difficult to accurately and reliably determine the effectiveness of aids from NGOs.

+ *Fifthly,* the aid budgets of NGOs have not been properly coordinated. Some regions and localities are poor and troublesome but receive little aid from NGOs. For example, from 2001 to 2019, the aid of NGOs disbursed to the South Central provinces accounted for less than 10%, the Southwest region received over 7%, and the Central Highlands only constituted 3%. Meanwhile, the Red River Delta provinces accounted for nearly 18%, and the Southeast shared for nearly 13%. [6]

3.2. Direction to Complete Legal Regulations on State Management for Foreign Non-Government Organizations in Vietnam

The 12th Party Congress continued to affirm the motto and great orientation of foreign activities as "Diversification and multilateralization in foreign relations; proactively and actively integrate into the world; to be a friend, a reliable partner and a responsible member of the international community"[7]. Promote and deepen relations with partners, especially strategic partners and major countries that play an important role in the development and welfare of the country, and put the established relationship framework into practice. Actively participate in and promote the role in multilateral mechanisms, especially ASEAN and the United Nations. Actively participate in multilateral mechanisms of national defense and security, etc. Implement synchronously foreign affairs, including politics, security, national defense, economy, culture and society. Improve the quality of consulting work on foreign affairs and international integration. Enhance the quality of consulting work on foreign affairs and international integration. Strengthen information work on foreign affairs, international integration, create domestic consensus and enlist the support of international friends to meet the requirements of national construction and defense.

On the basis of the guidelines and policies of the Party, the State has institutionalized them into legal regulations and gradually innovated and improved the effectiveness of state management of NGOs to bring about certain results. The objective of the state management of NGOs is to create a legal corridor to support and promote NGOs in making positive and effective contributions for the development of society and economy, as well as limit the negative matters in the operation of NGOs in Vietnam. From those goals, the basic perspective for the State to strengthen the state management of FNGOs is:

- *Firstly,* identify the important position of NGOs in the revolution led by the Party, the role of NGOs has been confirmed in practice; on the other hand, the Party and State also require NGOs to organize and operate within the legal framework.

- *Second,* the recruitment of participants in NGOs must be voluntary. Activities of individuals and NGOs must comply with laws and rules approved by competent state agencies and on the principle of self-management and self-responsibility before the law.

- *Thirdly,* the State also clearly defines the responsibility of the whole political system in creating all conditions for NGOs to operate within the legal framework.

The practice of management activities in recent years shows that the legal regulations on state management of NGOs in Vietnam have been paid attention in building, supplementing and amending, but still reveals many shortcomings and has not kept up with the current situation. Many new-formed complicated issues in the operation of NGOs have not yet been regulated. The functions and tasks of the management agencies have not been clearly defined. Sanctions for handling violations are not enough and lack of rigor. In the current situation, these shortcomings need to be promptly overcome to meet the increasing requirements of management.

In the coming time, relevant ministries should actively advise the Government and coordinate with competent agencies in building and completing institutions and laws on state management of NGOs in Vietnam. The improvement should adhere to the following orientations:

- *Firstly, completing relevant current legal documents, creating a favorable legal framework for the operation of NGOs.*

+ Supplement and amend regulations on registration and management of NGOs' operation:

Currently, Vietnam has a legal corridor for the registration and management of humanitarian and development assistance of NGOs. This legal corridor has basically created favorable conditions for NGOs to conduct humanitarian and development assistance, contributing to ensuring the effectiveness of aid. However, in order to encourage NGOs to expand humanitarian and development assistance, Vietnam needs to pay attention to addressing issues such as:

Simplify requirements for registration file, renewal, addition and amendment of all types of registration papers (including Operational Registration Certificate, Project Office Registration Certificate and Representative Office Registration Certificate). The new legal document should clearly state the required documents and provide the form (such as application form, application for renewal, supplementation, amendment of the registration certificate, and the sample of the designed operation plan in Vietnam, etc).

Simplify the way in which NGOs submit applications for grant, renewal, supplement and amendment of registration papers such as directly at the receiving agency, electronic registration, by post, or by an authorized person.

Stipulate procedures for dossier appraisal and responsibilities of ministries, localities in providing comments with specific and shorter time limits. At the same time, it is necessary to add the circumstance that within the stated time limit, if the ministries and localities do not have any reply shall be deemed to agree with the request for appraisal and comment. As this circumstance is supplemented, it can completely overcome the situation that some ministries and People's Committees of provinces and centrally run cities reply late or do not reply to the agency in charge of appraising application dossiers of registration, extension, supplementation and modification.

The State should stipulate a unique specialized agency to manage NGOs' operations and aid in each ministry and locality. This is especially necessary for provinces and centrally run cities. NGOs and Vietnamese agencies and organizations that cooperate with and receive aid from NGOs only need to contact a specialized agency to handle administrative procedures. This will be more convenient, clear and transparent. Similarly, each ministry and people's organization at the central level needs to identify especial agency to act as a clue in cooperation and receive aid from NGOs, as well as facilitate NGOs to contact for work, settle administrative procedures and seek cooperation opportunities.

+ Develop and promulgate a national program to promote aid mobilization from NGOs

The National Program to promote aid mobilization from NGOs for the period 2017-2019 has ended. Therefore, it is necessary to develop a new program for the next period to 2025 to match the time with the socio-economic development strategies and plans of Vietnam. In the current context, the program to promote aid mobilization from NGOs to 2025 should be developed and promulgated in the following direction:

The program must be associated with the contents and orientations of the national socio-economic development goals such as the Socio-Economic Development Strategy 2020-2025, Socio-Economic Development Plan 2020 -2025, Sustainable development strategy, etc. It is necessary to refer to the country's socio-economic development strategies and plans to encourage NGOs to contribute.

Consistent with the policies and priorities of NGOs in term of field (such as health, education, settlement of war consequences, environmental protection and climate change response, etc.), in term of locality (especially in mountainous, remote and ethnic minority areas, etc.), or beneficiaries (especially disadvantaged groups). Many NGOs are currently giving high attention and priority to environmental protection, natural resources, climate change response and sustainable development.

- *Secondly, solutions to improve the initiative and capacity of ministries, localities, agencies and organizations of Vietnam in relation to NGOs*

Enhancing the initiative and capacity of ministries, localities, agencies and organizations of Vietnam in cooperation with NGOs is decisive because these ministries, localities, agencies and organizations understand their advantages and disadvantages in cooperating with NGOs.

Accordingly, it is important to focus on the following key issues:

+ *Firstly*, proactively orienting priorities on fields, areas and contents of cooperation with FNGOs through building program to promote aid mobilization from NGOs based on the State's orientation. Such formal prioritization also helps NGOs to proactively plan funding and respond well to actual needs. Besides, it also helps to avoid duplication with the use of other resources, creates conditions to promote the efficiency of different resources in performing tasks.

+ *Secondly*, ministries, localities, agencies and organizations of Vietnam must strengthen to provide and share information on the needs and priorities of the ministries and localities with NGOs. Information sharing can be done through direct activities such as at working sessions with NGOs, conferences, or meetings; through the release of publications and documents. In particular, information can be posted on the internet for NGOs and individuals to search and study more. This measure will help NGOs grasp priorities, proactively plan cooperation and implement appropriate projects.

+ *Thirdly,* ministries and localities should pay attention to building capacity for specialized agencies and their subordinates about the work with NGOs. Training contents for officials include relevant State policies and laws; method to approach and mobilize funding from NGOs; monitor, supervise and evaluate projects funded by NGOs, etc.

+ *Fourthly*, ministries, localities, agencies and organizations of Vietnam must actively search for NGOs that have appropriate fields, locations and priorities for activities, establish relationships and propose specific cooperation programs and projects. Normally, NGOs welcome and appreciate the initiative of Vietnamese agencies and organizations.

- Thirdly, solutions to improve the operational efficiency of the national specialized agencies in working with NGOs

Specialized agency is the agency assigned by the Minister and the President of the People's Committee of provinces or centrally controlled cities to receive, consider, publish and manage information on the operational capacity of the organizations and individuals (hereinafter called specialized agency), including:

According to current regulations, the specialized agency for non-government aid relations and mobilization at the central level is the Vietnam Union of Friendship Organizations. Over the years, the Vietnam Union of Friendship Organizations has well performed its assigned tasks. However, in order to continue promoting the aid from NGOs for socio-economic development, the Vietnam Union of Friendship Organizations needs to emphasize the implementation of several core solutions:

+ Strengthening to disseminate information and guide ministries, people's organizations and localities on NGOs, priority fields for aid and the ability to establish cooperative relations, so that they can actively research, approach and establish relationships with potential NGOs. Specific measures include organizing conferences and seminars, publishing and disseminating guidance documents, providing information on official websites, etc. Authorities need to focus on providing information on websites because of its efficiency, quick, economical, and ability to approach the masses.

+ Promote dissemination and guidance to NGOs on legal regulations of Vietnam, including provisions on registration and operation management of NGOs, regulations on management and use of NGOs' aid, and other relevant rules. This activity is extremely significant in helping NGOs to operate smoothly and obey Vietnamese law. Forms of dissemination and guidance include directly instructing by officials; through conferences and seminars; publishing guidance documents, manuals, or handbooks; disseminating guiding documents on the internet (through the official website of the national specialized agency, website of ministries and localities' specialized agency).

+ Stepping up the mobilization of NGOs' aid sources in diverse forms such as providing information, organizing conferences and seminars, working directly, or even with their headquarters. Expanding the work of mobilizing enterprises, private funds, or government agencies of other countries to strengthen financial support for NGOs that are operating in Vietnam.

+ Organizing regular, periodical and irregular meetings with NGOs to listen to their opinions and recommendations. At the same time, guiding and providing them the necessary information on the priorities and proposals of ministries, people's organizations and localities of Vietnam.

+ Researching and proposing suitable policies to stimulate NGOs to come and implement aid projects in Vietnam. These incentives may include tax concessionary (personal income tax for foreigners working for NGOs, value-added tax, the import tax on goods equipment under FNGO funded projects, exempt from import tax on equipment of representative offices).

+ Researching and suggesting the State in amending and supplementing legal documents related to FNGOs and aid from FNGOs to ensure transparency in procedures, promote aid effectiveness in socio-economic development, but also strictly manage the activities and aid of FNGOs.

+ Selecting and arranging qualified and capable staff to perform the tasks of the national specialized agency in working with NGOs. Vietnam should train and foster staff to improve working capacity so that they can mobilize and guide NGOs when implementing aid activities in Vietnam, as well as guide competent agencies and organizations of Vietnam to build and maintain relationships with NGOs.

+ Planing programs and organizing to train and improve the capacity of officials working with NGOs of ministries, localities, agencies and organizations of Vietnam. Training content may include the situation of NGOs in general; methods and priorities in the operation of NGOs; skills in negotiating, signing, designing, implementing, monitoring and evaluating projects from aid sources of NGOs.

4. Conclusion

Mobilizing aid from non-governmental organizations and managing their activities play an important role in solving socio-economic problems and promoting the sustainable development of the country. The article is a systematic study on the actual situation of state management for NGOs in Vietnam. It can be known that, in the current context of extensive international integration, the article will contribute to clarifying the situation of legal regulations on state management for NGOs in Vietnam. Furthermore, the author recommends key directions and solutions to improve the legal system in order to improve the effectiveness of state management for NGOs in Vietnam in the future.

APPLYING ECONOMIC DEVELOPMENT THEORY OF HO CHI MINH TO MANAGE THE ECONOMY OF VIETNAM TODAY

Dr. Le Trung Kien

kienlt1511@gmail.com

The Institute of Ho Chi Minh and Party Leaders, Ho Chi Minh National Academy of Politics, Vietnam

Abstract

During the time when the industrial revolutions 2.0 and 3.0 were taking place in the world, President Ho Chi Minh led the revolution to fight for national liberation from "poverty", bringing Vietnam to unification, step by step building the socialism. Up to now, Vietnam is gradually undergoing comprehensive renovation, especially the economy development in the direction of modernity which is a proof of the correct inheritance and application of Ho Chi Minh's economic development theory and economic management experience and achievements of the science and industry in the world. Ho Chi Minh's theory of economic development needs to be continued to be fully aware, thoroughly grasped, comprehensively and systematically researched, creatively applied and developed theoretical and practical values to suit the economic management line of the Party, the policies and laws of the State and the current context of the industrial revolution 4.0.

Keywords: *Development theory, Ho Chi Minh, economy, Vietnam*

1. Introduction

Ho Chi Minh's theory of economic development is a system of viewpoints aimed at orienting and solving basic economic problems of the development process from a semi-feudal colonial society with backward agriculture to gradually progress to a socialist regime with a modern industrial-agricultural structure and advanced science and technology which is capable of continuously improving and enhancing the people's material and spiritual life. His ideology on economic development is evident in the stages of leadership, direction and administration of the revolutionary cause from the New Democracy and the Transition to Socialism, especially the construction of socialism in the North, containing new, modern, very scientific and revolutionary ideas. His views on increasing production, practicing thrift, improving people's living standards, building and developing production, economic characteristics, purposes and structure; efficiency and principles of economic management, integrated economic development, etc. have topical significance and profound directional value in the process of economic construction and development in Vietnam today.

2. Method

The study is based on the methodology of dialectical materialism and historical materialism. The study uses a combination of specific methods, namely historical method, logical method, analytical method, synthetic method, comparative method, generalization - abstraction method, expert method, survey and statistical methods, etc., to carry out study tasks.

3. Results

3.1. Ho Chi Minh's theory of economic development

Firstly, on economic development goals. In theory and practice, He affirmed that the role of the country's economic development has a close, intimate, harmonious combination and mutual impact of political, cultural and social aspects. When outlining the task of construction and developing of each aspect of social life, according to Him, the construction of each aspect of life cannot be separated, individual, simply, which is closely linked to the construction of other aspects and is a totality of all other aspects. In which, economy is always a fundamental field, playing a decisive role that deeply governs the fields of psychology, morality, society and politics. Stemming from our country's reality, He specifically directed: “Our most important task is to build the material and technical foundation of the Socialism so that the North can gradually progress to socialism with modern industry and agriculture and advanced culture and science. In the process of socialism revolution, we must reform our old economy and build a new one, in which construction is the key and long-term task”[20]. All of His concerns about the economy is to ensure practical benefits for the people, so that the people can have enough conditions to eat, wear, stay, study, travel, treat, etc. “He requested to act immediately: 1. Ensuring food to the people. 2. Ensuring clothes to the people. 3. Ensuring shelter to the people. 4. Ensuring education to the people”[21]. These are the goals and meaningful measures in each of our economic policies and measures. He said: “The policy of the Party and Government is to take great care of the people's lives. If the people are hungry, it is the Party and Government's fault; if the people are cold, it is the Party and Government's fault; if the people are ignorant, it is the Party and Government's fault; If the people are sick, it is the Party and the Government's fault, etc. If the people are hungry, cold, sick, our policies, no matter how good they are, can't be implemented”[22].

According to Ho Chi Minh, the goal of socialist economic development is to improve and enhance people's living standards. He affirmed: “The most important thing in our economic plan today is *to gradually improve people's lives*”[23]. In 1961, he asked and answered himself “What is the purpose of socialism? To put it simply and easily is *Constantly improving the material and spiritual life of the people,* first of all, the working

people"[24]. The purpose of improving the people's living standards governs the relations of ownership, independence and freedom and is the basis for formulating guidelines, plans and ways of organizing production and developing the socialist economy.

Secondly, making use of all resources to develop production and practice thrift - Methods of sustainable economic development. The basic problem of socialist economic development is how to increase labor productivity, which Marxist-Leninist theory considers a measure of the victory of socialism over capitalism. According to Ho Chi Minh, only the goal of industrialization can be achieved to sustainably develop a socialist society. Industrialization is an inevitable trend for sustainable economic development, contributing to promoting the development of social production, liberating labor force, mobilizing large capital sources and modern technology, creating high productivity. Right after the founding of the country, He advocated extensive integration for economic development: "Vietnam gives a favorable reception to investment from foreign capitalists and technicians in all industries, etc. Vietnam accepts to join all international economic cooperation organizations under the leadership of the United Nations"[25]. Opening up for cooperation creates great opportunities for nation-building and improving people's lives. He said: "People's lives can only be very abundant when we use machines for production widely: using machines both in industry and in agriculture. The machine will support the human, increase human strength hundreds, thousands of times and help people do extraordinary things. If want to have many machines, it is necessary to expand the industries of making machines, producing iron, steel, coal, oil, etc. That is the way we must go: *The way to industrialization in our country*"[26]. Industrialization puts new requirements on economic organization and management. Associated with human resources, in economic leadership and management, units need to focus on the key stage "promoting enterprise management, and that staff and workers must be technically proficient; leading agencies must follow closely and serve production"[27].

Ho Chi Minh affirmed the strategic point of view: Increasing production goes hand in hand with thrift practice. Thrift is the rational and efficient use of resources to increase the comprehensive strength of the country. If not saving, wealth produced as the situation that "A fool and his money are soon parted", so we must "save, be not luxury, not wasteful, not indiscriminate"[28]. Thrift in production is a mandatory requirement in planning and implementing economic development strategies. He advised people to actively produce, work diligently in association with thrift practice; Not only saving in wealth, money, time, energy (people's energy), but also saving in the consumption of wealth. "Thrift means: spending 1 hour doing the 2-3-hour work. 1 person works equal to 2, 3 people. 1 dong used

[28] Ho Chi Minh (2011), *Complete Volume,* Ibid, vol.6, p. 122.

is equal to 2, 3 dongs"[29]. He did not consider thrifty to be stingy, miserly, and that money is everything; He said: "Thrift is not being stingy. When it should not be spent, shouldn't. When there is a job worth doing, a benefit for the compatriots and the Country, no matter how much effort, no matter how much it costs, we will be happy"[30]. He pointed out the purpose of thrift: "We must be more strict in the use of our savings, in order to quickly progress to a full and prosperous life for everyone"[31]. He even proposed the motto "sparing of words" for economic development as "Talk the talk walk the walk", "Actions speak louder than words"[32]. With mass organizations, He advised not to have many meetings, to do their best to avoid "meeting without discussion, discussion without dicision, dicision without action"[33]. If we consider actions an expression of morality, we can consider the sparing of words (saying only the most practical things) as an expression of human prudence and faithfulness.

He asked everyone to save their own time, energy and money. The need to save comes not only from personal ethical requirements, but also from the requirements of the apparatus and production lines. In economic activities, as long as a loophole exists, money will follow it out and forcefully break into the entire system, making the loophole bigger and bigger. Therefore, in order to "seal the loopholes, and not let our savings be lost or dispersed"[34], everyone must work together, practice thrift, and fight waste. He asserted: "Waste, though not taking public money, its results are also harmful to the people, to the Government. Sometimes it is more harmful than embezzlement"[35]. It is more harmful because only powerful officials can embezzle, but regardless of person, in any position, it is easy to waste money, time, energy of the themselves, the agency and the society.

Thirdly, managing the economy according to the principles and ensuring economic efficiency. The socialist revolutionary process is a long, difficult and arduous historical process with the ultimate aim of ensuring the success of the cause of socialist construction. In that process, it is inevitable that economic, political, socio-cultural issues need to be solved in a scientific, comprehensive and effective manner. Ho Chi Minh was clearly aware of the value of economic development in order to achieve revolutionary goals, and He sought every way to carry out economic development activities. He has set out general and specific goals of economic development in each different revolutionary period, but they all demonstrate the principles of economic management: appropriateness - fairness - benefit - thrift - efficiency.

[35] Ho Chi Minh (2011), *Complete Volume,* Ibid, vol. 7, p. 357.

In economic management, He emphasized the role of the government as a regulator of the entire economy and as a subject of an economic sector. The Government develops mechanisms and policies, establishes and maintains a system of economic management principles and creates levers to stimulate economic development in the main fields; ensures the centralized management of the state and at the same time ensures the autonomy of the governing agencies and economic units. He advocated: “Management of a country is like managing an enterprise: it must be profitable. What is output, what is input, what to do immediately, what to wait, postpone, or discard, what is worth spending, who is worth using, everything must be carefully calculated”[36]. In the principle of economic accounting, economic efficiency must be taken as a measure, so economic managers must know how to use economic levers to achieve high efficiency. He raised the issues of price, salary, money, tax, contract, bonus and penalty as levers in different economic sectors that will stimulate labor, abundant, fast, good and cheap production, creating products that benefit the family and state.

He emphasized not to be equalized in the economy, in the distribution according to the quantity and quality of labor, so as not to destroy the momentum of development. “In the work of circulation and distribution, there are two important points that must always be reminded: Not afraid of lack, just afraid of unfairness and not afraid of poverty, just afraid of people's restless hearts”[37]. He asserted: “The distribution must be according to the level of labor. The more labor, the more it is distributed, the less labor, the less it is distributed, etc. The good people and bad people with difficult things and easy things should not be given the same points. That is egalitarianism. *Egalitarianism must be avoided*”[38]. In management, it is necessary to pay attention to the implementation: “Helping the poor have enough food, those who have enough food will be quite rich, those who are quite rich will get richer, etc. Making use of the people's wealth, the people's power, the people's property to benefit the people”[39]. Regarding the principle of distribution according to labor, He also mentioned the way and efficiency of lump work in production. “The lump work system is a condition of socialism, it encourages workers to always make progress so that the factory can progress. The lump work brings mutual and private benefits; Good lump work is appropriate and fair under our current regime. The lump work must increase the quantity, but always maintain the quality”[40].

For organizations and managers of economic development, it is required “to find a way to organize and arrange reasonable arrangements, so that one person can work like two

[36] Ho Chi Minh (1990), *On Economy and Economic management,* Theoretical Information Publishing House, H, p. 82-83.
[37] Ho Chi Minh (2011), *Complete Volume,* Ibid, vol. 15, p. 224.
[38] Ho Chi Minh (2011), *Complete Volume,* Ibid, vol. 13, p. 216.
[39] Ho Chi Minh (2011), *Complete Volume,* Ibid, vol. 5, p. 81.
[40] Ho Chi Minh (2011), *Complete Volume,* Ibid, vol. 10, p. 537-538.

people, working for one day equals for two days"[41]. He asked economic managers to uphold the gradual, from small to large, from low to high, voluntary, mutually beneficial principle, avoiding subjectivity, coercion and ostentatiousness. He advised "*don't be greedy to do things quickly and massively*"[42], need to closely follow the characteristics, situation as well as experience in economic management. "Production plan *is not determined in a bureaucratic way*, it must be closely related to the economic situation, to the source of wealth and a clear calculation of our support. The plan should not *fall behind*, but also should not *run ahead of* the development of technology, should not be separated from agriculture, should not forget about our thrift"[43]. The biggest feature of economic managers is related to a lot of materials and money, who are easy to be tempted, corrupted and perverted, if they are not clever, they will cause losses and bad consequences for the economic establishments. Therefore, He demanded that in the economy, "management must be democratic, fair and transparent"[44], the economic managers must have professional qualities, qualifications and standards to meet the requirements set forth.

Fourthly, expanding models and ways of economic development. During the transition to socialism, He advocated an economy with many forms of ownership and many economic sectors. He affirmed: In the transitional period, our country's economy still exists four main forms of ownership: "Ownership by the State means that of the whole people. The ownership of the cooperative means the collective ownership of the working people and the ownership of the individual workers. A few means of production are owned by the capitalist"[45]. Regarding economic components, according to Ho Chi Minh, in the new democracy, there are five different types of economy: "A- State-owned economy (belonging to socialism because it belongs to the people). B- Cooperatives (it is semi-socialism, and will move towards socialism). C- Economy of individuals, farmers and artisans (possibly gradually moving into cooperatives, i.e. semi-socialism). D- Private capital. E- Capital of the State (such as the State joining forces with private capital to do business)"[46].

The normal economic structure is considered from three angles, namely the sectoral structure, the component structure, and the territorial structure, in which the sectoral structure is the most important. According to Him, because our country is an agricultural country, in the structure of the economic sector, we must attach importance to agriculture, but first of all, food production. He pointed out that three economic sectors have an organic relationship with each other: agriculture, industry, and commerce (Historically: without agriculture, there would be no stability, without industry, there would be no wealth, without

[41] Hồ Chí Minh (1990), *On Economy and Economic management,* Ibid, p. 82.
[42] Ho Chi Minh (2011), *Complete Volume,* Ibid, vol. 9, p. 466.
[43] Ho Chi Minh (2011), *Complete Volume,* Ibid, vol. 7, p. 365-366.
[44] Ho Chi Minh (2011), *Complete Volume,* Ibid, vol. 13, p. 200.
[45] Ho Chi Minh (2011), *Complete Volume,* Ibid, vol. 12, p. 372.
[46] Ho Chi Minh (2011), *Complete Volume,* Ibid, vol. 8, p. 293-294.

commerce, there would be no activeness, without wisdom, there would be not flourish). In particular, commerce is the link between agriculture and industry. If the commerce link is broken, it will not be possible to link agriculture with industry, and the union of workers and farmers will not be consolidated. Talking about the role of agriculture, He pointed out that agriculture not only solves food problems but also provides raw materials to restore small industry and industry, and at the same time provides forest products to expand trade with foreign countries. It is necessary to develop comprehensive agriculture, while attaching importance to forestry, fishery, and salt production.

President Ho Chi Minh raised the issue that economic managers need to orient to build an independent and self-reliant economy in combination with expanding international economic cooperation in order to promote internal resources, potentials and strengths of the country and take advantage of international opportunities and favorable conditions for economic development. Economic development must be associated with the implementation of political tasks, with social progress and human morality, thereby strengthening the socialist political system. Therefore, He is particularly interested in promoting the spirit of socialism and collectivism, fighting individualism, and creating the necessary motivation for development.

When Ho Chi Minh lived in an era when socio-economic development did not set urgent requirements on environmental protection, but with a strategic vision, He had profound valuable thoughts on this issue. In His expression, although He does not directly refer to the term “sustainable development” as at present, the contents, goals, principles, and relationships among factors in sustainable development have all been mentioned by Him from very soon, there were even very accurate, comprehensive and systematic forecasts on the contents related to sustainable development, in which: social welfare must pay attention to the families of war invalids and martyrs who have contributed to the revolution; ethnic minority, etc.

3.2. Solution orientation to apply Ho Chi Minh's economic development theory to manage Vietnam's economy today

On the basis of the orientation to apply Ho Chi Minh's economic development theory and actively seize the opportunities of the industrial revolution 4.0 to develop our country's economy, it is necessary to synchronously implement the following important solutions:

Firstly, building a long-term strategy and vision, developing a smart nation.

Ho Chi Minh's theory of economic development and technological revolution are an important theoretical and practical basis to apply creatively to establish a strategy for Vietnam's economic development in a practical and effective way in the reform period. The Government and state management agencies need to renovate the thinking, apparatus and methods of management, administration, planning mechanisms and policies in accordance with revolutionary changes in technology.

Implementing well Directive No. 16/CT-TTg, dated May 4, 2017 of the Prime Minister on strengthening capacity to approach the fourth industrial revolution. Deploying the development of e-Government for administrative management and effective use in the direction and administration of the Government and in dealing with the affairs of people and enterprises; promoting the development of online public services and having solutions to encourage people and enterprises to use them; timely adjusting economic policies to suit the economic situation in the country, the region and the world. Enhancing the leading effective position and role of the state economic management. Effectively promoting the Project on Supporting the National Innovative Start-up Ecosystem to 2025 approved by the Prime Minister in Decision No. 844/QD-TTg dated May 18, 2016; Project "Digital Vietnamese Knowledge System". Continuing to promote the implementation of Resolutions No. 19-2017/NQ-CP dated February 6, 2017, No. 35/NQ-CP dated May 16, 2016 and No. 36a/NQ-CP dated October 14, 2015 by the Government to improve the business competitive environment to promote the development of enterprises, create conditions for enterprises to quickly absorb and develop new production technologies.

Raising awareness of leaders at all levels, sectors, localities, enterprises and the whole society about the Industrial Revolution 4.0. Strengthening international integration and information and communication to improve correct understanding and awareness of the nature, characteristics, opportunities and challenges of the Industrial Revolution 4.0 to have appropriate and effective approaches and solutions.

Secondly, delving into improving the quality of human resources to meet the requirements of economic development. Ho Chi Minh once said: "To build socialism, first of all, there must be socialist people"; "Must consider the human factor as the number one issue"[47]. In economic construction and development, in order to increase productivity, quality and efficiency, must create and regularly adjust mechanisms, policies, methods of organization and management, etc., to actively improve human resources for intelligent, qualified, healthy, creative and dynamic human resources for high production and economic development.

Well implementing the Party's policy on education is "Innovating educational programs and contents in the direction of streamlining, modernity, practicality, suitable for ages, qualifications and professions. Diversifying the learning content and materials to meet the requirements of all levels of education, education and training programs and the lifelong learning needs of everyone". Innovating education and training, building smart schools, increasing the application of science and technology in training, renovating curricula and

---

[47] *People's newspaper,* issued on April 7, 1965.

restructuring training professions to suit the requirements of the 4.0 revolution. Encouraging teachers to teach interactively (Interactive teaching) with smart devices, manage the learning (Class management) combined with team-based learning method (Team-based learning). Focusing on training students adaptability and creative working spirit. It is necessary to have a policy to attract high-quality human resources from the outside in order to create innovation motivation and opportunities to learn and develop on the basis of buying skills and knowledge from outside, building a learning society with the transfer and sharing of common knowledge of mankind.

Thirdly, clearly defining the content, nature and sequential steps in the development of economic sectors and fields. Focusing on developing industries to serve the development of agriculture and light industry. Our country's starting point is an agricultural country, and the potential for agricultural and rural economic development is high. Our Party affirms that "Promoting the development of a number of key economic sectors and fields, which have potentials and advantages to serve as a driving force for growth in the spirit of catching up, advancing with and surpassing in some areas compared to the region and the world"[48] is the creative application of economic development theory of Ho Chi Minh.

Fourthly, focusing on promoting development, creating a real breakthrough in infrastructure and technical applications. Developing digital connection infrastructure and ensuring network safety and security to create conditions for people and enterprises to easily and equally access digital content development opportunities. Building a digital transformation strategy, smart governance, prioritizing the development of the digital technology industry, smart agriculture, smart tourism, and smart cities. Reviewing and selecting to develop key products, strategic competitive products of the country, closely following new production technologies, integrating new technologies to focus on development investment.

Economic management needs to adhere to the combination of building the new and improving and upgrading modern technology in the process of industrialization and modernization. Ho Chi Minh once affirmed: "If technology is separated from the entire national economy, losing contact with it, technology cannot lead the national economy"[49]. In the economic development of the country, it is necessary to pay attention to the combination of rudimentary to medium technologies, and at the same time to boldly apply modern technology in each item (from single to synchronous) to create products of high quality, according to standards, with high competitiveness. This is considered a breakthrough and "leapfrog" to catch up with the world's development speed of Vietnam.

---

[48] Communist Party of Vietnam (2021): *Document of the 13th National Congress of Deputies,* National Political Publishing House, Hanoi, vol. 1, p. 235.
[49] Ho Chi Minh (2011), *Complete Volume,* Ibid, vol. 6, p. 499.

Promoting economic restructuring in association with growth model innovation, improving productivity, efficiency and competitiveness of the economy, in which focusing on 3 focuses: Investment restructuring with the focus on public investment; enterprise restructuring with the focus on economic groups and state-owned corporations; financial market restructuring with the focus on commercial banks and credit institutions.

Stepping up research and effective application of important scientific and technological achievements for socio-economic development, national defense and security assurance. Building socialism and defending the socialist Fatherland is an organic, dialectical relationship, forming a unified whole, "two are like one, one is like two". Our Party puts "stability and sustainable development in all aspects of socio-economic life as a solid foundation for national defense and security" as the top priority, but determines "to maintain a peaceful environment with political stability, national security, and human security"[50]. This view should be understood that economic development is the root of national defense - security; Socio-economic construction is an effective method to protect the Fatherland. If this root is solid, then national defense - security will be strong. The expression of solidity is stability and development.

4. Discussion and Conclusion

Vietnam is in the process of industrialization, modernization of the country and international integration, the industrial revolution 4.0 is opening up many opportunities, advantages and challenges and difficulties for economic development, requiring the participation of all actors in the economy on the basis of applying topical values of Ho Chi Minh's economic development theory and the country's reality in the current situation. The mastery, research, application and creative development in the current economic management, construction and development in Vietnam in the context of the industrial revolution 4.0 for the core goal of national economy development is to serve the cause of rich people, strong country, democracy, justice and civilization.

Ho Chi Minh's theory of economic development is part of a precious heritage containing profound values of Economic development goals; making use of all resources to develop production and practice thrift; managing the economy in accordance with the principles and ensuring economic efficiency; expanding models and ways of economic development. Along with that, researching on the characteristics, impacts and requirements of the 4.0 industrial revolution on Vietnam's economic development has practical significance today. The process of building and developing Vietnam's economy needs to be oriented to apply the following point of view: Recognizing the trend of economic development in the direction of industry and modernity is an inevitable development trend in promoting Vietnam's economic development; equal opportunities for Vietnam and other

[50] Communist Party of Vietnam (2021), *Document of the 13th National Congress of Deputies*, Ibid, vol.1, p.156.

countries; science and technology must be considered as an important foundation for the country's breakthrough and sustainable development in the future. Proposing synchronous solutions for economic development, including: Building a long-term strategy and vision, developing a smart nation; deepening the improvement of the quality of human resources to meet the requirements of economic development; clearly defining the content, nature and sequential steps in the development of economic sectors and fields; focusing on promoting development, creating a real breakthrough in infrastructure and technical applications.

In order to properly understand and effectively apply Ho Chi Minh's economic development theory and the achievements of the industrial revolution 4.0, it is necessary to avoid stereotypes and dogma, but to be flexible with methodologically oriented viewpoints and principles. In the current economic construction and development, it is necessary to derive from reality, the situation and characteristics of the world economy and Vietnam's economy to apply Ho Chi Minh's ideoloy practically and appropriately; apply Ho Chi Minh's economic development perspectives in managing and regulating specific, comprehensive and scientific economic issues, ensuring focus, innovation, integration and sustainable development.

IMPACT OF FISCAL POLICY ON VIETNAM'S ECONOMIC GROWTH

MSc. Le Tat Phuong

letatphuong@gmail.com

National Center for Socio-Economic Information and Forecasting, Ministry of Planning and Investment, Hanoi, Vietnam

Abstract

Fiscal policy plays a very important role in Vietnamese economy. In recent years, Vietnam's fiscal policy is gradually adjusted to the changes of the economy. By combining qualitative and quantitative methods to evaluate the impact of government spending on Vietnam's economic growth, this study finds that before 2011, Vietnam's fiscal policy was quite ineffectiveness and had negative effect on Vietnam's economic growth. Whereas, after 2011, those policies have been adjusted toward increasing effectiveness and contributing significantly to the country's economic growth.

Keywords: *Fiscal policy, growth, quantitative, Vietnam*

1. Introduction

Economic growth is one of the top priorities for many countries, especially those countries in transition like Vietnam. To achieve the expected growth target, governments can use many macro tools and policies to promote growth, including fiscal policies. By implementing fiscal policies, government can create impact on the economy in order to achieve the macroeconomic goals such as economic growth, job creation or inflation stabilization. Fiscal policy has a large impact on management and plays an important role in regulating the macro economy through mobilizing and using state financial resources.

In recent years, fiscal policy has contributed significantly to the economic growth of Vietnam. In the financial crisis in 2008- 2009, Vietnam implemented expansionary fiscal policy. Although this policy kept the economy not to decline sharply in the later period, it also led to budget deficit and increased the burden of repayment for the budget. Large budget deficit, high public debt, decreased budget revenue/GDP ratio and ineffective public spending, especially public investment, were all hindering sustainable growth. Since 2012, especially in recent years, in the context of pandemic Covid-19 has affected significantly to the entire socio-economic life of Vietnam, the Government of Vietnam is implementing policies towards strictly implementing revenue, saving, reducing the State budget deficit, supporting reasonable growth. To clarify the impact of fiscal policy on growth, this study uses a number of quantitative tools such as correlation analysis and econometric modeling to examine the impact of Vietnam's fiscal policy in various periods.

2. Method

To analyze the effect of fiscal policy on Vietnam's economic growth, the following methods are used:

- ***Correlation coefficient analysis***

Correlation coefficient is a statistical indicator measuring the strength and weakness of the relationship between two variables. The correlation coefficient is valid from -1.0 to 1.0. Correlation coefficient with a positive value implies that two variables haves the same direction, in contrast, the negative value implies an inverse relationship, the correlation coefficient is 0 implying two independent variables.

There are many types of correlation coefficients, but the most common is the Pearson correlation. This index measures the strength and cannot distinguish dependent and independent variables.

Formula

$\rho_{xy} = Cov(xy) / \sigma_x * \sigma_y$

In which:

ρ_{xy} :	Pearson correlation coefficient
$Cov_{(x, y)}$:	Covariance of variables x and y
σ_x :	Standard deviation of x
σ_y :	Standard deviation of y

- ***Multi-variable regression economic model (Hadjimichael model, 1994)***

This model evaluates impacts of capital, monetary policy and fiscal policy on economic growth based on Hadjimichael model (1994), which is described as follows:

$Yit = \alpha_{it} + \Upsilon * FMVar\ (t-1) + \beta * Xi\ (t-1) + c + \varepsilon it$

In which:

- Yit:	Dependent variable
- FMVar:	Variable representing fiscal policy[51]
- Xi:	Control variables.
- c:	Intercept
- ε:	Residual

The delayed fiscal targets and control variables in the model are due to:

[51] in Hadjimichael's original model, FMVar is Divestment of the Economy

First: The fiscal policies implemented in this year will have impact on the economy in the coming years, i.e. have a delayed effect.

Second: technically avoid the endogenous problem between dependencies and control variables

The model is applied in this research by following steps:

Step 1: Develop an integrated fiscal indicator

To build integrated fiscal indicator, principal component analysis method (dimensionality reduction) – PCA is used.

Principal Component Analysis (PCA) is one of the simplest methods for multivariate data analysis. The idea of this approach is to extract the greatest amount of information from single variables and indexes when combining them in ways through the least number of principal components (PC). In other words, PCA method allows the transformation from a large set of variables and its observations into a smaller set of variables but having full information of the initial variables. Through PCA, principal components (PC) are created by modeling the resonance capacity of single variables in different spatial directions, by which guarantees the maximum information of single variables and indices is retained in the principal components (Stock and Watson, 2002).

Step 2: Use the above Hadjimichael model to estimate the impact

Step 3: Analyze the results

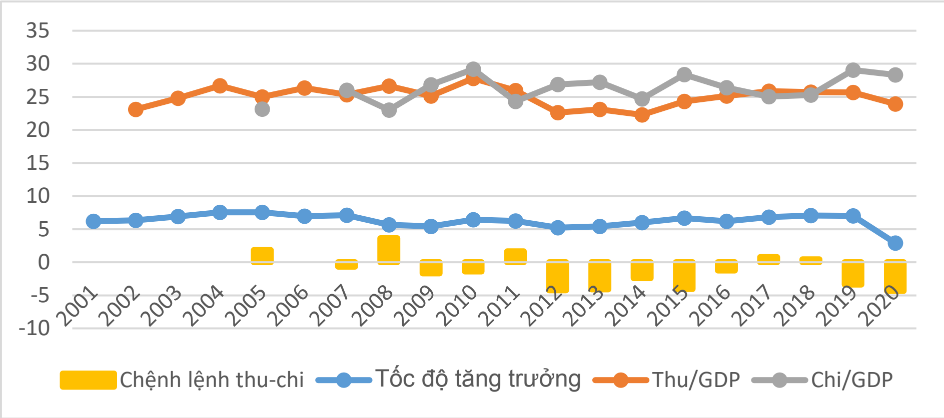
3. Results

Impact of fiscal policy on Vietnam's economic growth

In 2008-2011 when global economic crisis and recession appeared, Vietnam implemented expansionary fiscal policies to cope with. Although keeping the economy not to decline sharply during this period, those policies also led to a high level of overspending (about 6% in 2009), thereby increased the burden of repayment for the state budget. The large budget deficit, the declining budget revenue/GDP ratio and the ineffective public spending, especially public investment had certain effects on long-term sustainable growth.

Since 2012, Vietnam's economy started to recover and gained its growth momentum, in 2017 and 2018, the growth rate has reached 6.81% and 7.1% respectively; macro policies focus on macroeconomic stabilization and business support. Specifically, in term of fiscal policy, the Government is operating towards strictly implementing the items of revenue, saving, reducing the state budget deficit, and supporting reasonable growth.

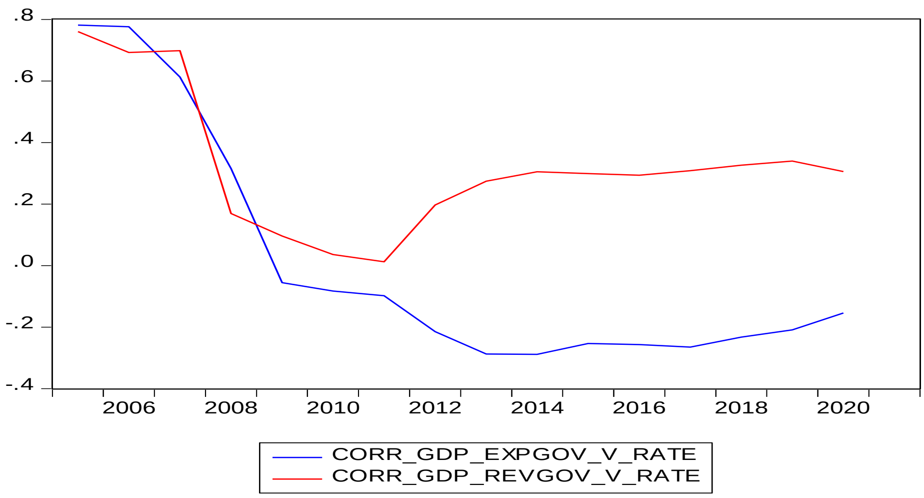
Figure 1: Budget revenue and expenditure and growth rate



Source: Author's calculations from GSO data

The relationship between specific fiscal policies and growth shows that before 2011, effectiveness of revenue-expenditure policy decreased quite rapidly, reflected in the correlation coefficient between revenues, spending and growth continued to decline from 0.8 to close to zero in 2011.

Figure 2: The correlation coefficient between revenue and expenditure - budget and growth rate[52]



Source: author's calculation from GSO data

However, since 2011, there has been a quite different effect between revenue and expenditure on growth.

After 2011, revenue policy has had increasing positive effects on growth, while expenditure policy has not had any significant changes, and somehow restricted economic growth (negative correlation coefficient).

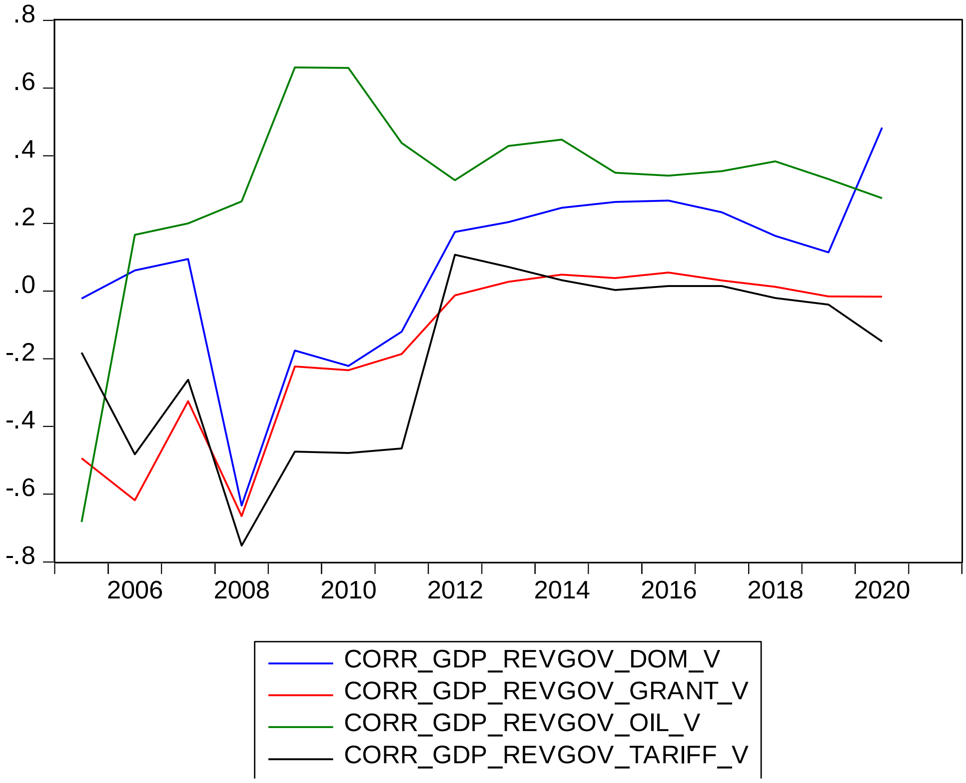
---

[52] CORR_GDP_REVGOV_V_RATE, CORR_GDP_EXPGOV_V_RATE: Correlation between revenue, spending/GDP and growth

Impact by composition of revenue and expenditure

Before 2011, the impact of revenue items on economic growth was instable, in which oil revenues have strong impact on economic growth of Vietnam, while revenues from tariffs have a minimal impact.

Figure 3: Correlation between revenues and GDP[53]



Source: Author's calculations from GSO data

After 2011, the impact of revenue sources on growth is relatively stable, which shows that the system of fiscal policies in Vietnam is gradually standardizing and stimulating growth. However, the order of effects of revenues on growth has not changed: the strongest effect was still revenue from crude oil and the lowest was revenue from import and export tariffs.

Impact by composition of expenditure

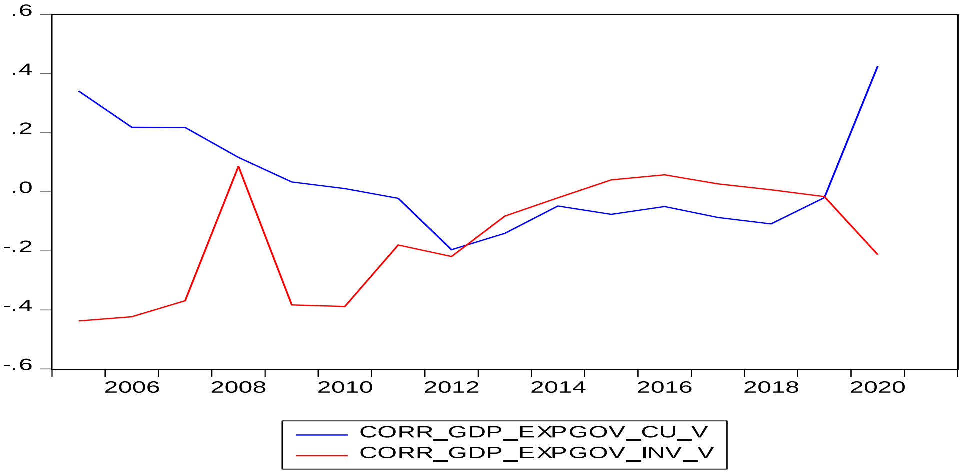
Before 2012, impact of recurrent expenditure on growth decreased gradually, especially in 2011 and 2012, recurrent expenditure not only did not have a positive impact, but also somewhat limited the growth rate. In term of spending for development, before 2012, there were large fluctuation in the impact of these expenditures on growth, but overall,

53 CORR_GDP_EXPGOV_DOM_V,CORR_GDP_EXPGOV_OIL_V, ORR_GDP_EXPGOV_ TARIFF_V, CORR_GDP_EXPGOV_ GRANT_V: Correlation between domestic revenue, oil revenue, custom revenue, ODA revenue and growth

development spending had many limitations, causing negative effects on Vietnam's economic growth.

The impact of recurrent expenditure is stronger than the impact of development spending. This shows that before 2012, Vietnam's economic growth was based on spending (rely on demand side to stimulate economic growth).

Figure 4: Correlation between recurrent expenditure, development expenditure and GDP



Source: Author's calculations from GSO data

After 2012, impact of development expenditure was greater than recurrent expenditure, which shows that the expenditure policy has gradually changed and has a greater impact on the economy. However, this impact is still relatively small, showing that Vietnam's spending on investment for development is still ineffective. On the other hand, the negative correlation between recurrent expenditure and growth implies the burden of recurrent expenditure on the economy, which is hindering economic growth.

In the past two years, the Covid-19 pandemic has had multidimensional impacts on state budget expenditure. On the one hand, the Covid-19 epidemic forced the government to reduce spending and improve its efficiency, and avoid wasting in recurrent expenditure due to difficulties in revenues, reflected in increasing impacts of recurrent expenditure on economic growth in 2019 and 2020. Whereas impact of development spending has decreased, due to the fact that Covid-19 pandemic has slowed down the production activities, and affected the investment in production.

Quantitative effects of fiscal policy on growth

Use impact assessment model

Using Hadjimichael model to assess impacts, we have the equation:

Log (gdp) = α_{it} + Υ * INDEX_GOV + β1 * LOG (FCF (-1)) + β2 * LOG (LF_AC (-1)) + β3 * LOG (OPEN (-1)) + β4 * (YEAR = 2008) + (YEAR = 2009) + β5 * (year = 2011) + Ɛ

In which:

✓GDP: Gross domestic product (constant 2010)

✓INDEX_GOV: Integrated fiscal policy variable

✓FCF: accumulation of fixed assets

✓LF_AC: economically active workforce

✓OPEN: the openness of the economy

✓(YEAR = 2008) + (YEAR = 2009): Dummy variable of year 2008, 2009 = 1

✓(YEAR = 2011): Dummy variable of year 2011 = 1

✓Ɛ: Residual

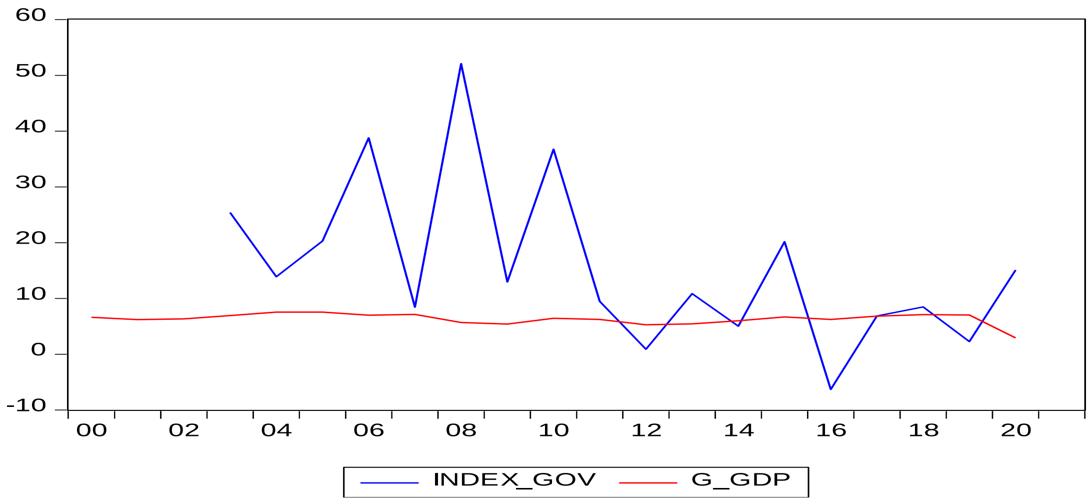
Data:

Data used in the analysis and estimation were collected from GSO from 2000 to 2020[54]

Develop integrated fiscal policy indicator

Using the dimensionality reduction method for fiscal and monetary indicators, we can get the integrated fiscal policy indicator (**Appendix 1**).

Figure 5: Integrated fiscal and monetary policy indicator[55]



Source: Author's calculations from GSO data

Estimated impact model

[54] Data for 2020 is estimated
[55] INDEX_GOV: integrated fiscal policy indicator, G_GDP: economic growth rate

When developing integrated fiscal policy indicator from component fiscal indicators[56] by applying PCA, the study finds that the coefficient of the integrated fiscal index is very small (-0.000977), which shows the inconsistent relationship between the integrated fiscal policy and growth.

Log(gdp) = - 0.000977*INDEX_GOV + 0.419992*LOG(FCF(-1)) + 0.8088760*LOG(LF_AC(-1)) + 0.002154*LOG(OPEN(-1)) - 0.036110*(YEAR=2008) + (YEAR=2009) - 0.087995*(year = 2011)

The coefficient - 0.000977 implies that Vietnam's fiscal policy still has problems that creating negative impact on growth, but the impact is quite small. This can be explained by the fact that the recurrent expenditure for the state apparatus of Vietnam is still very large while development spending is not effective.

Vietnam still grows in breadth, as the ratios for labor (0.8088760) and capital (0.419992) are very high. Whereas the coefficient of economic openness is small (0.002154) implying that Vietnam has not taken full advantage of economic integration.

4. Discussion and Conclusion

As Vietnam is a developing country with high openness, changes in the world economy would have great impact on Vietnam's economy. Both regional financial crisis 1997- 1998 started in Thailand, global financial crisis in 2017-2018, and Covid-19 pandemic have affected deeply to all socio-economic sectors of Vietnam. However, with the results achieved up to now, it can be affirmed that the Government's fiscal policies have been gradually adjusted to be effective and promptly support business and citizens.

However, in the current complicated and unpredictable context of Covid-19 pandemic, the fiscal policy needs towards cutting expenditure, increasing efficiency of spending especially development spending. In addition, the government needs to seek more sustainable revenue sources while strictly manage existing revenue by improving investigation in collecting fee and tax; carefully considering revenue from selling property, property right and increase in budget deficit and public debt in short-term.

THE ROLE OF THE STATE IN THE DEVELOPMENT OF A SOCIALIST-ORIENTED MARKET ECONOMY IN VIETNAM TODAY

MA. PhD Candidate. Cao Thanh Tuan
caotuangtvthanoi@gmail.com
Ho Chi Minh National Academy of Politics, Hanoi, Vietnam

Abstract

The socialist-oriented market economy that we are building is an economy with specific characteristics, suitable to Vietnam's political, economic and cultural conditions and the values of society. for which we are striving. In the current doi moi process, besides the achievements, the socialist-oriented market economy in Vietnam also reveals its limitations. To address these limitations, state management plays a very important role. The article clarifies the concept of a socialist-oriented market economy, analyzes the status quo of the state's management role in the socialist-oriented market economy in Vietnam, and on that basis proposes some basic measures to promote the management role of the State in the socialist-oriented market economy in Vietnam today.

Keywords: *Management, state, socialist-oriented market economy.*

1. Introduction

The socialist-oriented market economy in Vietnam was formed and developed on the basis of promoting the people's role of social mastery, ensuring the State's role in economic management and regulation. socialist rule of law led by the Communist Party of Vietnam. The state is gradually increasing the role of the management subject and gradually narrowing the role of the economic actor. Accordingly, the State manages the economy, orients, regulates and promotes socio-economic development by means of laws, strategies, master plans, plans, policies and material forces ensure the development of the market, comply with the rules of the market economy, and be compatible with the practices of other countries; create the macro environment; building infrastructure and ensuring social security; promulgate mechanisms and policies on resource allocation, distribution and redistribution towards ensuring economic growth associated with social progress and justice; environmental Protection. At the same time, the State must ensure the leading role of the state economy, perfect the tools for macroeconomic management, strengthen discipline in the observance of policies and regimes, use the credit investment program to facilitate and guide the development of sectors, localities and economic sectors.

2. Method

On the basis of using methods of analysis, synthesis, systematization and generalization of relevant documents on the socialist-oriented market economy in Vietnam, the article clarifies the concept of economic socialist-oriented market, analyze the status of the state's management role in the socialist-oriented market economy in Vietnam, on that basis, propose a number of basic measures to promote management role of the State in the socialist-oriented market economy in Vietnam today.

3. Results

3.1. The socialist-oriented market economy

The socialist-oriented market economy (Vietnamese: *Kinh tế thị trường theo định hướng xã hội chủ nghĩa*) is the official title given to the current economic system in the Socialist Republic of Vietnam. It is described as a multi-sectoral market economy where the state sector plays the decisive role in directing economic development, with the eventual long-term goal of developing socialism.

The socialist-oriented market economy is a product of the Đổi Mới economic reforms which led to the replacement of the centrally planned economy with a market-based mixed economy based on the predominance of state-owned industry. These reforms were undertaken to allow Vietnam to integrate with the global market economy. The term "socialist-oriented" is used to highlight the fact that Vietnam has not yet achieved socialism and is in the process of building the basis for a future socialist system.

The Đổi Mới economic reforms were initiated by the Communist Party of Vietnam in 1986 during the party's 6th National Congress. These reforms introduced a greater role for market forces for the coordination of economic activity between enterprises and government agencies, and allowed for private ownership of small enterprises and the creation of a stock exchange for both state and non-state enterprises.

The economic reforms aimed to restructure the Vietnamese economy away from Soviet-type central planning and towards a market-based mixed economy intended to be a transitional phase in the development of a socialist economy.[4] The goal of this economic system is to improve the productive forces of the economy, developing a firm technical-material base for the foundation of socialism, and to enable Vietnam to better integrate with the world economy.

In the early 1990s, Vietnam accepted some World Bank reform advice for market liberalization, but rejected structural adjustment programs and conditional aid funding requiring privatization of state-owned enterprises.

The socialist-oriented market economy is a multi-sectoral commodity economy regulated by the market, consisting of a mixture of private, collective and state ownership of the means of production. However, the state sector and collectively owned enterprises form the backbone of the economy. It is similar to the Chinese socialist market economy in that many forms of ownership, including cooperative/collective enterprises, communal, private and state ownership models co-exist in the economy, but the state sector plays a decisive role.

The Communist Party of Vietnam maintains that the socialist-oriented market economy is consistent with the classical Marxist view of economic development and historical materialism, where socialism can only emerge once material conditions have been sufficiently developed to enable socialist relations. The socialist-oriented market model is seen as a key step for achieving the necessary economic growth and modernization while being able to co-exist in the contemporary global market economy and benefit from global trade. The Communist Party of Vietnam has re-affirmed its commitment to the development of a socialist economy with its Đổi Mới reforms.

This economic model is defended from a Marxist-Leninist perspective, which states that a planned socialist economy can only emerge after first developing the basis for socialism through the establishment of a market economy and commodity-exchange economy and that socialism will only emerge after this stage has exhausted its historical necessity and gradually transforms itself into socialism.

3.2. The current status of the state's management role in the socialist-oriented market economy in Vietnam today

The basic feature of Vietnam's socialist-oriented market economy is that the economy operates fully and synchronously according to the laws of the market economy, while ensuring a suitable socialist orientation. suitable for each stage of development of the country. It is a modern market economy and international integration; under the management of the socialist rule of law state, led by the Communist Party of Vietnam, with the aim of "rich people, strong country, democracy, justice and civilization".

Vietnam's socialist-oriented market economy has advanced production relations in line with the development level of the productive forces; there are many forms of ownership, many economic sectors, in which the state economy plays the leading role, the private economy is an important driving force of the economy; subjects of all economic sectors are equal, cooperate and compete according to the law; the market plays a key role in effectively mobilizing and allocating development resources, which is the main driving force to release productive power; State resources are allocated according to strategies, master plans and plans in line with the market mechanism. The State plays the role of orienting, building and perfecting economic institutions, creating an equal, transparent and healthy competitive environment; use State resources and tools and policies to orient and regulate the economy, promote production and business and protect the environment; implement social progress and justice in each step and each development policy. To promote the people's mastery role in socio-economic development.

After nearly 30 years of renovation, our country has gradually shifted from a centrally planned, bureaucratic economy to a socialist-oriented market economy. The management role of the state has made great changes in the conditions of the market economy, reflected in the following points:

First, the socialist rule of law governs the market economy.

The socialist rule of law state in Vietnam as an important strategic task in the period of comprehensive renovation of the country. The construction of the Vietnamese rule of law state comes from the socialist orientation with the goal of national independence associated with socialism, in order to build a society of rich people, a strong country, a public society equality, democracy, civilization. In order to build such a targeted social regime, the basic tools and means can only be a socialist-oriented market economy and a socialist rule of law state under the rule of law. leadership of the Communist Party of Vietnam on the basis of Marxist-Leninist theory and Ho Chi Minh's thought.

Besides, the need for international economic integration after our country becomes a member of the World Trade Organization (WTO) requires us to continue to promote State administrative reform, legal reform, ensure that the State is constantly strong and effective to effectively deal with the tasks of socio-economic development, practice democracy, maintain independence, self-reliance and firmly integrated into international life.

Second, resources managed by the State are allocated according to strategies, master plans and plans in line with the market mechanism.

The government can, through the legal system and through its own choice, influence production. At the same time, through taxes and transfers to influence the distribution, thereby affecting the allocation of resources of the economy. The experience of Vietnam in recent years shows that in order to allocate capital effectively, a breakthrough is to solve the relationship between the State and the market. Even though the allocation of resources belongs to the State, the principles of the market must be respected.

With the policy of synchronous and steady development of the financial market, the State has used many measures to strengthen the management of the capital market, ensuring that this market operates smoothly, openly and efficiently; improve liquidity and make fundamental changes in market structure and institutions to create a strong financial foundation, assume the role of effectively allocating social resources, while ensuring financial stability for sustainable development.

Third, the State plays the role of orienting, building and perfecting economic institutions, creating an equal and transparent competitive environment.

The economic role of the state is towards the common goal of making the people rich, the country strong, stable growth and social justice. The orientation of the state's economy is carried out through the State's formulation of socio-economic development plans, strategies and plans in the short, medium and long term. On the other hand, the state creates a favorable legal environment such as: a synchronous legal system, in line with international laws and practices; a system of guiding documents, institutions, economic development policies, etc., so that economic entities can reduce risks and disputes. The state has developed a legal system to combat fraud including: the system related to property rights, bankruptcy and solvency laws, the financial system with the central bank and commercial banks to keep the cash supply strictly enforced.

At the same time, the State uses strategic tools, plans, laws and policies as the basis for activities of inspection, control and assessment of the economy to regulate the behavior of owners in a socialist-oriented market economy.

Fourthly, the State uses the resources of the State and tools, mechanisms and policies to orient and regulate the economy, realize progress and social justice in each step and each development policy. .

In the socialist-oriented market economy in our country, besides the inevitable development of society, an increasing gap between rich and poor appears. Therefore, the state needs to take measures to redistribute social wealth in order to limit this division and make society healthy. The State distributes the national income fairly, realizes economic growth in association with the improvement of people's living standards, with social progress and justice. This most clearly shows the social orientation of the market economy in our country.

Regarding income, the State uses two measures: Regulating income increase through subsidies and incentives for people with meritorious services to the revolution; policies towards the elderly, helpless orphans and disabled people; income reduction regulation is done through tax instruments: such as personal income tax; Corporate income tax; The tax increase will contribute to the redistribution of a part of income in the society.

Regarding social security, the State has a decisive role in improving public welfare, eradicating hunger and reducing poverty. Issues such as employment, health, health insurance, pensions, hardship allowances, etc. are always issues that need the attention of the State.

Through research and research shows; In order to achieve the above achievements, there are still limitations in dealing with the relationship between the management role of the State and the market economy in our country in the past time in some of the following points:

Firstly, there is still an incorrect perception of the relationship between the State and the market economy, especially in the organization of mobilizing and allocating resources. From the reality of mobilizing and allocating resources of competent state agencies in our country today, it shows that, in terms of thinking and organizing the implementation of the economic management function of the State from the central to local levels, methods are slow to innovate according to the requirements of the market economy, heavy on local and sectoral interests, lack of unity and interconnection.

Second, there is the phenomenon of the State interfering too deeply in the market. Ministries, branches, and local governments have directly intervened in the operation of the market. The business environment and the right to self-determination of enterprises are still constrained by many administrative factors. When entering the market, businesses still face many barriers, even higher barriers than the world average, and there is still a big gap compared to reality.

To ensure the leading role of the State (Government) as the representative of the entire people's ownership of some important assets, it is necessary to clearly distinguish the domination and use of financial resources, land. This bottleneck is very evident in the field of solving the State - market relationship in the field of using the budget and land. The fact that the economy's unhealthy problems have arisen in our country over the past time has shown that the role of the Government and the State as representatives of total ownership has not been defined more clearly and focused. people for some important assets such as finance, land, public resources, state capital in enterprises.

Third, limitations on the management of state-owned enterprises as a tool to regulate the market, social labor productivity, and low growth quality compared to other countries in Southeast Asia. The State expects through state-owned enterprises to solve market problems in order to increase the efficiency of market operations.

3.3. Some basic measures to promote the management role of the State in the socialist-oriented market economy in Vietnam today

After more than 30 years of renovation, especially in the last 5 years, the socialist-oriented market economy in Vietnam has been gradually formed. Thereby, the state's management of the economy achieved many important achievements. However, this is all just the beginning, the state's management of the economy still has certain limitations. The legal system and policies are not synchronized and inconsistent. Finance, banking, pricing, planning, construction planning, land management... there are still many weaknesses and loopholes, administrative procedures are still cumbersome, administrative reform is still slow and undecided. Therefore, improving the effectiveness and efficiency of state management over the market economy in Vietnam is still an objective and urgent requirement. To fulfill this requirement, the following measures need to be taken:

Firstly, continue to improve the economic legal system

Building and perfecting the legal system on the economy to create a unified and synchronous legal framework for production and business activities in order to maximize the positive aspects and minimize the disadvantages of the market economy. This legal system is the main tool for the state to manage the economy.

In recent years, the Vietnamese state has issued many laws and ordinances to meet the requirements of economic renewal. However, up to now, Vietnam's economic legal system is still lacking and inconsistent, often having to be amended, supplemented and adjusted. Therefore, in the immediate future, we must continue to urgently improve the economic legal system according to the program, guidelines and policies of the Party. At the same time, amend and supplement existing laws and ordinances and implement new laws. consistent with the fast-moving practice of the national economy (such as competition law, antitrust law, securities and securities market law, natural property rights protection law...). It is necessary to improve law-making, strengthen the role of the National Assembly, its committees and full-time National Assembly deputies in the process of formulating, promulgating and approving bills.

Second, to form a synchronous mechanism to manage the socialist-oriented market economy

Continue to synchronously create elements constituting the common market including the market for goods and services, the labor market, the science and technology market, the capital market, the stock market, and the money market, real estate market..v...

The State creates an equal favorable management environment for enterprises to compete and cooperate for development. Through appropriate strategies, planning, plans and policies to effectively use the state's material force to orient socio-economic development, ensure proactive macro-economic balance, regulate distribution and income.

Strengthen the state's inspection and supervision in accordance with the law, resolutely fight against the evils of smuggling, counterfeiting, commercial fraud, corruption..., creating a healthy competitive environment strong, open, transparent, limited and controlled monopolies. Clearly define the state administrative management function With the function of production and business management; thereby, properly performing the function of state management of the economy and the function of ownership of public property of the state.

Third, continue to innovate the state's macroeconomic management tools for the economy

Innovating planning activities in the direction of starting and closely linking with the market. Improving the quality of the formulation of socio-economic development strategies, master plans and plans: Strengthening the work of economic information, accounting and statistics. Solve well the relationship between budget revenue and expenditure. Ensuring transparency and fairness in state budget spending. Continue to improve the tax system in line with the national situation and international commitments. Improve the efficiency of capital use and investment, and prevent waste and loss of capital. Connecting banking reform with SOE reform.

Fourth, promote administrative reform

Over the years, Vietnam has taken a step in administrative reform, but it must be admitted that, administrative reform is slow, indecisive, and has low efficiency. The organization of the state apparatus is cumbersome, with functions with many intermediate duplication layers and administrative procedures. In many cases above, it is difficult for the central and local governments to act in unison, causing difficulties. for socio-economic development and reduce the driving force for development.

Therefore, in the coming years, more efforts must be made according to the master program of state administrative reform for the period 2001-2010 approved by the government in order to improve the state's management capacity in the context of market economy development. socialist oriented school.

Reform the organizational apparatus at all levels from the central to local levels in the direction of streamlining, effectiveness and efficiency, clearly delineating functions, tasks, powers and responsibilities.

Reform tools and civil servant regimes, build a clean and elite contingent of cadres and civil servants.

Reform administrative procedures in the direction of unity, publicity, transparency, simplicity, and resolutely eliminate administrative procedures that cause troubles and problems for people and businesses.

All these efforts are aimed at building a clean, strong, effective and efficient state administration in the direction of building a socialist rule of law state of the people, by the people, for the people under the leadership of the Communist Party of Vietnam.

Developing a socialist-oriented market economy in Vietnam is a new, difficult and complicated job, because there is no precedent in history. Therefore, in this process, the Communist Party of Vietnam both works and learns, summarizes reality and consults the experiences of countries around the world, constantly renewing its thinking, improving its practical organization, determined to bring the cause of building socialism in Vietnam to success

4. Conclusion

The socialist-oriented market economy in Vietnam is currently operating, which is an inevitable trend in the development of the country, ensuring the objectivity of the laws of the market economy. The market economy in our country has its own characteristics suitable to the current production method, therefore, the State's management method in many respects also has its own characteristics, consistent with the current state of production. practical conditions, such as recognition of the independence of economic actors; building a market system with fair competition, prices are mainly determined by the market... The state plays a great role in ensuring macro stability for economic development and growth, shows the balance and harmonization of the relations of needs and interests, creating consensus in the society for the development goal of the country. The correctness, rationality and timeliness of the State's role in planning and organizing the implementation of macro-development policies is a prerequisite for forming that consensus. The strengthening of the state's macro-management role will improve the effectiveness of the State's impact on the development of a socialist-oriented market economy in our country in the period of accelerating industrialization. national modernization and international integration.

Abstract

Based on the startup policy framework developed by UNCTAD (2012) and the survey of Incubators, SME support center and start-ups in Hanoi, the paper analyzes the current situation of Hanoi's startup policy framework in order to point out gaps and limitations of the policies; and then propose recommendations to complete policy framework for the development of Hanoi startup in the coming time.

Keywords: *HaNoi, Policy, Startup, Startup Ecosystem*

1. Introduction

Government policy is the first component in a startup ecosystem and plays an important role in promoting the development of other components.

With the development of a startup and innovation ecosystem identified as one of the key tasks amid the strong boom of the Fourth Industrial Revolution, the Ha Noi has issued variety policies to support startup and innovation in the city in recent years, towards building Ha Noi into a major startup and innovation center of the country. However, the survey results of the Vietnam Chamber of Commerce and Industry (VCCI) in 2019 showed that less than 10% of startups were successful in Vietnam.[57] Also, according to the report of Hanoi's Incubator Hib-IT, only 6 out of 9 projects incubated at the Incubator succeeded in raising fund from 2017 to 2019. Among the causes of the failure, limitation in the mechanism and policies supporting startup is very important. Meanwhile, Hanoi has not had sufficient studies on the situation of the policy framework to support startup. The current reseach

[57] VCCI (2019) Workshop "*Improving the start-up support policy*"

mainly focus on startup operation as the studies by Doan Xuan Hau (2020) and Tran Van Trang (2020).

Based on the research gap as mentioned above and UNCTAD's policy framework to support startup. The paper exemines the current situation of policies to support startup in Hanoi, and then proposing some solutions to refine the policy framework to support startup in the coming time.

Theoratical basis

Startup

According to Startup Blink (2020) "*A startup is any new business that applies an innovative solution. The innovation can be either technological or a unique business model"*.

The Law on Supporting Small and Medium-sized Enterprises in Vietnam issued in Jun 12, 2017, defines "a *small and medium sized startup enterprise is a small and medium sized enterprises established in order to implement ideas on the basis of exploiting intellectual property, technology, new business model and rapid growth potential*." (Clause 2, Article 3).

Basically, Vietnam's approach is also close to the majority when pointing out the characteristics of startups including: (1) technology innovation, (2) rapid growth, and (3) new business model. In addition, startups also have some other characteristics such as age (within 3-5 years, depending on the field). When it enters the stage of stability and development, it is not considered a startup.

Startup ecosystem

Like "Startup", there is no single official definition for a startup ecosystem and the term is used in different ways. Mason and Brown (2014) define entrepreneurial ecosystems as follows: '*a set of interconnected entrepreneurial actors (both potential and existing), entrepreneurial organisations (e.g. firms, venture capitalists, business angels, banks), institutions (universities, public sector agencies, financial bodies) and entrepreneurial processes (e.g. the business birth rate, numbers of high growth firms, levels of 'blockbuster entrepreneurship', number of serial entrepreneurs, degree of sell-out mentality within firms and levels of entrepreneurial ambition) which formally and informally coalesce to connect, mediate and govern the performance within the local entrepreneurial environment*' (Mason & Brown 2014, 5).

According to Isenberg (2010), a startup ecosystem includes the following domains: (i) Policy; (ii Finance; (iii) Culture; (iv) Supports; (v) Human capital; (vi) Markets.

UNCTAD's Startup Policy Framework

United Nations Conference on Trade and Development (UNCTAD) presented Startup Policy Framework in 2012, aiming to assist policy makers in developing countries and economies in transition in designing initiatives, measures and institutions to promote entrepreneurial spirit. UNCTAD's Policy framework proposes six basic policy areas to be prioritized for investment.

(1) ***Formulating national entrepreneurship strategy***: Entrepreneurship is one of the most important drivers of job creation and economic growth, and crucial for the development of a vibrant formal small- and medium-sized (SME) enterprise sector. The key elements of a national entrepreneurship strategy are: to Identify country specific challenges; specify goals and set priorities; ensure coherence of entrepreneurship strategy with other national policies; strengthen the institutional framework; Measure results and ensure policy learning

(2) ***Optimizing the regulatory environment***: The regulatory environment should encourage people to set up their own business, to try new business ideas and to take on calculated risks, keeping administrative burdens to the minimum required to support public policy and sustainable development objectives. UNCTAD offers solutions to optimize legal environment about a nation's startup, specifically: examine regulatory requirements for start-ups (ii) Minimize regulatory hurdles for business startups; (iii) build entrepreneurs' confidence in the regulatory environment; and (iv) guide entrepreneurs through the start-up administrative process.

(3) ***Enhancing entrepreneurship education and skills***: Effective entrepreneurship education policies and programmes focus on developing these entrepreneurial competencies and skills (start-up knowledge, business planning, financial literacy and managerial skills.) which are transferable and beneficial in many work contexts. The aim is not only to strengthen the capacity and desire of more individuals to start their own enterprises, but also to develop an entrepreneurial culture in society. (i) Embed entrepreneurship in formal and informal, (ii) Develop effective entrepreneurship curricula education, (iii) Train teachers, (iv) Partner with the private sector

(4) ***Facilitating technology exchange and innovation:*** Entrepreneurship, technology and innovation are mutually supportive. Technology provides entrepreneurs with new tools to improve the efficiency and productivity of their business, or with new platforms on which to build their ventures. In turn, entrepreneurs fuel technological innovation by developing new or improving existing products, services or processes and ensuring commercialization. Nations can apply solutions including: (i) support greater diffusion of iCTs to the private sector; (ii) Promote inter-firm networks that help spread technology and innovation ; (iii) Build link between public bodies, research institutions, universities and the private sector; và (iv) Support high-tech start-ups.

(5) ***Improving access to finance***: Inadequate access to finance remains a major obstacle for many aspiring entrepreneurs, particularly in developing countries. Solutions to support startups approach funds include: (i) Improve access to relevant financial services on appropriate terms; (ii) Promote funding for innovation; (iii) Build the capacity of the financial sector to serve start-ups, (iv) Provide financial literacy training to entrepreneurs and encourage responsible borrowing and lending

(6) ***Promoting awareness and networking:*** Negative socio-cultural perceptions about entrepreneurship can act as significant barriers to enterprise creation and can undermine the impact of policy intervention in support of entrepreneurship. Nations can apply specific solutions, such as: (i) Highlight the value of entrepreneurship to society and address negative cultural biases , (ii) Raise awareness about entrepreneurship opportunities; và (iii) Stimulate private sector-led initiatives and strengthen networks among entrepreneurs.

2. Methods

In this research, a qualitative approach with two main methods is used: collecting secondary data and interviewing startups and experts.

- *Secondary data used include*: programs, decisions, reports, etc on the official website of the Ha Noi People's Committee, Department of Planning and Investment, Department of Information and Communication, Department of Science and Technology, Ha Noi Center for SME Support, HBI-IT Incubator.

- *Expert interview method*: 12 structured interviews (from 30 to 60 min for each, some by phone due to Covid-19) with 07 startups and 05 experts, reseachers and managers from Ha Noi's incubators and departments.

- *Data processing method*: Step 1, data collected from secondary data and interviews will be classified based on the six policy areas of UNCTAD's framework. Step 2, the authors will examine how the current startups policy framework in Ha Noi is, in compliance with UNCTAD framework.

3. Results

3.1. Developing a startup strategy

Decision No. 844/QD-TTg of 18 May 2016, on Approval for "Assistance Policies on National Innovative Start-up Ecosystem to 2025" is a policy that is the first document and the foundation for later policies at central and local level.

After Program 844 approved, Hanoi has been implementing many breakthrough solutions, contributing to improve the business environment and creating favorable conditions for innovative start-ups. In 2019, the Hanoi People's Committee approved and issued the project to support innovative startups in Hanoi for the period of 2019 - 2025 at Decision No. 4889/QD-UBND (Project 4889).

The support policies under the project are aimed at individuals and groups of individuals with startup projects; innovative small and medium-sized enterprises (SMEs); organizations supplying services, technical infrastructure, media and investment for innovative startups; and domestic and foreign investment funds.The approval of the project targets to improve and develop the startup ecosystem and complete the mechanisms and policies to support and develop startup activities across Ha Noi. At the same time, it aims towards supporting the formation of 2-3 business incubators and startup spaces, while encouraging the establishment of 3-5 private startup investment funds and the attraction of foreign investment funds. Accordingly, the project has set a goal of supporting the development of 500 innovative startup projects by 2025, 150 of which can commercialize their products, with at least 20% successfully calling for investment from venture capital funds and conducting mergers and acquisitions totally worth around VND500 billion (US$21.5 million).

In addition, Ha Noi also issued another decision and plan related to supporting startup, including:

- Decision 5742/QD-UBND issued on December 29, 2020 to support SMEs in Hanoi in the period of 2021-2025.

- Plan 49/KH- People's Committee issued on February 28, 2020 to support and develop science and technology enterprises in Hanoi city until 2025.

- At the beginning of 2021, the Hanoi Party Committee issued Program 07-CTr/TU on "*Promoting the development of science, technology and innovation in Hanoi city, period 2021 - 2025*"

3.2. Optimize the legal environment

Legal documents on supporting startups

-Law on Supporting Small and Medium sized Enterprises (SME Law) approved in Jun 2017, amended and supplemented in 2018.

-Law on Intellectual property

-Decree No. 38/2018/ND-CP dated 11 March 2018 on investments in small and medium-sized start-up enterprises.

- Decree 39/2018/ND-CP dated March 11, 2018 guiding the Law on supporting small and medium sized enterprises;

- Decree 34/2018/ND-CP dated March 8, 2018 on the establishment, organization and operation of the Credit Guarantee Fund for Small and Medium sized Enterprises;

In Ha Noi, many programs assisting SMEs have been issued in recent years: Plan No. 83/KH-UBND, dated April 22,2020, implementing Resolution No. 02/NQ-CP, dated January 1, 2020 of the Government, Ha Noi People's Committee has set a goal of striving to maintain the PCI index in 2020 in the group of 10 leading provinces, cities in the country; The working programs of Ha Noi Party Committee.

As a result, many solutions have been applied to reform administrative procedures to reduce time and costs for SMEs such as online business registration, tax payment, etc. The percentage of online public services at levels 3 and 4 has reached 74% (VietNam Government Portal, 2019). The PCI index increased continuously in 2020, with an increase of 1.13 points compared to 2019, maintain the No. 9 in the ranking, in the group of 10 provinces and cities with the best governance quality among 63 provinces and cities (VCCI, 2020).

However, according to the interviews, 71.9% of the startups said that "*administrative procedures are still cumbersome*", and even some said " *bribe to get quick response*". In fact, Hanoi's PAPI Index in 2020 was still in the group with low total score eventhough there was an increase compared with 2019. This index seems to confirm the startup's opinions to be true.

3.3. Strengthening entrepreneurship education and skills development

In recent years, Ha Noi has paid special attention to supporting human resource training for SMEs, with a variety of activities such as: fostering bussiness knowledge for SMEs; Entrepreneuship and management training; Training courses for CEO and startup mentors.... By 2020, 14 excellent start-up projects in Hanoi Hib-IT have been awarded. In 2019, SME Support Center organized 02 courses with 120 startups; 07 workshops and forums on innovative start-ups. In 2021, the Center also plans to organize many courses, seminars, and forums on innovative startups for startups if the Covid pandemic is controlled.

However, the interviews have shown that the current training policies are assessed not as effective as desired. Specifically, the startups interviewed said that they lack tax knowledge, intellectual property and financial management skills, so training programs need to focus on specific issues instead of the general ones. Meanwhile, Austrade Report 2019 showed that not many of Vietnamese enterprises are equipped with the necessary skills to develop a sustainable business model, or to pitch for projects. As a result, many local startups have limited opportunities to connect with the regional ecosystem.

In addition, according to the interviewed experts, the policy of entrepreneurship education at all levels (from primary school to high school, college, vocational school, higher education) are vitually lacking. The current curicula has not promoted entrepreneurial skills, such as creativity, risk-taking, and leadership, as well as knowledge about the entrepreneurial process. Additionally, the linkages between schools and enterprises in Ha Noi must be boosted in updating curicula in compliance with labour market requirements and help students to improve their skills by having internship programe.

3.4. Creating conditions for technology transfer and exchange

Over the years, The City commited to have special investment in science and technology. From 2016 up to now, 346 city-level science and technology tasks have been implemented, including 212 natural science and technology tasks, 50 trial production projects with a total cost of 633,092 billion VND; More than 85% of research results have been applied in practice. The city also focuses on developing science and technology infrastructure, especially high-tech parks, software parks, information technology parks, transaction centers, technology transfer... Despite only being formed in the past decade, Hanoi's Startup ecosystem is basically completed with important components. (Table 1). According to Startup Blink, Hanoi was in the top 200 startup centers globally in 2020 (ranked 196, increased by 33 places compared to 2019).

Table 1: Hanoi city's startup ecosystem

No.	Group	No
1	Incubators	21
2	Accelerator	7
3	Co-working space	22
4	Venture	22
5	Angel Investor	32
6	Mentor /Coach	307
7	Startups	NA

Source: summerized by authors

Also, Hanoi has supported the establishment of a number of high-tech zones with a certain level of inter-sectoral linkage. Lang Hoa Lac Hi-tech Park is developed to become a science city, a place that attracts investors in the research and development field; training and incubation; manufacturing hi-tech products in the fields: biotechnology, information - communication technology, new material technology and automation technology. Besides, a number of business incubators in the fields of food, IT, mechanical engineering has been established in the city. Hanoi Innovative Enterprise Incubator of Information Technology (HBI-IT) was opened and officially put into operation in 2017 as the first incubator in the field of IT under the management of Hanoi Department of Information and Communications. After nearly 5 years of operation, HBI-IT has attracted many startup projects to participate in the Incubator through many activities such as investment promotion conferences, seminars, networking. Many startup projects have been supported to raised fund from domestic and foreign investors as well as business development. In the summary report, from 2017 to 2019, Hib-IT has incubated 24 projects, of which 19 projects are still in operation (79.17%), 6 projects are in Series C funding rounds. Successfully, 19 projects are in the process of negotiating with investment funds. In addition, the Department of Science and Technology has also implemented many programs to support intellectual property; measurement and quality; technology transfer and exchange, etc.

However, according to the interviews, significant improvement is needed in the current science, technology and innovation capabilities of Ha Noi. The innovation system is in a nascent, fragmented state, and R&D is still a peripheral activity both in business and the public sector (Austrade,2019). Moreover, the procedures and requirements are cumbersome, for example they must meet a series of criteria such as "*invested, selected by agencies, organizations or incubators; won national and international awards for innovation; certificates and patents for inventions; certificate of science and technology enterprise, high-tech enterprise…*". Meanwhile, to get these certificates, the startups must meet a series of other criteria as well.

4.5. Supporting the access to finance

The Law on Supporting SMEs 2017 presented various support measures for SMEs including the form of loan provision, credit guarantee, preferential corporate income tax, land rental preferences. Accordingly, SMEs may gain easier access to credit and credit guarantee via SME Credit Guarantee Funds set up by provincial-level People's Committees and the SME Development Fund formed by the Prime Minister.

- *Access to bank credit*: According to current regulations, short-term loans in VND currently have a maximum interest rate of 4.5%/year for 5 priority areas (agriculture and rural development, export, small and medium enterprises, supporting industries, high-tech enterprises) (State Bank of Vietnam, 2021). However, credit access is still a major concern for startup. Banks providing commercial loans prefer to allocate their resources to larger firms rather than startup. According to the interview, higher default risks, lack of financial transparency, and lack of assets for a mortgage are the major factors for not providing loans to startup. The manager of an Ha Noi Incubator also said that "*the loan terms are too strict while most startups often lack collateral assets, lack many other factors to ensure their borrowing and debt repayment capacity".*

- *Credit guarantee activities*: In Hanoi, the Hanoi Investment and Development Fund has implemented guarantee activities for SMEs. However, this activity is not effective due to the limited lending subjects, strict loan terms and capital use. Therefore, the number of startups accessing support from the Fund is very low.

- *SME Credit Guarantee Funds*: By 2019, the Fund had supported only 14 SME loans for a total of VND 106.4 billion.2 Major issues have been low awareness of the Fund among SMEs and, as noted earlier, cumbersome approval procedures and strict eligibility requirements. According to the survey results, the current financial access support policies is assessed as "*very inefficient*" and the accessibility to the policies is said "*very difficult to access*". "*Unfeasible policy enforcement measures*", "*cumbersome administrative procedures, conditions for participating is too strict*" are the main causes preventing startups accessing financial support policies.

- *Sources of funding from the private sector* (angel investors, venture capital funds, crowdfunding): the weak legal and regulatory environment for private equity and venture capital investments in Viet Nam is a main reason why the activities of sources of funding from the private sector for startups are ineffective. According to the interviews, in the early stages of startups, there are almost no private investment. So, the legal and regulatory framework for venture capital investments should be refined and additional policy measures are often required to incentivise private investors to make investments in high-risk start-ups and early-stage ventures (OECD, 2021)

4.6. Raising awareness about start-ups and establishing linkages, industry clusters, and supporting associations

In term of raising awareness about startup, the City has launched many campaigns on the media, organized many forums, Hanoi Innovation Summit and Contest... In addition to the opening of the Hanoi Startup Ecosystem Portal - startupcity.vn with more than 800 enterprises, the City has also established a network of Accelerator to improve the effectiveness of supporting businesses in the city. However, the activities haven't yet make a big change in term of promoting the interest about startup and startup culture of Ha Noi people.

Morever, Hanoi City has not yet built a portal that provide and centralise information and databases of Ha Noi startup ecosystem. Also, there are insufficient policies to regulate or encourage the cooperation between components within and outside the ecosystem. Therefore, the startup ecosystem operate separatelly that is difficul to make a strong network to be able to promote the development of startups.

4. Discussion and Conclusion

*Firstly***,** Ha Noi startup support policy system basically has all 6 policy areas in accordiance with with UNCTAD's Framework. *However,* the component policies of each policy areas have been incomplete, for example, with Area (2) Strengthening entrepreneurship education and skills development, entrepreneurship education policies at the high school level has not yet been built. Or lack of legal and regulatory environment for private equity and venture capital investments in terms of the area (5) Supporting access to finance. (see Table 2.)

Table 2: Hanoi city's policy framework to support innovative startups

No.	**UNCTAD startup policy famework**	**Hanoi's innovative startup support policies**	
	Policy areas	Component policies	Gaps/ Limitations
1	Developing National/local startup strategy	844 Project Hanoi's Project 4889	Measure results and ensure policy learning
2	Optimizing legal environment	Law on Supporting SMEs in 2017, amended and supplemented in 2018. Intellectual property law Decree No. 38/2018/ND-CP detailing investment for innovative start-up SMEs. Decree 39/2018/ND-CP guiding the Law on supporting small and medium enterprises Decree 34/2018/ND-CP on the establishment, organization and operation of the Credit Guarantee Fund for SMEs; Working programs of the Hanoi Party Committee	Business Regulations Tax incentives for innovative startups Online public service application The Implimentation of Intellectual property law
3	Enhancing entrepreneurship education and skills development	Support policy on in-depth skill & knowlegdge training on innovative start-ups Training and capacity building for coaches, mentors and individuals supporting innovative startups Scientific research policy	Entrepreneuship Education at all level (from primary to high school, vocational school, university) Linkage between schools institutions and enterprises.

No.	UNCTAD startup policy famework	Hanoi's innovative startup support policies	
4	Creating conditions for technology transfer and exchange	Supporting the exploitation and development of intellectual property; the implementation of procedures on standards, technical regulations, measurement and quality; Application support, technology transfer;Funding for trial production, sample making, and technology completion for innovative start-ups; product commercialization - Support the formation of a number of innovative start-up incubators in universities, academies, educational and training institutions or private incubators; - Support incubating innovative projects/enterprises at technical institutions, incubators, public or private working areas; - Support in the use of equipment at incubators and technical support establishments;	Policies to support startups in digital transformation Policies to encourage the private sector to form service zones and business spaces to serve innovative startup activities (R&D center), technology transfer and business models
5	Provide financial assess support	- Provide financial support for innovative start-ups: tax incentives, financial obligations according to regulations; - Guide and support projects, and innovative SMEs to access and use the City's science and technology development fund	legal and regulatory environment for private equity and venture capital investments

No.	UNCTAD startup policy famework	**Hanoi's innovative startup support policies**	
		(the City Development Investment Fund) - Provide Credit guarantee; support access to capital from commercial banks, venture, etc	
6	Raise awareness about entrepreneurship and establish affiliate clusters, industry clusters, and supporting associations	- Support communication activities on innovative startup and build startup culture. Support funds for events to connect investment, ecosystem components, conferences, seminars on startups and innovative startups	- Databases of the startup ecosystem and services for startup. - cooperation among domains in the ecosystem

Secondly, the current policy making approach is not based on startup development process. At each stage, a startup face diffirent challenges and thus needs specific and appropriate assisstances instead of the "one fit all". Moreover, the current policies and programmes have a strong technology and product development orientation while most startup lack innovation capabilities and finance.

Thirdly, Although a startup by law is an SME, it has specific characteristics, so it is necessary to have separate policies compared to other SMEs. However, in some current policies in HaNoi, startups are treated like other SMEs for example the policy of accessing finance.

In addition, policy evaluation activities have not been paid adequate attention. Until now, there has no official and comprehensive policy evaluation of the startup policy framework conducted. Therefore, limitations and gaps in the current policy framework have not yet clarified and made adjusment timely.

In summary, the paper examines the policy framework to support startup in Hanoi in compliance with UNCTAD Framework (6 main policy areas). To achive the objectives of The Project 4889 to boost the development of startup and to be a national-creative hub, Ha Noi need more efforts in which refining the current policy to support startup must be a priority

The first, The City's program comprehensively evaluating the impact of the startup support policies should be conducted in order to identify shortcomings and then have appropriate adjustment and refine the policy framework. Policy making must be based on startup development process in order to create favorable incentives at all stages of startup process; and enabling policy experimentation (sandbox regulation) for new technology (blockchain, fintech), new business models (sharing economy), that may not easily fit into existing regulatory frameworks.

The second, to increase efficiency of ecosystem, there need to promote the more cooperation among different stakeholders (enterprises, institutes, investors, etc), broader institutional capacity building.

The third, the City's policies must focus on strengthening startup's capabilities, access to financial resources and simplifing administration. Stronger innovation capabilities are essential for enterprises to better position themselves, and the City needs to invest more and support the development of advanced technological capabilities, including R&D.

PRIMARY COOPERATION METHODS IN RESEARCH - DEVELOPMENT - TECHNOLOGY TRANSFER BETWEEN HIGHER EDUCATION INSTITUTION AND ENTERPRISE IN VIETNAM

MA. Nguyen Thi Sam

samnguyen241129@ftu.edu.vn

Faculty of Business Administration, Foreign Trade University, Hanoi, Vietnam

Abstract

In recent years, Vietnam university education has experienced significant developments in scale and diversity of major and mode of study. There is a swift from elite to mass education which is more practical in the training system. Since university autonomy has become popular, many big universities are currently striving to respond to industrial situations through modules connecting universities with industry, business and service sectors. In the context of cooperative research between universities and enterprises, researching results might be more committed with specific requirements and development of the enterprises. On the one hand, enterprises would bridge the gap by sending signals of market demands as well as industries to institutions. On the other hand, they pose quests for innovation and research and training updates. As a result, it is true that the study of cooperation methods in research – development – technology transfer between higher education institutions and enterprises in international integration has practical meanings in the current situation.

Key words: *cooperation methods, higher education institutions, enterprises*

1. Introduction

The cooperation in research – development – technology transfer between higher education institutions and enterprises plays an important role in knowledge-based societies and economies. The collaboration happens to partly support the institution upgrading training quality and job opportunity for students. Besides, it comes the chance for the enterprises to change technology as well as access to modern equipment and updated manufacturing production. Moreover, there are several indirect achievements: knowledge-based economy development support, new established enterprise assistance, small and medium enterprises assistance, economic growth and job opportunities.

The cooperation between institutions and enterprises in research, development and industry transfer boils down to "knowledge trading" between universities and manufacturing business for mutual benefits. Those tradings are able to go direct or indirect, individual or common. In terms of the shared values, cooperation stimulates the interaction between lectures, students in universities and experts in enterprises. It also commercilizes research results, builds training programs, organizes lifelong learning and supports startup effort and organizational management.

Due to the specialization of majors, each institution has their own advantages - disadvantages and capacity to divide into occupational groups. In general, cooperation methods in research – development – technology transfer between higher education institutions and enterprises includes: Cooperation in research and development; Commercialization results of research and development; Transferring students; Transferring scholars & experts; Building and implementing training programs; Promoting lifelong learning; Inspiring startup spirit and supporting startup activities; Joining the university administration. The detailed analysis on each group is mentioned as below.

1.1. Definition: Cooperation between education institutions and enterprise

In many countries, universities - business collaboration and several cooperation methods are studied thoroughly. It is considered trading between universities and manufacturers which is toward the shared values. On the one hand, working with enterprises brings along the university financial support for schools while enterprises benefit in achieving and remaining competitive advantages in an active economy currently. On the other hand, the cooperation might boost economic growth and answer the labor market's requirements (Carayon, 2003; Gibb & Hannon, 2006).

The cooperation between higher education institutions and enterprises boiled down to the engagement of scholars as well as officers in universities, State offices and departments with local units which were involved. It pointed out the attention on works, policies as well as actual results of methods on paper and reality (Dan, 2013).

Therefore, the relationship and cooperation are defined direct or indirect, individual or public methods of cooperating between universities and enterprises with a target on shared values: Cooperation in research and development; Commercialization results of research and development; Transferring students; Transferring scholars & experts; Building and implementing training programs; Promoting lifelong learning; Inspiring startup spirit and supporting startup activities; Joining the university administration. The detailed analysis on each group is mentioned as below.

1.2. Definition - Cooperation between higher education institutions and enterprises in research - development - technology transfer

The relationship works as an effective method which enhances training quality, research and technology transfer. It has a good impact on training activities, research, university improvement and usage of human resources in both universities and enterprises.

Cooperation between higher education institutions and enterprises in research - development - technology transfer stimulates engagement of lecturers, students and experts working in enterprises. In addition, it encourages commercialization results of research and development; Transferring students; Transferring scholars & experts; Building and implementing training programs; Promoting lifelong learning; Inspiring startup spirit and supporting startup activities; Joining the university administration.

Therefore, cooperation in research, development and technology transfer in the cooperation between higher education institutions and enterprises are all forms of direct or indirect interactions, having an individual or organizational characteristics, between institutions and enterprises, and about research, development and technology transfer between the parties in order to support each other for the benefit of both sides.

1.3. Cooperation methods in research, development and technology transfer between higher education institutions and enterprises

There are a lot of authors who suggested different ways to classify cooperation methods. Santoro (2000) classified cooperation between universities and enterprises into 4 types: research support, technology transfer, knowledge transfer, and research cooperation. Davey, Muros, and Meerman (2011) gave a more detailed way to divide cooperation methods. This is the result of a study on university-enterprise cooperation in Europe in 2010 – 2011, as follows:

- Cooperation in research and development.
- Transferring scholars & experts.
- Transferring students.
- Commercialization of results of research and development.
- Building and implementing training programs.
- Promoting lifelong learning.
- Inspiring startup spirit and supporting startup activities.
- Joining the university administration.

Thus, there are a variety of studies on cooperation in research, development, technology transfer between higher education institutions and enterprises. University-enterprise cooperation is expressed in many methods and levels. The low and common levels are: Receiving students for internships, field trips, financial support and facilities support for teaching and learning. The higher levels are: Expert exchange and knowledge and technology sharing; investment in research and implementing for joint ownership and technology transfer; joint investment in business development in order to commercialize scientific research results and provide products and services to the society.

2. Method

Our research team approached the study of popular cooperation methods in research – development – technology transfer between higher education institutions and enterprises in Vietnam in dialectical methods and positivism and comparison. Using a dialectical method, our team studied the roles and connections of parties who joined in promoting the collaboration between higher education institutions and enterprises. In detail, we inspected theoretical basics and reality of the cooperation then identified specific methods of cooperation. By positivist and comparison methodology, we conducted surveys, researched and compared advantages and disadvantages of specific forms, thereby evaluated effects and finalized solution systems and recommendations towards cooperative forms in research – development – technology transfer between higher education institutions and enterprises in Vietnam.

Primary data is collected by depth interviews with higher education institution experts and professors, enterprise managers, Agency for Enterprise Support – Ministry of Planning and Investment, Agency for Enterprise Cooperation, and so on.

Our research team plans to interview 05 higher education institutions and 05 enterprises and authority in charge departments joining in the cooperation of institutions and enterprises ecosystem in each group.

3. Results

3.1. Advantages and disadvantages of cooperation methods in research – development – technology transfer between higher education institutions and enterprises in Vietnam

Relationship and cooperation methods in research – development – technology transfer between higher education institutions and enterprises in Vietnam conveys vital meanings. This is the force for training institutions in particular and knowledge-based economy in general in the Fourth Industrial Revolution. The success of the relationship is to improve training quality and work with enterprises to transfer technology, knowledge to the manufacturing area. Moreover, the relationship is considered trading between universities and manufacturers towards shared values. To improve the cooperation and explore its values stands a chance to help not only universities figure out financial issues but also enterprise to achieve and keep competitive advantage in the current active market. In addition, it contributes to economic growth and responses to job requirements in Vietnam.

As mentioned above, there are several methods between institutions and enterprises. Considering the result level that limitation and level of the cooperation might be easy to evaluate and analyze. At this level, there are eight cooperation methods and their advantage - disadvantages are shown in Table. 1.

Table 1. Advantages and Disadvantages of Cooperation methods

No.	Cooperation methods	Advantage	Disadvantages
1	Cooperation in research and development	- Implement easily, have potentials - Take advantage of human resource in both; - Have beneficial effects on training, research and manufacture.	- Need groups of professional and enthusiastic scientists and experts.
2	Commercialization results of research and development	- Improve research and transfer technology; - Provide training institutions with financial support.	- Require products to response to standards of enterprise; - Require price and quality competitive highly.
3	Transferring students	- Provide students with practical knowledge; - Provide students with the opportunity to find ideas and innovation to upgrade manufacturing activities.	- Fail to gain high productivity because students lack experience and depend on training courses and associate programs of enterprise.
4	Transferring scholars & experts	- Provide scholars and experts with opportunity to update knowledge; - Help enterprises upgrade latest technology, help institutions get updated manufacturing reality to edit practical training programs.	- Remain a likelihood to discontinue teaching, researching and managing processes of both.
5	Building and implementing training programs	- Design training program based on reality; - Diver the training program and motivate the engagement of learners.	- Require time for result verification of edited programs; - Require lecturers to update new information.
6	Promoting lifelong learning	- Provide enterprises with learning spirit; - Enhance manufacturing productivity and enterprise management.	- Require learners to manage time to avoid impacts on manufacture.
7	Inspiring startup spirit and supporting startup activities	- Improve startup spirit among students; - Motivate sponsorship (if successful)	- Require stable social capital from enterprises and sponsors.
8	Joining the university administration	- Make all information about training and economy transparent; - Access modern and positive management methods; - Construct and complete development strategies of training institutions.	- Pose difficulties for manager staffs (principal, chairman) of training institutions; - Remain unclear in the policy framework that makes enterprise unwilling to associate.

Source: Survey data collected by authors

It is clear that the factors leading to the cooperation must be learned to build up action strategies which fits the context to improve the cooperation in research – development – technology transfer between higher education institutions and enterprises. However, the biggest matter that the majority of school and institution administrators find is the insufficient consideration of financial shortage whereas taking bureaucracy for granted. The scholars in universities might assume that the State is supposed to provide financial resources toward developing between institutions and enterprises. They considered it the burden lies on relationships with the State in spite of the fact that they likely come over with a strong motivation and proper awareness on benefits in some cases.

3.2. Impact of cooperation methods in research – development – technology transfer between higher education institutions and enterprises in Vietnam

Institution and enterprise cooperation is no longer a new terminology over the world. It plays an important role in ensuring and upgrading training quality for students that are new resources for enterprises. Building and implementing cooperation between institutions and enterprises in terms of human resource is considered an urgent call as well as an compulsory task to which the universities and enterprises chairman boards pay attention. However, according to the International Labor Organization, there are under 20% of employees receiving professional training which has failed to respond to the market requirement in Vietnam. Many enterprises are in need of high-qualified workers while the number of graduates is insufficient. There appears a challenge with both institutions and enterprises. One of the human market issues is supply - demand disequilibrium. Given a worker is more qualified, he finds it more challenging finding a job.

Table. 2 illustrates survey results on cooperation methods in some universities and institutions in Vietnam on some research majors including Economics, Business and Management Field; Medical Field and Healthcare; Engineering and IT Field; Manufacturing and Processing Field; Agriculture, Forestry and Fisheries Field.

Table 2. Cooperation methods of some higher education institutions in Vietnam

Average number of cooperations / Cooperation methods	Economics, Business and Management Field	Medical Field and Healthcare	Engineering and IT Field	Manufacturing and Processing Field	Agriculture, Forestry and Fisheries Field	Avergae of all fields
Cooperation in research and development	4.6	27.2	11.2	12.6	14.2	13.96
Transferring scholars & experts	16.4	25.8	21.2	14.0	11.6	17.8

Transferring students	25.2	28.4	21.0	11.0	14.8	20.08
Commercialization of results of research and development	2.4	23.0	7.4	6.6	12.2	10.32
Building and implementing training programs	6.0	8.0	4.8	5.4	4.8	5.8
Promoting lifelong learning	3.2	3.6	3.2	2.6	1.8	2.88
Inspiring startup spirit and supporting startup activities	3.6	2.2	3.8	2.2	2.6	2.12
Joining the university administration	0.6	1.0	1.0	1.0	1.0	0.92

Source: Survey data collected by authors

As analyzed in Table 2, we can see that there are various cooperation methods between education institutions and enterprises, however, the impact of cooperation methods on each field are different. From the survey data, it is shown that in this sector, Transferring students method (Average no. 20.08) and Transferring scholars & experts method (Average no. 17.8) accounts for the majority compared to other methods. It indicates that education institutions always value highly-educated scholars and experts, and practical knowledge gained from manufacturing and business companies**,** as well as always put students at the center and find solutions to improve the training quality.

Application of other cooperation methods are still quite limited, for example, Commercialization results of research and development (Average no. 10.32) are mainly used in the group of universities in Medical Field and Healthcare. Application of methods such as Building and implementing training programs (Average no.5.8), Promoting lifelong learning (Average no. 2.88), Inspiring startup spirit and supporting startup activities (Average no. 2.12), and Joining the university administration (Average no. 0.92) are also limited. The reason is that there still exist many difficulties and obstacles hindering cooperations between higher education institutions and enterprises. It can be seen that, thanks to cooperation with enterprises, universities have opportunities to reform their organizational and management structures towards efficiency; to adjust, update training programs and training and research methods to make it more suitable with actual needs of enterprises and recruiters.

In a real situation, students always want to study at universities having close relationships with enterprises so that they can increase their chance to get hired after graduation. Universities with enterprise-oriented mechanisms and organization also have better opportunities to update advanced training methods.

However, being able to find an enterprise that cooperates closely with the institution and provides them support is a huge challenge that meets many limitations. Many enterprises still hesitate to accept students as interns with a fear that it may affect business activities. The short internship period also prevent enterprises from thoroughly guiding students. Therefore, it is necessary to have a deeper understanding of the connection between education institutions and enterprises, which will help discover difficulties and obstacles in the cooperation between education institutions and enterprises, thereby two sides can propose suitable solutions in order to strengthen the cooperation. Cooperation between education institutions and enterprises brings not only advantages for students at the present, but also benefits in the long run.

4. Discussion and Conclusion

According to the above analysis, here are some specific solutions to promote the relationship between education institutions and enterprises in cooperating in training, research, development and technology transfer.

4.1. Solution to promote cooperation in research

Education institutions as well as enterprises need to set up a department specialized in connection and cooperation. There are two forms of cooperation strategies: (1) Signing cooperation agreements on training and technology transfer, and (2) Becoming a shareholder of enterprises (in the inform of individual institutions or university groups with the same training fields). Through these cooperation methods, education institutions can get a closer look at enterprises in order to understand their requirements for high-quality employees, for technology transfer, etc. This is also a good chance for universities to expand their brand image, and to enhance their abilities and financial investment efficiency under the situation of “institutions going financial indepent”. The cooperation helps enterprises to have direct contact with a lot of students, to be able to monitor and evaluate their working style as well as their knowledge and ability in the most accurate way. Therefore, enterprises will know how to recruit, to select suitable employees and to expand their brand image. In addition, the cooperation with education institutions also helps enterprises to access the most recent, most up-to-date research results which can be applied in their manufacturing and business activities.

4.2. Solution to promote commercializing results of research

Commercialization represents "financial assessment of institutional intellectual property". It depends on how intellectual property is commercialized, therefore, to promote commercialization, the following basic solutions need to be implemented:

- Joint research: Bringing research into practice through cooperation means bi- or multilateral cooperation, in which each partner brings a deposit (research potential, capital, feasibility of investment, connecting with practice, etc.). It usually focuses on larger and more difficult projects, and often involves basic research.

- Order-based field research: Research is performed under a contract, in which the sponsor (enterprise) defines the research task (or result) that a scientific research institution (university) would implement. This leads to the creation of an intellectual property, which will be implemented by the sponsor and the law depending on the form of the signed contract.

- Intellectual property (IP) rights transfer (or sell): When the owner of IP rights (especially industrial rights) wants to avoid the risk of obsolescence in the IP (because the further use will be inefficient and unprofitable), the best strategy is to transfer ownership of IP.

- Licensing: If the IP rights holder is unable to bring the IP object to market on his own or to ensure commercial success to the required extent, a good strategy is to license. The rights holder licenses other parties to use the IP based on mutually agreed terms.

- Establishment of subsidiaries: This form of technology transfer is chosen for the independent use and development of IP belonging to academic or research institutions and for the creation of a product or service that is usable on the market. Activities of a spin-off enterprise often involve the author(s) of the IP. IP is provided to the spin-off enterprise through rights transfer or licensing agreements. Organizations can also purchase shares in a subsidiary.

4.3. Solution to promote students' ability to transfer

During the training process, enterprises support facilities for students to visit and do their internship: The internship process helps students to apply the knowledge and skills learned at institutions and to integrate well with future working environment. Therefore, enterprises can connect with education institutions to receive students as interns and create opportunities for them to get the best internship environment.

Enterprises cooperate with education institutions on training students during their time in institutions. For the training process, enterprises can coordinate with the institution in order to discuss with students contents and topics related to manufacturing and business activities, and to share practical experiences, practical problem solving, soft skills training, etc.

Having a strategy of "nourishing", "nurturing" talents at universities by granting scholarships, investing in facilities, technology, finance, recruiting before and after graduation; Ordering training facilities to solve the necessary problems that enterprises are occurring and are going to occur…

4.4. Solution to promote lecturers' activeness and transfer

During the time working at universities, in addition to the main tasks, lecturers are also required to carry out the actual research of enterprises to apply in lessons at their university. The purpose of this task is to encourage students to have a realistic mind, as well as to inspire lectures to do practical research, so that they can come up with ideas and practical research topics.

Institutions and enterprises need to have detailed mechanisms and policies when using a team of scientists and managers to teach necessary contents in the training program as well as to participate in seminars and talks about technology transfer.

4.5. Solution to promote cooperation in building and implementing training programs

Institutions need to update training programs and methods frequently based on enterprises' needs. They also need to do frequent discussion, and to find enterprises' needs for employees in order to build learning outcome standards for the training process.

Enterprises need to actively "dig deeper" into the institution system (including leadership apparatus, curriculum, content, teaching methods, thesis defense, graduation thesis, etc.) in order to offer suggestions and adjustment of the training program, so that it can "match" the needs of enterprises and society. The policy of bringing entrepreneurs into the university council has recently been seen as a step forward in the strategy of socializing education as well as training to meet social needs. This is also an opportunity for enterprises to expand their brand image…

4.6. Solution to promote lifelong learning

To achieve this goal, it is necessary to have solutions coordinated between education institutions and enterprises, specifically as follows:

During the training process, institutions need to guide their lecturers and their scientists (especially young scientists) to spend time learning and doing research practically at enterprises, in order to approach and perceive knowledge which is updated by enterprises and transferred from foreign countries to apply in manufacturing.

Education and research institutions also need to coordinate in designing and implementing training programs that are sustainable and inclusive in order to solve pressing problems of different fields, on the basis of predictable solutions to narrow the gap and incompatibilities among academic and professional standards.

4.7. Solution to promote cooperation in university administration

The institution governance mechanism needs to be built and continuously improved to match the training needs and the development of society.

The administration of training and research facilities will also be performed by one leader (such as Rector, President of the School Council, etc.). The leader must have qualities like: strategic mind; ability to assign tasks; good employee control, etc.

In order for a training and research institution to have sustainable development, it is necessary to have a number of solutions to promote cooperation between training, research, development, and technology transfer institutions with enterprises, as follows:

- Inviting experts in the field of business management to participate in the institution council to join hands in building a high-quality, practical and transparent training institution.

- Coordinating in building and sharing experience in using employee management and evaluating software to adjust its usage to the characteristics of training institutions.

4.8. Conclusion

In the current situation, cooperation between universities and enterprises is an inevitable trend in the socio-economic development of all countries. The width and depth of this relationship depends much on the orientation of the authorities, the choice of methods as well as the compromise of both sides. The effectiveness of the connection is always to raise the “position”, to strengthen the trust as well as to increase the level of positive influence on the social life of the associated parties.

Shortening the distance from the lecture hall to business practice is an urgent requirement for higher education institutions and the enterprise community. The Communist Party of Vietnam and the Government always encourage, while the society is urgently demanding, "barriers" are only within the scope of subjective factors of the associated parties.

PROMOTING THE ROLE OF STATE MANAGEMENT AGENCIES IN ENVIRONMENTAL MANAGEMENT AND PROTECTION FROM IMPACTS OF INDUSTRIAL PARKS IN THAI NGUYEN PROVINCE

MA. Do Quynh Hoa

dqhoa@ictu.edu.vn

TNU-University of Information and Communication Technology, Thai Nguyen, Vietnam

Abstract

These days environmental protection has become a crucial and global issue. In our country, this has not only become the cause of the Party and entire people but also a fundamental and inseparable part of policies and plans for socio-economic development of the country and each each locality. The increasing speed of economic development and industrialisation has brought about many benefits such as higher living standards, better education and health, and longer life expectancy. However, this is accompanied by environmental degradation, which has become a very heavy responsibility for the state role from the central government to local authorities in controlling the impacts of environmental pollution from industrial parks. In this paper, we analyse the role of the state management agencies in controlling pollution from industrial parks in Thai Nguyen province.

Keywords: *Environment, Industrial Park, State Management*

1. Introduction

When talking about the Vietnamese environment, some international experts normally argue that issues of environmental crisis have been ignored in the academic literature. Vietnam is vastly mentioned as a bright spot in terms of economic development and poverty reduction. After just over two decades of industrialisation, the number of poor people has decreased significantly and the living standards of the majority of people have been improved. However, citing environmental pollution data, Ortman (2017) makes a very rigorous assessment that the natural environment has been traded off, even sacrificed for economic goals. The environmental state management agencies in Vietnam is completely powerless to enforce its laws and to make those who pollute the environment take their responsiblility. We argue that such assessment is a bit too strict and not paying attention to the specific context of Vietnam. The Party, State and Government of Vietnam have devoted a lot of enthusiasm and early attention to environmental issues in the process of industrialisation and modernisation. This is clearly demonstrated through the process of perfecting environmental management institutions and commitment to the implementation of sustainable development goals.

2. Methods

In this article, the author uses the method of meta-analysis to fully understand the connotation of the term the role of the state in environmental protection.

In addition, the author uses the case study method to examine the actual implementation and operation of industrial parks in a specific area, especially considering the case of Thai Nguyen province to see the role of state management in environmental protection in industrial zones in Thai Nguyen province. In addition, the author also uses the method of logical reasoning to identify problems that are still limited in environmental protection in industrial zones in Thai Nguyen province; then propose some solutions to improve the efficiency of state management in environmental protection in industrial zones in Thai Nguyen province in the coming time.

3. Results

3.1. Legal framework on environmental protection

** Advances in buiding capacity of environmental management institutions*

Table 1.1. Legal framework for environmental protection

Year of issuance	Laws
1991, 2004, 2017	Law on Forest Protection and Development, Law on Forestry
1993, 2000, 2008	Petroleum Law
1993, 2005, 2014	Environmental Protection Law
1998, 2012	Law on Water Resources
2003, 2017	Fisheries Law
2013	Law on natural disaster prevention and control
2008	Law on Biodiversity
2010	Law on Economical and Efficient Use of Energy
2010	Law on Environmental Protection Tax

Vietnam is a latecomer but has soon learned and absorbed environmental management knowledge from previous countries and made much progress in building environmental protection institutions. First, Vietnam's progress and achievements are reflected in the number of laws, policies and regulations on environmental protection made and compiled by the government. Since 1993, the Government has made and proposed to the National Assembly for approval of the Law on Environmental Protection. In 2005 and 2014, the Law on Environmental Protection continued to be revised, supplemented and perfected. In addition to the Law on Environmental Protection, in the early 1990s, the

Government developed other basic laws which have been passed by the National Assembly such as the Law on Forest Protection and Development, the Land Law, the Petroleum Law, the Minerals Law and Law on Water Resources. The Laws on Protection of Natural Resources and Environment are continuously revised, supplemented and updated according to the domestic and international development context. Up to now, the legal framework on protection of environment and natural resources in our country has fundamentally been relatively adequate and comprehensive.

In addition to the basic environmental protection legal framework, the Government of Vietnam has shown itself to be an active government, acting for the environment through national strategies and action programs on environmental and resource protection from the very beginning of the reform period. In 1986, with the support of international experts, the Vietnamese government developed a national strategy on environmental protection. This strategy is the basis and foundation for the development of national laws, strategies and plans on environmental protection. Since 1986, the Government has developed and issued three national strategies for environmental protection and many other plans and strategies that incorporate environmental protection (table 1.2). Since 2012, the Government has committed and developed a green growth strategy for the period 2011-2020, with a vision to 2050.

Table 1.2. Environmental strategies and plans to protect the environment

Year of issuance	Names of strategies, plans
1991	National environmental protection strategy for the period 1991-2000
1992	National plan on environment and sustainable development for the period 1991-2000
1998	Plan to implement Directive No. 36 of the Politburo on strengthening environmental protection in the period of industrialisation and modernisation of the country
1998	Water resource development plan to 2000 and vision to 2010
1998	Strengthening environmental protection in the period of industrialisation and modernisation
1999	National strategy for environmental protection 2001-2010
2003	National strategy on environmental protection to 2010 and vision to 2020
2004	National action plan for cleaner production
2007	Strategic orientation for sustainable development in Vietnam (Agenda 21)
2011	Sustainable development strategy, 2011-2020

2011	National strategy on climate change
2012	National strategy on environmental protection to 2020 and vision to 2030
2012	National strategy on green growth for the period 2011-2020 and vision to 2050
2017	National action plan to implement the 2030 Agenda for Sustainable Development

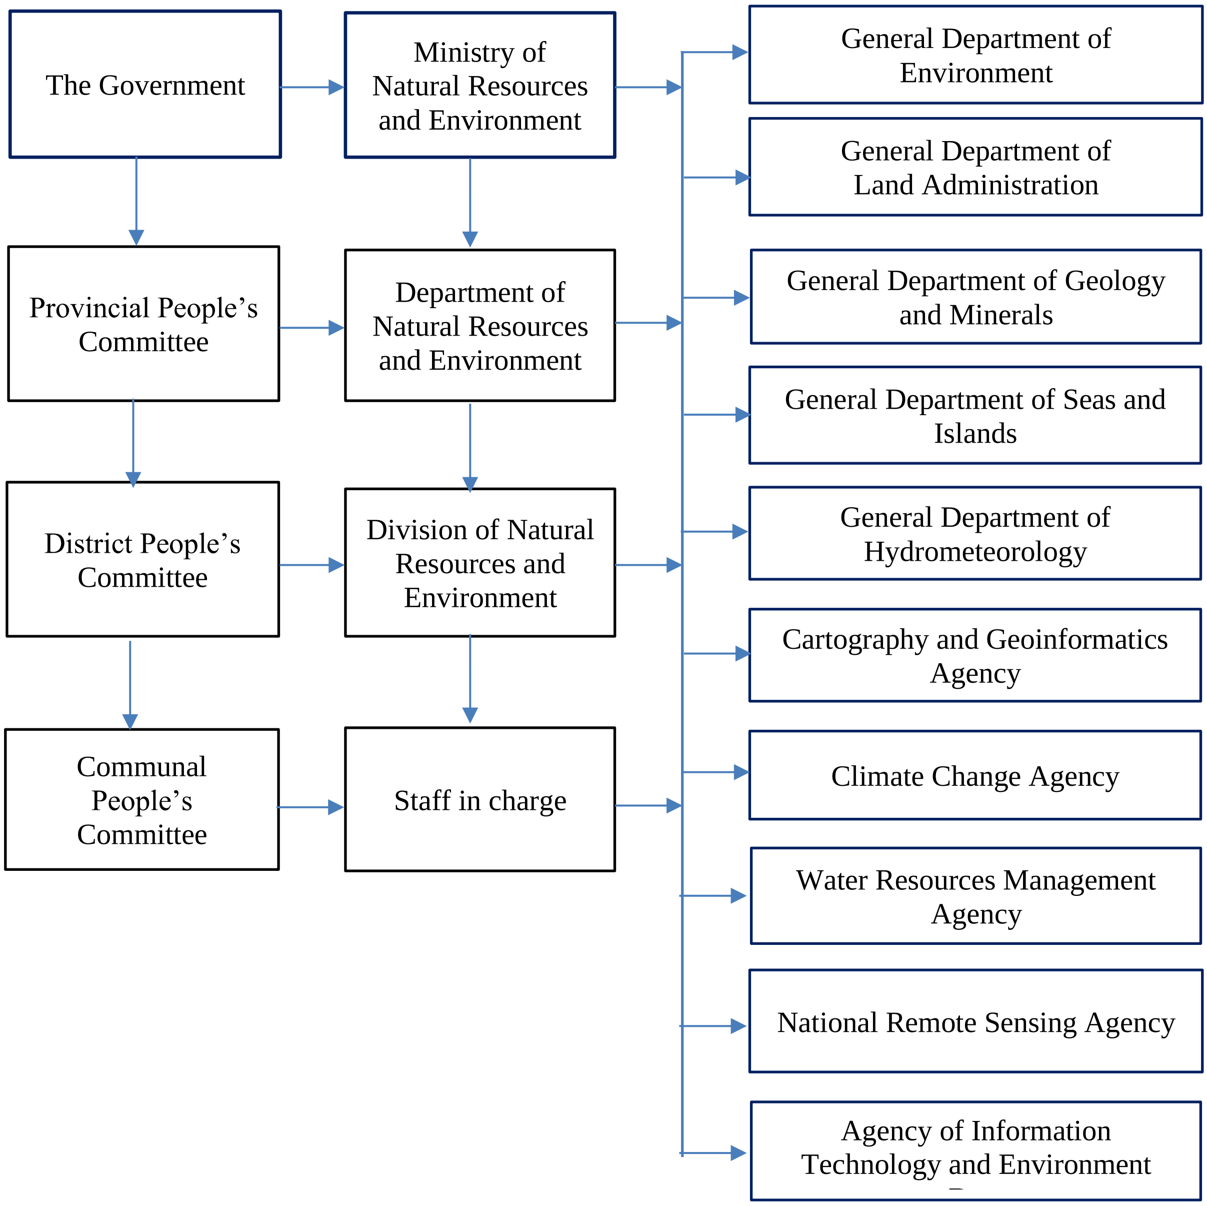
- *Resource and environmental protection and management system*

Besides the advancements in the legal framework for environmental protection, the environmental protection system is constantly being improved. Since 1992, the environmental management system under the Ministry of Science, Technology and Environment has been established. In 2003, the Ministry of Natural Resources and Environment was established on the basis of general departments: the General Department of Land Administration, the General Department of Meteorology and Hydrology and the Environment Agency. By 2017, the Ministry of Natural Resources and Environment has a structure including 5 general departments, 5 agencies. Several new units were established such as General Department of Seas and Islands, Climate Change Agency, Remote Sensing Agency. Besides, the Ministry of Natural Resources and Environment also has public non-business units and enterprises including two centers, five specialised research institutes, two universities and three companies. At the provincial level is the Department of Natural Resources and Environment, at the district level is the Division of Natural Resources and Environment, and at the commune level, there is full-time staff in charge. Moreover, in the Ministries and sectors, there are departments or officers in charge of the environment to monitor and manage environmental issues related to the fields of expertise. Since 2006, in order to strengthen the capacity to manage and handle violations related to environmental protection, the Government has proposed and the National Assembly approved the establishment of the Environmental Police Agency to prevent environmental crime, which is increasing in the process of industrialisation, modernisation and international integration.

Figure 1.3. The Natural Resources and Environment Management System in Vietnam



3.2. Industrial parks in Thai Nguyen

The whole province has planned 06 industrial parks with a total planning area of about 1,420 ha, including:

Song Cong I Industrial Park is planned 195 ha for lease

Yen Binh Industrial Park is planned 400 ha for lease

Nam Pho Yen Industrial Park is planned 120 ha for lease

Diem Thuy Industrial Park is planned 350 ha for lease

Song Cong II Industrial Park is planned 250 ha for lease

Quyet Thang Industrial Park is planned 105 ha for lease

Song Cong II Open Industrial Park (Under planning, scale 300ha).

Phu Binh Industrial Park - Urban – Services (Under planning, scale 900ha)

Cummulatively, the industrial parks in Thai Nguyen province have reached the coverage rate of industrial land area of 61%. It is accumulated by the end of September 2020 that in industrial parks in Thai Nguyen province, there are a total of 236 projects with valid investment registration certificates, including 119 FDI projects with a total investment registered capital is $8,438.3148 million and domestic-investment-capital 117 projects with a total registered investment capital of VND 15,611.2109 billion.

Regarding the socio-economic development orientation of Thai Nguyen province, according to the Task of planning Thai Nguyen province in 2021-2030, with a vision to 2050 approved by the Prime Minister in Decision No. 664/QD - TTg dated May 20, 2020 and according to the Resolution of the 20th Thai Nguyen Provincial Party Congress for the 2020-2025 term and the Action Plan to implement the Resolution of the 20th Thai Nguyen Provincial Party Congress for the 2020-2025 term, Thai Nguyen province will plan a key economic development area in the South, including the localities of Pho Yen, Song Cong, and Phu Binh as urbanised, industrial and service areas. Correspondingly, in the planning period from 2021-2030, with orientation to 2050, industrial parks in the province are mainly planned in these three localities.

3.3. The work of protecting the environment from the impacts of industrial parks of the provincial government over the years

- When carrying out the construction of industrial parks, the authorities in Thai Nguyen province always ensure the motto: the planned area is suitable, synchronous with the surrounding terrain, does not change too much of the current situation, ensures ecological landscape; protects the land and water resources by only exploiting surface water, not the groundwater and complies with discharge conditions.

- Regarding environmental protection against wastewater: wastewater in the production process of factories in industrial parks is treated locally at factories, then collected and further treated at centralised wastewater treatment stations of the industrial parks. In these stations, industrial wastewater will be treated and cleaned to reach the requirements specified in column A of the National Technical Regulation on Industrial Wastewater QCVN 40:2011/BTNMT before being discharged into the environment. With such a solution for drainage in and around the factories, the negative impacts on soil quality will be minimised.

- The protection of the soil environment is carried out by the following measures: to ensure that rainwater in the industrial parks, especially in production areas with many chemicals, does not flow into the surrounding soil to damage the soil. Solid waste from industrial production and daily consumption of the industrial parks is collected and transported to the collection area of all kinds of solid waste in the industrial parks. Then, this waste will be transported, sorted and treated according to regulations.

- The process of planning and implementing projects ensures the compliance with the provisions of the Law on Water Resources like compliance with the prevention of pollution, degradation and depletion of water sources, compliance with overcoming pollution incidents and restoring polluted and depleted water sources; compliance with the protection of the quality of domestic water sources and with discharge of wastewater into the source, and registration for issuance of permits for exploitation and use of water resources. Industrial wastewater after treatment must meet the standards and regulations before being discharged into the receiving source according to Regulation 40:2011/BTNMT and the discharge into irrigation systems must meet TCKT 01:2018/TCCL standards in Decision No. 150/QD-BNN-TCCL dated January 15, 2018, without affecting the environment, irrigation canal system, lakes and dams near the industrial parks and people's daily life. Moreover, there are plans to use, protect or relocate, return irrigation systems (lakes, dams, pumping stations, canals and ditches ...) according to regulations to ensure irrigation for agriculture production; ensure the compliance with irrigation planning and relevant regulations.

- The work of information propaganda and awareness raising on environmental protection continues have been promoted. Thai Nguyen Management Board of Industrial Parks has issued a plan and organised propaganda, dissemination, guidance and taken notices of the situation of environmental protection at each enterprise that has been put into operation in industrial parks. Thereby, Thai Nguyen Management Board of Industrial Parks has guided businesses strictly implement the requirements of environmental protection such as the investment, construction, and renovation of environmental protection works, the making environmental protection projects and plans; the connection of rain water and wastewater; measures to collect, classify and treat industrial waste; the register book of owners of hazardous waste and waste sources; difficulties and problems that need to be solved in terms of environmental protection.

- The mobilising businesses to join hands to protect the environment is enhanced and its quality is improved. Annually, the Management Board has mobilised cadres, civil servants and public employees together with leaders and employees of enterprises to join forces to respond and support "Volunteer Saturday", "Environment Day", "World Environment Day", "World Cleanup Day", "National Week of Clean Water and Sanitation". All together have cleared up trees, collected garbage, trimmed ornamental plants, dredged sewers, manholes for rainwater, wastewater of industrial parks.

- Leading and directing activitities have been in a timely and effective manner. The promulgating plans and implementing urgent tasks and solutions on environmental protection in the spirit of Directive No. 25/TC-TTg dated August 31, 2016 of the Prime Minister, Directive No. 22/CT-UBND dated October 4, 2016 of the Chairman of Thai Nguyen Provincial People's Committee has been done. A draft regulation on coordination of environmental protection in industrial parks with relevant localities and units in the spirit of Decree 82/2018/ND-CP dated May 22, 2018 of the Government has been compiled. Annually, about 450 documents (plans, guidelines, official letters, decisions, reports,...) are issued to strengthen the state management of environmental protection.

- Environmental monitoring in and around industrial parks is carried out regularly and signing a contract with capable monitoring units to monitor the current environmental status of Diem Thuy Industrial Park with frequency of 4 times per year at approved locations in order to assess the level and causes of air pollution, noise levels in and around the industrial park, and quality of wastewater and surface water has been carried out. Correspondingly, there are active directions for businesses specialising the industrial park infrastructure to strictly implement periodical monitoring at approved locations, promptly take measures to protect the environment in industrial parks when there are signs of pollution.

- Inspection and supervision have been always focused and ensured the compliance with regulations. Annually, the inspection plans for enterprises in the industrial parks and the coordination with relevant units set up inspection teams and take samples of waste discharge at enterprises to assess environmental protection have been done.

- Participation as a member of the delegation to inspect the implementation of the law on environmental protection at enterprises in the province developed and led by the General Department of Environment, the Department of Natural Resources and Environment; participation as a member of the Council for assessing environmental impact reports, plans and projects on environmental protection of new projects which have just put into operation in industrial parks; coordination with the environmental police division of the provincial police and functional branches in inspecting the implementation of the law on environmental protection of enterprises in industrial parks.

4. Discussion and Conclusion

4.1. Discussion

The achievements in making environmental management institutions of the Government in general and the government of Thai Nguyen province in particular are abundant, but the environmental pollution around the industrial parks of the province is bad, even worrisome. A number of foreign studies have assessed the state of environmental pollution in Vietnam as an environmental crisis and considered it the clearest evidence for the failure of the government in environmental management and protection (Ortman et al. 2017). However, among the current limited issues in environmental protection and management, we only mention a few of the emerging challenges and limitations in Thai Nguyen. Below is a summary of some issues related to the state management in environmental protection in Thai Nguyen province including the control of environmental pollution in industrial parks, industrial clusters, and craft villages, the inspection, examination and handling of violations on environmental protection; handling thoroughly units causing serious environmental pollution and controlling residual polluted areas.

Firstly, a difficulty in solving environmental pollution is that since the units were established and operated for decades ago, so the production lines are outdated, followed by the system of asynchronous environmental protection works including seven units with wastewater discharge volume of more than 1,000 m3 per day and night This is not to mention the waste volume of two metallurgical plants with production scale of more than 200,000 tons per year and one acid factory with an output of more than 10,000 tons per year. To monitor the waste discharge of these units, the Department of Natural Resources and Environment of Thai Nguyen province has coordinated with each unit to install an automatic and continuous environmental monitoring system and run pilot tests. This has increased the total number of units implementing water and air automatic and continuous monitoring systems to 11 units, of which data of six waste sources are transmitted to the Department. The remaining units continue to integrate with the Department's automatic monitoring system to regularly and promptly control waste sources.

Secondly, one of the production activities with high risk of causing environmental pollution is the mining of minerals and construction materials with nearly 100 licensed organisations and 195 mining licenses, mainly exploiting limestone, sand and gravel, leveling soil, antimony, barite, kaolin, lead, zinc, coal and iron. Especially, there are 10 licensed gold mines. The process of mining minerals as well as construction materials has more or less affected the natural environment as the wastewater from the drying of the mining pit, the water washing the surface through the mining area, the waste dump areas and wastewater from the ore washing process; dust, emitted gas from transportation, loading and unloading, drilling and blasting, accidents caused by landslides or waste dumps. In addition, there are 15 industrial clusters planned in the province with enterprises who are investors in infrastructure construction without centralised wastewater treatment system, but mainly the secondary units themselves invest in separate waste treatment systems. Related to the natural environment, there are 220 traditional craft villages, of which more than 198 craft villages grow and process tea, the rest process forest products and food.

Thirdly, for waste management: Regarding ordinary industrial waste: about 1,000 tons is generated per day mainly in some operating industrial parks and Thai Nguyen iron and steel industrial park, of which Samsung Company and satellite units generate 600 tons per day, Thai Nguyen Iron and Steel Company generates 240 tons per day. Most of the industrial waste generated is reused, collected and treated. However, there are still some units that are not conscious of environmental protection, and there is a situation of illegal waste discharge. *Regarding hazardous waste:* In 2020, the whole province has 245 units that are granted hazardous waste source owner books, in which the largest source comes from Samsung Company (accounting for about 30% of the total amount generated). Most of the generated hazardous waste is collected, treated or contracted with a functional unit in accordance with regulations. There is no illegal discharge of hazardous substances into the environment. The control and supervision of waste transportation and treatment activities of the units (especially the units outside the province that carry out solid waste treatment for Samsung Company and satellite companies) still face many difficulties.

In the province, currently there are 188 investment projects in industrial parks, 121 of which have been put into operation including: 48 projects in Song Cong I Industrial Park, 55 projects in Diem Thuy Industrial Park, 13 projects in Yen Binh Industrial Park and 5 projects in South Pho Yen Industrial Park. Of the total 121 investment projects in the above mentioned industrial parks, 65 projects are subject to make environmental impact assessment reports; 56 projects are subject to make environmental protection plans. Up to now, 59 out of 65 projects have been approved for their environmental impact assessment reports and detailed environmental protection projects; six out of 65 projects have been put into operation but have not been yet approved their environmental impact assessment reports or environmental protection projects; 37 out of 56 projects have been confirmed with environmental protection plans. The new completion confirmation rate reached 63.6%, while 36.4% of the projects have been into official operation but have not yet been confirmed for completion. Currently, only two out of 19 operating industrial parks have wastewater treatment systems with the amount of about 500 m3 wastewater being treated centrally per day. For industrial parks without an investor, the wastewater treatment is mainly built and operated by enterprises themselves. The total amount of wastewater generated and discharged is estimated from 1,000 m3 per day and night; emissions according to the Appendix attached to the Government’s Decree No. 38/2015/ND-CP.

Fourth, according to the provisions of Decree No. 38/2015/ND-CP dated April 24, 2015, in Thai Nguyen province, there are 07 units with wastewater discharge volume of over 1,000 m3 per day; two metallurgical units with scale of more than 200,000 tons per year; two thermal power plants and five units of cement production; one acid factory with over 10,000 tons per year. Most of these units have been established for a long time and the system of environmental protection works is not synchronized, so this is one of the environmental hot spots in the province.

Fifth, the inspection, examination and handling of violations of environmental protection: In 2017, the General Department of Environment inspected the observance of the law on environmental protection in Thai Nguyen provinces from September 18, 2017 to November 17, 2017 of 19 units in Thai Nguyen province and issued eight decisions on sanctioning administrative violations in the field of environmental protection for violating units in Thai Nguyen province, with a total fine of 2,052,860,500 VND. The inspection results show that there are nine out 19 inspected units discharging wastes (wastewater, exhaust gases) in excess of technical regulations into the environment. In addition, some units are inspected for violations on management of hazardous wastes and for not having a certificate of completion of environmental protection works, improperly performing the contents of the EIA report/environmental protection project/commitment to environmental protection and there is no automatic monitoring system as prescribed. The inspection delegations organised in 2020 by local authorities: During the reporting period, all levels and sectors in the province organised more than 500 periodical and irregular inspections and checks on the observance of the law on environmental protection; conducted the specialised subject on guidelines for confirmation of the completion of thorough treatment of pollution, certification of completion of environmental protection works, approval of environmental protection and restoration projects, verification of voters' opinions and petitions. Accordingly, 130 units have been handled for administrative violations on environmental protection with a fine of nearly 6 billion VND; in which 14 cases of illegal dumping and discharging into rivers and streams were detected and handled with the fine of VND 2.5 billion.

Sixth, the thorough handling of units causing serious environmental pollution: For factories belonging to Thai Nguyen Iron and Steel Joint Stock Company, the situation of environmental pollution has not been thoroughly handled, especially at Steel Plant, Mechanical Joint Stock Company, Thai Nguyen Steel Rolling Factory, Iron and Steel Alloy Joint Stock Company. Gas sample analysis results show that most metallurgical units in Song Cong 1 Industrial Park and Shinwon Company had an interest in investing in the installation and operation of a system to treat dust and gas emissions into the environment at the time of inspection meeting the permitted standards. There was one enterprise in Song Cong 1 Industrial Park that was detected to have the dust concentration in the exhaust gas exceeding the standards. Air pollution and environmental pollution caused by smoke and dust released into residential areas near these factories are always pressing public opinions. Correspondingly, Thai Nguyen province has directed functional sectors to urgently handle and solve "hot spots" of environmental pollution caused by mining and industrial production activities. The provincial Department of Natural Resources and Environment has strengthened their inspection, examination, and periodic monitoring of wastewater and gas emissions at large industrial facilities, closely supervised the implementation of environmental impact assessment reports of enterprises, coordinated with functional agencies to resolutely sanction acts causing environmental pollution, suspended operations of enterprises causing the serious and prolonged environmental pollution.

4.2. Conclusion

Some suggestions for improving the efficiency of state management for environmental impacts from industrial parks in Thai Nguyen province

Firstly, solutions on science, technology and environment:

The province needs to support interest rates on termed loans for businesses with technological innovation programs. It is necessary to promote the process of socialisation of science and technology non-business units in order to move towards establishing science and technology enterprises to better perform the role of technology transfer units; step by step create local technology markets; develop policies to support enterprises to innovate and use modern technology, apply scientific and technological advances, improve productivity and quality of products, goods and services and establish industrial property rights in the province. Moreover, the establishment of relationships between enterprises and scientific research institutions to develop production should be done. The province also need to spend a part of the budget to support research and application of new technologies. Finally, the province need to take measures to limit the use of outdated equipment, machinery and means of production with outdated technology having bad impacts on the environment.

Second, solutions to environmental protection

It is necessary to link industrial development planning with environmentally sustainable development, closely combine the investment in renewal of production equipment with modern solid waste and industrial wastewater treatment technology in order to provide useful solutions to protect the environment. Besides, regular monitoring and inspection of production units in compliance with regulations on environmental protection must be done. Synchronous investment for construction of concentrated environmental treatment works together with enhancing education, training and raising awareness on environmental protection for employees, business managers, management boards, state officials on industrial environment should be carried out. Stakeholders need to fully enforce legal regulations in new investments in industrial constructions and exploiting, processing and using works of natural resources. It is necessary to make a plan to protect the environment and strictly organise its implementation, especially pay special attention to environmental protection in industrial parks and clusters.

Another solution is to conduct a specific assessment of the environmental status of industrial parks, clusters, and operating production units, assess pollution caused by exhaust gases and industrial wastes, emissions and dust of vehicles, pollution levels of water sources, etc. to have a general treatment plan in the locality as well as in each area. Besides, it is needed to periodically monitor and analyse the composition of hazardous wastes.

Before construction, investment projects and factories must commit or make a report on environmental impact assessment before being granted investment and construction permits. Industrial parks and clusters must invest in a waste treatment system so that treated waste reaches the prescribed level before being discharged into the environment. For projects and factories which have been granted construction investment permits must conduct periodic environmental impact assessments in accordance with the provisions of the Law on Environment.

Drainage planning for industrial parks must take into account specific water drainage sources. It is necessary to apply two wastewater treatment systems: the on-site water treatment system for each factory and the general treatment system of the industrial park.

Third, it is necessary to renew the development thinking and approach in resource management and environmental protection towards a comprehensive and sustainable approach, eliminate the local approach to resource management and environmental protection. In particular, it is necessary to consider the task of environmental protection as an important task of the province in order to realise the goal of sustainable development.

Fourth, it is necessary to reform the administrative system for environmental management in the direction of leanness, efficiency and quality with a clear assignment and division of responsibilities between the provincial and district environmental management agencies. In addition, it is advisable to increase civic and social criticism to the province's policy and management effectiveness on environmental issues, and to reform the administrative system in the direction of focusing on reforming services and interactions between the government and citizens and businesses towards a modern and convenient market to reduce the cost of time and money. The administrative agencies need to promote businesses that are responsible for the social community and the country. Regularly, stakeholders need to update technology in the direction of green, saving resources and protecting the environment. The provincial government needs to improve the capacity of the environmental management system by strengthening research, updating and applying modern technological solutions in monitoring and evaluating the current state of the environment.

ENHANCING DIRECT DEMOCRACY: CASE STUDIES IN VIETNAM

MA. Nguyen Thi Thanh
nguyenthanh.apa@gmail.com
National Academy of Public Administration, Hanoi, Vietnam

Abstract

Direct democracy is the original and true way to ensure the power and position of the people as the owners of the state and society. Along with representative democracy, the implementation of direct democracy is important and indispensable in modern states in the world. In Vietnam, direct democracy has been recognized in many important legal documents and has been concerned by the Vietnamese Government, especially in recent times. Promoting and expanding direct democracy in Vietnam is evaluated as very correct and consistent actions of the Communist Party and the Government of Vietnam. The implementation of democracy is an important driving force to promote the socio-economic development as well as people's sovereignty. It also stimulates the material and spiritual resources among the people to serve the socio-economic development and fulfill social tasks. In the recent context of Vietnam, there are a lot of difficulties and challenges in implementing direct democracy, which requires significant solutions to strengthen in the future. In this paper, besides providing general researches and opinions on direct democracy, the authors focus on analyzing issues of direct democracy implementation as well as proposing some solutions to improve direct democracy in Vietnam.

Keywords: *Democracy; Direct democracy, Election*

1. Introduction

Direct democracy is the original and accurate way to ensure the power and position of the people as the owners of the state and society; Along with representative democracy, the implementation of direct democracy is important and indispensable in contemporary political regimes. Through direct democracy, the people themselves could decide which laws and policies are important for the community and the country. In decades, the trend of strengthening direct democracy is increasingly stronger in all countries in the world.

Reality practices in the world show that there is no archetype for the application of direct democracy’s forms in all countries in the world or for the different development stages a country. Some forms of direct democracy are suitable for one society but they are not acceptable for the others. In other cases, the forms of direct democracy which bring the good results for a society in a specific of period may cause serious consequences for that society in another period. In order to successfully apply direct democracy, besides progressive and strict legal framework, parties, organizations and the citizens need to have an understanding of the nature of direct democracy as well as methods of enforcing direct democracy. They also have to be sensitive to the situation of their country, be dedicated to a true direct democracy and act based on the mutual benefits of the community and the nation.

Vietnam is a developing country and does not have a long history of democratic enforcement in general and direct democracy in particular. The main reason is that the constitutional foundation - the foundation for Vietnam's modern democratic mechanisms is quite new in comparison with other democratic regimes in the world (the first ever democratic regime of Viet Nam only started on September 2, 1945 through the Declaration of Independence for the Democratic Republic of Viet Nam read by President Ho Chi Minh in Ha Noi). Long-lasting fierce wars are additional factors affecting the effective organization and implementation of both direct democracy and representative democracy. In Vietnam recently, direct democracy is recorded in many important legal documents. The 2013 Constitution of the Socialist Republic of Vietnam, Law 96/2015/QH13 Law on Referendum, Law No. 85/2015/QH13 Law on Election of Deputies to the National Assembly and Deputies ... National Assembly and Deputies to People's Councils and Ordinance No. 34/2007/PL-UBTVQH11 Ordinance on exercise of democracy in communes, wards and township are some of them. They provide clearly definition, understanding as well as legal regulations about concepts, objects, general principles, procedures and validity of the results of direct democracy in Vietnam.

Through the study about direct democracy in Vietnam, we are trying to solve the following questions:

- What are the current situation as well as difficulties and obstacles when implementing direct democracy in Vietnam?

- What are solutions to overcome existing difficulties and challenges?

Though the research’s findings may not provide the most comprehensive solutions to overcome the recent problems of implementing direct democracy in Vietnam; the authors suppose that they detect major problems on Vietnam’s direct democracy and give directions to solve them.

2. Method

To answer the above research questions, in this article, the authors use research methodology : common methods in legal scientific research including synthesis, analysis, assessment, comment, statistics and consultation with experts. Although direct democracy is not new in Vietnam, there remain many liminations in practice. The method of consultation with experts was used to collect comments and in-depth assessments from experienced experts in direct democracy, specifically the election. The team has interviewed three experts, whose comments and opinions are reflected in the article.

3. Results

3.1. Literature review

Direct democracy is understood as the form of people directly give decisions on important, matters of the nation and directly make laws without any intermediaries. The most popular forms of direct democracy include:

- *Referendum* is a direct vote in which all electorate is invited to vote to accept or veto a special proposal. It could be the adoption of a new Constitution, a set of laws, the dismissal of an elected official or simply a new government policy (Dao, Trinh, Vu, & Truong, 2014; Truong, 2011; Dao, 2013).

- *Voting* is a process of making people's decisions to select an individual to hold government positions. This is the usual mechanism that democracies currently use to allocate positions mostly in the legislature branch and sometimes in the executive and judicial branches as well as in the local government (Central Committee of Vietnamese Fatherland Front, 2002; Shafritz, 1988; Nguyen, 2003).

- *Recall election* is understood as the electorate voting to express their mistrust with the elected representatives and force these representatives to retire their duties when their term was still available (The 2013 Constitution of the Socialist Republic of Vietnam, Article 7.2; The 1992 Constitution of the Socialist Republic of Vietnam, Article 7).

- *Citizens' initiative* is the act that citizens propose and vote to decide a matter of their country or local community. The condition for this implementation is that proponents must collect sufficient signatures on statutory initiatives range. Citizens' initiatives could be new proposals or proposals to amend existing legal documents or to decide important matters prescribed in the Constitution (Giao, n.d.).

- *Grassroots democracy* is understood as democracy at the lowest geographic or social level where people express their ownership most directly (Directive No 30-CT/TW; Ordinance No. 34/2007/PL-UBTVQH).

In the context of Vietnam, understanding and awareness about direct democracy and related matters come from some significant works of scholars around the world as following:

First of all is the handbook named *Direct Democracy: The International IDEA* Handbook (Beramendi, et al., 2008). It was translated and published in Vietnamese by the Institute of Public Policy and Law of VNU Publishing House in 2014 (Dao, Vu, Phung, Bui, & Le, 2014). The handbook analyzes, compares and provides information and insights on the concerns related to direct democracy. Through the work, the authors articulate the perspective: Direct democracy demonstrates people's participation in government activities (Beramendi, et al., 2008). A range of democratic practices exists to help citizens become more and more involved in making political and institutional decisions. The handbook presents an overview of direct democracy implemented in all regions of the world and evaluates particular cases in 6 countries including Hungary, Switzerland, Uganda, United States (Oregon), Uruguay and Venezuela. The handbook also clarifies and examines the scope of usage four direct democracy mechanisms which are referendum, citizens' initiative, agenda initiatives and recall. Through case studies, the handbook provides a significant comparison among different direct democracy mechanisms and methods in which those mechanisms are applied each country with specific contexts. Accordingly, this research partly reflects the practice of direct democracy in some countries around the world. This is a useful reference for researchers as well as the authors working on direct democracy implementation in Vietnam.

Besides the work of Beramendi, et al., it has to mentioned the contribution of David Held. Held's work shows in the book called *Models of Democracy* (Held, 2004) (its second and the third edition were published in 2006 and 2018, respectively). In Vietnam, it was translated and published under the name *Các mô hình quản lý nhà nước hiện đại* which can be understood as *Management models of modern states* in English (Held, Phạm, & Đinh, 2013). The book consists of three parts, in which, in the first part, Held presents four classic democratic models including Athenian democracy - classical democracy, Republicanism, Liberal democracy and Direct democracy. In part two, he introduced four variants in the twentieth century and one is currently forming. In part three of the book, the author focuses on clarifying the question of "How should the democracy be understood today?". The author critically assessed the existing democratic models and thereby built up a definition of his own: democratic autonomy which is argues as " can link systematic difficulties that often occur and recur in political and social life" (Held, 2004). According to Held (2004), autonomy implies not only personal freedom and but also equal rights and responsibilities of individuals in organizing the community to ensure their eligibility to pursue their plans. This is a new contribution that sets the foundation for grassroots democracy in general and provide valuable suggestive topics for democracy researches in the context of Vietnam.

Last but not least, the book called *Le referendum: Etude Comparative* of Francis Hamon (1995) was introduced to Vietnamese researchers and readers through the name *Trưng cầu dân ý: Một nghiên cứu so sánh*. The book introduced on referendum, the relationship between democracy, democracy and the referendum (Hamon, 1995). According to Hamon (1995), democracy is understood in two different forms: the direct democracy (including the direct participation of each citizen in exercising political power) and the representative democracy (political power is entrusted to the elected representatives who take responsible to the people). In his research, Hamon:

- Gives comprehensive theoretical and practical point view of referendum;

- Provides referendum models in some countries in the world. Those models include (i) scope and objectives of referendum; (ii) method of performing referendum; (iii) the relationship between referendum and political life; (iv) factors influencing the results of referendums; (v) the increase at global scale of referendums.

It can be said that this is an important reference for the authors to propose and apply referendum in Vietnam because there is no referendum which had been held since the Law on Referendum (2015) taking effect in July 2016.

3.2. Implementation of direct democracy in Vietnam

In Vietnam, sovereignty belongs to the people and this is the foundation of the democracy. The people are the sokle and supreme subject of State power. They exercise their right to mastery through the activities of the State and the entire political system and forms of democracy. At present, the Party and State define the election and dissmisal of delegates as one the most basic forms of direct democracy for the people to exercise their right to sovereignty, delegating and control of State power. The electoral system became the mainstay of democracy. Right after regaining independence, Vietnam held the general election in 1946 and was considered to be truly free and democratic, becoming a brilliantly milestone in the history of democracy. In Vietnam, direct democracy implementation has received a lot of concerns and been gradually enhanced by the Government and citizens. Regardless of those actions, there are still many shortcomings.

First of all is the referendum. Initially, the Law on Referendum (2015) was created to create a legal mechanism for citizens to exercise their voting rights when the government bodies organize a referendum. However, in reality, since the Law has come into effect, none of referendum has been held. Considering the current legal documents, it can be seen that the law on referendum still has loophole and lacks of detail causing difficulties in practice, specifically as follows:

(i) The issue of citizens' initiative: at first, it must have a citizens' initiative in order to conduct a referendum. The current Law on Referendum states that: "The Standing Committee of the National Assembly, the State President, the Government or at least a third of the total number of delegates of the National Assembly has the right to request the National Assembly to consider and make decisions on referendum." (Article 14, Law on Referendum, 2015). Citizens or voters do not have the right to propose referendums. Therefore, the absence of specific regulations on voters'/citizens' rights to request referendums has limited the practice of direct democracy.

(ii) The legal validity of the referendum results is unclear: The Law on Referendum 2015 states: "The Standing committee of the National Assembly shall be responsible for making report to the National Assembly on the result of referendum in the next meeting session. Based on the result of referendum, the National Assembly shall decide necessary measures to ensure the execution of the result." (Article 49, Law on Referendum 2015). This provision can be understood that the referendum's results will be reported to the National Assembly for consideration and the National Assembly has the right to accept or not accept such results. The decision of the National Assembly is final, and the will of the people expressed through the referendum is only for reference to government agencies. In this sense, the core of direct democracy - a form of helping people to decide for themselves important issues of the country, is not guaranteed to be implemented.

The second matter is the election. Currently, the voting has not fully promoted the direct democracy in Vietnam. Some specific limitations can be seen as follows:

(i) Voters are lacking information about the candidates. Normally, the Election Boards make brief lists of information about the candidates to provide to the voters. However, the information in those lists of information is often very sketchy. Their contents include only name, hometown, workplace, education and position of the candidates, while the voters' most concerns, for example ability to work, morality, or their contribution for the society, are rarely provided. So, voters do not have many chances to nominate candidates and select delegates in the election, thus they do not play a really decisive role in electing delegates. « *In a constituency, among 5 candidates, three are elected. This means the chance* *for voters to select their representatives is 40%. Delegates are elected mainly because of the selective structure, thus the election becomes formal » (Source : in-depth interview, Prof. Dr, Hanoi Law University, 2021).*

(ii) About equality of representation of voters. The Vietnamese law prescribes the principle of compulsory equality in elections. However, the equality of representation of voters in fact has not been ensured yet due to the unreasonable distribution of the number of elected representatives. In the recent National Assembly elections, there was a huge disparity in the proportions of the population of a province or a city and the number of National Assembly elected candidates. The three highest proportion belong to Ho Chi Minh City with 1 elected candidate represent for 234,838 people, Thanh Hoa with 1 elected candidate represent for 216,494, and Nghe An with 1 elected candidate represent for 218,879 people. Meanwhile, some provinces witness the significant low proportion of representation (around 5 times lower than the highest ones) such as Lai Chau with 1 elected candidate represent for 53,317 people, Bac Kan with 1 elected candidate represent for just 50,250 people (Resolution No. 53/NQ-HDBCQG).

Thirdly, the matter of grassroots democracy. Ordinance No. 34/2007/PL-UBTVQH11 Ordinance on exercise of democracy in communes, wards and township has improved the legal basis for securing direct democracy at the grassroots level. According to statistics, up to 100% of communes, wards and towns have built and implemented the grassroots democracy. However, the reality practice reflects that there are many documents at the grassroots level making their own regulations and policies without compliance with higher legal regulations, especially financial decisions (fees, charges, penalties, etc.). For example, in some communes of Gia Binh district, Bac Ninh province, the commune stipulates that villagers who have motor vehicles and agricultural vehicles must pay specific amount of money per year as road maintenance fee. Outsiders with cars passing through the village must pay a fee from 3,000 to 4,000 VND per trip as road maintenance fee. In Thua Thien Hue, Ninh Thuan, Lang Son and Nghe An provinces, there is a regulation that people have to pay for processing documents and applications at the communes and wards. The fee reaches to 20,000 VND or 30,000 VND per application (Quan, 2015).

4. Discussion and Conclusion

4.1. Solutions to enhance direct democracy in Vietnam

Firstly, to complete and effectively implement the Law on Referendum in practice. The Law on Referendum has been in effect for 3 years, but in fact no referendum has been organized. In the future, it is necessary to amend the Law on Referendum in the directions that give voters the right to propose referendum initiatives and expand the scope of local referendums in order to ensure the voting right as well as nature and effectiveness of referendum when it is held of the State.

Secondly, to finalize the voter's rights as following:

- Issuing documents detailing provisions in the Law on Election of Deputies to the National Assembly and Deputies to People's Councils: (i) Guiding the process and procedures for voting at workplace or permanent residence of the voter to ensure that voters could exercise their right under any circumstance. (ii) Guiding voters to register for voting at temporary residence instead of permanent residence.

- Ensuring the right to select the most competent candidates through the elimination of a restriction on the number of candidates per constituency.

- Prescribing sanctions for the case that one person cast other ballots. In some countries around the world such as Australia and New Zealand, the voting is a civic duty; if the citizens do not fulfill their duty, they can be subject to administrative sanctions. In Vietnam, voting is a citizen's right but the state also needs regulations to ensure voters exercise their right without affecting the exercise of the others' rights.

Thirdly, to strengthen grassroots democracy's regulations by promulgating the Grassroots Democracy Law on the basis of consolidating the current legal documents on grassroots democracy. This Grassroots Democracy Law should strengthen the implementation of democracy at the grassroots level, such as: (i) increasing the number of mattes that grassroots administrations must inform, discuss and absorb people's opinions; (ii) improving the legal effectiveness of receiving public comments; (iii) improving the people's supervision role in elected bodies in the localities.

4.2. Conclusion

Establishing a direct democracy is an indispensable development as well as an objective trend of mankind in order to ensure the principle that all state power belongs to the people. The implementation of democracy is an important driving force to promote the socio-economic development and promote the people's ownership. In the process of social development towards sustainability and the creation of a constructive government, the leaders of the Vietnam Government are increasingly focusing on assessing the limitations and difficulties in implementing direct democracy. A specific roadmap to strengthen the implementation of direct democracy is essential in Vietnam currently. The authors hope that the research's theoretical contribution along with previous studies could help improve the effectiveness of direct democratic practices in Vietnam in the near future.

COMPLETING REGULATIONS ON INSURANCE CONTRACTS IN VIETNAM IN THE REQUIREMENTS OF SUSTAINABLE DEVELOPMENT AND INTERNATIONAL INTEGRATION

Dr. Kieu Thi Thuy Linh

kieulinh.hlu@gmail.com

Faculty of Civil Law, Hanoi Law University, Hanoi, Vietnam

Abstract

The article focuses on analyzing the limitations of the Law on Insurance Business on insurance contracts. In the context that Vietnam is amending the Law on Insurance Business, the author wants to improve the regulations on insurance contracts in the Law on Insurance Business to create a completely legal basis. To make insurance contract relationships useful, in line with the subjects' needs and line with the rapid development in the insurance field.

Keywords: *Law on Insurance business, insurance contracts, completing legal regulations.*

1. Introduction

The world, as well as Vietnam, are facing significant challenges due to the Covid-19 pandemic. The economic sector has become troubled because it could not concentrate on production, people's health is being seriously threatened by the consequences caused by covid. Up to this point, the role of insurance, especially life insurance, can promote its position. Of course, insurance payment also depends on many different factors, but importantly, when meeting the payment conditions agreed upon by the parties, the insurer will have to perform the insurance obligation. At that time, the beneficiary of the insurance money will share the risk, creating a financial reserve to serve life in the future. Therefore, from the early days of the human economy, the insurance area was also simple. However, today, when the human economy has stepped to a new height, the economy of professional production, the insurance also develops strongly and is as diverse as colourful flowers to meet the different needs of people and subjects in society.

Insurance contracts are the backbone of bringing insurance services into the lives of subjects. They are the bridges to form an insurance relationship between the service providers (insurance enterprises) and the demander (the insurance buyer). The guiding legal provisions and the basis for dispute settlement on insurance contracts have also been developed and recognized from an important role. Before having the Law on Insurance Business, insurance contracts were recorded in the Civil Code. However, after the Law on Insurance Business in 2000, especially with specific characteristics, the regulations on insurance contracts were no longer recorded in the Civil Code but only in separate laws. Of course, the basic principles for contracts recorded in the Civil Code still have a specific influence on all contracts, including insurance contracts.

With the importance of insurance and insurance contracts, legal regulations always need to be studied and considered to be complete to ensure stability and safety in each insurance relationship towards the stability of the insurance sector in general. When the insurance sector develops and stabilizes, it will stabilize the country's economy, helping Vietnam integrate into the world economy.

2. Method

To achieve the research result, the authors use the following research methods:

Historical method**:** The author uses historical method to understand the birth and development of insurance and insurance contracts towards finding out the role of insurance in human life. The author wants to prove that sustainable socio-economic development makes it impossible not to pay attention to insurance, insurance service provision, and insurance contracts.

Analysis method: The authors will analyze the provisions of the current law on insurance contracts to find out the inappropriate and limited points in this regulation. With the limitations found, of course, there will be a way to overcome it to be complete and convenient in applying legal regulations.

Comparison method: Compare the provisions of the Law on Insurance Business with the primary law in the field of private law - the Civil Code - so that it can be perfectedin the direction of consistency and logic between specialized law provisions and the primary law. Only then will the legal provisions be synchronous and convenient for application.

Inductive method: After analyzing and comparing, the author concludes the issue to recommend perfecting the legal provisions on insurance contracts, aiming to create a unified and appropriate legal framework for essential adjustments. It will help to create sustainable development for the insurance sector in particular and socio-economic in general.

For this subject, some questions need to be answered and clarified, including:

The first question is the role of insurance contracts, the law on insurance contracts in the development of the insurance field, and socio-economic life.

The second question stipulates whether the current law on insurance contracts has any limitations, especially concerning the current 2015 Civil Code – the primary law in the field of private law.

The third question is the limitations in the regulations on insurance contracts in the insurance business law, which direction should be completed to contribute to the sustainable development of the insurance business and the economy.

3. Results

3.1. The role of insurance, insurance contracts and legal regulations on insurance contracts in today's life as well as in the goal of sustainable development of the economy and society

As early as BC in Egypt, the fact that stone carvers knew how to set up a "mutual fund" to help victims of accidents showed recognition and encouragement to do "mutual assistance".", "risk-sharing" for social actors – especially those who do jobs that are dangerous to their lives, health, or property. That vision has opened up the birth and robust development of a highly diverse insurance field as it is today. Marine insurance considered the first systematic insurance business, laying the foundation for later insurance with the event that researchers found a policy issued in 1347 in Genoa, Italy[58]. Thus, insurance aims at risk-sharing and minimizing damage if an unfortunate event occurs in general economic life. As for the goal of sustainable development, insurance plays an even more critical role. Because, in order to develop sustainably, the subjects themselves must minimize the risks they have to bear. Therefore, insurance seems to be a pedestal right behind for the subjects to maintain their stability, avoid financial "squirrels, " and secure business development.

The basis for forming the insurance relationship between the insurance enterprise (the insurance service provider) and the customers (the insurance buyer) is the insurance contract. In other words, the insurance contract is the basis for the formation and performance of the insurance contract relationship, allowing the service provider to carry out insurance for its customers. Therefore, the implementation of insurance only really comes to life if the parties enter into an insurance contract.

For regulating social relations in a particular order, states must use law. Legal regulations are the basis for orienting social relations and the legal basis for dispute resolution (if any). Legal regulations on insurance in general and on insurance contracts, in particular, are the legal basis for regulating insurance contracts and insurance contract relationships. Therefore, if regulations on insurance contracts are appropriate, it will undoubtedly create a clear legal corridor and a basis for resolving arising disputes (if any).

At this time, as a member of many free trade agreements, of international trade treaties, and a member of the World Trade Organization, Vietnam legal provisions on insurance, insurance contracts, in particular, must not only conform to international commitments but also meet development trends in the world and socio-economic conditions. Regarding insurance and insurance contracts, to achieve the sustainable goal, the legal regulations for this issue must be flexible, suitable with the nature of social relations, the movement of the economy - the society in general. Therefore, finding out the limitations and perfecting the legal provisions for insurance contracts is also an essential need to ensure the

[58] Tlđd.

sustainability of the insurance contract relationship, the sustainable development sustainable for the insurance sector in particular and the economy - the society in general.

3.2. Fundamental limitations in the provisions on insurance contracts in the insurance business Law

Regulations governing insurance contracts arein the Law on Insurance Business. However, the insurance contract is a separate form of the general contract, so the insurance contract must also comply with the provisions of the current Civil Code. In Vietnam, the Law on Insurance Business No. 24/2000/QH10 passed by the 10th National Assembly on December 9, 2000, officially became a legal corridor for business activities and providing insurance services in Vietnam. Then, in 2010 and 2019, in response to the requirements of meeting the development of the insurance market and the context of Vietnam joining international organizations such as the World Trade Organization or participating in international trade agreements. With countries and regions worldwide, the 12th National Assembly and 14th National Assembly passed Laws amending and supplementing the Law on Insurance Business to make timely adjustments to suit practical requirements.

Regulations for insurance contracts are the foundation governing the insurance contract relationships between the insurer and the insurance buyer. Analysis of the provisions on insurance contracts in the Law on Insurance Business in 2000 and the amended and supplemented laws in 2010 and 2019, as well as comparison with the current Civil Code of 2015, can be seen, Insurance contracts have the following fundamental limitations:

First, the definition of an insurance contract. The definition recorded in Clause 1, Article 12 of the Law on Insurance Business has shown the nature of the agreement and the essential obligations of the two parties in the contract, but it also shows some incomplete points. Specifically: If the insurance enterprise and the insurance buyer have other agreements on the payment of insurance premiums or payment of compensation for damage, according to the nature of the contract, it must comply with the contents of the contract signed by the parties. Moreover, many contracts are entered into, but if the conditions for validity are not met as noted in Article 117 of the 2015 Civil Code, they will not have legal effect. In other words, a contract that is entered into is not necessarily legally valid, but a legally valid contract must, of course, be the contract that signed.

Second, the principles of insurance contracts have not been regulated. These principles govern throughout the process of negotiation, conclusion, implementation and termination of insurance contracts. Of course, insurance contracts also adhere to the principle of good faith and honesty. However, this principles in insurance contracts are even higher than that regular contracts because it is associated with insurance risks and even. Just incomplete and inaccurate information can misjudge the incident and lead to insurance fraud. In addition, several specific principles, such as the principle of subrogation, the principle of compensation, have not been recognized. The principle of subrogation is based on recognizing property right to be transferred by agreement or by law. The principle of indemnity is understood to be paid only according to the actual damage to avoid insurance fraud.

Third, the content of the insurance contract. In the provisions of Article 13 of the Law on Insurance Business, the principle that the content of a contract determined based on the parties' agreement has not been brought up first is not appropriate. Among the primary contents: (i) the absence of regulations on the adequate time of the insurance contract. It is crucial because there is a difference between signing the insurance contract and when the insurance liability arises. However, the recognition of the adequate time of the insurance contract is essential because it is related to the exercise of the rights and obligations of the parties, especially the obligation to pay the insurance premiums of the insurance buyers; (ii) should not identify "dispute settlement provisions" because this is the term agreed upon by the parties to resolve disputes if any arise. Therefore, it is not appropriate to call the dispute settlement regulations the same as legal regulations. At the same time, the content of dispute settlement can be noted on their principles, dispute settlement methods and legal consequences for dispute settlement. Moreover, the regulations as the current Law on Insurance Business are making a difference with the 2015 Civil Code when this Code names "dispute settlement method at point g, clause 2, Article 398 of the 2015 Civil Code"; (iii) The Law on Insurance Business has no provision on the term "liability for breach of contract". In fact, for an insurance company - a professional insurance service provider - the liability for a breach of contract or the insurance buyer when intentionally breaching an obligation should also be recognized. This responsibility must exist if we accept the principle of absolute honesty and goodwill. With any contract, goodwill and honesty are required, but in the insurance field, this principle seems to be more demanding, more absolute because it not only ensures the insurance role is promoted. Against the risks that occur in life, but also to ensure the stability of this field. The absence of this provision in the mandatory provisions of the insurance policy would be a significant omission; (iv) the content of the insurance contract in the Law on Insurance Business has not mentioned the "insured scope or interests". If the law does not recognize it, it will also reduce the law's orientation for negotiating and drafting contracts. It is a significant issue as it relates to the insurable value.

Fourth, the limitation on the regulation of the form of insurance contracts. The formality of transactions in general and contracts is currently being considered an issue that needs to be studied deeply because entering the 4.0 technology, if we only look at contracts in general and insurance contracts, we will not solve them. In particular, the three traditional forms of co-insurance, which are oral, written or behavioural, will be significantly entangled in the application process. More specifically, when the trend of electronic contracts is increasingly popular, the insurance industry certainly cannot stand aside from the trend. Many contracts do not even need a detailed agreement, but only basic terms such as civil liability insurance contracts. Forcing the subjects to enter into a written contract is not appropriate and unnecessary. Therefore, the current law regulation is rigid and will cause "frustration" if insurers want to change the form of contract. More importantly, it is inevitable that in order to conclude an electronic contract, the content of this contract itself must also be registered by the insurance enterprise as a model contract and approved by a competent state agency. Therefore, to avoid the "lagging" of the legal regulations, the provisions of the law need to have reasonable anticipation for future trends.

Fifth, limitations in the provisions on the time of signing and the adequate time of the insurance contract. Currently, the Law on Insurance Business has no regulations on entering into a contract and the adequate time of an insurance contract. Meanwhile, the time of signing has great significance in determining the legality of the contract. The adequate time of the insurance contract is meaningful in determining the time when the parties must comply with their rights and obligations to the other party.

Sixth, limitation in regulations on providing information of insurance buyer and responsibility due to the breach of the obligation to provide information. The Law on Insurance Business has the following limitations: (i) it is necessary to identify the obligation or responsibility in providing information correctly. The obligation is the conduct that the subject must perform. Liability refers to the adverse legal consequences if there is a breach of the obligation. Therefore, correct naming should be an obligation to provide information and liability if this obligation is breached; (ii) the policyholder has not been given a specific obligation to provide information. The obligations are to provide personal information, health status, information of the insured or insured property or other information. When this obligation has not been recognized, it will be challenging to handle the consequences of this incorrect information; (iii) no specific record of liability, especially the issue of compensation for damage caused by a breach of the insurance buyer's obligation to provide information.

Seventh, limitations in the regulation on providing information of insurers and liability due to breach of the obligation to provide information. The content includes: (i) the name of the law is not accurate with the true nature of the regulation. The term "responsibility" is used for a variety of insurers' obligations in providing information. Meanwhile, "responsibility" must be understood as the party's adverse legal consequences who violate the obligation. Therefore, there must be an accurate separation of obligations and responsibilities of insurance enterprises in providing information to insurance buyers; (ii) it is necessary to supplement the responsibility of the insurance enterprise if the insurance buyer violates the information security obligation of the insurance buyer; (iii) cases where the insurer is liable due to incomplete or unclear information provided by the insurance buyer due to its fault. It is necessary because of the insurance business.

Eighth, limitation in the interpretation of insurance contracts. In the provisions of Article 21 of the Law on Insurance Business, there is only one orientation for the interpretation of insurance contracts, which is in favour of the insurance buyer. The Law on Insurance Business also does not show a relationship with the principle of contract interpretation in the current Civil Code or other law sources such as custom.

Ninth, limitations for instituting an insurance contract. The provisions of Article 30 of the Law on Insurance Business do not have any logic with the Civil Code 2015. In Article 429 of the Civil Code of 2015 stipulating the "*time limit for initiating lawsuits on contracts*", it is noted: The statute of limitations for initiating a lawsuit to request a court to settle a contract dispute is 03 years from the date the person entitled to claim knows or should know that his/her lawful rights and interests have been infringed. The provisions of the current Civil Code 2015 on the statute of limitations for initiating lawsuits clearly show that respect and guarantee for the party whose rights and interests are infringed can request the Court to protect their rights and interests. its benefits. When the subject knows his rights and interests are infringed, he can calculate the statute of limitations for initiating a lawsuit. Only then, the subject can consider whether or not to ask the Court to protect his/her legitimate rights and interests (i.e., ensure the voluntary element in entering into and performing the contract).

Tenth, limitations in regulations on the insurance contract form. In the 2015 Civil Code, there is a contract record according to the form in Article 405. With such a provision, the Law on Insurance Business has the following limitations: (i) Co-insurance is a type of contract that is mainly signed according to the content of the model contract that the insurance enterprise offers to the customers. The insurance enterprise is not only the subject of contract drafting but also has to carry out the procedures for registering the contract according to the form at the competent state agency (usually the Ministry of Industry and Trade);

(ii) Model insurance contracts often have long content and many terms, so customers (insurance buyers) cannot always fully and accurately understand the content of each article and clause of the contract, including the case where the insurance enterprise (usually an insurance broker) explains to the customer. If there is no specific recognition, the policyholder may have to bear adverse consequences if a dispute arises.

Eleventh, limitations in regulations on general transaction conditions in the conclusion of insurance contracts. The absence of these provisions in the Law on Insurance Business leads to the following limitations: (i) the insurance sector itself in the field in which insurers regularly have programs to apply to customers who are policyholders in specific periods. Many promotions, incentives are announced to attract insurance buyers. Therefore, when customers decide to enter into insurance contracts, they can rely on these promotions and incentive programs; (ii) Lacking synchronization with the current Civil Code. In the 2015 BDLS, the general transaction conditions in entering into a contract are recorded in Article 406. In this law, the legislator recognizes the general trading conditions, the application effect and the requirements for the general trading conditions. The recognition of general trading conditions in the current context is inevitable when the market economy develops strongly. There are regularly announced product supply programs between goods suppliers and service providers. Public policies are the reason for attracting customers to come, and of course, if the contract is concluded, the published contents must be considered part of the contract content. That is the only way to ensure the interests of customers and guarantees from suppliers.

3.3. Specific recommendations to improve the law on insurance contracts towards the goal of sustainable development

Based on the limitations mentioned above, especially before the requirement to perfect the law to ensure the sustainable development of the insurance sector, the stability in the implementation of insurance contracts, the legal provisions on The contract is completed in the direction of ensuring the following requirements: First, ensuring the principles of the contract in general. The principle throughout the adjustment of a contract from the stage of establishment, performance to termination of the contract must be the principle: free will, voluntariness, respect for agreement[59]. When these principles apply throughout, they will directly govern the self-determination and voluntary rights of the parties from the negotiation stage, contract signing, contract performance (especially the right to amend, contract supplements) until contract termination (especially when you want to terminate the contract, cancel the contract unilaterally); Second, respect and ensure maximum freedom of agreement and free will of the subject parties. This content is an inevitable consequence of noting the principles as mentioned above. However, when included in the law, it must be concretized, such as the right to be offered to enter into a contract, adjust the proposal's contents to enter into a contract, and request a risk warning obligation to explain the agreement appropriately. The concretization of rights will be the legal basis for performing obligations to ensure the rights of the subject parties; Third, respect and ensure the confidentiality of information, personal secrets and family secrets of subjects. The recognition in 2013 amended and supplemented Constitution recognizes human rights, fundamental rights and obligations of citizens, and then basic personal rights in the 2015 Civil Code all show civil rights. Fundamental human rights must be recognized and guaranteed in any contract, including insurance contracts. Therefore, these rights must be recognized explicitly in the Law on Insurance Business to create a cross-cutting legal mechanism to ensure the implementation of the rights as mentioned above. In the current Law on Insurance Business, there may be provisions but not fully or not yet specified the number of fundamental rights such as the right to provide information, the right to warn risks from the insurer.

4. Discussion and Conclusion

The specific direction of completion of the contract provisions should be specified as follows:

[59] Nguyên tắc Pacta sunt Servanda được coi là nguyên tắc lâu đời trong pháp luật quốc tế. Nguyên tắc này thực chất là nguyên tắc dành cho pháp luật quốc tế trong đó bao hàm hai nội dung cơ bản: (i) các điều ước quốc tế có hiệu lực ràng buộc và (ii) các bên có nghĩa vụ phải thực thi các điều ước đó một cách thiện chí. Với nội hàm này có nguyên tắc thiện chí (good faith). Nhưng nguồn gốc của nguyên tắc này có từ thời Luật La Mã và nó chứa đựng nguyên tắc là “những điều ước giao ước thì cần phải được giữ”. Chính vì lẽ đó, khi áp vào hợp đồng, nếu các bên thống nhất giao kết hợp đồng thì phải có sự thiện chí, trung thực để thực hiện những gì mình cam kết. Từ đó dẫn đến hệ quả, nếu các bên không tôn trọng những điều ước của mình thì đương nhiên cũng phải gánh chịu các hậu quả nhất định (trách nhiệm pháp lý mang tính bất lợi) cho bên vi phạm. (Nguồn: https://iuscogens-vie.org/2018/09/09/96-nguyen-tac-pacta-sunt-servanda/, ngày truy cập 30/4/2021).

First, it is proposed to complete the definition of an insurance contract. Accordingly, the insurance contract needs to emphasize the rights and obligations that must be performed according to the legally enforceable contract content. Therefore, the definition of an insurance contract can be adjusted as follows: *An insurance contract is an agreement between an insurance buyer and an insurance enterprise, whereby the insurance buyer must pay a premium, and the insurance enterprise must pay insurance money. The insurer must pay the insurance premium to the beneficiary or indemnify the insured according to the legally enforceable contract*.

Second, to develop principles in the establishment, conclusion, performance and termination of insurance contracts. This principle should include the following specific principles: (i) The principle of absolute honesty. This principle is understood that all information must be provided fully and accurately based on the parties' request. This principle also includes the content of providing risk warnings from insurers or providing information related to difficulties in contract performance. In English, this principle is known as "Utmost Good Faith" and is commonly prescribed in the insurance industry. This principle emphasizes aspects such as the insurance enterprise must be honest, disclose the signed insurance contract, and the insurance buyer must declare the risk to calculate the appropriate premium[60]; (ii) The principle of insurable interest. The insurance buyer must always be the one with the insured interest for avoiding insurance profiteering. This principle is always insured. There must be a close financial relationship between the insured and the insured, and this relationship must be recognized by law; (iii) Compensation principles [61] means restoring the original financial status of the participant/insured as before the damage occurred. The insurer can apply compensation forms such as repair, replace, restore or even pay with cash. Of course, in this principle, the insurer limits the insurance amount based on the premium paid by the buyer; (iv) Nguyên tắc thế quyền[62] The principle of subrogation means that the insurer has the right to claim against a third party after completing the indemnification for the insured if this third party is the person responsible for indemnification; (v) The principle of direct cause means that the insured event must be the direct cause of the damage, occur in practice and be the direct cause of the insurable damage[63].

Third, the content of the insurance contract needs to be completed in a specific direction: (i) put the clause "the parties agree on the contract's content" as the first clause of

62 Thanh Tùng, Nguyên tắc thế quyền (principle of subrogation) trong bảo hiểm là gì, tại đường link: https://vietnambiz.vn/nguyen-tac-the-quyen-principle-of-subrogation-trong-bao-hiem-la-gi-20191128164945482.htm, truy cập ngày 15/5/2021.

63 Bài tham khảo "6 nguyên tắc bảo hiểm không phải ai cũng biết" đăng trên đường link: https://thebank.vn/blog/17832-6-nguyen-tac-bao-hiem-khong-phai-ai-cung-biet.html, truy cập ngày 15/5/2021

the Article of "insurance contract content"; (ii) add the value of the insured property to point b, clause 2 of the Law, next to the insured object; (iii) supplementing the effective date of the insurance contract; (iv) change the term from dispute settlement provisions to "dispute settlement method"; and (vi) Add provisions on liability for breach of contract. When the provisions on contract content follow this direction, it will ensure orientation for the parties to negotiate and draft contracts. Insurers, when drafting a model contract, must also comply with these primary contents. The insurance buyer also relies on the provisions of the law to review the model contract offered by the insurer.

Fourth, propose to improve the form of insurance contracts. Regulations on this issue should be completed in the following way: It is unnecessary to prescribe the mandatory form for insurance contracts. The 2015 Civil Code itself also removes the provisions on the form of contracts and provides separate provisions for separate contracts if necessary. Therefore, even in insurance contracts, if any contract is significant and necessary, such as a contract with human subjects, a property insurance contract should be mandatory for the form. A civil liability contract is not necessary or reserved only for specific categories in this group.

Fifth, perfect the regulations on the time of signing and the adequate time of the insurance contract. The Law on Insurance Business needs to stipulate the time of entering into the contract and the adequate time of the insurance contract. Construction content should ensure consistency with the provisions of the Civil Code 2015 and the unique nature of the insurance sector. It concludes: (i) The date of signing should be recorded as the time when the last party signs the contract. In a separate case, where the buyer has an insurance application, the time of signing is when the insurance enterprise accepts this application; (ii) The effective date of the insurance contract. This time should be the time of signing unless otherwise agreed by the parties or provided for by law. When the insurance liability arises, the insurance buyer fulfils the obligation to pay the premium unless otherwise agreed by the parties..

The specific recording of the time of signing and the effective date of the insurance contract will make it easier for the parties to enter into the contract. Moreover, it will also create a legal basis for dispute resolution on this issue if it is recognised.

Sixth, recommendations to improve the regulations on the obligation to provide information of the insurance buyer and the responsibility for breach of the obligation to provide information. The Law on Insurance Business needs to supplement the obligation to provide information and liability due to a breach of the obligation to provide information. This completion focuses on the following aspects: (i) The name of the article is "*the obligation to provide information and the responsibility for breach of the insurance buyer's obligation to provide information*" to ensure the complete and correct regulation.; (ii) The insurance buyer's obligation to provide information should emphasize the following issues: One, confirming the insurance buyer's obligation to provide information is mandatory; Second, the principle of providing the information is entirely truthful and complete, especially information that may affect the process of insurance contract performance.; (iii)

Particular requirements on the provision of information by the insurer to the insurance buyer such as the form of request, settlement of legal consequences if the provision is incomplete or not provided or the information is not provided correctly. believe (false information).

Seventh, a proposal to improve the insurance company's obligation to provide information and the responsibility for breaching the obligation to provide information. Similar to the sixth recommendation, with this content, provisions of the Law on Insurance Business need to focus on the following aspects:: (i) The name of the article must be adjusted to its true nature is entitled "*obligation to provide information and responsibility for breach of the obligation to provide insurers' information*". Lawmakers must separate the statutory obligation to provide information and the responsibility due to the breach of the obligation to this subject; (ii) fundamental issues for insurers in providing information such as requirements for information disclosure, terms of their insurance services, explanation of contents not yet understood by the insurance buyer or do not understand; (iii) obligation to warn of possible risks based on experience in providing insurance services.

Eighth, it is recommended to improve regulations on the interpretation of insurance contracts. This regulation needs to be completed with the following aspects: (i) We must develop principles for interpreting insurance contracts comprehensively, especially ensuring a consistent relationship with the logic in the current Civil Code.; (ii) We must see the special in explaining the insurance contract because this is a model contract given by the insurer to the insurance buyer. Therefore, the information asymmetry between the two parties certainly exists. Therefore, there must be a priority for the insurance buyer; (iii) The insurance industry has the peculiarity of being long-standing and having many customs, so it is necessary to consider custom as a source to explain and explain disputes in terms and contents of insurance contracts.

Ninth, we complete regulations on the statute of limitations for initiating lawsuits on insurance contracts. The Law on Insurance Business should be completed in a way that is consistent with the current 2015 Civil Code. Accordingly, the law should record a statute of limitations of 3 years from when the subjects know their legitimate rights and interests have been infringed to initiate a lawsuit to a competent Court to request settlement. The statute of limitations of 3 years from the time the dispute arises is no longer appropriate.

Tenth, to complete regulations on insurance contracts according to the form. If the Law on Insurance Business does not record a model contract for the insurance sector, there will be no legal basis to regulate this issue. Model insurance contract can be recorded with the following contents: (i) The name of the article is “model insurance contract”; (ii) To develop the concept of "model insurance contract" to identify this type of contract. The model insurance contract is understood as a contract containing terms and conditions set forth by the insurance enterprise for the insurance buyer to reply and accept the contract within a certain period. If the insurance buyer replies that he accepts the conclusion of the contract, the insurance contract shall be concluded according to the entire contents set forth by the insurance enterprise.; (iii)

To develop principles applicable to model insurance contracts, especially the principle of publicity. The insurance enterprise must disclose the insurance contract to the insurance buyer. The insurance enterprise is obliged to clearly explain the insurance contract's content to the insurance buyer.; (iv) The insurance enterprise must register the insurance contract according to the form according to the order and publicity. An insurance enterprise must formulate the contents of an insurance contract and register it at a competent state agency by the order, procedures and publicity; and (v) If an insurance contract contains a clause that exempts the insurer from liability, grants liability or removes legitimate interests of the insurance buyer, this provision shall not take effect unless otherwise agreed by the parties.

Eleventh, to complete regulations on general transaction conditions in the conclusion of insurance contracts. The insurance sector needs to be aware of the general transaction conditions in the conclusion of an insurance contract. Regulation on this issue should focus on the following aspects: (i) The article's name needs to be affirmed as "general transaction conditions in entering into insurance contracts" to be consistent with the Law on Insurance Business and have different regulations suitable for the insurance field; (ii) To regulate on identifying characteristics of general transaction conditions in the conclusion of insurance contracts. These conditions must include publicity, transparency, terms containing the rights and obligations of the parties if entering into an insurance contract.

Completing the regulations on insurance contracts in the Law on Insurance Business will be one of the prerequisites that directly affect the stable development of the insurance industry and insurance business. Therefore, this is considered an essential fundamental task for Vietnamese legislators in the current period.

MULTI-TIERED SOCIAL INSURANCE MODEL - ISSUES RAISED IN THE REFORM OF SOCIAL INSURANCE POLICIES

PhD. Phan Anh Tuan

phananhtuan@neu.edu.vn

MSc. Dang Thi Minh Thuy

thuydm@neu.edu.vn

Faculty of Insurance, National Economics University, Ha Noi, VietNam

Abstract

The article studies the current situation of Vietnam social insurance system, also the challenges and requirements for reforming the social insurance system towards the goal of social security for the entire population. On that basis, the article recommends converting from a multi-pillared social insurance model to a multi-tiered pension insurance model: the first tier focuses on expanding the participants to informal workers, farmers, people outside labour force who do not have regular income; the second tier is compulsory social insurance which applies to employees with labor contracts; the third tier is voluntary social insurance which is applicable to specific occupations, high-income workers, and voluntary contributions to get increased pension benefits.

Keywords: *Multi-pillared Social Insurance, Multi-tier Pension Insurance, Social security*

1. Introduction

The current social insurance system in Vietnam is formed under the model of "multi-pillared social insurance system". The design of the multi-pillar system has played a role in promoting the participation of formal groups in social insurance. However, the main limitation of this model is that it excludes a singnificant number of rural and informal workers who do not participate in voluntary social insurance. Thus the goal of ensuring income and stabilizing living standard for these groups still faces many difficulties, then affecting the goal of ensuring social security for the entire population.

In that context, Vietnam government is orienting to build a multi-tier social insurance model to replace the multi-pillared social insurance model.

In the Resolution No. 28-NQ/TW issued by the 7th plenum of the 12th Party Central Committee on reforming social insurance policies, it also clearly stated the viewpoints and goals are "Developing a flexible, diversified, multi-tiered social insurance system …" So, what is multi-tiered social insurance? What tiers does this model include? What are the principles and conditions required to build a multi-tiered social insurance model?

The article studies the limitations of the multi-pillared social insurance model, simultaneously based on the experience of implementing multi-tiered social insurance in order to propose orientations, model suggestions and conditions for forming multi-tiered social insurance system in Vietnam. When studying the social insurance model, the most important regime which accounts for the largest proportion and has considerable influence on social insurance is the pension scheme, therefore, the article focuses on studying the multi-tiered pension insurance model.

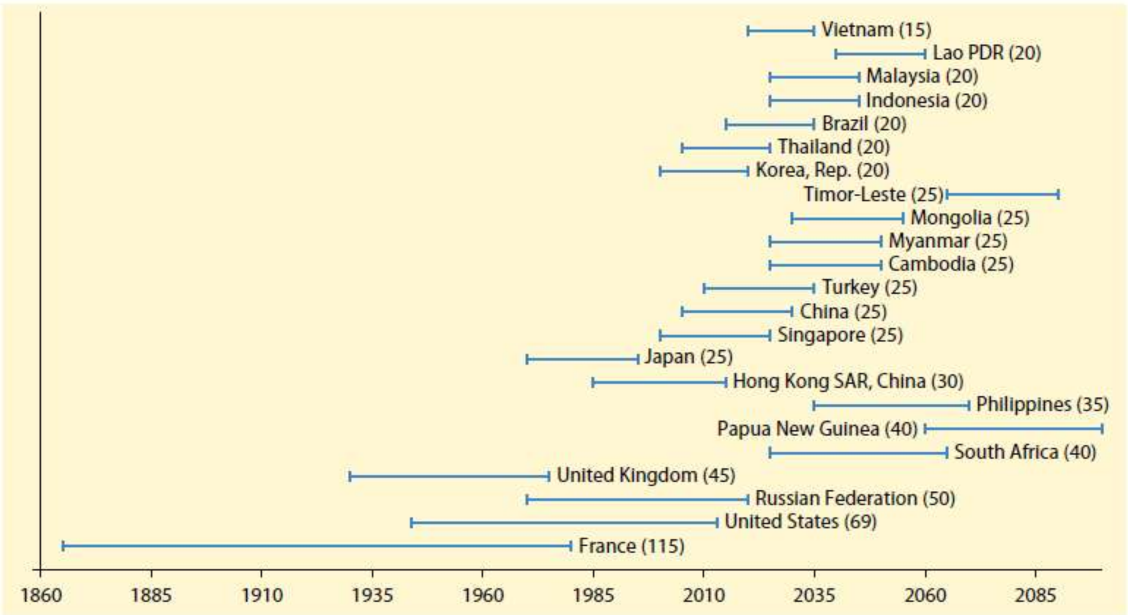
2. Content

2.1. Limiations of multil – pillared social insurance system in Vietnam

The current social insurance system in Vietnam is built based on the model of "Multi-pillared social insurance", including (1) Social allowance for the elderly (Pillar 2), (2) Compulsory social insurance including pension and free health insurance card for pensioners (Pillar 1 and Pillar 4) and (3) Voluntary supplementary retirement insurance/ voluntary retirement Insurance (Pillar 3). Under this model, Vietnam's social insurance is facing a number of challenges, such as:

Rapid population aging: Vietnam is entering a period of rapid population restructuring and has a very fast aging rate when comparing to other countries. Specifically, the time required to move from the "aging phase" to the "aged phase" is much shorter in Vietnam than in other countries. For this change, Vietnam will need only 18 years, while France needs 115 years, the US needs 69 years, Japan and China need 26 years (WB, 2015). In 2015, the ratio of working age population (15-59 years old) to the elderly (over 60 years old) was 6.6:1, then it is forecasted that by 2055, this ratio will be 2.1:1. This movement becomes a challenge for Vietnam and certainly requires significant adjustment of the pension system.

Years to move from 7 to 14 percent population share 65 years and older and the start and end years of transition



Sources: World Bank estimates based on data from UN 2013 and Kinsella and He 2009.
Note: Figure shows starting and ending year for transition from 7 percent (aging) to 14 percent (aged) of population ages 65 and older. Aging and aged thresholds are based on United Nations definitions. East Asia and Pacific economies rounded to five-year increments.

Figure 1. Population aging rate in Vietnam

Demographic trends require expanding retirement coverage: Increasing life expectancy and falling birth rates will increase the number of older people who need adequate protection in old age. The risks of the working-age population are "stuck" between caring for their children and their parents, also facing the increasing financial burden of caring for three generations: their children, themselves, and their parents. This burden is exacerbated because there are fewer people of working age and fewer siblings to share the growing burden of caring for aging parents.

Coverage expansion remains challenging: Despite expanding legal coverage (from January 1, 2018, all workers with a contract of 1 month or more are required to register in the social insurance system, including migrant workers in Vietnam), the number of pensioners is still low. In 2017, only 25.1% of workforce paid social insurance contributions; and about 8.3 million of the 10.1 million elderlies were not entitled to a pension in, accounting for 83% of the total population who are over 60 years old. (ILO, 2018b).

The voluntary pension scheme has worked ineffectively in closing the coverage gap. The voluntary social insurance system aims to attract workers who are not required to participate, but so far this mechanism has only reached about 270,000 people in 2015 - equivalent to about 1.3% of 53,673 thousand labor force (ILO, 2018b). The experience of Vietnam as well as other countries shows the limited effectiveness of voluntary mechanisms in expanding coverage because these programs reach only a small number of workers.

A small number of elderly people are getting low pension benefits from tax source. The subsidy is currently at 5.6% of GDP per capita and among the lowest compared to other middle-income countries. The low benefit may explain the high poverty rate of people over 80 years old even when they are entitled to social pension. Furthermore, only 95,000 people aged 60-70 who live in poor households without supporters are getting pension benefit at 405,000 VND/month (Kidd et al., 2016).

The increase in participants with lump- sum withdrawal affects negatively on the expansion of social insurance coverage. Those who stop paying social insurance contributions for a period of at least one year and have not reached 20 years of contribution are allowed to withdraw. However, a lump –sum withdrawal will affect the old age income security. The number of these participants is approximately 500,000 people per year, and this number is relatively high compared to the number of people receiving monthly pension. Additionally, most young workers tend to receive lump-sum payment, thus it will impact heavily on their old-age income security.

2.2. Multil – pillared social insurance model

In order to deal with the coverage challenges, the Vietnam Government aims to gradually close the coverage gap by combining contributors and non-contributors in multi-tiered social insurance system. The solution is developing a mechanism based on the principle of pension verification to cover all elderly who are not currently receiving pensions from the contribution system. These reforming measures demonstrate Government's strong commitment to universal social security, linked to a number of key values in line with ILO Social Security’s Conventions and Recommendations.

Currently, there is no unified concept of multi-tiered social insurance. Many countries have pursued an expanded coverage approach based on a multi-tiered pension system that typically includes a tax-funded pension tier, an income-based compulsory pension tier and an additional pension tier.

The first tier of the system is usually supported by the Government from public revenue sources to ensure basic old-age security for citizens. This approach has been proven to be one of the most effective ways to expand coverage in the short and medium term, including for those who have not accumulated a sufficient number of years of contributions or who have made no contributions at all. The 2nd tier is a defined – benefit mechanism (DB) that gets financial resources from pay as you go (PAYGO) or partial funding, similar to the current system of Vietnam Social Security. Finally, Tier 3 is usually the supplementary pension, with defined - contribution (DC) which allows people to get higher retirement rates.

Tier 1: Retirement benefits are taken from tax sources

Tier 1 aims to ensure everyone with a minimum income in retirement through a pension derived from tax sources. This is fully consistent with the ILO Social Protection Floor Recommendations. This benefit is particularly relevant for those who have little or no ability to contribute to pension scheme while working, including those with low and irregular incomes, informal and agricultural workers. Each country can choose to design its policy under the following three models: (1) Basic pension, (2) Social pension based on income verification or (3) Minimum pension.

Resolution 28-NQ/TW of Government dated issue 25/03/2018 stated that by expanding coverage, all people who do not receive a social pension will get a tax-funded retirement. It also sets targets to increase coverage by the years 2021, 2025 and 2030, where 45%, 55% and 65% of people above the normal retirement age are entitled to pension scheme, monthly social insurance and social allowance , respectively.

Tier 2: *Compulsory social insurance.*

The tax-funded program (tier 1) is aimed at poverty reduction and redistribution of the pension system, but it lacks the function of stabilizing income. The compulsory pension scheme (tier 2) is sourced from contributory sources to ensure adequate benefits for a large segment of workers, including the middle class. According to ILO standards, this tier must be designed in the form of defined - benefit (DB) managed by the state. Convention No. 102 sets a minimum replacement rate of 40% of lifetime income (after 30 years of contributions) along with Tier 1. ILO's Convention No. 128 sets higher standards that requiring a periodical payment, corresponding to at least 45% of the reference wage.

Tier 3: *Additional Private Retirement*

The occupational pension or other voluntary private pension that constitutes Tier 3 has a limited role in Asian countries as only a small number of people are able to contribute. These individual retirement plans provide a supplementary superannuation in addition to the compulsory retirement for those who want a higher rate of pension.

3. Results

Under the above model, there is a multi-tiered pension system in Vietnam, specifically:

- Tier 1: Social pension is based on income verification. Particularly, Decree No. 136 /2013/ND-CP is about social allowance policy for the elderly (aged 80+/60+ and the poor/60+ and disabled person). Furthermore, it is possible to add a monthly preferential allowance for people who are credited with meritorious services to the revolution.

- Tier 2: Compulsory social insurance implemented by Vietnam Social Security. Currently, there are about 14.5 million people participating in compulsory social insurance. About 1.7 million people are receiving monthly pension and social insurance from the social insurance fund and 1.3 million people are receiving monthly pension and social insurance from the state budget (retired before 1995).

- Tier 3 includes: (1) Supplemental retirement insurance according to Decree No. 88/2016/ND-CP issued by Ministry of Finance. However, it currently has not attracted participants. (2) Voluntary retirement insurance products according to Circular No. 115/2013/TT-BTC and Circular No. 150/TT-BTC issued by Ministry of Finance.

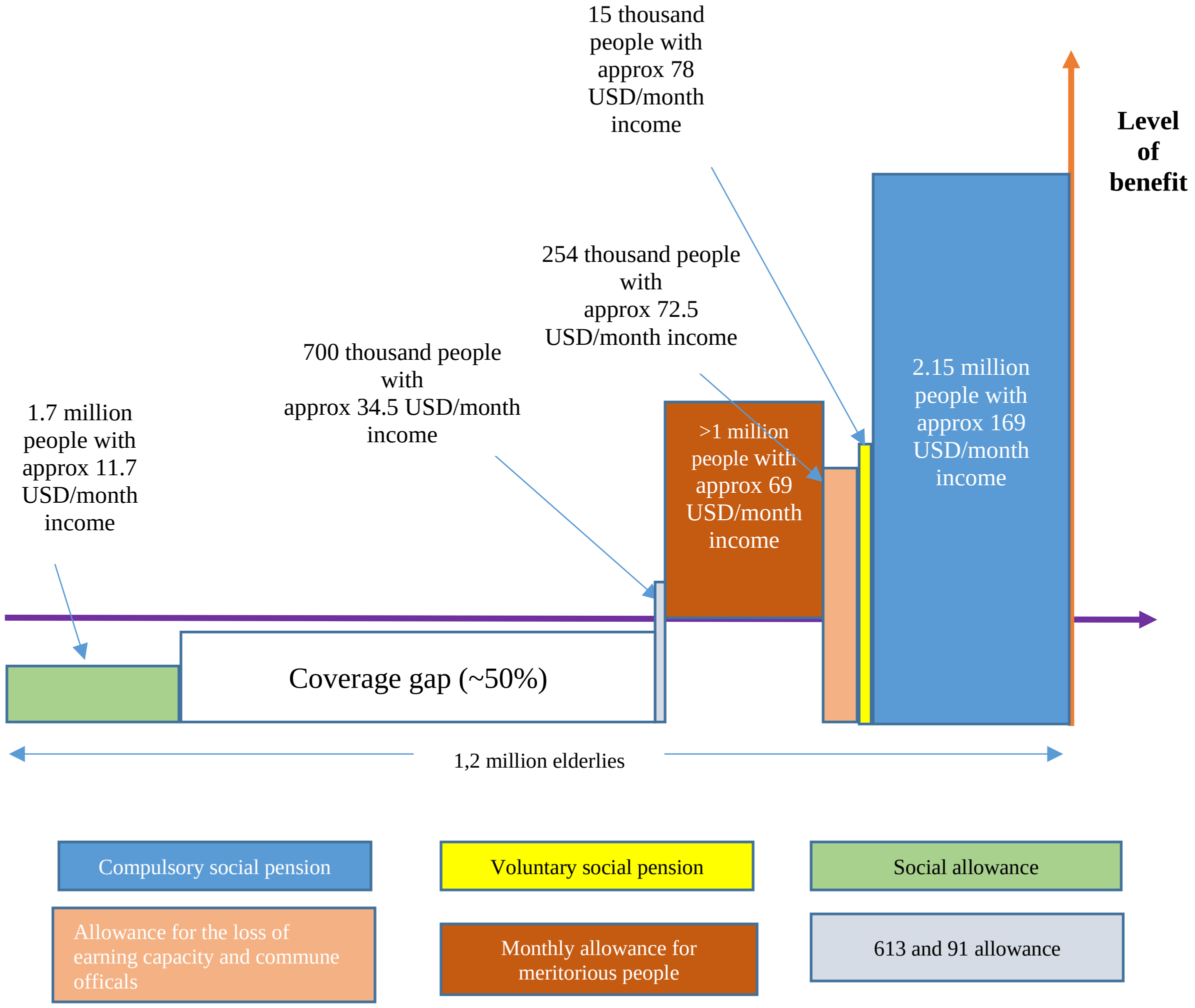


Figure 2: Rate of elderly receiving pensions

Presently, only about 47% of elderly have monthly pensions, social insurance, social allowances and preferential allowances for those with meritorious services.

In order to set up a multi-tiered model for Vietnam social insurance which contains different methods dealing with risks and resources needed to ensure people's health and income.

It can be divided into three groups: children, the workforce and the elderly from a demographic perspective. In which, the labor force is the force that creates material wealth, mainly contributes resources (both taxes and social insurance contributions) to ensure social security for themselves (illness, maternity, unemployment, occupational accidents - occupational diseases), as well as for their children (nutrition, education, medical care...) and their parents (income, medical care). Thus, the system should encourage employees to improve labor productivity, actively contribute to social insurance and savings to take care of their old age; encourage the elderly to partially participate in the production process with suitable jobs to generate additional income; creating conditions for children to have good nutrition, good medical care, good education and training.

Social security policies should be formed under a general and human-centered design. Social security policies should be diverse but not overlapping. Social security policy is designed based on the risks that each person may face. In order to help people overcome their life risks, only one social security policy (single tier) or multiple social security policies (multi - tier) may be needed. For example, an elderly person can have 3 sources of pension: (i) social protection allowance; (ii) social insurance pension and (iii) supplementary pension/ pension from voluntary retirement schemes. A woman giving birth can receive two financial sources: (i) the maternity benefit of the compulsory social insurance and (ii) the payment when giving birth from a life insurance product. A sick worker migh be paid (i) medical expenses from the health insurance fund and (ii) sick benefits from the social insurance fund.

4. Discussion and Conclussion

In the future, social insurance policy should be designed to reach 100% of elderly people having a pension with the following notes:

- Formalizing informal jobs to increase the percentage of employees participating in social insurance, thereby increasing the number of elderly people receiving social insurance pensions (tier 2). The minimum contribution conditions to receive monthly pensions should be reduced to 10-15 years instead of the current 20 years (Korea 10 years, Indonesia 15 years) to encourage employees to join, lower lump-sum withdrawal.

- Encouraging people to participate in other types of insurance in tier 3 so they can also get an additional (higher) pension benefits in.

- Gradually lowering the age of receiving pension allowance from 80 to retirement age according to the labor law and the law on social insurance (65 years old), thus, hose who have no opportunity or cannot participate in social insurance will be supported with basic/minimum pension.

- Separating the contributions of employees and employers into 2 funds. The employer's contribution (14%) is formed into the Paygo-DB fund, which is a risk-sharing fund that demonstrates the nature of insurance. The purpose is promoting employees with monthly pensions, so it is not allowed for employees to withdraw lump-sum pensions, and shortening the period for minimum pension payment to 15 years, then 10 years.

The employee's contribution (8%) should be put into an account and managed under the DC fund. This is not a risk-sharing fund but only for the savings of the employees. If employees pay more, they will benefit more and vice versa

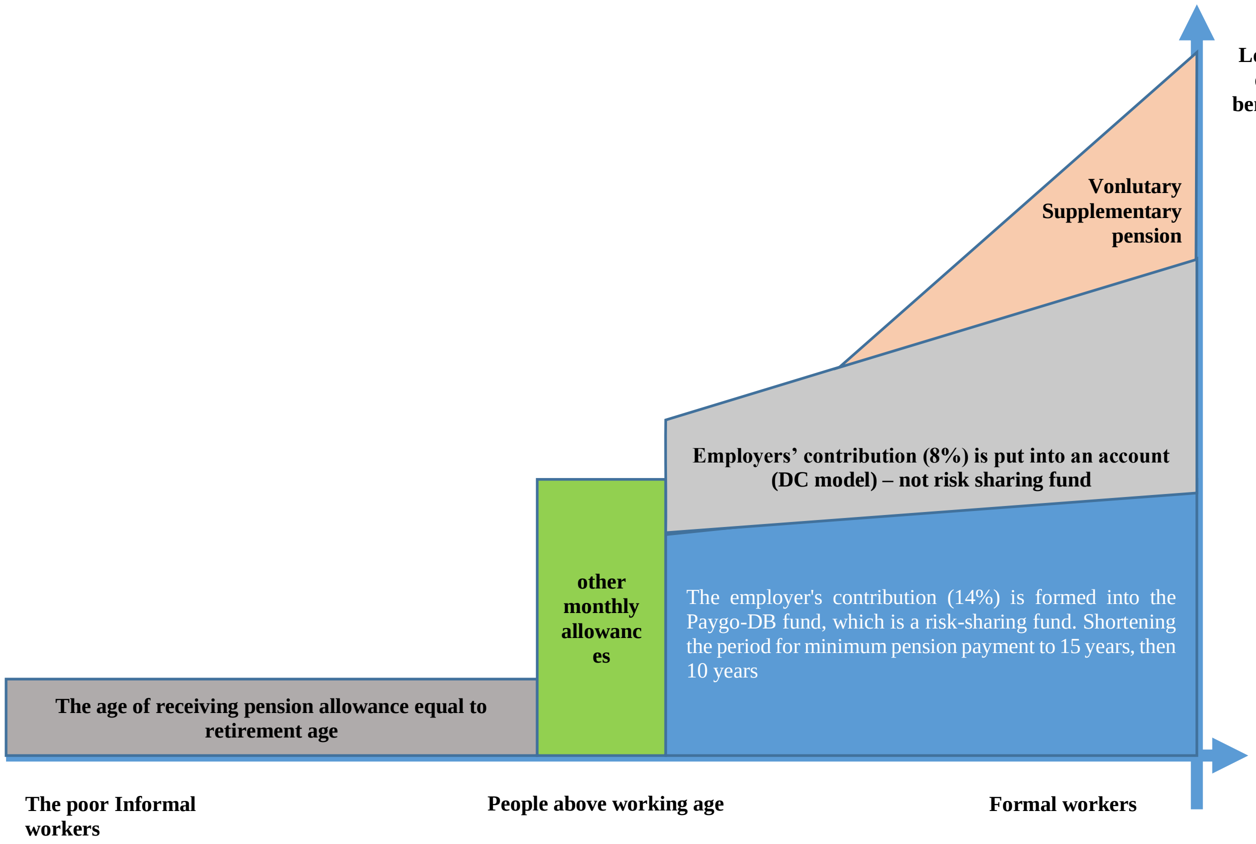

Figure 3: Multi – tiered pension model in Vietnam

The employer's contribution (14%) is formed into the Paygo-DB fund, which is a risk-sharing fund. Shortening the period for minimum pension payment to 15 years, then 10 years

SESSION 7:

SOCIAL AND HUMANITIES ISSUES

FACTORS AFFECTING TO WORK MOTIVATION OF ENGLISH LECTURERS IN FACULTY OF FOREIGN LANGUAGES AT NATIONAL ECONOMICS UNIVERSITY, HANOI, VIETNAM

Dr. Pham Thi Thanh Thuy

thuyptt@neu.edu.vn

National Economics University, Hanoi, Vietnam

Abtract:

From the fact that there is a decrease in labor motivation among English lecturers at a non-language major university - National Economics University (NEU), the author has studied some factors affecting to their labor motivation. through conducting exploratory research with the aim of (i) narrowing and clearly identifying the motivating factors for English teachers in the Faculty of Foreign Languages, NEU, and (ii) exploring responses, attitudes, opinions of officials, managers, as well as experts on research issues and questions, for timely adjusting before conducting official research. From the research model with 7 main groups of factors, 43 explanatory and dependent variables, the author has used a technique to remove the variables that increase Cronbach Alpha value. On the basis of the exploratory factors analysis (EFA) for the independent and dependent variables, the author has compiled research results from all English teachers (58 people) who are teaching in the Faculty of Foreign Languages. - NEU and interviewed some experts in the field of human resources, to draw out 9 specific factors that affect the labor motivation of English language teachers. Stemming from these 9 specific factors, the author proposes groups of specific solutions to increase labor motivation for English lecturers of the Faculty of Foreign Languages in Economics - National Economics University.

Keyword: *Motivation; Motivating Factors; English Lecturers*

1. Introduction

Recently the National Economics University (NEU) in general and the faculty of foreign languages in particular has been facing a problem of reducing number of English classes. This reduction de-motivates English lecturers in the faculty of foreign languages much because it directly affects income of these teachers who also have to complete appropriate number of teaching hours according to the requirements of the university. Besides, in a non-language environment, the faculty of foreign languages is likely considered a minor faculty and rarely receives priorities from the Board of the university presidents. These changes and reality have affected to mental attitude and motivation of English lecturers in the faculty of foreign languages.

The study aims at finding out alternatives, current job motivation of teaching staff in the faculty of foreign languages, National Economics University in a difficult context when number of classes is reduced and a lot of English lecturers are in danger of lacking their teaching position; assessing factors affecting to motivations of English lecturers in the faculty; providing some recommendations to maintain motivations of these English lecturers. Population of this study includes all the teachers of Faculty of foreign languages-National Economics University, Hanoi, Vietnam.

2. Method

In this study, it is because there are so many factors affecting to motivation of employees that the researcher decides to conduct exploratory study with aims to (i) narrow and identify clearly factors motivating English lectures in the Faculty of Foreign languages, NEU, and (ii) (2) explore reactions, attitudes and opinions of officers, managers, expert about the issues, research questions, in order to adjust timely before conducting official study. After that, the author has given a research model that predicts the work motivation of lecturers of Faculty of Foreign Languages - NEU below.

Also through the previous research, the writer has hypothesized that the motivation of English teachers in the NEU Faculty of Foreign Languages - NEU could be influenced by 7 groups of factors: Motivation of English teachers in the Faculty of foreign languages can be hypothetically affected by 7 factors: Fully Recognized through Completed Tasks (FRCT); Income (INCO); Stable and Permanent Job (SAPJ); Independence in Work (INIW); Environment and Working Conditions (EAWC); Flexible and Sensitive Discipline Handling (FSDH) and Supports from the University Management Board (SUMB)

3. Results

3.1. Benefits of motivation

The concept of motivation is situational and its level varies between different individuals and at different times. If the people understand what motivates them, the people have at their command the most powerful tool for dealing with them. According to Higgins (1994), motivation is a psychological process that orients individuals to act for certain purposes. Sharing the same opinion, Bernard (1997) thinks that motivation comes from inside individuals to meet his/her needs and it forces him/her to take efforts, be ready to achieve the targets with own desire.

To be able to create the motivation for employees, it is needed to learn need systems and working force of staffs to help them achieve what they desire with an aim to promote their employees to take effort and achieve main objectives of both employees and organization. According to Cook (1991), there are three main groups of staff motivation including income motivation; Objective achieving personal development; and Objective satisfying social activities.

Like other working staff, teachers need to be motivated. Teachers' motivation is similar to teachers' attitude to participate in their teaching processes within the education environment. Motivation can underlie their involvement or noninvolvement in academic and non-academic activities in their university. An essential factor in an academic environment is creativity which can be created through motivation methods. If a teacher experiences the classroom as a safe, healthy, happy place with supportive resources and facilities for teaching for optimal learning, he/she tends to participate more than expected in the process of management, administration and the overall improvement of the university. The teacher commands and transmits the image of one who improves knowledge and the physical conditions of the classroom through orderliness, discipline and control.

3.2. Factors affecting to motivation of teaching staffs

There are many factors affecting to staff motivation. The following table illustrates factors affecting to motivation of teaching staff which is summarized by the writer.

Table 1. Summary of factors affecting to motivation of English lecturers in the Faculty of foreign languages

No	Factors affecting to motivation of teaching staffs	Researchers
1.	Interesting work/ tasks	Edwin Locke (1968) and Kenneth A. Kovach (1999)
2.	Fully recognized through completed tasks	
3.	High salary	
4.	Independence in work	
5.	Stable and permanent job	
6.	Promotion and professional development	
7.	Good working condition	
8.	The friendly relationship of the management board with teaching staffs	
9.	Flexible and sensitive discipline handling	
10.	Supports from the University Management Board	
11.	The increasing diversity and importance of the teaching tasks	Hackman and Oldham (2005)
12.	Changing teaching tasks into opportunities for employees	
13.	Empower/ Giving autonomy to the teaching staffs	
14.	Quick, direct and timely feedback mechanism	

No	Factors affecting to motivation of teaching staffs	Researchers
15.	The fairness	Stacy J. A. (1963)
16.	Attraction (Award)	Vroom, V. H. (1995)
17.	Expectation (task realization)	
18.	Means (belief)	
19.	Bonus and welfare	Nguyễn Thị Hương (2015)
20.	Infrastructure and working conditions	Nguyễn Thị Hương (2015)

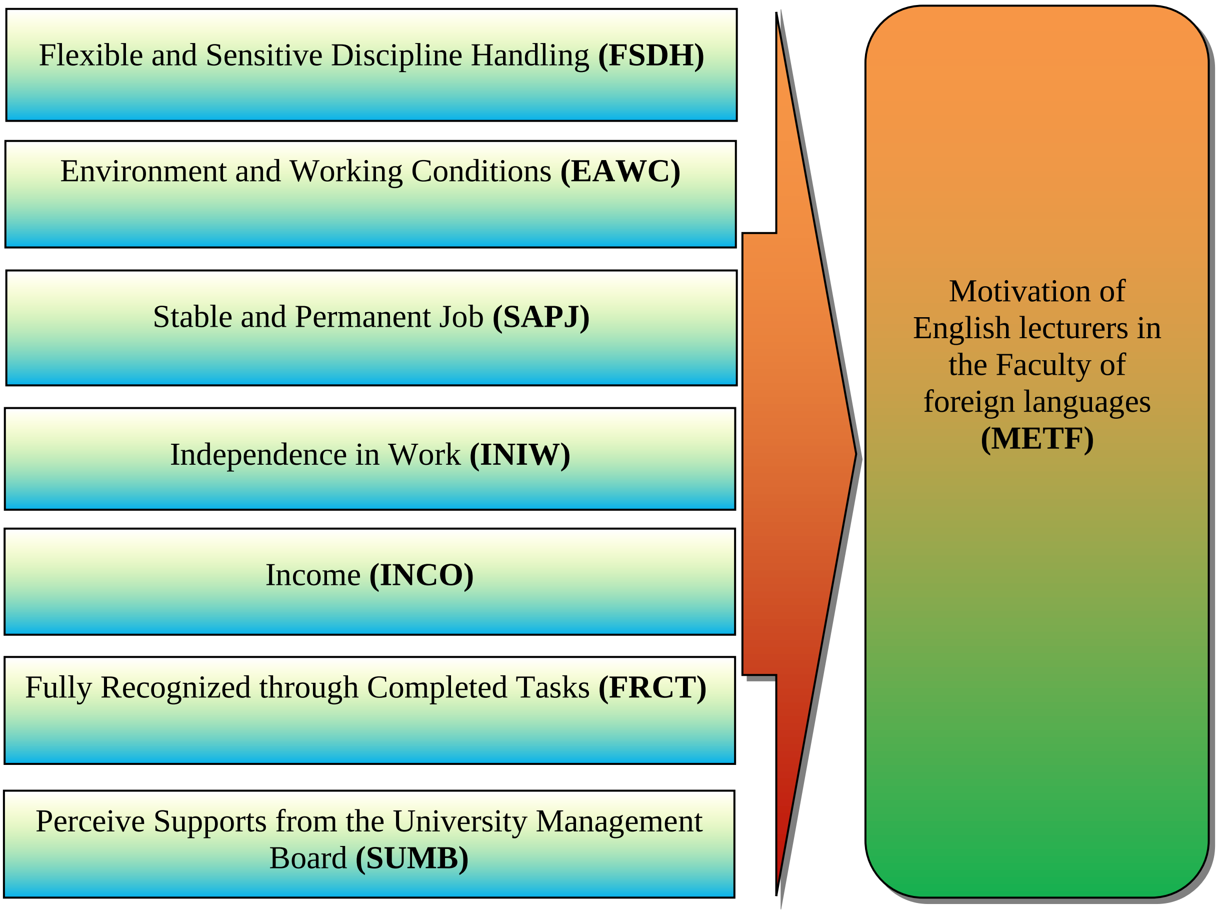
23.	Responsibility	
24.	Advancement	
25.	Expecting growth	
26.	The monitoring inappropriate tasks	
27.	Out of expectations working conditions for teaching staff	
28.	Relationship with troublesome colleagues	
29.	Un-expectation in relationship between the superior and inferior	
30.	The appropriateness with teaching work	The hypothesis of the author
31.	Desire	

Source: Summary of the author

From the previous research, the author comes up with a predictable model for the research about motivation for lecturers of Faculty of Foreign Languages- NEU as follow.

Figure 1: Predictable model for researching motivations of lecturers in faculty of foreign languages in NEU



Source: Summary from the previous researchers

The writer hypothesizes that motivation of English lecturers in the Faculty of foreign languages can be affected by 7 following factors: Fully Recognized through Completed Tasks **(FRCT);** Income (**INCO);** Stable and Permanent Job **(SAPJ);** Independence in Work **(INAW);** Environment and Working Conditions **(EAWC);** Flexible and Sensitive Discipline Handling **(FSDH)** and Supports from the University Management Board **(SUMB).**

4. Discussion and Conclusion

4.1. Discussion

To examine the scale reliability, variables have been designed and surveyed. Cronbach Alpha coefficients have been used. The author has analyzed the scale reliability for the independent and dependent variables which were assumed. These include:

- Fully recognized for completed tasks (FRCT): includes 4 explanatory variables (FRCTi = 1-4)
- Income: includes 4 explanatory variables (INCOi = 1-4)

- Stable and Permanent Job (SAPJ): includes 4 explanatory variables (SAPJi = 1-4)
- Independent in work (INAW): includes 5 explanatory variables (INAWi = 1-5)
- Environment and working conditions (EAWC): includes 11 explanatory variables (EAWCi = 1-11)
- Flexibility and Sensitive Discipline Handling (FSDH): includes 6 explanatory variables (FSDHi = 1-6)
- Perceive Support from the University Management Board (SUMB): includes 5 explanatory variables (SUMBi = 1-5)
- Motivation for English lecturers in Faculty of Foreign Languages (METF): includes 4 dependent variables (METFi = 1-4)

The following table presents the calculation coefficient Alpha Cronbach for dependent and independent variables.

Table 2: Cronbach's Alpha summary

Variables	**Cronbach's Alpha**	**Cronbach's Alpha Based on Standardized Items**	**Variables**	**Cronbach's Alpha**	**Cronbach's Alpha Based on Standardized Items**
FRCT	0.671	0.683	FSDH	0.698	0.698
TNNH	0.743	0.747	EAWC	0.896	0.896
SAPJ	0.801	0.802	SUMB	0.713	0.708
INAW	0.868	0.869	METF	0.994	0.994

Detailed results from the above table show that the majority of these variables meet the conditions of Cronbach Alpha values> 0.7 and will be selected; At the same time, the author also uses the technique to eliminate variables increase Cronbach Alpha value.

Table 3: Results calculated reliability of scales

	Scales	**Cronbach Alpha**	**Types of Variables**	**Cronbach Alpha after rejecting variables**	**Notes**
01	Fully recognized for completed tasks (FRCT)	0.671	FRCT2	0.709	Reject FRCT2 to get Cronbach Alpha > 0.7
02	Income (INCO)	0.743			No rejection
03	Stable and Permanent Job (SAPJ)	0.801			No rejection

04	Independent in work (INAW)	0.868			No rejection
05	Environment and working conditions (EAWC)	0.896			No rejection
06	Flexibility and Sensitive Discipline Handling (FSDH)	0.698	FSDH4	0.769	Reject FSDH4 to get Cronbach Alpha > 0.7
07	Perceive Support from the University Management Board (SUMB)	0.713			No rejection
08	Motivation for English lecturers in Faculty of Foreign Languages (METF)	0.994			No rejection

Source: Results from author research

From the original assumption of 43 explanatory variables and dependencies, analytical results of scale reliability are down 2 explanatory variables (FRCT2 and INAW4) which are not appropriate in terms of statistical value. The remaining variables (41 variables) totally meet the conditions for the reliability of the scale and are continued to be used in the study.

Based on the analysis of the exploratory factors for independent and dependent variables, the author has summarized the research results from 58 sample surveys and a model studying factors affecting to motivation for English lecturers as follows:

Table 4: Factors affecting to motivation of English lecturers in Faculty of Foreign Languages

	Factors	**Explanation**	**Variable**
1.	**Factor 1**: EAWC8, EAWC10, EAWC9, EAWC1, EAWC2, SAPJ2 ➔ ***Teaching environment***	The university/ faculty has a safe and clean teaching environment	MTLV8
2.		The university/ faculty always have tactical way to behave and treat teaching staffs	EAWC10
3.		There are available convenient teaching facilities and office facilities for English lecturers	EAWC9
4.		The university/ Faculty has friendly teaching environment	EAWC1
5.		The university/ faculty has a good foundation values, philosophy, culture,	EAWC2

	Factors	Explanation	Variable
6.	***and social welfare*** Expectation "+"	The university/ faculty always fully has welfare benefits such as social insurance, health insurance, vacation for English lecturers.	SAPJ2
7.	**Factor 2:** EAWC6, EAWC7, EAWC5, EAWC3, EAWC4 ➔ ***Close relationship and internal strength of the university/ faculty*** Expectation "+"	Communication and relationship between departments in the university/ faculty are good	EAWC6
8.		The faculty always encourages all teaching staffs to exchange information, communication, strengthen their relationship.	EAWC7
9.		The faculty has reasonable, understandable and timely policies and procedures.	EAWC5
10.		The faculty is a fair and honest organization	EAWC3
11.		The university/faculty has high reputation in public	EAWC4
12.	Factor 3: INAW2, INAW3, INAW4, FRCT1, SAPJ4 ➔ ***The suitability of work and encouragement policies*** Expectation "+"	English lecturer feels the teaching work is meaningful to their life, business and community.	INAW2
13.		Working time of the university/ faculty is rational	INAW3
14.		The work is suitable with ability and capability of English lecturers	INAW4
15.		Physical rewarding policies when achieving objectives at work in the university/faculty	FRCT1
16.		The faculty always has the bonus system such as holidays, anniversaries to motivate English lecturers	SAPJ4
17.	**Factor 4:** INCO2, INCO1, INCO3, EAWC11 ➔ ***Income and opportunities for***	English lecturers can fully base on salary/ income receiving from university	INCO2
18.		Appropriate income worthy to the effort of English lecturers	INCO1
19.		The lecturers need to receive relevant bonus after completing assigned work	INCO3
20.		The university/faculty always creates conditions and opportunity for English lecturers to develop personal or professional development	EAWC11

	Factors	Explanation	Variable
	professional development Expectation “+”		
21.	**Factor 5:** FRCT3, INCO4, FRCT4, SAPJ1 ➔ ***Developing capabilities and being recognized*** Expectation “+”	Admiration and applause of the colleagues for the teaching work	FRCT3
22.		Per diem policy of the university can encourage and appropriate with teaching environment	INCO4
23.		The ability to get promotion when reaching achievement in work	FRCT4
24.		English lecturers can use their personal capacity in the teaching job well	SAPJ1
25.	**Factor 6:** SUMB2, SUMB3, SUMB1 SUMB5, SUMB4 ➔ ***Perceive Supports from the University Management Board*** **(**SUMB**)** Expectation “+”	The management board is friendly, closed with the teaching staffs	SUMB2
26.		The management board always motivates, encourages the lecturers in working process.	SUMB3
27.		The management board always concern, take care of the English lecturers	SUMB1
28.		English lecturers are always respected by the management board	SUMB4
29.		University/faculty leaders recognizes the contribution of English lecturers	SUMB5
30.	**Factor 7:** INAW3, INAW1 ➔ ***Independent at work*** Expectation “+”	English lecturers become self-aware, self-monitoring and self-correcting	INAW3
31.		English lecturers are self-motivated or do not need regular feedback in order to make progress	INAW1
32.	**Factor 8:** FSDH5, FSDH1 ➔	University/faculty handles complaints of teaching staff timely and keep the teaching staff informed of progress	FSDH5
33.		University/faculty managers keep problematic incidents	FSDH1

	Factors	Explanation	Variable
	***Flexible and Sensitive Discipline Handling* (FSDH)** Expectation "+"	confidential	
34.	**Factor 9:** INAW6 ➔ ***Confident at work*** Expectation "+"	English lecturers take the initiative rather than waiting to be told what to do	INAW6
35.	**Factor Y:** METF1, METF2, METF3, METF4 ➔ ***Motivation of English teachers in the Faculty of foreign languages (METF)***	English lecturers always try their best to complete the assigned teaching work	METF1
36.		English lecturers always work hard to fulfill the objectives of the university/ faculty	METF2
37.		English lecturers are ready to impliment assigned teaching tasks	METF3
38.		English lecturers always try to improve themselves at the highest level with an aim to satisfy the work requirements of the university/ faculty	METF4

Source: Results of the author's analysis

Basing on testing results of the reliability of the scale, and analysis of exploratory factors the author draws out a model studying factors affecting to motivation of English lecturers in faculty of foreign languages summarized in Figure 2 below.

With factors from 1 to 9 as described in Table 4 and explained in figure 2; to consider which factors in the model really affect to motivation of English lecturers in the Faculty of Foreign Languages, the author conducts the following pairs of assumptions with significance level of 5%.

Ho: with $\beta i = 0$ (There is at least one factor which does NOT affect to employees motivation of English lecturers in the Foreign Languages)

H1: with $\beta i \neq 0$ (There is at least one factor affecting to motivation of English lecturers in the Foreign Languages)

Table 5. Summarizes the results of the test.

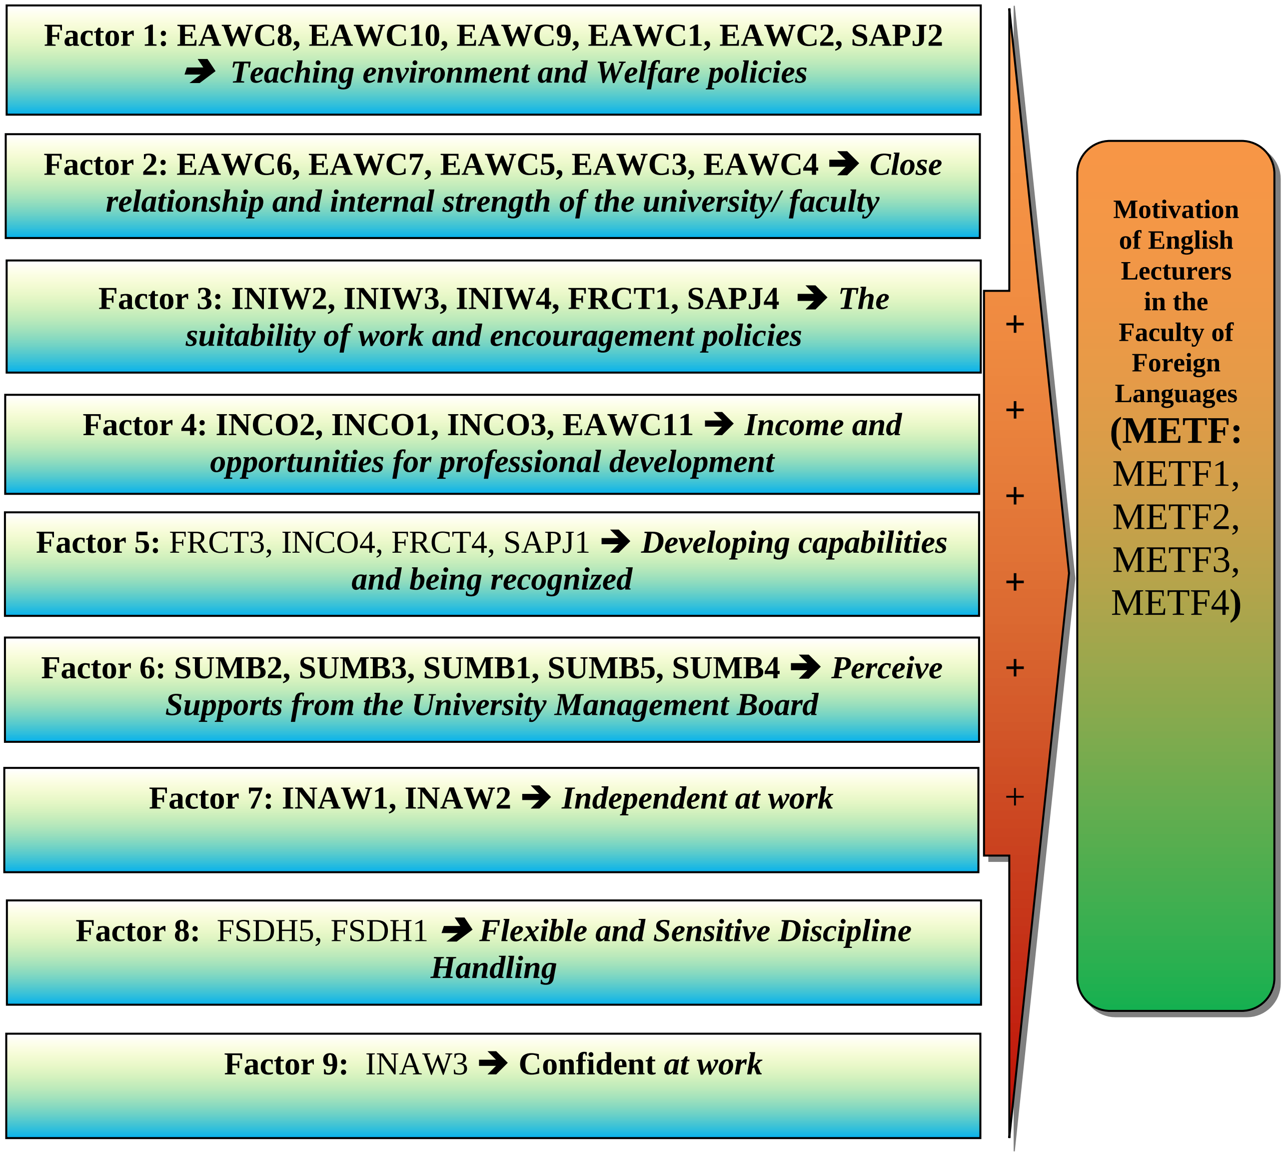


***Figure 2*: Research Model of Factors Affecting to Motivation of English Lecturers**

Table 5: Testing Results of assumptions pairs (Source: Results of the author's analysis)

Factor	T	Sig.	Conclusion	Status of Impact
Factor 1	2.162	.032	< 5%. reject Ho => Factor 1 has affection	+
Factor 2	4.453	.000	< 5%. reject Ho => Factor 2 has affection	+
Factor 3	4.075	.000	< 5%. reject Ho => Factor 3 has affection	+
Factor 4	.858	.392	> 5%. accept Ho => Factor 4 has no affection	-
Factor 5	-2.693	.008	< 5%. reject Ho => Factor 5 has affection	+
Factor 6	.176	.860	> 5%. accept Ho => Factor 6 has no affection	-

Factor 7	3.789	.000	< 5%. reject Ho => Factor 7 has affection	+
Factor 8	2.892	.004	< 5%. reject Ho => Factor 8 has affection	+
Factor 9	2.372	.019	< 5%. reject Ho => Factor 9 has affection	+

4.2. Suggestions to motivate english lecturers in faculty of foreign languages

4.2.1. Improving the teaching environment and welfare policies to motivate English lecturers (Factor 1)

Studies shows that teaching environment and welfare factor has a positive impact on motivating English lecturers; thus improving a better teaching environment (safe, clean, friendly, fully equipped, and good corporate culture, transparent labor regulations) and building reasonable welfare policies will facilitate increased working motivation for English lecturers.

For physical health, English lecturers have the right to work in a safe and sanitary environment. That factor 1 is at average level of importance can probably be explained because teaching environment is a risk-free environment. Teaching conditions must be assured so that English lecturers feel comfortable to have creative, interesting lectures.

Regarding to mental health issue, English lecturers are eligible to teach in a friendly, safe environment where other lecturers are willing to help them overcome difficulties, are willing to share with them interesting experience to teach better. Rewards and positive compliments are good to create a motivated teaching environment for English lecturers. In addition, almost all English lecturers are female; therefore, organizing outdoor activities for them and their families to join will create a peaceful, friendly and happy environment for these female English lecturers to prolong their working time.

4.2.2. Increasing relationship and promote intrinsic strength (factor 2)

Research results show that the relationship and intrinsic strength within the faculty will increase motivation for English lecturers through such elements as communications among lecturers in the faculty, communication with other faculties; encouraging all members to exchange information, communicate, interact; policies, procedures are reasonable, understandable; fairness, honesty; high reputation under public opinion ....

To increase relationship and promote the intrinsic strength for English lectures in the faculty of foreign languages, some of the following should be addressed. Firstly is building the core value for the university and especially faculty. Basically, the core value will be basic in each daily decision, and helps lecturers have unified behavior and standards in every situation. Second point is building counter-relationship with colleagues. Relationships with colleagues will be appreciated. In addition to understanding the professional capability, it is advisable for English lecturers to learn about individual circumstances, the family of colleagues in the faculty, so when it is needed people can support each other in time to complete the work on time. As mentioned above, most English lecturers in the faculty of foreign languages are female who have separated from teaching by a time maternity period, and they have to spend much time taking care of their babies, their family; therefore, during this time, the faculty dean should not ask them to teach in the early morning, or late in the afternoon. Besides, the faculty tries to organize outdoor parties, sporting events, children competition, cooking contest, family festivals where they can take their family and children to participate, to create conditions for all English lecturers to exchange and understand each other more deeply. Thirdly is recognition and rewarding achievements. It is necessary for the faculty to appreciate the achievements made by a group or an individual to have timely praise and reward these people. Quarterly, the faculty dean holds an official meeting to vote for individual excellence in the implementation under the core values of the university, faculty, then given rewards for some of the most talented individuals. Award is not important than the way to reward; therefore, the awards are organized with the participation of all lecturers and representatives of the university leaders, and these awards are posted on the website of the university. The award should also be based on achievement award and progress award which reflects efforts of the lecturers because those who are rewarded progress award will try hard to get higher achievements. Fourthly is increasing public relation. One important part to increase intrinsic strength of the faculty, university is creating close relationship and responsibility to the community closed to the university. These activities involve volunteering staffs to improve living conditions for the community. Creating English community is an example among many other social activities the faculty can do. When participating into this activity, lecturers will find they are a part of the community having responsibility to make the community better, and they will be well known soon when participating into activities creating English community in the university. The fifth thing is communicating. It is necessary to encourage frequent communication and information exchange among all levels and departments within the university. At the same time, the leader of the faculty creates an open environment, conditions which allow the employees to ask questions or personal aspirations with the leaders/ head of the faculty when they have unsolved problems in the group or in parts. The sixth point is committing to organize training courses for the staff. The university/ faculty must make every English lecturer understand that capacity development for the staff is extremely important, and the university/ faculty now always creates changes for English lecturers to promote creativity and advancement. In addition to the training programs improve skills and qualifications, the university/ faculty has taken other way such as organizing an initiative book club, professional club to encourage all lecturers to participate. The seventh point is creating connection with levels in the university/ faculty. Participating in sports activities, singing contests is necessary for the university presidents and the faculty dean to create close relationships with English lecturers. The last point in the section is writing about traditional figures in the history. This document will help everyone in the university/ faculty as well as other counterparts, alumni fully know about the historical milestone in the development process every few year. The university prints out and widely publishes this document because this document helps staffs to better understand the role of the university and even each lecturer in the faculty. It is also a very necessary book for new lecturers who will understand the traditional aspect of the university/ faculty.

4.2.3. Constructing relevant disciplines for employees (Factor 3)

The university has some disciplines and policies identifying regulations and procedures for employees. Appropriate labor policies bring many benefits for the university and faculty. Preparing a clear policy may also provide a positive image for the university/ faculty in the eyes of students, alumni and local authorities. Besides enhancing the university's reputation, standards can also help the university attract more new excellent teaching staff. There are some basic regulations the university consider the following things. Among many regulations, as mentioned above, because the faculty consists of many female staffs, such disciplines as aternity regulations, sick leave, childcare policy; Equal Opportunities; Health and safety; Salaries, benefits and contributions policies; Controlling and handling violations; Chatting should be highly cared.

Among these principles, salary is an important factor affecting work relationship. The university/faculty needs to develop appropriate salary system and rewarding policy for their employees. Salary system includes rewarding forms for employees relevant to their contributions to the university/faculty. When considering bonuses for employees, the president of the university keeps in mind that salary and financial benefits are important and are engine for the implementation of the staff. The other important motive for employees include safety at work, job satisfaction, being recognized for their good work and are properly trained so that teaching staff can fully be promoted their potential ability.

For the case of English faculty, an appropriate salary system should be tailored to meet the needs in this particular circumstance of the university. Paying salary by considering workload and work performance is a good and fair way the university to apply. The university must organize talks in which teaching staff can raise questions for personnel officers as well as school leader relating to salary system, wage increases. Teaching staff must have the right to participate into process designing salary system so that their comments can be heard before the salary system is applied.

4.2.4. Developing capabilities for English lecturers in a reasonable manner (Factor 5)

Research has shown the improving capacity and being recognized factor has negative effect to labor capacity. Some following measures should be considered: (i) Constructing good examples which typically represent the advanced qualities that both the leaders and staffs want to reach; (ii) Setting clear objectives, goals and mission for teaching staff which base on physical items such as output, quality, profitability, cost ... or some spiritual items such as working style, ethics ...; (iii) Taking care and using emotions are good methods to "win" lecturers' hearts. The head of the university/ faculty must pay more attention not only to his/her own work, but also to practical difficulties of English lecturers to help them feel comfortable when teaching, and not be distracted from working during creativity and working time; (iv) Rewarding or punishing timely and fair will help employees realize that their contributions are recognized. Timely and firm compliments have great effect to employees' confidence, stimulate pride and it will stimulate their creativity.

4.2.5. The university/ faculty create relationship, and take more care teaching staffs (factor 7 and 8. 9)

The leader of the faculty of foreign languages should implement a number of things as follows: (1) Do not get angry because anger does not include in "set of tools" for a leader to manage the organization; (2) Do not be indifferent, rude and unfriendly and apart from teaching staffs; (3) Be careful with communication to avoid causing confusion to teaching staffs; (4) Be careful with the rights, benefits of the faculty itself rather than anything else because. The teaching staff is always sensitive and appreciates the job a manager through their behavior; (5) Be responsible to actions. A proper manager is always a reliable person and ready to accept responsibility of his actions; (6) Be consistent. There is nothing better to show the excellence of a manager and reflect the success of an organization than proving that manager is a consistent person who always keeps his word and always does exactly what he has declared; (7) Be positive and enthusiastic in doing job of the faculty (for example, answering phones, emailing response to the teaching staffs); (8) Be opened to help and support the staff. The disappointment and dissatisfaction with the teaching staff must be addressed privately and not rushed; (9) Be frank in recognizing mistakes the leader him/herself ... and receives criticism, suggestions for different mistakes in his/her work; (10) Be fair and smart in evaluating and recognizing the strength and weakness of English lecturers in the faculty. The head of the faculty recognizes the importance, great effect and the power of the recognition and praise on employees for the effort of the teaching staff.

4.3. Conclusion

The study points out factors affecting to motivations of lecturers in faculty of foreign languages - NEU. It is found that motivated lecturers will fulfill their responsibilities by exerting maximally if the university/ faculty apply appropriate methods and techniques to encourage teaching staff to show their capacities and creativity.

From the study, it is recommended that motivation techniques may be included in detail in training courses of teachers and a special training course may be arranged for educational managers, administrators and supervisors to use motivation techniques appropriately to achieve competency. It was found that abstract benefits such as teaching environment, welfare policies, relationship, intrinsic strength, relevant disciplines for employees, and developing capabilities in a reasonable manner. In this study, it is clear that although teaching staffs are in financial difficulty, high salary is not always what teaching staffs really expect and motivate them. Therefore, creating a friendly environment, taking care of staff training should be taken more care by the university. Besides this, the study also suggests some specific recommendations which target to affecting factors 1, 2, 3, 5, 6, 7, 8 mentioned in the study.

Fellowship in Politics, Graduate Academy of Social Sciences, Hanoi, Vietnam

Abstract

This study focuses on analyzing the role of the Vietnam Fatherland Front in promoting religious resources in national development. The research results show that over the past time, the Fatherland Front of Vietnam at all levels has shown up good role for promoting religious resources in socio-economic development in Vietnam. The evidence is that religions have certain contributions to politics, economy, culture and society. From research results, solutions are given to further enhance the role of the Vietnam Fatherland Front in promoting religious resources in national development, especially in Vietnam is in the process of accelerating the process of industrialization, modernization, extensive international integration and coping with complicated developments of the Covid-19 pandemic.

Keywords: *Vietnam Fatherland Front, religious resources, national development*

1. Introduction

1.1. An overview of the Vietnam Fatherland Front

The history and traditions of the Vietnam Unified National Front are attached to the history and traditions of the Vietnamese nation's struggle, led by the Communist Party of Vietnam, in order to gain independence for the country and freedom for the people to liberate the people, liberate society, and liberate people [1, p.9]. From the middle of the nineteenth century, the French colonialists invaded, turning our country into a semi-feudal colonial country. The French colonialists carried out cruel policies of rule towards the Vietnamese people. In the society at that time formed two basic contradictions: the conflict between the entire Vietnamese people and the invading imperialism and the conflict between the majority peasants in society and the feudal landlords. There have been many struggles of Vietnamese generations that have emerged, but all have failed.

In the face of the crisis of the way to save the country, the problem at that time was that it was necessary to have a pioneering revolutionary force leading and organizing the masses to gather the entire people in the struggle to liberate the people. In that context, Nguyen Ai Quoc was the first Vietnamese patriot to find the light of national liberation in a new way. Along with the preparation to establish the Communist Party of Vietnam, Nguyen Ai Quoc rekindled the idea of designing a front to gather a large number of social strata to realize the goal of national independence associated with theism. In 1923, in the Report to the Communist International, Nguyen Ai Quoc suggested that an action plan should be soon to "gather revolutionary ethnic elements" [2, p.204]. At the 22nd session of the Fifth Communist International Congress (in 1924), He again petitioned the Communist International to make the united front of the people of the country and the colony a reality [2, p.282]. Those were important early outlines of the idea of forming a national struggle front.

Resolutions on the problem of treason at the Central Committee of the Communist Party of Indochina in October 1930 clearly stated the urgency to establish the counter-imperial unification Front. On November 18, 1930, the Party Central Standing Committee issued a directive to establish the Anti-Allied Association - the predecessor organization of the Vietnam Fatherland Front, the first form of the National Front for reunification of Vietnam.

Over the past 90 years of establishment and development, the National Union for the Unity of Vietnam has different specific organizational forms and names, suitable to the tasks of each revolutionary period. History has proven that the Vietnam Unified National Front is an indispensable factor, ensuring the Vietnamese people from being a slave to the owner of the country. It is a glorious and very proud history of the nation, a valuable asset that generations of Vietnamese people forever preserve, cherish, inherit and promote [1, p.9].

Currently, the Vietnam Fatherland Front is an organizational form of the National Front for the unification of Vietnam. Since the liberation of the South and reunification of the country, the Vietnam Fatherland Front has gone through 08 congresses and is in the 9th congress (term 2019-2024). It can be seen that the Vietnam Fatherland Front has increasingly enhanced its position and role in the political system in particular and in society in general. Article 1 of the Law on Vietnam Fatherland Front affirms: The Vietnam Fatherland Front is a political alliance, a voluntary union of political organizations, socio-political organizations, social organizations and typical individuals in all classes, social classes, ethnic groups, religions, overseas Vietnamese; is the political basis of the people's government; representing and protecting the legal and legitimate rights and interests of the People; rally, promote the strength of great national solidarity, exercise democracy, strengthen social consensus; social monitoring and criticism; participate in building the Party and State, and participating in people's foreign affairs, contributing to building and defending the Fatherland [3].

1.2. Be aware of religious resources

Religion as a form of social consciousness, an entity that affects society both positively and negatively. In that context, "peaceful coexistence", proactive identification of religious resources to promote and serve the cause of national construction and development has become the attitude of dealing with religion of many countries with different political institutions in the world, including Vietnam. There are many approaches to religious resources. According to author Nguyen Hong Duong, religious resources, after all, have: spiritual resources and material resources [4, pp.9-10]. The author Chu Van Tuan also thinks that religious resources have a quite broad connotation, not only spiritual resources but also material resources. From the perspective of spiritual resources, it is ideological, philosophical, worldview value, human-life, moral value, culture, educational values, humanistic philosophies, good direction ..., these values have been participating in all fields of social life, in building the cultural and spiritual foundation of society. . In terms of material resources, religions in Vietnam have a system of worship facilities with many valuable legacies that have great potential for exploitation. Religions can attract huge social resources such as economic resources, human resources, cultural resources ... From here, religions transfer these attracted resources into society. , in areas such as social security, charity, health, education ... Religious resources are formed from spiritual and material factors as mentioned above are religious resources. Religious resources can be exploited in a sustainable way to serve the development of the country. The correct awareness of religious resources and promotion of religious resources will contribute to preserving, preserving and developing the values of religion itself; preventing wastage of religious resources, avoiding negative impacts on society; providing a scientific basis for the formulation of religious policies participating in social service provision [5].

Religion is the spiritual need of a part of the people, which is and will exist with the nation in the process of building socialism in our country [6]. The reality shows the continuous development of religion in the number of followers, dignitaries, and jobs; the activities of religions are increasingly diversified and plentiful. According to the Government Committee for Religious Affairs, by the end of December 2020, the State of Vietnam recognized 36 religious organizations of 16 religions and 04 organizations, 01 dharma subject was granted the certificate of registration of religious activities [7]. Incomplete statistics show that the whole country has nearly 27 million followers of all religions, accounting for about 27% of the population; more than 55,000 dignitaries, 145,000 positions and 29,000 worshiping facilities. Promoting the resources of religions in development will contribute to accelerating the process of industrialization, modernization, international integration and sustainable development of the country.

2. Method

To do this research, on the theoretical basis, the author has based on the views of Marxism-Leninism, Ho Chi Minh's thought, the views of the Communist Party of Vietnam on religion and based on regulations of Vietnamese law on the rights and responsibilities of the Vietnam Fatherland Front. Regarding scientific research methods, the author uses the scientific inheritance method from the authors who have researched before; the method of synthesizing and analyzing information and data to give an objective view of the issue demonstrating the role of the Vietnam Fatherland Front in promoting religious resources in national development.

3. Results

The Vietnam Fatherland Front shows its role in promoting religious resources through gathering, propagating, and mobilizing - the Front's basic and important functions up to now. The Vietnam Fatherland Front has gathered and gathered religions in the great national unity bloc; propagate, mobilize and bring into full play the resources of religions to develop the country, towards the successful realization of the goal of "rich people, strong countries, a democratic, fair and civilized society". Gathering, propagating, and mobilizing and promoting religious resources of the Vietnam Fatherland Front in recent years has achieved good results, reflected in the contribution of religions to political stability, security, order and strengthen the block of great national unity and People's diplomacy; in economic development; cultural development and social problem solving.

3.1. The role of the Vietnam Fatherland Front in promoting religious resources in political stability, security and order, strengthening the block of great national unity and People's diplomacy

The Vietnam Fatherland Front gathers and unites religions in the great national unity bloc, propagates and mobilizes religions to comply with the Party's lines and guidelines, and the House's policies and laws; well implemented patriotic emulation movements, campaigns such as: "All people unite to build a new countryside and a civilized city", "The whole country joins hands For the poor - No one will be left behind". The Vietnam Fatherland Front Committee in localities across the country regularly propagates and popularizes movements and campaigns for people of all religions to respond, implement, and contribute to the movements. The people of all religions always ensure the full and serious implementation of the Party's and State's lines, undertakings, policies and laws. In fact, very few religious people commit criminal crimes.

The Vietnam Fatherland Front Committee at all levels has mobilized religion actively join the world, contribute more in all areas of social life. Religions have built the path of practice in close association with the nation; gather a large number of believers in the great national unity bloc, contribute to building the homeland, a rich and beautiful country, such as: "Dharma - Nationality - Socialism" of Buddhism; "Live the gospel in the heart of the people" of Catholicism; "Living the gospel in service of God, of service to the Fatherland and people" of Protestantism; "Glorious country, bright religion" of Cao Dai religion; "For the Dharma, for the nation" of Hoa Hao Buddhism, ...

In recent years, together with the authorities, the Vietnam Fatherland Front has mobilized and supported religions to promote their role and position, strengthened foreign affairs and hosted many national religious events. economic and regional; attend multilateral and bilateral conferences, seminars and forums; actively contribute to the common initiative to reduce violent conflicts due to religious and ethnic reasons; contribute to introduce the image of the country and people of Vietnam, and promote People's diplomacy. Specifically, the 500-year Reformation Ceremony was held in Vietnam in 2017; Great Buddha United

Nation Day - Vesak has been held in Vietnam over the years 2008,2014,2019; The Catholic Church organized the World Dominican Congregation in Dong Nai, Vietnam in 2019, etc. In recent years, Vietnam has been known as a country for peace and political stability. Having this is not to mention the efforts of religions in Vietnam in promoting resources and contributing to the overall development of the nation. One of the actors playing an important role in promoting religious resources in political stability, security and order, strengthening the great national unity bloc and People's diplomacy is the Fatherland Front of Vietnam.

3.2. The role of the Vietnam Fatherland Front in promoting religious resources in economic development

The Vietnam Fatherland Front propagates and mobilizes religions to actively promote resources in organizing religious activities. Today, spiritual tourism is strongly developed, contributing to economic promotion, creating jobs and income for people. Reality proves that localities with famous religious places often attract a large number of tourists, thereby bringing economic benefits and creating jobs for local people. The festival of Huong pagoda, Bai Dinh pagoda, Yen Tu pagoda, Ba Vang pagoda, etc. of Buddhism are typical examples of this problem. In addition, the Vietnam Fatherland Front Committee at all levels supports religious organizations to create products that contribute to the life of the community. Products made by religion are also easy to win the hearts of society and are trusted by many people, such as: Buddhist vegetarian food,

In the movement of economic development, hunger eradication and poverty reduction, the Vietnam Fatherland Front Committee in many localities encourages people of all religions to boldly renew their ways of thinking, doing, and having bright ways, creating to improve the lives of individuals and families, contributing to poverty reduction in the locality. Typically in Quang Binh province in recent years, there are many fishing households in Tan My parishes (Quang Phuc, Ba Don), Van Phu (Quang Van, Ba Don), Xuan Hoa (Quang Xuan, Quang Trach), Trung Hai (Quang Phu, Quang Trach) has invested funding in building new large and modern fishing ships to cling to the sea. With the aim of getting rich, many lay households in the hilly and mountainous areas of Bo Trach and Tuyen Hoa districts of Quang Binh province have taken advantage of and promoted the development of high-income breeding models such as livestock models. wild boar, pepper planting, ... Along with that, the cooperative groups for growing sim-fruit trees, the cooperative groups for growing saffron and processing commercial turmeric starch of the Nguon Son parish; the forest tree breeding complex of Cho Sang parish (Quang Lien commune); flower growing village of Tuong Son sect (Quang Long ward); household seafood and seafood processing complexes in Nhan Tho parish (Quang Tho)... have bravely applied science and technology, developed highly competitive chains, bringing stable income for the people [8].

3.3. The role of the Vietnam Fatherland Front in promoting religious resources in cultural development

The diversity of religious forms is an important factor contributing to the formation of the national cultural identity. In the process of leading the revolution, the Party and State not only affirmed a consistent policy of respecting and ensuring freedom of belief and religion, but also advocated promoting cultural and ethical values of the goodness of religion in the cause of building and defending the country. In the history of the Vietnamese nation, religious culture and morality are not constant, but always have been adjusted to suit social life and accepted by society. Buddhism has deepened and enriched the traditional values of Vietnamese culture such as: the concept of compassion, bliss, selflessness, the six republics, or the law of cause and effect. The moral value of Catholicism is expressed in the 10 commandments, of which there are 7 moral ones about human morality such as: be respectful of parents, must not kill people, cannot lewd, do not covet others, do not testify lies, hide deception, must not desire another's wife (or husband), must not lust for wealth. The Islamic ethics has brought about valuable and unique values about the culture and customs of the Cham people ... These standards contribute significantly to the principle of appropriate behavior in society, very useful in maintaining social morality [9].

Recognizing that, for many years, the Vietnam Fatherland Front Committee at all levels has propagated and mobilized religious organizations, dignitaries, and job organizations for religious organizations and dignitaries. mobilize believers to actively participate in movements "All people build cultural life", live a good life - be beautiful, build residential areas free of social evils ...; building models of "streets, neighborhoods without rubbish", propagating on "Traffic Safety Year" for believers and people to raise awareness of law observance when participating in traffic. Religious organizations have step by step improved the self-governance of the community, a sense of civic responsibility, contributing to the elimination of outdated practices, limiting the youth violation of the law.

In addition to a deep philosophical system, religions also contribute to national culture by works with profound human values such as architecture, painting, and sculpture. Buddhism has contributed to the creation of unique art works in Vietnamese pagodas, towers and statues. The integration of Western style and architecture of Catholic and Muslim has contributed to the integration and integration of the national culture. The creation of the Catholic national script is a great contribution to Vietnamese culture; the birth and development of religious newspapers have contributed to conveying religious values and national cultural values, making religious culture closer, more familiar with Vietnamese culture and vice versa. Vietnam is expressed in religious rites [9]. These are achieved by the Party organization, the State and the Vietnam Fatherland Front, from the central to local levels, regularly coordinate closely with each other in the gathering, propagation, advocacy and management of religion, creating all favorable conditions for religion to maximize resources, contributing to the preservation, inheritance and development of national culture in particular and the development of the country in general.

Cultural values, religious ethics contribute to the creation of social unity and consensus, religious beliefs have influenced the behavior and conduct of each believer and religious community. The close connection with people of the same faith always has a stable vitality and spreads to the community, creating relationships in social relationships, contributing to consensus and social progress.

3.4. The role of the Vietnam Fatherland Front in promoting religious resources in solving social problems

In the religious community, dignitaries and priests always play the role of mediating disputes, conflicts in families, communities, and even mediating conflicts between social institutions. The Vietnam Fatherland Front Committee at all levels regularly focuses on mobilizing religious dignitaries and monks, orienting them to advise believers to work hard, obey the law, avoid evils, and comply with the guidelines and policies in the locality; build village friendship, respect and unite religions, national solidarity. Those jobs have created stability and created cohesion, inner strength in the religious community and made religion always have a certain place in social life. In addition, the Vietnam Fatherland Front Committees at all levels also monitor and closely follow the political situation, Timely propaganda and mobilization, not allowing activities to take advantage of religion, superstition, self-seeking, causing social frustration, separating the people, undermining the national unity bloc, religious solidarity; raising the spirit of vigilance, not allowing anti-revolutionary forces to take advantage of the destruction.

In recent years, the Vietnam Fatherland Front at all levels has mobilized and supported religions to contribute resources that are considered the strength of religion in the cause of health, education and charity work, social security, and environmental protection. Specifically:

Educational activities are both strengths and interested by religions in the missionary process and are often carried out in the following models: preschool, vocational training and study promotion activities, establishment of relics, support poor students, students in remote areas. Currently, the country has 270 kindergartens, about 1,000 groups, independent preschools established by religious individuals, accounting for 2% of the total number of public and non-public kindergartens, accounting for 15% of the total. the number of non-public preschools in the country, mobilizing about 125,594 children to go to school/class, accounting for 3.06% of the total number of preschool children nationwide (public and non-public), accounting for 18, 3% compared to children going to non-public preschools. Religious organizations have established 12 vocational training institutions nationwide, including: 01 vocational college, 01 vocational secondary school and 10 vocational training centers.

In the health sector, with the spirit of charity, religions clearly show their influence through free medical examination and treatment, opening charity clinics, building a system of ambulances to transport patients. . Raising awareness for believers to organize a hygienic life, prevent disease, go to the hospital when sick, take medicine instead of praying, and advise people to eliminate backward practices that affect their health. Religions have opened 185 medical examination and treatment establishments, including 143 medical examination and treatment establishments combined with traditional oriental medicine or traditional medicine; 42 western medicine establishments (33 medicine cabinets, 9 pharmacies) and 01 clinic. In the three years from 2011 to 2014, the total number of people receiving medical examination, treatment and health care at humanitarian medical examination and treatment establishments of all religions was over 1.5 million [10, p.7].

The whole country currently has 113 social assistance institutions belonging to religious organizations (with permits) taking care of and nurturing 11,800 social protection beneficiaries with a total of 2,600 employees, on average, 01 support facility. Society belongs to religious organizations to care for and nurture 104 objects of social protection [10, p.7]. In the campaign "Day for the Poor", "Fund for the poor" of religions has actively participated. The total value of social charity activities of religions in 2016 is more than 3,146 billion VND [10, p.27].

In sustainable development, religion plays a special role in environmental protection, and promotes living in harmony with nature. The Vietnam Fatherland Front regularly strengthens the mobilization of religious organizations, dignitaries and religious organizations to mobilize believers and people to actively respond and take practical actions in the program "All people participate in environmental protection". In 2015, at the National Conference on "Promoting the role of religions participating in environmental protection and responding to climate change" held in Hue city, representatives of 14 religions were presenting the Message on environmental protection and climate change response. Leaders of religious organizations in Vietnam together with the Standing Committee of Central Committee of the Vietnam Fatherland Front.

In particular, over the past time, religions have made many positive contributions to the prevention and control of Covid-19 pandemic with many practical activities in religious communities and establishments, making an important contribution to the whole country to control the first effective control against the spread of pandemics in Vietnam. Facing the complicated situation of the Covid-19 pandemic, spreading rapidly in a number of countries, with the number of infected and fatalities continuing to increase, on March 3, 2020, the Standing Committee of the Committee. The Central Committee of the Vietnam Fatherland Front has issued Official Letter No. 603/MTTW-BTT requesting religious organizations and religious organizations to continue to coordinate with agencies, departments, branches, and the Fatherland Front, national organizations and mass organizations to step up activities to participate in pandemic prevention and control.

4. Discussion and Conclusion

All religions in Vietnam have a spiritual direction and motto that is closely related to the nation, actively participates in patriotic emulation campaigns and movements, together with the government to resolve people's difficulties. The oriented development of religious resources has brought into full play, serving the cause of national construction and defense. To get those good results, it is impossible not to mention the important role of the Vietnam Fatherland Front. In addition to the achieved results, the Vietnam Fatherland Front still has a number of limitations, such as the contents and forms of propaganda and advocacy are not yet diversified and plentiful; sometimes not fully proactive in promoting religious resources in national development, waiting for the direction of the Party or the coordination of the State and other organizations.

Vietnam is in the period of accelerating the process of industrialization, modernization, extensive international integration and coping with complicated developments of the Covid-19 pandemic. To maximize the mobilization of religious resources in the country's development in the current period, it is necessary to pay attention to the specific characteristics, strengths and capabilities of each type of religion and religious organization to exploit and promote in an effective way. In the coming time, in order to further enhance the performance of the Vietnam Fatherland Front's role in promoting religious resources in the country's sustainable development, the author of the article gives the following notes:

- *Firstly*, continue to propose to the Party and State the completion of guidelines, policies and laws related to religion in order to promote well religious resources.

- *Secondly*, proactively, creatively and renovate the contents and modes of operation of the Vietnam Fatherland Front at all levels for the promotion of religious resources in particular, for the implementation of other political tasks in general.

- *Thirdly*, actively coordinate with the Government and related agencies to formulate and soon issue specific policies to promote the role of representative in religions; increase religious communication activities; organize praise conferences to replicate models and typical in religions.

- *Fourthly*, to pay more attention to the training and retraining of religious officials and civil servants to improve their skills and understanding of religions in Vietnam, thereby making it easier to promote their resources towards sustainable development of the country.

- *Fifthly*, improve operational efficiency, promote roles and responsibilities of Advisory Council, Advisory Board, Advisory Group, members of the Vietnam Fatherland Front Committee, dignitaries, intellectuals, ethnic groups, religions, scientists, religious experts, practices.

- *Sixthly*, strengthen the task of social supervision and criticism of the Front and socio-political organizations in religious work. Well implementing the motto "People know, people discuss, people do, people check" in areas where people have faith.

- *Sevenly*, promote the role of media agencies to participate in and support propaganda about the advocacy and solidarity of religions, attaching importance to propaganda about good people, good deeds, collectives and individuals. People do well religious work in order to gather, unite, promote the aggregate strength of religions in the great national unity bloc, to build and defend the Fatherland.

The development path of the Vietnam Fatherland Front and the outstanding contributions of religions in Vietnam recently affirmed:

- *Firstly*, the more revolutionary career progressed, the more successful the innovation was, the more the position and role of the Vietnam Fatherland Front and the religious resources were increasingly confirmed, contributing significantly to the realization to present democracy and strengthen social consensus.

- *Secondly*, the more extensive and developed the innovation cause, the deeper the international integration, the heavier the Front's mission. One of the important tasks is to promote religious resources in sustainable development of the country. One of the factors contributing to the country's sustainable development is the resources of religions in Vietnam.

Faculty of Political Theory and Social Sciences and Humanities,

People's Security Academy

Abstract

Although, Buddhism is an imported religion to Vietnam, with the spirit of loving kindness, compassion, vicarious joy, equanimity, egolessness, selflessness, especially with the thought of saving from misfortune and danger and reincarnation, Buddhism has established a particularly important place in Vietnamese life. Over the historical periods of Vietnam, Buddhism has always accompanied the nation, performing its social security function well. The Buddhism's social security work is developing in breadth and depth, from charitable and humanitarian fundraising activities to sustainable hunger eradication and poverty reduction activities by multi-activities. Therefore, Buddhism plays an increasingly important role in ensuring social security in Vietnam in the current background. In order to clearly show the purpose of the article, the author proceeds to clarify the following points: (1) analyze the basic philosophical contents of Buddhism related to social security; (2) assess the reality of ensuring social security of Buddhism in Vietnam through analyzing and synthesizing Buddhist activities; (3) propose some solutions to promote the role of Buddhism in ensuring social security in Vietnam in the coming time.

Keywords: *Buddhism, social security, Vietnam.*

1. Introduction

In the view of the International Labor Organization (ILO), social security is the society's guarantee to individuals through a series of public measures, aimed at counteracting economic and social difficulties caused by income suspension or reduction, caused by illness, maternity, work accident, unemployment, injury, old age and death; at the same time, ensuring medical care and subsidizing multi-child families. Therefore, in essence, social security is the guarantee of income and life for individuals in society through public measures, therefore, this is a deeply humanistic and important action for the sustainable development of society. Social security includes a number of basic components that are social insurance, social assistance, family subsidy, social savings fund, and other social services financed by public funds.

In Vietnam, ensuring social security is always considered as a regular duty of the State and the entire society. In Article 34 of Constitution of the Socialist Republic of Vietnam

2013, it is affirmed that: "Citizens have the right to social security". Currently, the system of social security policies in Vietnam consists of four basic groups: (1) The group of employment policies to ensure minimum income and reduce poverty: supporting people to proactively prevent risks by entering the labor market for good jobs, minimum income and sustainable poverty reduction; (2) The group of social insurance policy: supporting people to reduce the risks of getting sick, work accident, old age ... through social insurance to be actively compensated for the reduced income or lost due to the above risks; (3) The group of social assistance policies, including regular subsidies and irregular subsidies. (4) The group of basic social service policy, helping people to access basic services in education, health, housing, clean water and information and communication1.

Buddhism has a long tradition, accompanying the development of Vietnamese history. Buddhism was an important resource in the process of building and defending the country from the historical dynasties of Vietnam to the period of resistance against French colonialism and American imperialism. Currently, in the period of peace and integration and national development, Buddhism continues to conduct charity and social activities to help unfortune people. The Buddhist social security activities not only show compassion, thought of saving from misfortune and danger but also show the function of patronage and social relief. Not only that, Buddhism also cooperates with other social organizations to conduct many charity and social activities to support people and build a social security system.

2. Method

The author combines many research methods, in which mainly using methods of analysis, synthesis, demonstration, comparison, data tabulation, generalization to clarify the content of the stated theses.

Introduction: The author uses analytical methods to clarify the basic content of social security; overviewing of the social security policy system of Vietnam; clarifying the role of Buddhism in the development process of the Vietnam's history.

In the research results and discussion section: The article inherits the relevant research results, in which analytical methods are used to clarify the contents of Buddhist philosophy of reincarnation, responsibility to the social community and others, clearly showing the spirit of social security. To evaluate the current state of the work of ensuring social security of Buddhism, the author collects and gathers data to make a demonstration table. From the specific data, the author analyzes and proves the Buddhist social security activities such as building charitable, building roads, building bridges, vocational training, career guidance, medical examination and distribution to the people and other volunteer activities.

From the research on the current situation, the author uses the synthesis and generalization method to assess the success and limit of the Buddhist social security work, as a basis for proposing solutions to improve the quality of social security in the coming time.[64]

Conclusion: The author uses the synthesis and generalization method to highlight the research results.

3. Results

3.1. Buddhism and social security issues

In the Buddhist scriptures, the concept of social security is not mentioned in detail and clarity. However, over the period of more than 2500 years of establishment and existence and development, Buddhist philosophies and perspectives have covered contents related to social security and are manifested by reincarnation activities, saving life, saving people.

Since its inception, Buddhism has promoted the spirit of loving kindness, compassion, vicarious joy, equanimity and kindness for the happy and peaceful human life. According to Buddhist philosophy, the goal of practice is enlightenment and liberation, however, in order to accomplish that goal, the religion must be associated with life, "The Buddha Dharma is irresistible to the world" must take loving kindness, compassion, vicarious joy, equanimity, egolessness, selflessness to perform. In particular, Buddhism always upholds the spirit of compassion in a practical way through sharing human suffering and loss, helping people in need. In Buddhism's Six Degree (which includes the virtues of almsgiving, morality, patience, diligence, meditation and wisdom), almsgiving is the first action to be performed on the path of liberation. In the Ten virtues, not only not stealing but also almsgiving is one of the three good things about karma that all Buddhists must practice. Or like the concept of the Four Divine State of Mind of Buddhism, Buddhist philosophy states that people need to have loving kindness, compassion, vicarious joy, equanimity. This is the main factor that helps to develop compassion, saving life, and directing Buddhist activities to human purpose. Buddhist scriptures in Ignorance Rakshasa booklet have affirmed that "the ability to harmonize, create karmic effects, turn samsara" means living in harmony with other people, doing good deeds, accumulating virtues is the way of liberating from samsara. In the Medicine Sutras, the Buddha advised sentient beings to light a lamp to bless, to be liberated from calamities and accidents. As in the Lotus Sutta states: One is to be recited by the Buddhas, the second is to plant the roots of merit, the third is in right concentration, and the other is to devote to saving all sentient beings. Thus, in the way to enlightenment, the first thing is to practice generosity, live responsibly with society. This content is close to social security, directing Buddhist activities to human purposes, meeting the urgent human needs for the right to life, the right to seek happiness.

[1] Mai Ngoc Cuong: Xay dung va hoan thien he thong chinh sach an sinh xa hoi o Viet Nam hien nay, National Political Publishing House, Hanoi, 2009, tr.21.

Stemming from the theory of dependent origination and the conception of Causal Law and Reincarnation Law, Buddhism has found the relationship between human and human, human with society, the relationship between past, present and future; helping people and live responsibly with society is the path of practice. The basic purpose of the Buddhist Doctrine is to release people from the suffering of present and next incarnation. Liberation does not mean spiritual practice to escape from life, but to best perform its duties and responsibilities to society by concrete actions, ie "Dharma Prachar" is associated with "benefit of populace".

Thus, in the spirit of Buddhism, helping people and helping life is a natural reason on the path of enlightenment. The Buddhist philosophy is rooted in welfare from the individual to the family and society level. From a research perspective, it can be affirmed that Buddhism has performed many social functions, ensuring social security including ideological functions, directing activities of a certain community of people in the commune to carry out material and social activities, as an affirmation of "Religion often has a decisive influence on social resources…, combined with human and financial resources, determines the national economic growth"[65].

3.2. The current situation of Buddhism in ensuring social security in Vietnam

Vietnamese Buddhism pays a lot of attention to regular sponsorship activities, helping the vulnerable people, people in need and at risk through the formation of a system of orphanages, centers for nurturing old and childless people, volunteer classes. To demonstrate Buddhist activities in ensuring social security in Vietnam, the article mainly goes to research the actual figures in 2019, because in 2020, due to the impact of the Covid-19 epidemic, all aspects of activity leveled off. If we take the data in 2020, it will not really correct when considering the current situation of Buddhism in ensuring social security.

In 2019, Vietnam Buddhist Sangha has 46 active orphanage raising centers with 136 nannies, nurturing 1,329 children; 15 centers for nurturing the lonely elderly are in operation with 49 employees, helping 527 elderly; 21 active volunteer centers; 12 charity classes in operation with 12 teachers and 5,687 students (See Tables 1, 2, 3, 4).

In addition to centers established for regular subsidies, Vietnamese Buddhism has promoted charity and social activities, and unexpected subsidies to support natural disasters, floods and droughts with the total amount in 2019 of 10,217,000,000 VND.

One of the basic activities is providing medical and accommodation assistance for people in need. Many monasteries, monks, nuns and Buddhists have donated health insurance cards and paid health insurance premiums for the lonely elderly, the poor, and orphans. In some localities, the Board of Trustees of Vietnam Buddhist Sangha has set up counseling and support centers for people infected with HIV/AIDS. The system of oriental medicine clinics works very effectively, bringing many benefits to everyone, and is operating in many provinces and cities nationwide. In 2019, Vietnam Buddhist Sangha of has 33 active oriental medicine clinics, with 206 doctors and nurses, examining free of charge for 6,298 people/month; 10 active western medicine clinics, with 40 doctors, examining free of charge for 4,680 people/month (See Table 5,6).

These medical facilities have provided traditional medical diagnosis and treatment, acupuncture, acupressure, physiotherapy, examination and distribution of Vietnamese herbs and Chinese herbs for hundreds of thousands of patients, with funding up to tens of billions dong. Monks, nuns, and Buddhists in many places also enthusiastically participate in humanitarian blood donation activities, donate to support free eye surgery for cataract patients, etc.

Associating social security activities with forms of health care, medical examination and treatment, Buddhism also organizes kitchens, charity porridge pots for poor patients. In 2019, Vietnam Buddhist Sangha provided 14,816,209,000 VND to charity vegetarian rice cookers and 1,263,790,000 VND for charity porridge pots (See Table 7.8).

In recent years, the social security work of Vietnamese Buddhism has aimed at sustainable development such as developing a type of career orientation, vocational training to create the self-reliance of people. The major Buddhist vocational training centers are concentrated in the central of Vietnam, with 02 centers in Quang Tri and Thua Thien Hue (See Table 9).

Since its establishment up to now, these two centers have had thousands of children studying embroidery, knitting, sewing, office computers. After graduating, depending on the profession, they are introduced to work at a garment company in Ho Chi Minh City, Thuy Duong weaving company, an embroidery factory in Hue or working at home.

In the South of Vietnam, there is a vocational centers of Kom Pong Chray pagoda (Hang pagoda) in Chau Thanh town, Chau Thanh district, Tra Vinh province; Phonoraka pagoda in Soc Trang with its wood carving vocational training has given jobs and increased income for hundreds of disadvantaged people in the province, especially Khmer ethnic people. In Ky Quang 2 pagoda, Go Vap district, Ho Chi Minh city, there are vocational activities, teaching Japanese technique massage - acupressure for visually impaired students. Employees, collaborators and administrators at Buddhist vocational and social protection centers have sense of responsibility, enthusiasm, wholehearted love and care for disadvantaged people. Most Buddhist vocational and sponsoring centers have been established in accordance with the law, having well-organized skills development activities for learners and operating with the motto, non-profit charitable purposes, focusing on educating ethical qualities, responsibility and professional skills for students. Buddhist vocational centers contribute to diversifying the mobilization of social resources, sharing the burden with local authorities, with the state and society in vocational training and giving job to workers.

Vietnam Buddhist Sangha has promoted social security in the form of building charity houses, building bridges, building roads, digging wells to contribute to building a new countryside with a budget of over 41 billion VND in 2019 (See Table 10). Particularly, Giac Ngo Pagoda (with Today Buddhist fund), in 2019, implemented 05 programs with a budget of more than 6.1 billion VND, including building 04 rural traffic bridges in Kien Giang province (Giac Ngo Bridge 21, 22, 23, 24); building 03 rural traffic bridges in Tien Giang and Ben Tre provinces (Giac Ngo bridge 25, 26, 27).

(Source: Social Charity Committee of the Central Vietnam Buddhist Sangha: Summary Report on Buddhist work in 2019, December 1st, 2019)

Responding to the trend "favour repaying", monks, nuns and Buddhists throughout the country have participated in supporting Vietnamese heroic mothers, giving charity houses to mothers, wounded soldier; donating to the favour repaying fund, sea - island gratitude program, the fund for victims of agent orange.

The mobilization of resources for social security has continuously increased over the terms of Vietnam Buddhist Sangha, as can be seen as: 111,733 billion VND in Term III (1992 - 1997), 296,972 billion VND in Term IV (1997 - 2002), over 400 billion VND in Term V (2002 - 2007), 2,879,432 billion dong in Term VI (2007 - 2012), which was 10 times higher than previous term. During the Term VII, the social charity work of the Vietnam

Buddhist Sangha made great progress. In just 4 years from 2013 to 2016, the total funding for Buddhist social charity reached over 4,000 billion VND, greater than the total funding of all previous terms. In 2019, the amount raised to charity by Vietnam Buddhist Sangha was 2,031,072,316,500 VND. These figures confirm the important role and effectiveness of Buddhism's contribution to social security.

3.3. Some reviews and comments

The activities of Vietnam Buddhist Sangha in recent years have made great contributions to the social security work of Vietnam, which can be mentioned on a number of points, as follows:

Firstly, in recent years, the social security work of Vietnam Buddhist Sangha has expanded in terms of beneficiaries and scope of activities, forming a diverse and flexible organization in the way of conducting. The operation process has been in coordination with the authorities, National Front and socio-political organizations, attracting a large number of people, especially businesses, therefore bringing great efficiency, contributing to share burden with the State in solving social security and welfare issues, and building a democratic, fair, civilized and happy society.

Secondly, Buddhism's social security activities emphasize humanity, human values and social responsibility, so it has a great effect on helping people to ignore their selfish lifestyle, having altruism and social responsibility, contributing to consolidating and building up the ethical values and lifestyles of the Vietnamese people. Therefore, Buddhist social security activities have great educational functions. In addition to material gifts, the compassionate spirit of Buddhism also brings noble spiritual values, such as giving sympathy, love, giving pure faith, giving merciful energy and help people to rise in life.

Thirdly, the Buddhist social security programs have a great attraction and spread, positively affecting the soul life life of the human and society. Through social security programs, the positive values of Buddhism have entered the lifestyle and thinking way of many Vietnamese people, thereby helping them to behave properly at work, to everyone, to society and the environment. Those are the necessary factors to build a sustainable society, harmonious between the economy and the society and the environment.

Fourth, Buddhist social security activities are associated with patriotic emulation movements, social charity campaigns, activities conducted by National Front, Labor – War Invalids and Social Affairs and departments, branches and unions, having actively contributed to building the great unity block of the whole nation, the bond between religion and life is increasingly strong. Many individuals who are monks, nuns and Buddhists actively participate in social protection activities, lovingly and taking care of people with all their heart; actively call on believers to participate in social security activities.

However, the social security work of Buddhism in Vietnam still has some limitations:

Firstly, the systemic connectivity in Buddhist social security activities is still not high, the organizational level is still not professional. The organization of teams helping people suffering from natural disasters is still fragmented, lacks of linkage; not fully promoting rich human potentials of the divisions and members in social security activities; there is a lack of linkage with socio-political mass organizations.

Second, the qualifications and quality of training in social security assurance, especially vocational training, are still simple and have not yet reached specialization and high level. At present, vocational institutions are small in size, scattered, and technical facilities are still poor and degraded; the professional qualifications and skills of teachers and staff members in a number of Buddhist medical, educational and vocational centers are limited; The opening of new centers is still limited and facing many difficulties in personnel, facilities and finance, etc.

Thirdly, the work of reporting information related to social security activities to the Central Vietnam Buddhist Sangha of a number of the Board of Trustees of Vietnam Buddhist Sangha in provinces is still limited therefore Social Charity Committee of the Central Vietnam Buddhist Sangha could not capture data và situation sufficiently. This leads to difficulty in promoting the overall strength and the support of other social forces in social security activities for the people.

Fourthly, Vietnam Buddhist Sangha currently does not have a basic and stable financial source to carry out social security work, so it is sometimes confused and passive in the implementation process.

3.4. Solutions to promote the role of Buddhism in ensuring social security

Firstly, it is necessary to educate the masses of Buddhists to understand the Buddhist philosophy of samsara, cause and effect, their own spirit of will and energy, as the foundation for enlightenment and liberation, driving force for the development of society. It is necessary to educate believers and the masses to understand the roots of the Buddhist philosophy which affirms that the Buddha cannot bless or harm anyone, can not help people escape from poverty and suffering that each person has to take responsibility for his own live. Rich or poor must be created by each person according to the law of cause and effect. Living good accept lucky, living a good life, training willpower, striving to improve morality, wisdom will be the decisive factors to escape poverty, enjoy a fully prosperous life in present. Properly understanding the philosophical spirit of Buddhism, each person will strive for wisdom and mercy, to attain the true values of truth - goodness - beauty, personal enrichment and helping others. These are important factors for the implementation of social security, sustainable escape from poverty, and development of the society.

Secondly, it is necessary to promote social security models, including vocational training and career guidance. With the view of incarnation and saving people from misfortune and danger, Buddhism should continue to promote various types of vocational training and career guidance to help the poor have the ability to establish themselves and establish a career. However, as a major religious organization in Vietnam, this aspect of activity is still limited. Vietnam Buddhist Sangha needs to upgrade the scale and quality of the existing vocational and social assistance establishments to care, educate and train more and more; to adopt policies to support and invest more in training facilities and equipment for Buddhist vocational training centers to develop, making these centers be prestigious and reliable vocational training destinations and competitiveness in the market mechanism and deepening international integration.

Thirdly, it is necessary to train the team working in social security to be more professional. To improve and expand social security work, there must be a professional social security team, equipped with soft skills in social knowledge, psychological understanding and communication ability, public media and events. This team is the adviser to the Central Vietnam Buddhist Sangha and other provinces and cities on social security work; to develop a scientific and methodical social security plan, both to promptly solve arising unexpected problems, while ensuring the long-term to bring Buddhist social security work in depth and sticking to observe social practice. Universities in Vietnam such as: University of Social Labor, Open University, University of Social Sciences and Humanities - Hanoi National University, Academy of Journalism and Communication etc. all have training this subject in many different levels. Therefore, the Social Charity Committee of the Central Vietnam Buddhist Sangha needs to coordinate with these educational institutions to train and issue certificates of social work for monks, nuns and Buddhists.

Fourthly, it is necessary to create a stable financial source for social security. The financial source for the social security of Buddhism can come from a variety of contents such as: donations from Buddhists, sponsorships from businesses and philanthropists and international organizations and the main source of income from activities of Buddhism. To have financial resources for ensuring social security activities, it is necessary to focus on the sources of income from Buddhism itself. For Buddhism, spiritual cultural tourism is a strength, if there is an effective direction and organization, this is an abundant source of finance, serving the missions of Buddhism. Currently, in Vietnam, there are many spiritual and cultural tourist sites such as Huong pagoda, Yen Tu, Tam Chuc, Bai Dinh, which have attracted thousands of domestic and foreign tourists. The cultural and spiritual centers of Vietnam have had great economic and social impacts on the region in particular and the country in general. The revenue from ticket money, accompanying services, performed religious activities, career such as statue casting, cultural and spiritual products etc. have created jobs for thousands of people, at the same time increasing revenue for Buddhism.

However, it is necessary to have a more effective management and organization method in order to comply with the provisions of the law on beliefs and religions; strictly manage financial resources, avoid loss and waste.

Fifthly, it is necessary to renew the social security work of Buddhism, the activities need to go into depth, the method needs to be more creative. The social security work of the Vietnam Buddhist Sangha must be flexible and creative to suit different subjects. To well implement this content, the social security work of the Vietnam Buddhist Sangha needs to be organized systematically, establishing a specialized social security agency from the central to the district level and divided into thematics. Each thematic is undertaken by a corresponding unit, usually voluntary social work teams consisting of monks, nuns and Buddhists in coordination with mass organizations to promptly support people in by natural disasters, floods, poor rural areas. It is necessary to diversify social security activities, for each person and depending on the age to have appropriate forms of help. Associating with material help and spiritual help, it is also necessary to focus on education, converting, spiritual improvement to help them calm down and be at peace and content with unusual events of life, thereby getting rid of worries and grief to rise to master themselves.

4. Conclusion

The social security work of Buddhism is increasingly developing in breadth and depth. Previously, Buddhism carried out social security mainly humanitarian and charitable social activities in the form of fundraising to support, but now it has expanded job creation activities with sustainable poverty reduction through diverse activities such as: donating scholarships, donating charity houses, vocational training, medical treatment, free medicine distribution, supporting family under preferential treatment policy, nurturing orphans, and other volunteer work. With its contributions, Vietnamese Buddhism increasingly asserts its role in society, making an important contribution to the sustainable development of Vietnamese society. In order for the social security to be better, in the coming time, Vietnamese Buddhism needs to promote educating and disseminating its ideas so that the masses can take the initiative and make efforts to rise to master themselves; improve the efficiency of vocational education and training; increase revenue and manage financial resources effectively; Be creative flexible in organization and training for the team of social security work.

RESEARCH ON VIETNAMESE TRADITIONAL MILITARY CULTURAL VALUES

PhD candidate. Ngo Bang Linh

linhnb0209@gmail.com

Political Academy, Hanoi, Vietnam

Abstract

The traditional military cultural values of Viet Nam is the combination of material and spiritual creativeness that contain truth, goodness, beauty and reflect and express the noble social values of Vietnamese people in the field of military. These values have been passed and developed from generation to generation and have great significance for the development of society and people nowadays. They include patriotism, humanism and unique military art. Currently, it is necessary to actively do propaganda, education, well organizing practical activities and emulation movements, and creating a favorable cultural environment to promote cultural military values in the new situation.

Keywords: *military cultural values, traditional, Viet Nam*

1. Introduction

Over thousands of years of history, the Vietnamese people have created highly unique material and spiritual values that contain truth, goodness and beauty, reflecting and expressing the noble social values of Vietnamese people in gaining and protecting national independence. These values have continuously been passed, transferred, fostered and developed from generation to generation, becoming a particularly important element in the national culture - traditional military cultural values. Traditional military cultural values play a great role in the development of people and society in Viet Nam in general, and soldiers in the People's Army of Viet Nam in particular. However, such role naturally exists only in potential form; in order to create power in practice, it is necessary to have a process of promoting in reality, with the presence of the subjects and elements of military life. Clarification of the concept, arising, development and content of traditional military cultural values is an important condition for proposing solutions to promote them in practice.

Up to now, many scientists have approached and studied the traditional military culture from many different dimensions. Due to the limited scope of research, this article only focuses on considering traditional military culture of Viet Nam in terms of system - value, that means considering it as the core and basic values of Vietnamese military life and activities throughout the history of country building and protecting.

2. Method

This study applies the general methodology of dialectical materialism and historical materialism, namely the views of Marxism-Leninism, Ho Chi Minh's thought, and the policies of the Communist Party of Viet Nam on culture and culture development, human and human development, war and the army. Concurrently, the works also use specific methods such as: analysis and synthesis, history and logic and comparison methods.

Analysis and synthesis method: Being used to analyze documents on related issues, such as: scientific topics, scientific articles, dissertations, practical evaluation reports…etc. to draw information basic information about military operations and life. Systemize such information to identify the article's main points.

History and logic method: By researching the history of Vietnamese military ideology, history of major events in the process of fighting to gain and protect national independence to logicise, finding out the practical arising and development basis of traditional military culture as well as its basic and natural issues.

Comparison method: Being used to compare traditional military culture with modern onesand anti-values. Therefore, we can see the richness, diversity and new manifestations of traditional military cultural values as well as the need to do research of methodological issues in order to promote them in the new situation.

3. Results

3.1. The basic issues of traditional military cultural values

Cultural values is a concept conceived by researchers in many different ways, such as: considering it "the most noble, beautiful; the smell, taste, scent of life" [1, p.133], "the cultural achievements that promote the rise of history and serve the interests and needs of the people and the country" [7, p.136], or "the sum of human achievements, demonstrating the development of the human nature according to the criteria of truth, goodness and beauty of each individual and community in creative activities with social significance" [8, p.17]…ect. In brief, *cultural value is the combination of material and spiritual creativeness that contain truth, goodness, beauty and have great significance to promote human and social development*.

In fact, *culture* and *cultural values* are "couple" terms, which are unified in many ways, even a lot of researchers identify them when they think that "the whole culture is one kind of values, culture only contains values, and culture is a part of values" [6, p.40]. However, to draw a relative distinction when culture is mentioned, people often see it from an aspect of life, where there are not only values - which exist as the stable foundation, but also vivid and diverse expressions. When it comes to cultural values, it is to emphasize the core - the last one remaining when we filter out all external phenomena of cultural life, which have great ability to affect the depth of all people's thought and consciousness. Naturally, the real level, scope and effectiveness also depend on many factors in different periods of the history.

Rejecting some fallacies, which always consider the military as a non-cultural field, we all affirm the existing of military cultural values in the history of military operations of all countries, nationalities, and political - social regimes. Although the military is an area associated with human losses, violence and destruction, wherever the military operations are for the sake of righteousness and protection of human dignity, peace and happiness of the community, which contains the truth, goodness and beauty, they by themselves generate cultural values - military cultural values. Military cultural values can be divided in many different ways, existing in two basic forms: physical forms such as military buildings, combat plans, accommodation arrangements, and other military activities etc; intangible forms such as ideals, spirits, political characters, beliefs, traditions, manners, military lifestyle, etc.

According to Sino-Vietnamese meaning, “Tradition” means the righteous transfer and continuation from generation to generation. When mentioning about the power of tradition, K. Marx had a classic saying: “The tradition of all dead generations weighs like a nightmare on the brains of the living” [2, p.145]. Thus, according to the logic of conceptual development, it can be conceived: *The traditional military cultural values of Viet Nam is the synthesis of material and spiritual creativenesses that contain truth, goodness, beauty and reflecting and demonstrating the noble social values of Vietnamese people in the military, which has been handed down, transferred, inherited and developed from generation to generation, and have great significance for the development of current society and people*.

The traditional military cultural values are always associated with the history of building and protecting the country of Vietnamese people, the social existing with natural and geographic conditions, the ways to organize the state and fight against aggressors throughout the history. The military struggle accounts for a large part of the national history, so the traditional military cultural values are always associated with the history of building and protecting the nation. From the era of the Hung Kings, although the class division was not severe, the demands on water control and against foreign invaders prompted the early birth of the Vietnamese state; along with that, military organizations and activities were also built and carried out in many different forms to protect the community, the nation and the territorial sovereignty. Right from the beginning of history, the core values of the Vietnamese traditional military culture had been identified, laying the foundation for our nation's continuous existence and development in the next centuries. It is more than 10 centuries of fighting against assimilation to preserve the spirit of the nation; is a brilliant Dai Viet civilization; and being continued until the era of Ho Chi Minh when Viet Nam, regardless of being poor and backward, had a great influence on many countries and people in the world with great victories in the national struggle to gain independence and freedom.

Viet Nam’s geopolitical position is highly valuable, located in the region connecting the Pacific Ocean and the Indian Ocean, between two major civilization centers - China and India. From a very early age, Viet Nam has become the meeting point of those civilizations. With coastal terrain, located in the tropical monsoon area, this land is rich and fertile but harsh and fierce with a lot of unexpected disasters. It is such geographical characteristics and natural conditions that have fostered Vietnamese people’s passionate patriotism, humanism, solidarity and love throughout the history of fighting against two frequent threats: foreign invaders and natural disasters. The natural conditions have also contributed significantly to the formation of special features in the Vietnamese military arts such as "use small force to win big enemy", "use small forces to fight against big enemy", etc. From a very early age, the Vietnamese knew how to exploit the terrain in military activities, relying on the dangerous terrain to fight against the forces of invaders. The victory in several wars against foreign invaders was partly due to the fact that Vietnamese people took the most advantage of terrain conditions.

In the history, foreign powers had repeatedly invaded Viet Nam, forcing generation by generation of Vietnamese to constantly stand up to fight against them in order to maintain human rights and national sovereignty. In this process, the values of traditional military culture of Viet Nam have been continuously fostered and deepened. Right from the beginning of the nation's construction, the inhabitants of Van Lang - Au Lac had carried out heroic struggles against were brave and conspiring to fight against the enemies of An, Man, Red Nose, Qin and Trieu dynasty. After An Duong Vuong's defeat by Trieu Da, Viet Nam had been controlled by Chinese feudal dynasties for more than 1,000 years. However, during such period, the Vietnamese continuously rose up in arms against these oppressive rulers.

After the victory of Bach Dang battle in 938, Viet Nam built up an independent feudal state. However, during the next 10 centuries, we could not live in peace due to several foreign invaders. Vietnamese army and people continued to rise up to carry out resistance and insurrection such as: Two times of resistance against the Song, three times of resistance against the Yuan, the resistance against the Ming, the Lam Son uprising, the resistance against the Siam and the Qing, etc. In the modern time, the values of traditional military culture once again shined and developed to the peak, making an important contribution to the nation's victory over the invading French and American professional armies.

3.2. Values of basic traditional military culture of Viet Nam

The basic contents of the values of Vietnamese traditional military culture have been affirmed and clarified by many researchers; therefore, this article mainly inherits and systematizes them into 3 issues:

Firstly, nationalism

Patriotism is a universal value in human life, but for the Vietnamese people, patriotism has been developed and upgraded to a level of nationalism, covering the whole consciousness, directing all activities in every aspect of every human being, especially in the military field. In other words, Vietnam's military is not a purely military foundation, but all aspects of military organization and activities are imbued with nationalism, using nationalism as the foundation to build, maintain and promote the military strength to protect the Fatherland. Nationalism becomes a core value of Vietnamese traditional military culture, the deepest source of all spiritual qualities and creative potential in every human being, so that when being aroused, it creates extremely strong military power, "passing through all dangers and difficulties and engulfed all gangs of traitors and invaders" [5, p.38], keeping the country and people everlasting.

One of the core contents of Vietnamese nationalism is the spirit of fighting against foreign invaders, protecting independence, freedom and national survival. In the world, it is rare to find out any people who had to go through a long and arduous process of fighting against aggression like the Vietnamese people (throughout history, our people have been dominated by foreign powers for nearly 12 centuries). However, it seems that the more difficult the situation is, the more powerful Vietnamese people’s nationalism is showed. When the country was in peace with good kings, people from all walks of life were gathered under the banner of great cause and ruling classes to consolidate national defense and build the country. When the country was invaded, our people continuously stood up to an armed uprising and were ready to sacrifice to the last one to regain national independence. When the feudal class abandoned the leadership role and the country stood on the brink of many disasters, the people rose to undertake the national mission to fight against foreign invaders and eliminate the feudal reactionaries. In the new era, with the light of the Marxism – Leninism, Vietnamese patriotism has highly developed to the target of national independence being associated with socialism.

The nationalism in the military field not only has a strong attachment to the environment, living situation, family and homeland, but also a deep sense of independence, self-control and sovereignty, which are showed with the acts to sacrifice themselves for a great cause, dare to sacrifice personal benefits for the benefit of the community and the country. All Vietnamese people love peace, but it is not a kind of peace in bondage. Therefore, whenever the enemy invades, the Vietnamese people, from young to old, are all ready to go to the battle and determined to drive them out to regain the independence and freedom. During the thousand-year history of the nation's struggle to build and protect the nation, exemplary examples of noble sacrifice for great cause always appear: They are ready to sacrifice for the independence and freedom for the nation as well as peace and happiness for the people.

From nationalism, the traditional resilience and undauntedness in struggle was formed in the cause of fighting against foreign aggression. Although the vast majority of invaders were the most powerful empires in the East, even in the world, the Vietnamese people have never trembled with fear and never surrendered. With the spirit of "being ready to die for the motherland", "better die in honor than live in disgrace", "better die in Viet Nam than live as an emperor in China", the Vietnamese people always show their tenacious will to fight against the enemy on all fronts and battlefields with any kind of forces and weapons. The most precious thing of every human being is life, but for the country, Vietnamese people are ready to dedicate their lives when necessary to the cause of national liberation.

Nationalism also becomes the common denominator to realize national unity and consistent will in the army and all of Vietnamese people, creating great military power against enemies. In the army of Vietnamese feudal dynasties, the tradition of "generals and solders like father and son in a family with singleness of mind" was built and passed from generation to generation. Standing together like flesh and blood relation is a precious tradition, stemming from the reason that all members of the army share their patriotism and deep hatredness for the enemy. On a larger scale, the national unity is also built on such foundation. In case of foreign invaders, all internal conflicts and discords would be pigeon-holed, highly expressing the spirit of community solidarity, and creating great strength. History has also proven whenever the leading forces of the country are capable of gathering and uniting all classes of people under the banner of nationalism, we could gain victory, no matter how strong the enemy is; on the contrary, if the leading forces fail to do such, failure is inevitable.

Secondly, the military humanity

Military is inherently anti-humane activity, especially in war - where the warring parties always find ways to decimate, destroy, and damage the opponents' life and materials. However, the humanistic spirit is imbued with the Vietnamese military because of the righteousness and self-defense in military organization and activities. In Viet Nam, the military force is built entirely not to dominate, invade and threaten other countries and people, but to defend ourselves, being ready to defeat any invaders and protect the interests of the state and the peaceful life of the people. The Vietnamese people always want peace and find every possible way to prevent war, but the enemy never gives up on their intentions to annex the country. Whenever the Fatherland is invaded, the army forces and the entire nation are resort to stand up for self-defense. At such times, humanity is like a spiritual fulcrum, an ideal that covers the entire life of the Vietnamese community - people, with the fundamental content of human morality, motivating each person to perform their sacred duties and lofty duties: protect the Fatherland, fight against the assimilation, oppression, exploitation and enslavement of great countries, and protect human dignity. It can be said that the goal of protecting people, defending the righteousness and justice is the highest level of perfection and humanity of the Vietnamese military. The nation's great thinkers and generals always have strong and clear declaration on such humanistic goals before, during and after each war, affirming: "using military is a cause of humanity to save the people and the country "[4, p.286],"we go into the battle to save all the people"[3, p.320].

Viet Nam's military humanity is clearly shown through minimizing the death and loss of the people and soldiers. The Vietnamese military always affirms its will to fight and win but not at all costs. We always try to find out the best and most effective way to fight in order to minimize the loss. Accordingly, the Vietnamese military always implements "quality is better than quantity", "use small forces to fight against big enemy", well combining the factors of forces - position - time – strategy to create general power against the enemy, making the enemy weaken, bogged down and led to failure.

Viet Nam's military humanity is also evident in its tolerant and humane policies in dealing with the invaders. In the history, our people had suffered the oppression of the northern feudal dynasties for more than a thousand of years, and a lot of enormous consequences caused by the brutal policies of such invaders. However, with the policy of using great cause to win cruelty and humanity to replace violence, Vietnamese people and military forces are always tolerant and humane towards our own enemies. The Vietnamese military does not aim to completely destroy the enemy, but the highest goal is to weaken the enemy's will to fight, and then driving them out of the country. The Vietnamese people always seek to awaken the invaders' native good judgment, making them being aware of the inhumanity and meaninglessness of their actions which are contrary to the God's will and people; therefore, their failure is inevitable and call them to withdraw their troops in order to avoid loss and death. Even when the enemy has been defeated, we still give them the chance to withdraw in peace. Additionally, the prisoners of war are also treated in a humane way. Above show that the Vietnamese military not only tries to limit the loss of Vietnamese lives, but also always shows the lofty humanity towards their own enemies.

Thirdly, unique military art

Military art is a creative product of Vietnamese people in preparing and carrying out the fight against foreign invaders during the process of building and protecting the country. In addition to its similarities with other countries, Viet Nam's military art has its own characteristics, expressing the independent and creative thinking of Vietnamese people. To Viet Nam, even facing with strong enemies, building up elite forces is not the only target but they include the truth, goodness and beauty. Moreover, in the wars against foreign aggression, the army was not alone, not the only force, but always the core for the entire population to fight the enemy. Therefore, Viet Nam's military art from its birth to the present has always contained unique features with being imbued with the truth, goodness and beauty, becoming a cultural and traditional military value. Depending on the research direction, there are many different approaches, but as a value of traditional military culture, the unique military art of Viet Nam is considered with two main slices, including the art of organizing war preparation and waging war.

The art of organizing war preparation in traditional Vietnamese military culture has always been thoroughly prepared with the spirit of early and remote preparation, taking advantage of peaceful times to gather, build armed forces, and prepare necessary sources, consolidating all aspects being ready for war. It is clearly demostrated with a series of strategies used by many feudal dynasties such as, "For the people"; "Sending the troops to work as farmers in a period of time when the country is in peace", "every common person could become soldiers in the war time", etc. The art of organizing war preparation with the above strategies has brought into full play the power of righteousness, built the trust in victory of the entire nation and aroused a sense of national unity for the independence. All-people war can produce desired effects be effective only when being based on appropriate methods of force organization, mobilizing the power of the entire society. Nowadays, the tradition has been developed to the strategy of all-people defense with the highest purpose of preventing any kind of war, but at the same time, being ready to win all wars of aggression, firmly defending the Fatherland – the socialist republic of Viet Nam.

Vietnamese military art is also very prominent in waging war, especially the unique ways of fighting. Viet Nam's ways of fighting contain all common characteristics and comply with the harsh rule of war - "The strong will win, the weak will lose". However, grasping the idea of proactive attack, promoting the great and endless potentials of the entire army and people, the Vietnamese military has created a lot of effective, flexible strategies and plans in multiforms, causing all invaders failed, no matter how big or violent they are. In feudal times, the strategies of "deserted country", "night attack", "surprise attack", "diversion", etc. have become the fear for the Chinese invaders. In the time of Ho Chi Minh, the Vietnamse military art had developed from the guerrilla warfare to the regular troop operations (raid, ambush, attack an entrenched fortification to decimate its reinforcements, offensive movement, air landing attack, etc.) to the combined operations among military regions or army corps, combining the general uprising and offensive of the masses.

3.3. Promoting the values of Vietnamese traditional military culture in the current situation

Currently, in the world, the Fourth Industrial Revolution has strongly and comprehensively been impacting on all fields and all aspects of social life, creating many important premises for people to develop comprehensively and become stronger. The achievements of more than 30 years of renovation have made the material life of the people, cadres and soldiers constantly improved. The army continues to receive the attention and care of the Party and State leaders. These are the basic advantages that affect the promotion of the traditional military cultural values today. However, addition to these advantages, many difficulties and challenges appear, affecting and dominating the promotion. Along with achievements in material development, the society is also facing many problems such as degradation of moral, culture, lifestyle, human personality; social evils; a part of young people "empty" of historical awareness, turning their backs on traditional values, the trend of "Western lifestyle" is taking the throne, etc. Additionally, the non-stop antigovernment in many aspects of the hostile forces has been affecting the psychology, thoughts and feelings of the masses, especially the young, creating the risk of "self-evolving", "self-transforming".

The national traditional military cultural values have proved their great role and impact on the development of Vietnamese society and people in history. In the current situation, the traditional cultural and military values not only continue to assert their role, but also show the continuous increase in their effectiveness. A value system of humanity, human love, human character and solid cultural origin in the nation's millennial military tradition are the solid spiritual support for the Vietnamese people to overcome all difficulties and challenges, creating a resilient and strong country of Viet Nam.

Today, promoting the traditional military cultural values requires many solutions, with the synchronous participation of all levels, branches and forces. First of all, it is necessary to focus on carrying out effective propaganda and education of traditional military cultural values in order to raise the awareness and responsibility of all classes of the people, especially the young. It is necessary to continue to have in-depth studies to continue to systematize, summarize, affirm, clarify and enrich the values of the national traditional military culture. Actively innovating methods of propaganda and education, focusing on new, visual methods, promoting the application of new technologies to improve the quality and efficiency of these activities. Paying special attention to traditional history education and propaganda for pupils, students, teenagers and children through history learning activities, historical monument visiting, history discussion, etc. Through the education of traditional military cultural values, to focus on building political ideologies, ideals, goals, lifestyles and develop comprehensive personality for them. To effectively carry out the above work, it is necessary to promote the creative and proactive role of youth union organizations, socio-political organizations, and at the same time, closely link school education with home training.

Well organizing practical activities, emulation movements in the whole society. The national traditional military cultural values are not only limited to the Army, but they always exist through the practices of living, fighting, labor and learning of all people. Therefore, for these values constantly spreading, promoting their effects and roles, it is necessary to put it into all practical activities, promoting the competitive spirit in the whole society. Therefore, the essential issue is to ensure "ideological value" in organizing all activities. Any organized activity should always aim at the highest goal: the direction of people towards patriotism, humanism and other noble values. Fighting against any thoughts and expressions of selfishness, or trivial material goals in practical activities. In order to gain the target, it is highly necessary to have the close and comprehensive leadership and direction of the party committees at all levels as well as the drastic and creative participation of the contingent of managers and commanders at all levels.

Building a cultural environment honoring the traditional military cultural values of the nation. First of all, it is necessary to study, refine, select and standardize the cultural value system of the current Vietnamese people, including a suitable integration of traditional military cultural values. In other words, building the current Vietnamese cultural and human value system needs firmly sticking to the traditional military cultural value systems, as well as modernizing them to adapt to the new situation. Improving the efficiency of cultural institutions in society; in which, besides promoting the cultural organizations and full-time staff, each party organization, government organization and leader also acts as a cultural institution, even a powerful and embracing one. Properly investing in the cultural activity organization as well as embellishing and preserving historical relics, works, and military cultural symbols, at the same time, promoting its effectiveness in political and ideological education and satisfying cultural needs for all classes of people. Building a cultural environment imbued with traditional military cultural values will create a very effective "cultural filter", preventing the intrusion of anti-values, anti-culture, and creating favorable conditions for the development of Vietnamese personality.

4. Conclusion

In summary, the traditional military cultural values of the Vietnamese people are a specific part of the national culture, arising and developing during the nation's struggle to build and protect the country, associated with military organizations and operations. The basic traditional military cultural values of the nation include: patriotism, humanism and unique military artistic values. In the face of rapid, profound and comprehensive changes in social life, the work of building the Army, protecting the Fatherland, as well as fighting against the hostile forces should strongly rely on the traditional military cultural values of the nation to well perform the functions and tasks of the Army and develop the personality of the revolutionary soldiers. It is necessary to actively conduct education, propaganda, well organize military practice activities and emulation movements, and effectively do the work of building a cultural environment in order to strongly promote the role and strength of national traditional military cultural values in the current situation./.

POPULATION AGING'S CHALLENGES TO VIETNAM'S ECONOMIC GROWTH AND DEVELOPMENT

MSc. La Ngoc Mai
mailn@neu.edu.vn
Faculty of Human Resources Economics and Management,
National Economics University, Hanoi Vietnam

Abstract

Vietnam has an extremely high rate of aging population and a truly short time to adapt to social problems. This change will reduce both the labor force participation rate and the saving rate, and it also raises real concerns about the slowing of future economic growth. Along with that, Vietnam will face an additional challenge of being "old" before "rich", with an income per capita in the group of low, middle-income countries. Using the annual population change survey data, the GSO's population census data and population projections, the author has specifically described the current situation of the aging population in Vietnam and analyzed several key aspects: changes in consumer behaviors, savings; pressure on public spending; human capital; capital accumulation and aggregate factor productivity; and the adjustment of interest rates, exchange rates, and foreign relations, through which population aging will affect Vietnam's economic growth in the coming period. The main conclusion of the author is that population aging presents enormous challenges but not impossible.

Keywords: *population aging, economic policy, labor force participation, life expectancy, retirement age*

1. Introduction

Vietnam, after the period of the current golden population, in the coming decades, a sharp increase in dependency ratio is expected to appear in all sectors. However, due to improved science and technology in the health sector, the population's health status is improved, and the mortality rate rapidly reduced. At the same time, in the 90s of the twentieth century, our country controlled the birth rate and succeeded in controlling population growth. However, this has created a major social challenge: The high proportion of dependents (children and the elderly) reduces the working-age population and increases the cost of care for the elderly and children, thereby reducing the country's economic growth.

Declining fertility and changes in population structure also reduce the working-age population. As the working-age population declines, the demographic dividend becomes a demographic burden for the country. The higher the population aging, the slower the country's economic growth rate is reduced, as the declining working-age population reduces the workforce, wages and productivity, savings, and investment. Besides, when the age structure changes, the changes in goods and services demand will certainly change and affect a country's total production productivity. The need for goods and services is significant to define both the production structure, the labor market, and the capital, so these factors are directly influenced by the age structure of the country's population.

A lot of research has been done in various institutions on the impact of aging on public finances, yield potential, private savings behavior... However, this article tends to analyze the factors of "general equilibrium" to fully understand the probable impact of population aging on economic growth.

2. Methods

The authors begin with the presentation and analysis of descriptive statistics on population aging size and rate, based on the results of the 2014 Labor Force and Employment Survey, the Population Census, and housing from 1979 to 2019 by the General Statistics Office; Survey of population change from 2010 to 2019 and sociological surveys on the elderly in 2019. Then, the article analyzes the overall impact of population aging on economic growth as well as Adjustment effects across two main channels through which growth can occur: labor supply and human capital accumulation. Finally, the paper emphasizes the vital role of the institutional and policy environment in determining the economic growth impact of the aging population. The author also analyzes many important demographic, behavioral, and policy factors to understand and clarify the effects of population aging on economic growth.

3. Results

3.1. The reality of the aging process in Vietnam

Population aging reflects the process of population structure transformation towards increasing the proportion of the elderly, as shown by the aging index. The Law on Vietnamese Elderly, the Elderly (Elderly) is a Vietnamese citizen aged 60 years or older. In Vietnam, due to the change in the population’s age structure following the decreasing trend of the proportion of children under 15 years old and the increase in the proportion of the population aged 60+, the aging index tends to increase rapidly over the past two decades. As a result, the ratio of the elderly population in Vietnam is much higher than the average of the developing countries and growing faster than the global average. The proportion of the elderly population has steadily increased from 7% in 1989 to 11.9% in 2019%. Although this is still lower than the overall global rate of 12.3% in 2015 [1], it is significantly higher than the general rate of the developing countries. Furthermore, the valuation of the population in Vietnam takes place at a faster rate than the world average. The World Population Aging Report 2013 [2] predicts that the total number of older people will be greater than the total number of children globally by 2047 for the first time. Table 1 below shows that the number and proportion of elderly in Vietnam have increased rapidly since 1979.

Table 14: Number and percentage of the elderly (aged 60+) in Vietnam

Source: 1979-2009 Population and Housing Census, 2012 Annual Population Change Survey, 2009-2049 Vietnam Population Forecast Results.

Unit: million people

Investigation method	Year	Population on 01/04	Number of the elderly (aged 60+)	Percentage of the elderly (aged 60+)	Population growth rate (%) of the period	The growth rate of the elderly (aged 60+) of the period
Census	1979	53.74	3.71	6.9%		
	1989	64.41	4.64	7.2%	19.8%	25.0%
	1999	76.32	6.19	8.1%	18.5%	33.0%
	2009	85.85	7.72	9.0%	12.4%	24.7%
Investigation of fluctuations	2010	86.75	8.13	9.4%		
	2011	87.61	8.66	9.9%		
	2012	88.77	9.06	10.2%		
Forecast	2040	107	22.17	20.7%		
	2049	108.7	26.95	24.8%		

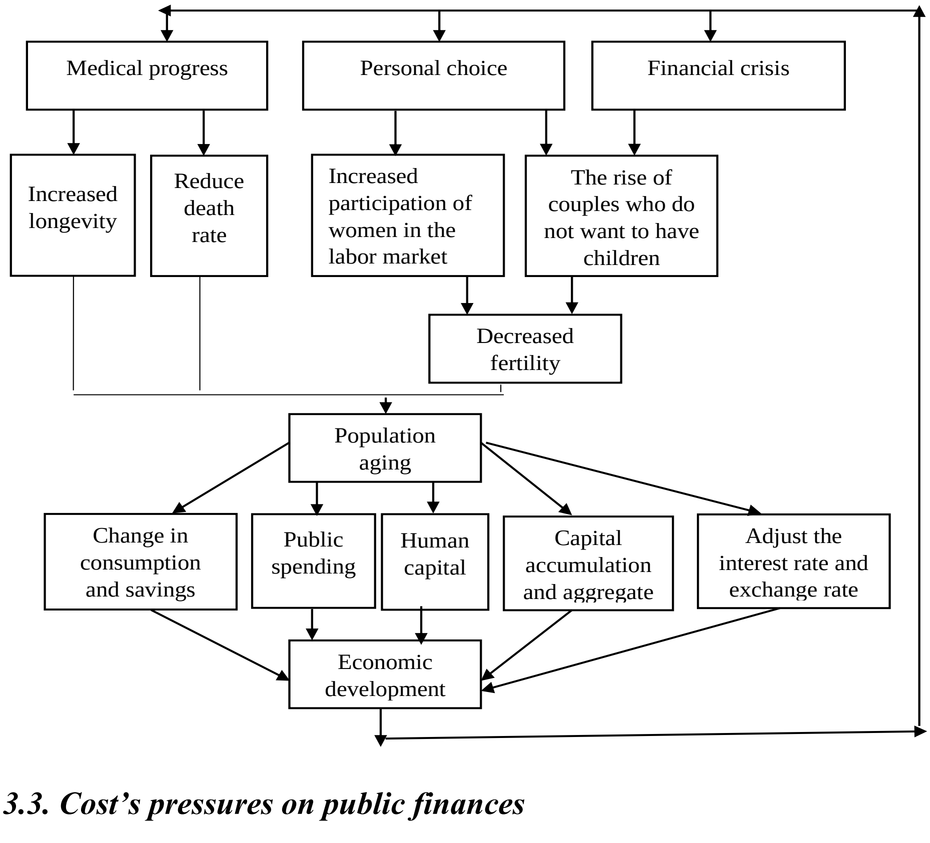
3.2. Challenges of aging for Vietnam's economic development

Models and perspectives on the determinants of economic growth are abundant in scholarly literature. Several frameworks highlight the importance of improving productivity in all sectors and the need to shift by sector. That is, reallocating labor from low-productivity agriculture to service and industrial productivity is higher. Others emphasize the contributions to growth in technological progress, human capital, institutions and governance, trade and macroeconomic policy, and random shocks. Others emphasize the feedback effects from economic growth to technical progress and human capital accumulation, which in turn affects economic growth ((Tyers and Shi, 2007) [3]

The article's main point is that the author wants to emphasize that changes in population structure by age can have a significant effect on economic growth. Besides, a few authors such as Prettner (2012) and Lee et al. (2011) confirmed a positive interaction between population aging and economic growth. According to Prettner (2012) [4], the elderly tend to save more. Therefore, they provide more resources for investment, positively impacting economic growth. An increase in life expectancy will positively affect investments, and capital is often recognized as the engine of economic development (Aghion and Howitt, 1992) [5]. However, most documents suggest that there is a negative relationship between population aging and economic growth, such as: Narciso, 2010 [6]; Bloom et al., 2010 [7]; Lisenkova et al., 2012 [8]; Walder and Döring, 2012 [9]. According to these authors, an individual's physical abilities, preferences, and needs will vary with age. Therefore, inequality in the age structure (higher proportion among the elderly) is expected to affect a country's productivity level. With the emphasis on the two main causes of population aging due to health advancement, socio-economic development that increases life expectancy and decreases fertility, the authors generalize the effects of aging. The coming population growth is mainly through the following factors:

- Spending pressure on public finances
- The effect of the factor "life cycle" on consumption and personal saving behavior
- Labor capital
- Potential effects on capital accumulation (TFP) and Total Factor Productivity (TFP)
- The role of adjustment to interest rates and exchange rates and changes in the external balance

Diagram 1: Factors interacting between population aging and economic development



3.3. Cost's pressures on public finances

Despite the uncertainties associated with all population projections, such as the thrust or pattern of demographic change that has largely been identified over the next 50 years, aging has always been an essential feature of the population. These changes and pressure on public spending in areas of budget management, such as spending on health and pensions, are associated with the development of a person's life cycle.

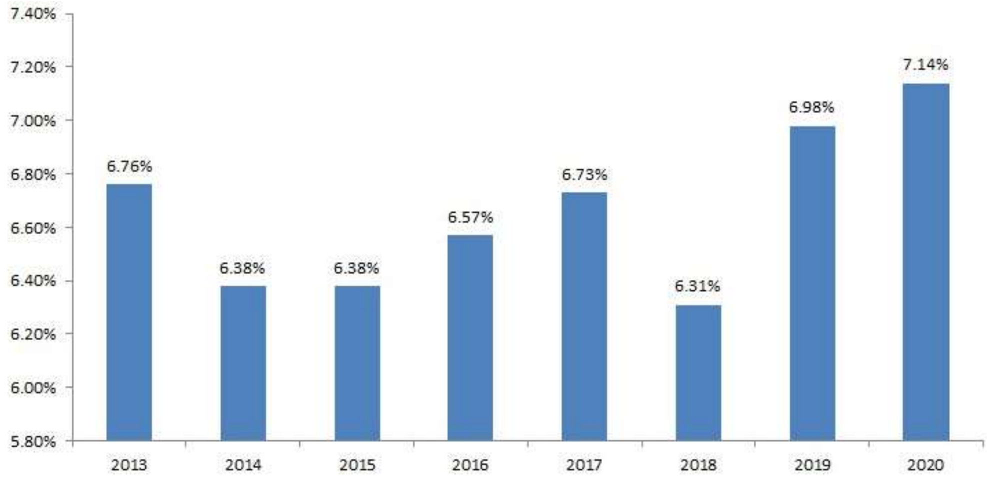
As the population ages, there is a significant increase in age-related public expenditures. Moreover, it is also worrying that if the government has no experience managing this issue, they will find it challenging to keep the budget for existing pensions and health care. These difficulties appear at present when Vietnam is in the "golden population" phase. When the demographic is relatively favorable in terms of public finance, the cost of health and pensions is calculated by % GDP, has been steadily increasing over the past few decades.

Current demographics are favorable in terms of public finances: Generally, current public finances can benefit from demographic growth (demographic dividends), with a low birth rate of the two recent decades, tend to reduce government spending. Indeed, this has something to do with the post-World War II generation of «BabyBooms» who are at their peak in their ability to make money and making a solid contribution to revenue. However, this could bring subjective feelings to the government and prevent the implementation of necessary reforms and contingencies as demographics begin to change radically over the next 10 years.

Health and pensions reform will not be easy: The government needs to face the implications of controlling spending on health and pensions over the next 10 to 50 years. As seen, these increases in expenditures are the main culprits explaining the inevitable increase in the share of government spending in GDP, but only a fraction of this pressure comes from the effects of aging, and the rest comes from other non-demographic factors.

- In recent years, as the share of children in the population has decreased, the proportion of people over 60+ has increased to over 10%, pension spending as a percentage of GDP has increased, partly explained by changes in the old-age dependency ratio and the remainder are due to other non-demographic factors such as: increased benefits and expanded pension eligibility, years of insurance contributions, related State general expansion of social welfare.
- Population aging has a clear impact on current pension systems. Policymakers have long recognized that deficits in the pension system will quickly reach unsustainable levels if no changes are made in distributing benefits and contribution rates. But policy changes from increasing contributions to social security will be a financial burden on the workforce in the future and could cause a negative response to labor supply.
- As for health spending, Oxley and MacFarlan (1994) [10] estimate that “health needs related to population aging, income growth, and insurance coverage can only explain one share of growth in public spending on health in general. However, this may be due to developments related to the provision of medical services”. In addition, public spending on health has also increased significantly to address and responds to pandemics, or the impacts of climate change and environmental pollution on human health. As the Covid-19 pandemic is a testament to this.

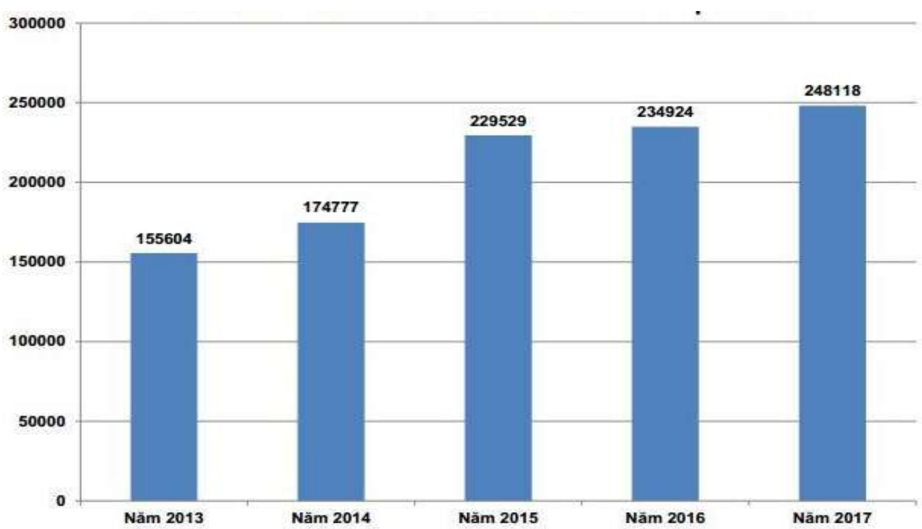
Table 1: Total state budget expenditure on health in the period 2013-2020 (%)



Source: https://nhipsongdoanhnghiep.cuocsongantoan.vn/vi-mo/chi-ngan-sach-cho-y-te-cao-nhat-7-nam-chi-tien-tui-van-vuot-khuyen-cao-3554439.html

Education expenditure: The bottom line to do here is that a reduction in budget spending on education is expected, reflecting a decrease in the proportion of children in the general population, which expected failed to materialize. The imbalance between figures and expenditure essentially reflects the large fixed cost factor inherent in all public education systems Masson, Bayoumi and Samiei (1995) [11]. Therefore, hoping to recoup spending for higher pensions and healthcare, does not seem to be coming.

Table 2: State budget expenditure for the education and training sector in the period 2013-2017 (billion VND)



Source: https://www.giaoduc.edu.vn/5-nam-ngan-sach-cho-giao-duc-tang-92500-ty dong.htm

3.4. Changes in personal savings and consumption behavior

Demographic changes and personal savings behavior: Many studies are related to the aging population and its impact on savings rates. For example, life cycle models of savings behavior show that an important component in determining the aggregate savings rate is the population's demographic profile and the tendency to save and the rate of savings. The overall dependence is expected to be negatively correlated. According to this view, savings rates are expected to be high when a large portion of the population is employed, with the savings accumulated to finance consumption after retirement. Likewise, savings rates are lower when a large part of the population is very young or above retirement age.

Personal consumption behavior: The elderly population is also the consumer group; although the consumption of this group is lower than that of other groups, but this population also contributes to the development of production of goods, and services for the elderly. Elderly groups have a longer working time and hold more assets because they have savings, the elderly can pay consumption from their own assets, so if the viewpoint that they are people dependent is not "satisfactory".

3.5. Lack of human capital

Population aging is an inevitable and aging rule that leads to more aging out of the workforce each year than young people entering the labor force, resulting in the size of the labor force is narrowing, in the long run, there will be a shortage of labor force. Along with that, the aging of the population leads to the aging of the workforce, which will lead to a decrease in productivity and labor efficiency because the aging workforce will be less agile and dynamic in approaching public science technology, job change training, or even the labor productivity of physical strength. In Viet Nam, the data only show that the aging index of the four key economic regions is the highest in the country, which will potentially risk a lack of local human resources in these regions. The current golden population structure of Vietnam also requires the exploitation and utilization of potential labor resources, requiring the State to actively create jobs and promote vocational training to meet the needs of the labor market is increasingly competitive.

3.6. Impacts on capital accumulation and aggregate factor productivity

Capital accumulation: Savings and investment have an important role in helping offset the effects of increased dependence, with higher savings leading to higher investment efficiency and long-term higher growth. In this way, the negative impact on living standards resulting from a decrease in labor supply can be offset by the rate of increase in labor productivity resulting from increased capital. However, this increased investment to drive long-term growth is likely to be cut off, as the rate of national saving is expected to decline due to demographic and non-demographic factors. It is clear that technical progress plays a large role, and it is important to accept those larger savings, which can convert into greater physical and human properties. These increasing options can be available to deal with the adverse effects of the aging process. Therefore, cautious action is required to increase the national saving rate in the medium to long term.

Total Factor Productivity (TFP) is an indicator reflecting the production results brought about by improving the efficiency of capital and labor, thanks to the impact of new technology, streamlining production processes, improving management… However, it seems complicated to determine with certainty whether the demographic change will be positive or negative for productivity. According to some studies, that could be detrimental to productivity growth if the aging workforce becomes less active and creative. At the same time, other researchers have a different view that technology changes can be promoted to offset the negative effects of labor scarcity Simon (1986) [12] and Wattenberg (1987) [13].

3.7. Interest rates, exchange rates, and external relations balance

The development of savings and investment affects potential growth and interest rates, exchange rates, and international capital movements. The global and regional movements are also variables that are later driven by various pressures on the savings/ investment fronts. Collectively, when the savings/ investment imbalance arises at the world level, such tensions manifest in real interest rate volatility. In contrast, regional tensions lead to changes in exchange rate and net foreign asset position. Among the many factors that can put the savings/ investment balance that demographics could cause in the coming decades, the following stand out for particular attention:

- Adverse effects on private and public savings: These pressures will vary between countries, and this difference will inevitably create a strain on exchange rates and current accounts.
- Negative effect on output growth: If this happens less investment will be required as slower growth in output will automatically translate it into a needed decrease in the growth rate of reserves.
- Changes in the relative share of the output of developed and developing countries

4. Discussion and Conclusion

The population is both a productive force and a force of consumes social wealth. The size and structure of the population will determine the size and structure of production and consumption and therefore play a crucial role in the socio-economic development. Population aging has been occurring in several countries, including Vietnam, posing many challenges to economic growth, with the important premise that labor supply, productivity and savings change with life cycle:

- First, preliminary estimates of the effect of population aging on labor force participation rates and the simultaneous impact of changes in labor force participation rates on the growth economy
- In addition to fundamental resource constraints, the dominance of the informal sector in Vietnam makes the design and implementation of pension, and social security systems, that becomes more and more difficult.
- The next problem that Vietnam faces is the rapid aging of the population, so the pension system and the healthcare system face unprecedented challenges.
- In another situation in Vietnam, the family remains the mainstay of care for the

elderly. However, as life expectancy becomes longer, a family structure may be disrupted, leading to a public transfer system, will change the rate of budget spending for the health system, construction of infrastructure of the State.

To adapt to an aging society or to actively step into aging, it is required to join the entire political system and especially the conditions of policies and laws of the Party and State. In particular, the policy environment plays an important role in the impact of aging on economic growth. New approaches will be needed if countries consider the natural dynamics individuals face to adjust their behavior in the context of population aging. Through analysis and inquiry, the authors have a few recommendations:

Firstly: One of the often encouraged policies is the change of retirement incentives so that people can fulfill their desire to work longer to meet higher life expectancy expectations. More flexible old-age pension arrangements combined with an increase in formal retirement age will encourage long-term workforce participation. Along with that, legal and cultural efforts are also needed to prevent employment discrimination. Lifelong education programs can support these efforts by helping people, especially the elderly, adapt their skills and knowledge to the needs of a changing economy.

Second: Investing in improving the health of those 60+ is an essential policy choice, and health care and healthy lifestyle changes for the young and middle age are also a long-term policy. This approach reduces the burden on the health care and social security systems and allows people to work longer by reducing the incidence of illness into fewer end-of-life years.

Third: Policies and laws against gender discrimination and increased child care support have helped expand the working environment for women in many countries worldwide. Pressure to raise wages is likely to increase women’s participation in the workforce. This could be complemented by policies that enable mothers to combine work and home, such as State-funded child care and more flexible working hours. Of course, the second approach also encourages the upbringing of children, with long-term effects on the age structure.

Fourth: Immigration for developed countries can also make a big difference. However, for Vietnam, the uncontrolled labor export and the brain drain of a high-quality workforce have a huge impact on the quality of the labor force. Therefore, policies on salaries, bonuses, subsidies, and remuneration for employees also play a crucial role.

Fifth: A more important policy consideration addresses the funding gap caused by latent intergenerational transfers in the pension and health systems. Policies that can help reduce the elder’s “dependence” include adjusting premiums and benefits or switching to total funding or individual account systems, whereby individuals can withdraw less. Most pensions from investments are made during employment and they also have a larger amount to withdraw when they retire. Moving to such a system would require large organizations to efficiently and securely attract enough personal savings and investment and financial reserves to pay for the transition of the old generation.

Abstract

Time management is important and it may affect an individual's overall performance and achievements. For university students, time management plays a vital role in improving their academic performance. Although there have been a number of studies from all around the world showing the relationship between time management and student learning outcomes, in Vietnam, the relationship has not been adequately explored and poorly understood. This study aims to investigate the relationship between students' time management and academic performance. By using quantitative methods with a sample of 455 students studying in economics and business administration fields, the research reveals that two factors namely Planning and using time management tools and Improvement and adjustment positively impact on students' academic performance. Based on analysis, several recommendations are given for students to improve their time management skills.

Keywords: *Academic performance, students, time management.*

1. Introduction

Students are the key assets of universities. Student's academic performance plays an important role in producing the best quality graduates who will become high quality human resource and will be responsible for the country's economic and social development. Academic achievement is one of the major factors considered by employers in recruitment of labour, especially of fresh graduates. Thus, students need to put the greatest effort into their studies to obtain good grades and to prepare themselves for future opportunities in their career as long as to fulfil society's demands.

There are numbers of factors influencing students' academic performance. Among them, time management is recognized as a significant factor. Koch (1998) pointed out that time management is considered a very important element for personal and corporate success, especially in the professional environment. For individuals, time plays an important role in completing tasks on time, and in business, every minute can be converted into profit. According to Macan et al. (2000), the secret to achieving success in life is effectively managing the resource that everyone possesses equally, which is time in this case.

In higher education, students from different majors, especially students in economics and business administration, believe that academic success depends on such objective factors as intelligence, assignment accomplishment ability, passing final exams, etc. (Hansen, 2000). Others think it depends on personal time management (Eliseo P. Marpa, 2014; Barbara et al., 2015).

In fact, most university students these days are often prone to falling into unprofitable activities, which in turn affects the time and quality of other jobs. Instead of considering the urgency and importance of the remaining jobs, many of them tend to do things they enjoy or what are easy first. Besides, most students of the current generation are not aware of the importance of planning. As a result, they often neglect important tasks or do not have time for unexpected ones. This may have a bad effect on their daily life in general and academic performance in particular (Ali et al., 2009).

The objective of this study is to investigate the relationship between time management and academic performance of students in Hanoi, Vietnam. The quantitative method is applied with a convenient sample of 455 students studying in economics and business administration. *Based on analysis of the relationship, the study hopes to come up with several recommendations for students and higher education institutions to improve students' time management skills and academic performance.*

2. Literature and hypothesis development

Time management

Shellenbarger (2009) views time management as behavioural change techniques that help people get organized, clarify their thinking and increase their outputs. In this study, the outcomes are learning outcomes. The measure of students' academic performance used in this paper is the Great Point Average (GPA) - a measure supported by the studies of some authors such as Adebayo (2015), Kaushar (2013), and Jalagat (2016).

There are many different ways for effective time management. According to David McDonald (1983), time management consists of four elements: planning, scheduling, monitoring, and control. Jo-Ana D. Chase et al. (2013) suggested that time management approaches include monitoring, setting goals, prioritizing, planning, commiting rights and time analysis.

Based on previous studies, the research team argues that the simplest approach to time management is from consciousness to action. Having positive thoughts helps form good time management habits. Time management routines include planning for certain time periods, testing and evaluating and improving process use of time. At the same time, a person should use time management tools such as notebooks, time management applications, time management matrices, and innovative tools such as 5S, Kaizen, etc.

Previous researches

There has been a growing concern over the relationship between time management and learning outcomes for the last few years. In general, many research and articles from all over the world have indicated this relationship in order to improve students' learning outcomes through time management. However, in Vietnam, there have been several researches on this issue and they mostly were conducted in the South of Vietnam.

In 2014, Miqdadi and colleagues conducted a study on the relationship between time management and academic performance of first-year and second-year male students at Petroleum Institute in Abu Dhabi. The respondents did not include female students and international students because the authors believe that their habits and lifestyles can affect and make a difference in time management habits. This study has come to a conclusion that there is a relationship between time management and academic performance of the male PI Student in UAE. Research has shown that male students tend to use their time inefficiently, leading to unsatisfactory academic results. However, this study has only been conducted on male students of the technical school and has not yet reached female students, so it cannot be generalized to all types of students.

The study of Eliseo P. Marpa (2014) disclosed that correlations existed between mathematics students’ time management and study habits and math major students' study habits and academic achievement. Results of the study reveal that time management of mathematics students was average. They do not manage their time well.

The study of L. Miertschin and colleagues (2015) suggests that relationships do exist between students’ time management behaviours, development of time management skills, and the design of online courses. However, these relationships are not close. In the other words, time management has an unremarkable impact on students' academic performance.

The research by Hoang Khac Hieu & Huynh Van Son (2011) focuses on studying students' time-consuming habits in Ho Chi Minh City. In this study, 1021 students from different universities had been surveyed. The research results show that these student's time management ability is only average. In addition, many students have difficulty maintaining good time management habits such as planning, dividing work, etc.

Dinh Thi Hoa and colleagues (2018) conducted a study to analyse factors that affect the learning outcomes of students in the economics department at Dong Nai University. The authors gradually removed the unreasonable variables, reran the model after eliminating the inconsistent variables and the results were consistent. However, the limitation of the research model is that the survey scale only focuses on final-year students, so the generalization of all students is not high.

In general, there have been a number of studies conducted to learn about the influence of time management on student academic performance. However, the results of each study differ in the impact of time management, caused by different groups of students in specialized, personality and culture. The sample of the study is not large, and also made the results of the study not overall. In particular, in all studies, no research has pointed to the factor "Improvement and adjustment" as a factor that directly affects the management of time. Most studies only mention this factor as a condition added to the study.

In Vietnam, previous studies have not specified how time management affects student academic performance. Studies providing an overview of factors that influence academic performance are mostly concentrated in Southern Vietnam. Given the reasons, the authors focus on the impact of time management on the academic performance of Economics and Business Administration students in Hanoi.

Hypothesis development

Attitude to time management

The perception of how their time requires to be used up or planning including utilizing short and long period goals and time attitudes or students accomplished that both planning and encouraging time attitudes initiated that they had much more time to finish their everyday jobs because they experiences more in control of how their time (Nasrullah & Khan, 2015). Denlinger (2012) also reported that self-perception of having good time-management skills proved to have a direct correlation to performance levels. Considering these views, it was hypothesized that:

[H1] Having a good time attitude has a positive impact on the academic performance of economics and business administration students in Hanoi.

Planning

Planning is defined as the process of identifying goals and choosing ways of action to achieve goals. Kaushar's research (2013) has shown a positive relationship between student planning and academic performance. In other words, when students plan well, the academic results will also be better. Other authors such as Dahie, Osman & Mohamed (2015), Narsrullah & Khan (2015), etc. It is also agreed that planning has the same impact on student academic performance. Thus, the second hypothesis is that:

[H2] Good planning positively has a positive impact on the academic performance

of economics and business administration students in Hanoi.

Using time management tools

Research by Jo-Ana & Associates (2013) published in the Western Journal of Nursing Research has produced research that suggests that people who are likely to refuse jobs that don't create value often achieve better personal achievements. Through in-depth interviews with a number of subjects, the team obtained the result that students who regularly use time management tools often have better academic results. The third hypothesis is stated as following:

[H3] Using time management tools has a positive impact on the academic performance of economics and business administration students in Hanoi.

Self-examination and evaluation

Research by Hamoud Mohammed Alshaya & associates (2017) has shown that students who perform a routine goal-based results assessment often have good academic performance. Research by Karima Sayari, Revenio Jalagat & Van Dalluay (2017) also agrees with this view. The fourth hypothesis is stated as following:

[H4] Self-examination and evaluation has a positive impact on the academic performance of economics and business administration students in Hanoi.

Improvement and adjustment

Improvements and adjustments are necessary activities after detecting problems that arise during the use of learning time to repair, adjust and eliminate them. At the same time, improvement is constantly growing, finding ways to be able to use time more and more effectively. Thus, we suppose that:

[H5] Improving and adjusting time management has a positive impact on the academic performance of economics and business administration students in Hanoi.

Table 1. The table encodes indicators

	Variables	**Encode**	**Reference**
Time Attitude

Research model

The research model consists of 5 proposed variables which are 5 factors that affect time management, affecting the learning results of the students: (1) Attitude to time, (2) Planning, (3) Using management tools, (4) Self-examination, evaluation, (5) Improvement and adjustment. Dependent variables are student academic performance (Grade Point Average).

Observation variables are built on a Likert scale of from 1 (Completely disagree) to 5 (Completely agree).

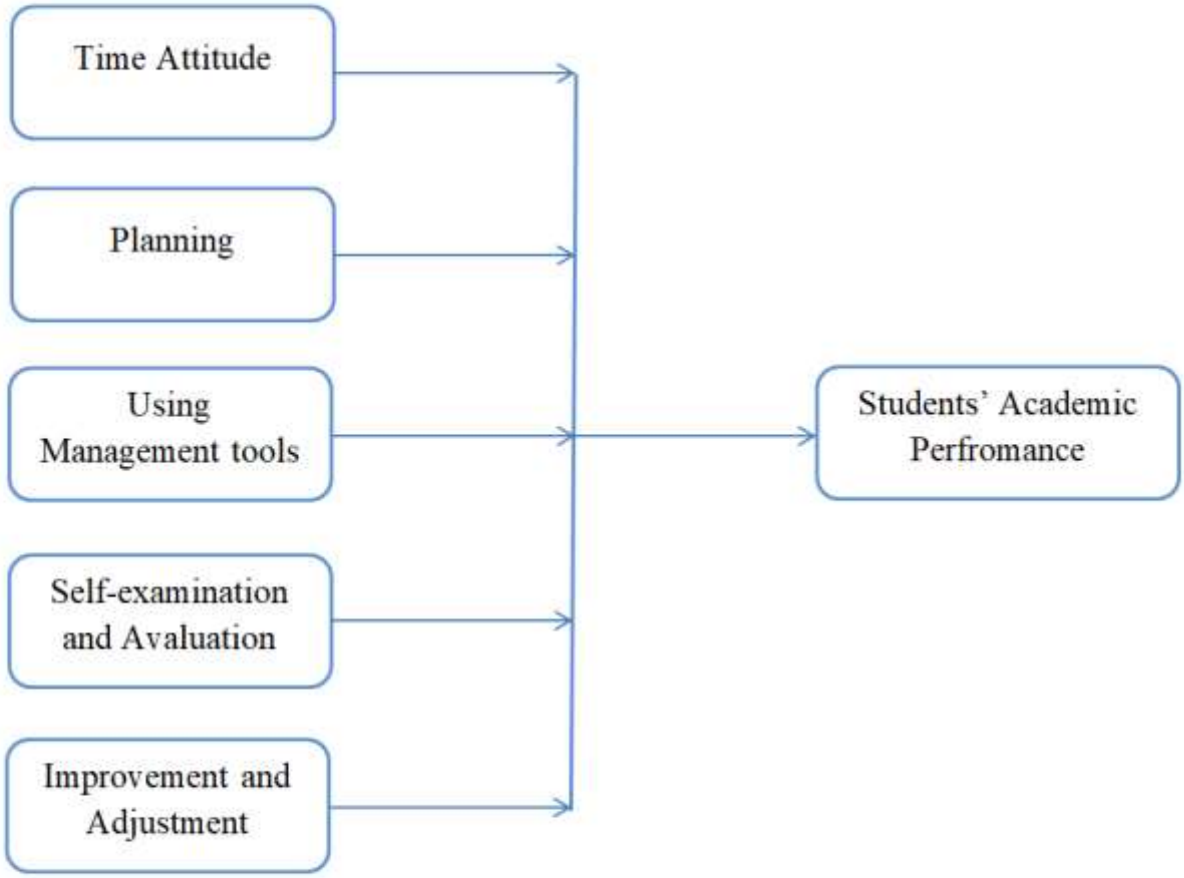

Figure 1. Research model

Source: conducted by the author

3. Method

This study was conducted with students studying economics and business administration universities in Hanoi, Vietnam. By conducting the official survey on a total of 22 universities educating these two majors, the research team obtained 455 valid responses.

Data collection and analysis:

Step 1: Secondary data collection: collected from previous research papers on similar or related topics.

Step 2: Research overview: synthesizing information from sources, secondary data collected in the first step and writing a research overview. From those data, the research team confirms a research gap.

Step 3: Building research models and hypotheses.

Step 4: In-depth interview: after building the research model, the research team continued to interview students and lecturers at universities in different fields of economics and business administration in Hanoi to build the questionnaire.

Step 5: Building the expected questionnaire.

Step 6: Trial survey: conducted on a small group of students to receive comments and edit the survey.

Step 7: Rebuilding the survey and conducting the official survey at universities under the research scope.

Step 8: Data synthesis, processing and analysis: synthesizing processing the primary data obtained. After that, start to analyze and evaluate the analytical results obtained, verify the hypotheses given.

Step 9: Synthesizing all the content done to complete the research to make conclusions and recommendations.

4. Results

4.1. General information of the sample

According to the data analysis result, among these surveyed students, 47.3% belong to the third-year students, whereas 21.5% belong to the second-year ones. The freshmen and the seniors are 12.1% and 13.0% respectively.

It also reveals from the study that students studying Business Administration account for 33.2%, Economics' occupy 28.1%. The student rate of the remaining three surveyed factors (Banking - Finance, Accounting - Auditing, and other majors) is quite equal. The majors mentioned in the survey have a large number of students studying at the School of Economics. The sample is representative of the overall.

Among the 455 valid answers, 25.9% of students come from National Economics University, Foreign Trade University placed in second place with 19.6%, Thuong Mai University constitutes 14.9%, and the 19.8% left belongs to the University of Economics and Business - Vietnam National University, Hanoi and others.

The academic performance within the last semester, 42.2% of students have got GPA at level 3 (from 2.5 to 3.19). 35.4% of students have scored level 4 (from 3.2 to 3.59). Around 15.0% of students have got 3.6 to 4.0 at GPA while there are no students who have scored lower than 1.99 GPA in their last semester.

4.2. Findings

After analysing Cronbach's Alpha coefficients for each group of observed variables depending on different factors, only the factor TĐTT1 is eliminated because the corrected item-total correlation is less than 0.3, the others factor are kept with the Cronbach's Alpha is higher than 0.6.

After selecting the qualified variables, the research team continued to determine the number of factors to retain in EFA with 3 times of conducting.

Table 2. Final EFA analysis result

Source: Result of the study

In Bartlett's test, the sig. value = 0,000 <0.05, it means the data used for the analysis is appropriate, the remaining variables are convergent, suitable for analysis purposes in the next steps.

The results also showed that the remaining 18 variables were allocated to 3 new groups.

Group X_1: Including 8 variables, TĐTG2, TĐTG3, TĐTG4, LKH1, LKH4, LKH6, LKH7, KTĐG1. The variables are mainly about student attitudes and awareness of the importance of planning and time management. The research team named this group is Attitude to time management.

Group X_2: Including 4 variables, LKH2, LKH3, CCQL2, CCQL3. Due to these observed variables mainly referring to short-term and long-term planning habits, and showing how often students are using management tools, the research team named this group is Planning and using the detective management tools.

Group X_3: Including 6 variables, CTĐC1, CTĐC2, CTĐC3, CTĐC4, CTĐC5, CCQL1. Because the variables mostly belong to the Adjustment, Improvement factor, the research team decided to remain the name of this group as Adjustment Improvement.

In the table of Coefficients analysis, the sig. value of group X1 = 0.888 > 0.05 whereas the sig. value of group X2, X3 < 0.05. It means, group X1 has no statistical significance, group X2 and X3 are statistically meaningful in the model.

So, group X1 has no statistical significance in the model. In other words, group X1 has no effect on student academic performance. But according to the result of testing the correlation, there are multi-collinearity phenomena between X1 and X2, X1 and X3. In conclusion, group X1 has effects on group X2 and X3, but has no effect on student academic performance.

Regression model: KQHT = β0 + β1 X2 + β2 X3

Table 3. Model summary

Model summary					
Model	R	R square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	0,450[a]	0,202	0,199	0,744	1,930
a. Predictors: (Constant) X3, X2					
b. Dependent Variable: GPA of the last semester					

Source: Result of the study

Regression function: KQHT = 1,186 + 0,275*X2 + 0,377*X3

The result shows that, if X2 (Planning and Management Tools) increases by 1 unit, the academic performance will increase by 0.275 units. And if the variable X3 (modified improvement) will increase by 1 unit, the academic performance increases by 0.377 units as well.

4.3. Discussion

The factor X3 has $\beta = 0.372$. The results show that the set of factors that have the highest mean and highest influence on the academic performance of students are Improvements and Adjustments in time management. The influence of this factor accounts for 37.2% of academic performance. The fact shows that most students are aware that they need to improve their time management process but do not believe that modifying their time management process can improve their results. According to descriptive statistics, most of the questions about improvement and adjustment in time management are responded to by research subjects at a neutral or agreed level, which proves that students at economic schools are somewhat aware of the adjustment but vague and not implemented seriously and methodically.

The factor X2 has $\beta = 0.275$, reflecting the influence of this factor accounting for 27.5% on learning results. Thus, when there are no adjustment factors, planning and using the detective management tools increases by 1 unit, the results of students' learning results increase by 1,461 units. Many students now choose the form of planning, implementing, applying the formulas, and allocating time to their time management to easily track the journey in pursuit of their goals. However, that number is not the majority. Students who do not plan for their life are still aware of the importance of time but cannot maintain the habit or think of planning and learning about time management tools that are time-consuming, effortless, and useless. Planning does not inevitably give students an excellent result. But planning will improve the results of students' academic endeavors.

The adjusted R2 value of 0.199 determined by the two groups of factors above means time management accounts for 19.9% of student learning outcomes. So, time management is a factor that positively affects learning outcomes, but the impact is not too good. This result is perfectly plausible because time management, especially "Planning and management tools"; "Adjustment and Improvement" are not the only factors influencing student learning outcomes. Previous studies have also shown that many factors influence student learning outcomes. Research by the authors Dinh Thi Hoa, Hoang Thi Ngoc Diep & Le Thi Kim Tuyen (2018) has shown that many factors affect student learning outcomes such as (1) knowledge and how faculty organization (2) friends (3) steadfastness (4) competition (5) service (6) facilities (7) school impression (8) classroom interaction (9) learning methods (10) commitment to learning, and ultimately (11) motivation. In conclusion, time management is just one of many factors that can affect a student's academic performance. However, this is a factor that can be changed and developed over time.

5. Conclusions and recommendations

5.1. Conclusions

In general, the research has answered the proposed questions, including the use of time and time management of students in economics and business management field in Hanoi; the relationship between time management and students' academic performance, and what time-management factors influence students' academic performance? The study also systematized the factors of time management and their influence on student learning outcomes, including "Planning and using time management tools" and "improvement and adjustment" two groups of factors that have high impacts on learning outcomes.

5.2. Recommendations

In order to make students achieve higher learning result, students should increase their awareness of time management, learn how to plan and use effective time management tools. They should also constantly learn new things, improve time management skills to achieve better academic peformance. Lecturers and managers of universities play an important role in orienting and creating a favorable environment for students to improve this soft skill. They should eliminate activities that are not beneficial for students, focus activities that bring value to students, and orient students to practise time management skills.

RELATION BETWEEN ISLAM AND MALAYSIAN POLITICS

MA. Phan Minh Chau

phanminhchau2010@yahoo.com

Thua Thien Hue Pedagogical College, Thua Thien Hue, Vietnam

Abstract

Currently, Islam has developed rapidly and become a multicultural belief, a religious community covering many cultures around the world, including Malaysia. Islam was introduced into Malaysia around the 15th century and played an important role in political and cultural life here. During its seven centuries of ups and downs, Islam has had a great influence on spiritual and material life and become an indispensable element in Malaysian culture.

However, the dogmas of Islam, which actually encourage believers to be more active and try to increase their power, are propagated as a religion that goes against the development of history, associated with poverty and backwardness. Islam was ethnicized and politicized at the same time. In that context, in order to build an independent, prosperous country with a unified culture, Malaysia had to solve problems related to its ethnicity and religion. Especially in the current context, when Islam is the most prominent and complex issue in the region and the world, associated with all aspects of the political life of many countries, and Malaysia is not an exception.

Keywords*:* *Malaysia, Islam, politics, religion.*

1. Introduction

Today, the relation between religion and politics is considered a central issue in the history of modern Islam. It can be said that, there is no separation between religion and government in Muslim countries in general or Malaysia in particular and it is difficult to distinguish between canon law and national law.

As an official religion, Islam has become the way of life of the Malaysian Muslim community, becoming a determining factor in ethnic and national cultural identity. Thus, Islam not only changes the external structure of society but also changes the internal structure, that is, its spiritual value. Malaysians follow Islam, eat foods that are allowed by Islam, live according to the rhythms of Islam, dress in the style of Muslims and perform Islamic rituals. Islam has truly raised the national consciousness of Malaysians and created a new framework for their national identity.

This topic will contribute to clarify the process of Islam's introduction to Malaysia; The relationship between religious power and political power; The influence of Islam in Malaysian political life.

Some sources the author has used:

Islam in Malaysia (Pham Thi Vinh): Presents an overview of "Islam in Malaysia" and its influence on all social, cultural and political spheres of Malaysia.

Federation of Malaysia, cultural history and modern issues (Institute of Southeast Asian Studies): Islam in Malaysia was introduced to the basic features, the process of Islam infiltrating and affecting aspects such as culture and society. However, it has not gone deeper into the cultural and social aspects. It shows the influence of Islam on all aspects of Malaysia.

Through the above works, it shows that the issue of "Relation between Islam and Malaysian politics" has been studied from many different angles, but most of these works are still individual and not comprehensive.

In the current era, along with the general development of the world in general and Malaysia in particular, Islam is constantly changing and increasing its influence on countries around the world. But how much influence does Islam have on Malaysian politics? These are issues that need to be studied and clarified.

With that in mind, the author chooses the topic "Relation between Islam and Malaysian politics" to contribute to a better understanding of Islam and its effects on politics in Malaysia. It is a source of material of scientific and practical significance.

2. Methods

To solve the scientific problems posed by the topic, the author has used:

Historical method: to see the overall development of Islam in specific historical periods as well as its influence on Malaysia in general.

Logical method: to consider the relevant facts in the dialectical relationship of the development process, the process of historical perception, thereby finding out related issues.

3. Results

3.1. The introduction of Islam into Malaysia

Since the 9th century, Arab Muslim merchants have already known the land of Southeast Asia. Old Malaysian history mentioned merchant ships to the coasts of Sumatra, Riau Lingga and Pulau Tioman, but there was no record of organized trade there until the middle of the 10th century. Andaya claimed that: "The first evidence about the activities of Islam in Southeast Asia is the report of Marco Polo in 1292. Marco Polo's report is about the city of Perlak (or Ferlec) that followed Islam, in Marco Polo's travel diary, he recounted as follows: Ferlec was a kingdom located so far south of the South China Sea, the Sarrasins (Islam) came here so often that they converted the natives to believe in Muhammad, just only in the city and the people living in mountainous areas live primitive lives, cannibalize and worship natural spirits. (Marco Polo, 2008, p.255)

By the 13th century, an important event for global trade took place in the world: Mongolia, a newly emerging empire in Southeast Asia, destroyed the Arab Empire (1258), occupied Asia, part of Europe, and cut off the way to trade spices from East to West [66] of Muslim Arab merchants. To save the situation, a new road was opened by the Indians, not the Arabs. This road begins in the East through India, the Strait of Aden, the Red Sea, the port of Alexandria and goes north. Because the king of Egypt opened the port of Alexandria, large ports such as Cambay, Surat and Diu in the Gujerat region (India) flourished. In addition, Europe in this period prospered, the demand for goods and the expanding market made Gujerat occupy a prominent position in the market of flavorings.

In the 13th - 15th centuries, Muslim merchants came to the Malaya archipelago - Indonesia to trade, settle, and marry natives, creating very favorable conditions for Muslim monks to invade into this land for evangelizing. The native aristocracy, long coveted for Muslim wealth, gladly welcomed, befriended and adopted their religion. However, not only merchants in Gujerat, but also merchants in Malabar, Coromandel coast, Bengal... also contributed to spreading Islam into island Southeast Asia. As a result, in the 13th - 15th centuries, some countries in Southeast Asia such as Pasai (Indonesia) became Muslim countries. Malaysia was then converted later, in the XIV - XV [67] centuries. In the early 15th century, the king of Melaka, Parameswara (1403-1424), converted to Islam, taking the Islamic name Iskandar Shah. From here, Melaka was not only the center of international trade but also the largest center of religious propagation at that time. Following Melaka's example, other states in the north Demak, Terengganu, Kelantan… through marriage and trade, gradually established good relations with Melaka. From businesses, Islam from Melaka went to Terengganu, Pattani, Kelantan, Borneo. The Melaka Sultans, who saw Islam as a sharp weapon to expand their territory and spread their religion, vowed to help the minor states to escape the Majapahit rule on the condition that they have to follow Melaka's Islam. Meanwhile, the title "Sultan" strongly attracted the aristocracy of small states to convert to Islam, creating favorable conditions for Islam to flourish. During more than a century from 1403 until the Portuguese invasion (1511), Melaka was a wealthy country, a dynamic international trading center and the largest Islamic center in Southeast Asia and since here, Islam spread to most of Western Malaysia and had a profound influence on the spiritual and social life of Malaysia.

After infiltrating Melayu, Islam quickly developed and occupied an important position in Malaysia, which was understandable, because the process of Islamization here had many advantages:

First, Islam came to Malaysia at a time when the Majapahit Hindu empire was in crisis and disintegration. At this time, trade in Southeast Asia was caught up in the whirlpool

---

[66] *The route that Arab Muslim merchants opened before the 13th century was from the East through the Persian Gulf, the Levantine coast and then to Northern Europe, which was very busy at that time.*

[67] *It is written that, before Parameswara followed Islam, there was an earlier country in Malaysia that followed Islam, typically Kedah. According to the Kedah Chronicle, at the beginning of the fourteenth century, the ninth king of Kedah, Ong Mahawangsa, converted to Islam and changed his name to Mudzaffar Shah I (1136-1179). Since then, there have been 27 Muslim kings ruling Kedah.*

of the international market vortex; The caste system of Hinduism is outdated, not suitable for the development needs of the market and society. The crisis of Hindu ideology has created an emptiness of belief, a big gap for Islam to enter and develop. Islam with the idea of freedom and equality, helps to liberate people from the harsh concepts of Hinduism and towards a large Muslim community.

Second, in Southeast Asia, at that time, there was an economic shift. From an early subsistence agrarian economy, it has now become an important center for spice trade, especially for developing Europe. Through the trade routes, Islam has gradually penetrated into Malaysia. The principles of equality and liberality of Islam are suitable for the people and aristocrats, so they have been warmly welcomed by them. In that context, Islam became the flag of the small states fighting against the Majapahit empire and gaining independence, typically Melaka. From a poor fishing village, Melaka has gradually risen to a powerful military country with great economic potential. It was the success of Melaka that encouraged the Majapahit countries to convert to Islam and participate in the international market.

Third, Islam came to Southeast Asia in peace, so it was suitable for local people's psychology, helping them easily integrate into this new religion. Tolerance and good adaptation to local beliefs reduced envy and hatred among indigenous people, making them easier to accept the new religion. In the Malaysian kingdoms, the Kings played an important role in spreading Islam in Malaysia. In Sejarah Melayu, the image of the king is considered the center of the kingdom, the subject for all subjects to be loyal and obedient. Without a king there would be no kingdom. If the king follows Islam, all the people will follow. A specific example in Melaka is that "the king, after converting to Islam, ordered his officials and subjects in Melaka, whether high or low, to become Muslims." (Milner, 1985, p.27). And another factor that also facilitates Islam to spread quickly to Southeast Asia is mysticism (Sufi). Many scholars believe that, when coming to India, Islam absorbed and transformed it into a feature of regional culture. When coming to Malaysia, Islam has a mixture of mystical elements that penetrate strongly into Malaysian residents while they are still heavily superstitious.

Fourth, the use of the Malay language made Islam spread faster on the peninsula. Before Islam came, this language was widely used by residents in communication and trade in the Malayu archipelago - Indonesia. When Islam entered, this language has become the national language widely used in political, economic and social aspects of Malaysia. And not only in Malaysia but in mainland Southeast Asia, Melayu is still spoken in religion in Southern Thailand, Cambodia and Vietnam.

3.2. The Role of Islam in Malaysian Politics

Islam is the second largest religion in the world with about 1.57 billion followers, accounting for 23% of the total world population. In the current globalization context, Islam, like any other religion, is experiencing changes in political, cultural and social life to find ways to adapt to new circumstances.

3.2.1. Unity between religious power and political power in Malaysia

Today, the relationship between religion and politics is considered a central issue in the history of modern Islam. It can be said that in Muslim countries in general or in Malaysia in particular, there is no separation between religion and government and it is difficult to distinguish between canon law and national law. Islam has become the lifestyle of people in all aspects. Although it is an international religion and has a religious center in Mecca, Islam does not have a unified "church", no hierarchy. The religious power therefore does not lie within the "church" but is determined by the followers. Therefore, separating religion from politics is not easy in the case of Islam. Leaders are also missionaries, exerting government influence through mosques.

During the 1970s and 1980s, many political leaders were seen identifying their regime and themselves with Islam. The union between religious power and political power is one of the important features of the Muslim world. When looking at the future of Islam, many scholars believe that it is necessary to separate these two powers to break down all barriers and pave the way for Islam to develop. However, as Islam has spent thirteen centuries maintaining the unity of religious power and political power, the separation is a challenge for the Muslim world and the rest of the world, especially the West.

In Malaysia, the Malay Muslim community makes up half of the country's population, while the Chinese community doing business in cities accounts for about 30% of the population, the Christian community and semi-dwellers on the island of Borneo account for 11%, and Indian descent take up 9%. Malaysia is a multi-ethnic, multi-religious country in which Islam has a special place in the political, cultural and social life of the country. The status of Islam is enhanced because it is the official religion of the Federation and also the religion of the indigenous Melayu community - the largest population, and throughout the history of Malaysia has always prevailed politically and legally. However, Malaysia not only has the Muslim Melayu community, but also has many communities following different religions and beliefs. Muslims account for over 60% of the population, but are concentrated mainly in the countryside, where the economy is weak and backward. Therefore, since independence, Malaysian leaders have been particularly interested in the ethnic community base of society and politics in a multi-ethnic country like Malaysia. They see the need to maintain the political dominance of the Muslim Melayu people, but also to find a way to reconcile with other communities to ensure political stability and security, to create a foundation for the country's construction and development. Therefore, they have classified ethnic and religious issues as "sensitive" issues that need proper attention.

In a multi-ethnic society, the complex relationship between ethnic groups is one of the factors that determine the political destiny of the country, especially when those ethnic community groups are aware that differences between them and other community groups is the difference in ethnicity, religion, language, socio-economic status...Malaysia is not an exception. Ethnic community groups in Malaysia have maintained their national character and in fact have become opposing political forces, fighting for the economic, political and socio-cultural rights of the people. In this complex political context, the national spirit of the Melayu people has risen dramatically and has become a determining factor in the character of Malaysian politics.

Melayu nationalism appeared at the beginning of the twentieth century, when the Chinese and Indians flocked to Malaysia to do business and live, creating a multi-ethnic, multi-cultural Malaysia. The policy "Divide and Rule" is intended to easily govern the natives at the same time. The complex context of Malaysian society is not only due to ethnic composition, but also due to differences in religion, customs, lifestyle, communication habits, rituals, and so on of different ethnic communities: Melayu, Chinese and Indian. The disparity in economic development level, socio-cultural difference and disparity in economic and political status of ethnic communities, in addition to the policy of "divide and rule" of colonialism made Malaysian communities not have the opportunity to stick together, but on the contrary, they also nurtured seeds of mutual hatred. Each ethnic community has its own parties that represent their community in the political arena. These are the Melayu Unified National Organization (UMNO) of the Melayu people, the Association of Overseas Chinese in Malaysia (MCA) of the Chinese and the Congress of Overseas Indians in Malaysia of the Indians. The conflict in community relations, especially between the two largest community groups, the Melayu community and the Chinese community, has in fact occupied all political, economic, and socio-cultural activities in the country.

Immigration has always been a major concern for the Melayu people. Nationalism against colonialism and the threat of immigrants, and especially the Chinese, made Melayu nationalism a silent but smoldering element in Malaysia society. During the colonial period, the national consciousness and the religious consciousness supported each other in the struggle to protect the national interests and also to protect Islam against the attack of colonialism and Christian thought. Islamists and Melayu nationalists stood side by side in the struggle for the country's independence. It was only in 1946, when the UMNO Party was born, that the relationship between Islam and the national consciousness of Melayu began to show signs of tension. The Melayu nationalists gained leadership in the struggle for national independence. They advocate building an independent, secular country while the Islamists advocate turning Malaysia into an Islamic country. However, in the race for political supremacy and the support of Melayu voters, nationalists still uphold the value of Islam and consider Islam as one of their top goals.

After Malaysia achieved political independence (1957), Islam did not occupy a prominent place in the political life of the country, although it was still respected by UMNO leaders. Islam is still used by UMNO to attract the votes of Melayu Islam in elections with the Islam PAS party. The Melayu nationalist leaders attempted to consolidate the traditional Melayu dominant position, seeking ways to elevate the Melayu to an equal and higher economic, cultural and educational status than other communities in the country. The constitution recognizes the "special rights" of the Melayu people as indigenous communities. A series of economic policies of the government create conditions for the Melayu people to participate in industrial production, especially business, giving priority to Melayu children in vocational training and employment.

In educational policy, the Malaysian government also prioritizes education and scholarships for the Melayu people and other indigenous residents. The state is also interested in developing agriculture and rural areas, where the Melayu community resides and works. Melayu language became the national language, Islamic spiritual values were recognized as an important part of the national culture. However, the Muslim Melayu did not make up the majority in the country. Therefore, while pursuing the goal of nationalism, the Malaysian government cannot fail to respond to the demands of other communities. The Malaysian Constitution declares freedom of belief and prohibits racial discrimination on the basis of religion.

State economic policies encourage and facilitate the active participation of the Melayu people in business activities to enhance their economic status and achieve social justice, but not by sharing economic benefits of other ethnic groups (Chinese, Indian) for the Melayu people. Thus, UMNO somewhat softened its previous nationalist views.

At the end of the 60s of the twentieth century, the political situation in Malaysia was very complicated, especially the ethnic issue facing the risk of crisis. Relations between the Chinese and the Melayu are increasingly strained. Disagreements between the leaders of UMNO and the ruling Coalition, were long suppressed, now threaten to explode. Some Chinese politicians have raised their voices to claim the rights of the Chinese. Many people are still afraid that the Association of Malaysian Overseas Chinese is not able to protect their interests and put their hope in a number of newly established political parties, including the established Democratic Action Party (DAP). In 1966, the Malaysian People's Movement Party (Gerakan rakyat Malaysia) was born in April 1986, the Progressive People's Party (PPP) was established in Perak. In addition, there is the Labor Party (Parti Buruh) which has ties to the Communist Party of Malaya… These political parties also voiced opposition to UMNO's policy of prioritizing the Melayu people and demanding equality in education, whether the medium of instruction is Melayu, English, Chinese or Hindu. They proposed to build Malaysia on the principle that "Malaysia belongs to the Malaysian people". Meanwhile, the UMNO party faces many difficulties in running the country because of conflicts and divisions within the party's leadership. This division, together with the strained relations between ethnic groups in the country, led to the political crisis of 1969.

After the crisis, the Malaysian government took many measures to stabilize the situation and maintain the unity of the country, especially the policy of administrative reform and economic development. In July 1969, the National Unification Commission was established to draft the "National Ideology and New Socio-Economic Programs". The government sets out economic development strategies, including the New Economic Policy

(NEP) and political goals to ensure the rights of the Melayu people in the economic field, especially with employment opportunities and high positions in modern and developed economic sectors.

In parallel with the implementation of the New Economic Policy, the Malaysian Government carried out political reforms in the country, consolidated the dominant power of the UMNO leadership organization, implemented parliamentary democracy, and eliminated the imbalance. ethnic equality in some areas of national life and towards national unity through constitutional amendments, passed by the House of Representatives (Dewan Rakyat) in February 1971.

The 1969 political crisis led to major changes in the Malaysian government's policy in favor of the Melayu community and created an opportunity for Islam to expand its influence. The Malaysian Government implemented the policy of "Islamizing" the country with two purposes.

First, strengthening the dominant position of the UMNO party, against the accusations of its strongest competitor, the PAS, attracted the political support of the Melayu Islam.

Second, strengthening the ability to manage Islamic activities in the country so that Malaysia, despite being a country with a large Muslim population, is still a progressive secular country. The government's pro-Islamic policy greatly enhanced the Muslim consciousness of the Melayu people and more than once they caused trouble for the Government in the implementation of its national policy.

Not only in domestic policy, in foreign policy, UMNO's government is increasingly leaning towards the Islamic world where in recent years Malaysia has been given a suitable place for itself, as an active member, wants to associate its name with the problems of the Islamic world *Islam* (Hussin Mitalib, 1980, tr.128). The Malaysian government has developed economic and commercial relations as well as political relations with Muslim countries, especially Arab countries. Economically, Malaysia reduces its exports to the West, increasing the proportion of trade with countries in the Middle East. Politically, Malaysia strongly supports the Palestine Liberation Front (PLO), affirming Malaysia's leading role in supporting Palestine against Israeli aggression.

Despite strongly supporting Muslim countries, the Government is also very sensitive to issues related to Malaysia's national interests and the country's situation. They fear the impact of the Islamic revolution in Iran on Malaysia's secular democracy. Malaysia's Islam-oriented foreign policy, in terms of religion, is understandable, because Malaysia's current Islamic movement cannot be separated from the development of world Islam, in other words, it is greatly influenced by major Islamic events in the world.

First, Islam in Malaysia was influenced by the international Islamic revival movement that began with the Arab-Israeli War in 197 and the oil crisis that followed, especially since the Islamic revolution in Iran in 1979. The above events contributed to promoting the Islamic revival movement to develop as a political force in the international arena, strongly influencing the spirit of Islam in Malaysia.

Second, the spirit of Islamic revival in Malaysia was heated by the complicated internal situation of a multi-ethnic and multi-religious country, especially after the political crisis in 1969. The relationship between Islam and Melayu (Melayu people and Melayu identity) is a reciprocal relationship. When the national spirit of Melayu was high, Islam became the link of the Melayu community against other communities. Islam and its culture are considered by the Melayu people as their national cultural feature, the solution to all the problems of the country. Therefore, Islam was promoted day by day and occupied an increasingly important position in society. In the context of Malaysia in the 70s-80s, the Islamic revival movement, specifically the Dakwah movement, had a strong impact on the development of the political situation in the country. This movement put great pressure on the existence and development of Malaysian political parties, especially PAS and UMNO. This explains why from the 70s to the 80s, the Malaysian Government attached great importance to the role of Islam, introduced many favorable policies for Islam, and enhanced Islam's position in the political and social life in Malaysia. It was also Islam that made Malaysia change its foreign policy in favor of the Islamic world.

Looking back at the development history of Islam, we can affirm that Islam from its birth until now has always been political. According to the principles of Islam, if a place is the land of true Islam (Da-ul Islam), then the head of the religious community will have to be the one holding the secular power, especially political power. Therefore, we should not be surprised to see that Islam has a great influence on the political life of Malaysia, where Islam is the state religion, but the real power rests with a nationalist party (UMNO), while the head of the Muslim community is only the nominal head of the country with certain powers. The Muslim forces in Malaysia represented by the PAS party have always opposed the UMNO government for political supremacy, with the aim of turning Malaysia into an Islamic state in its own right, although ultimately PAS is also a nationalist party, protecting the interests of the ethnic Melayu Islam community. So in the context of Malaysia - a multi-ethnic, multi-religious country - Islam has always been a factor promoting more conflicts between ethnic communities. In fact, the Islamic revival movement strongly influenced the activities and political trends of the Malaysian Government, making Malaysia more and more inclined towards the Muslim world. In contrast, the domestic and foreign policies favoring Islam of the government of this country further enhanced the role and status of Islam, of the Melayu Islam community in all areas of Malaysian social life by the end of the 80s of the twentieth century.

For Malaysia, the role of Islam in politics and ideology was clearly shown. In the state power structure, the nine states of Malaysia, Kelantan, Terengganu, Pahang, Kedah, Perak, Perlis, Selangor, Johor and Negeri Sembilan, were ruled by Muslim dynasties, headed by Sultanats. The states of Penang, Malacca, Sarawak and Sabah did not have any rulers, but the Agongs still acted as heads of Islam in each district in the state.

3.2.2. Parties in Islamic politics in Malaysia

After gaining independence, the people of the Malay peninsula were grateful and believed in their policy for helping to break the domination of British colonial rule and lead Malaysia to independence. Due to the need to promote the country's development after independence, the United Malays National Organization (UMNO) allied with other parties to form the United Malayan Front. The United Malaysian Front consists of 14 political parties: UMNO (United Malays National Organization), Democratic Action Party (Democratic Action Party), National Justice Party (Keadigan Party), party Islam Malaysia (Pan-Malayan Islamic Party), and the Spirit of 1946 Party. These Islamic parties represent the following wills and aspirations:

The United Malays National Organization (UMNO), which represents the Malays, is the largest party. Traditionally, the party's President and First Vice-President serve as Prime Minister and Deputy Prime Minister.

The Democratic Action Party (DAP), whose members are mostly Chinese, has ties to Singapore's People's Action Party. It is the second largest opposition party, with representatives in parliament.

The Malaysian Islamic Party (PAS), which broke away from UMNO in 1951, is made up of radical Muslim Malays who now control the state of Kelantan.

The National Justice Party (KP) was founded by the wife of former Deputy Prime Minister Anwar in April 1999 to fight for Anwar's freedom.

Spirit of 1946, which broke away from UMNO in 1987 after a general election defeat, was led by Mr. Razaleigh, the former Finance Minister.

The UMNO party, the mainstay of the United Front of Malaysia, has ruled since Malaysia's independence from Britain in 1957.

In addition, in Malaysia, there are: Chinese Ma Association (MCA) - the second largest party, representing the Chinese bourgeoisie, the economic force in Malaysia; The Malayan Association (MIC) is the third largest party representing the Indian community in Malaysia.

4. Discussion and Conclusion

It can be said that Islam is increasingly occupying an important position in the spiritual life of the Melayu people and has a strong impact on domestic and foreign policy of the Malaysian government.

Islam in Malaysia has been influenced by the international Islamic revival movement that began with the Arab-Israeli war in 1973 and the oil crisis that followed, especially since the Islamic revolution in Iran in 1979. The above events contributed to promoting the Islamic revival movement to develop as a political force in the international arena, strongly influencing the spirit of Islam in Malaysia.

Although not becoming the dominant religion in Malaysia, Islam has a special place in this country. Islam became the “way of life” for the Melayu and other Muslim indigenous populations.

The highlight of Malaysian political life is the relationship between Melayu nationalism and Islam represented by UMNO and PAS. Although they are fighting each other fiercely on the issue of Muslim Malaysia and the Melayu people, after all, the main purpose of these two parties is still to protect the interests of the Melayu people and the conflict between the two parties and the non-Melayu community is the key issue.

Ethnicity and religion are two sensitive issues, closely related to each other, especially when religion is considered a national cultural identity as in the case of Islam in Malaysia. By properly handling that complicated relationship, Malaysia avoids the development of Islamic separatism that countries in the region such as Thailand and the Philippines are facing.

THE IMPACT OF THE MARKET ECONOMY ON CIVIL SERVICE ETHICS IN VIETNAM TODAY

MA. PhD Candidate. Hong The Vinh
hongthevinhhv3@gmail.com
Academy of Politics Region III, Da Nang, Vietnam

Abstract

Civil service ethics is a form of professional ethics, an integral part of the social ethics system, closely related to politics and law, and has a profound influence on the political and social institutions in each country. Therefore, civil service ethics has a very important position and role for socio-economic development and the survival of the social system. Further improving public service ethics at all levels of government is one of the urgent tasks today. The article analyzes the positive and negative impacts of the market economy on the civil service ethics of civil servants; on that basis, identify a number of problems and solutions to prevent the negative effects of the market economy on civil service ethics, contributing to improving civil service ethics for civil servants in Vietnam to day.

Keywords: *Civil service ethics, market economy, impact.*

1. Introduction

In recent years, the issue of civil servants, and public service ethics has not only attracted the attention of the Party and State but also attracted the attention of society, especially researchers. There are many relevant documents and documents issued, many scientific research works have been published. All are towards the goal of building a clean and potent administration, a contingent of civil servants who are really "*public servants*" of the people, meeting the requirements of sustainable development of the country. The process of transforming the economic management mechanism to a market economy in Vietnam has affected many different areas of social life, including social ethics in general, public service ethics of public employees, or office in particular. Our market economy is still in the process of being perfect, especially the legal system, mechanisms, and policies; the level of development of different types of markets; effectiveness and efficiency of state management; discipline, etc. All of these have been having an impact on the economic and social development in general, and the transformation of civil service ethics of a section of civil servants in particular.

2. Method

To carry out the stated research purposes and tasks, the author uses a system of popular scientific research methods: Logical and historical methods (this method is used in the article for analysis, explaining the concepts of public service, public service ethics, market economy); Methods of analysis and synthesis (to develop and collect research contents); Statistical method (used in section 3.2 of the article to collect and evaluate the research situation related to the changing status of civil service ethics of civil servants under the influence of the market economy in Vietnam today). Now on); Scientific forecasting method (used mainly in section 3.3 of the article to forecast some basics solutions to devote to improve civil service ethics for civil servants in Vietnam today).

3. Results.

3.1. Bureaucrat, civil service ethics and market economy

The bureaucrat is a socio-historical term, referring to those who hold regular duties in state agencies and organizations. The name - function - was formed with the introduction of water maps. The content of the term bureaucrats is identified in many different ways, which depended on the socio-economic conditions of each country and each specific historical period. For many countries, a bureaucrat is understood as: "Those who hold regular jobs in state agencies, are classified into public ranks and ranks, and receive salaries from the state budget" [5]. In some other countries, the company is understood as: "those who hold regular jobs in the state agencies, are classified as civil servants, receive salaries from the state budget" and "those with similar in sign but working in organizations of organizations, socio-political organizations"[5]. In Vietnam, a bureaucrat is a person holding positions and titles in the Party, State agencies, socio-political organizations at all administrative status, in the regime, receiving salaries from the state budget classified according to the level of training and classified into the classification function. Therefore, bureaucrats must not only have professional qualifications but also have good moral qualities.

Any administrative system that wants to operate effectively, efficiently, and with high service quality needs a team of cadres and bureaucrats with civil service ethics (besides professional capacity). Civil service ethics is a system of standards, rules, and behaviors aimed at regulating attitudes, behaviors, conduct, responsibilities, and obligations of cadres and bureaucrats in civil service activities. Civil service ethics is often considered under two aspects: civic ethics and professional ethics. Civic ethics is the general social moral standards and values that exist as a citizen. As for professional ethics, besides social ethics, bureaucrats must conform to the principles, standards, and regulations on the behavior of bureaucrats in the performance of their official duties without ever violating the ethics of civil servants. Civil service ethics is a form of professional ethics, an integral part of the social ethics system, closely related to politics and law, and has a profound influence on the political and social institutions in each country. Therefore, civil servant ethics has an essential position and role in socio-economic development and the survival of the social regime.

Stemming from different historical conditions, political regimes, and cultures, each country has a different perspective on civil servant issues and the ethics of civil servants. In Vietnam, civil servant ethics are formed based on inheriting the good traditions of the nation, the cultural quintessence of humanity, and taking Marxism-Leninism and Ho Chi Minh's thought as the foundation. standards, striving for independence, peace, democracy, and social progress. Therefore, civil servant ethics do not only stop at the sense of morality but also manifest themselves through ethical behaviors. It is expressed in the practice of state management activities.

President Ho Chi Minh paid great attention to the ethics of cadres and civil servants, considering it a necessary minimum condition for cadres and civil servants to fulfill their duties. He wrote: "Just like a river, it has a source to have water, without a source, the river dries up. The tree must have a root. If there is no root, the tree will wither. A revolutionary must have morality, and without morality, even if he is talented, he can't lead the people ... Without morality, he is already evil, he can't do anything" [4]. In the process of building the national administrative system, Party and State also pay special attention to building civil service ethics for cadres and bureaucrats. The Law on Cadres and Civil Servants in 2008 has identified public service ethics as one of the most far-reaching qualities that cadres and civil servants must possess. Article 15 (Chapter II) stipulates: "Civilians and civil servants must exercise diligence, thrift, integrity, righteousness, and impartiality in public-duty activities." Article 16 (chapter II) stipulates: "1. In-office communication, cadres, and bureaucrats must have a polite and respectful attitude to colleagues; Communication language must be standard, clear and coherent. 2. Cadres and bureaucrats must listen to opinions of colleagues; fair, impartial, and objective when commenting and evaluating; democracy and internal solidarity. 3. When performing their official duties, cadres and bureaucrats must wear badges or civil servant cards; be polite; preserving prestige and honor for agencies, organizations, units, and colleagues". Article 17 (chapter II) stipulates: "1. Cadres and bureaucrats must be close to the people; have polite, serious and modest manners and attitudes; Communication language must be standard, clear and coherent. 2. Cadres and bureaucrats must not be bossy or authoritarian, causing difficulties or troubles for people when performing their official duties. Article 18 (chapter II) also stipulates what bureaucrats must not do related to public service ethics, including: "1. Evading responsibility, abdicating assigned tasks; causing factions and disunity; voluntarily quit work or join a strike. 2. Illegally using the property of the State and the people. 3. Abusing or abusing duties and powers; use information related to the public service for personal gain. 4. Discrimination and treatment of ethnicities, men and women, social classes, beliefs, and religions in any form".

The Anti-corruption Law also has provisions that reflect the standards of bureaucrats and civil servants, in which uniquely identifying cadres and bureaucrats as one of the subjects who have positions and powers. Corruption is illustrated as an act of a person with a position of power who takes advantage of this position or power to embezzle, bribe, or intentionally violate the law for self-seeking motives, causing damage to the property of The State, collectives, and individuals, infringe upon the proper operation of agencies and organizations. The identified corrupt acts are embezzlement of socialist property; Bribery; abusing their positions of power to give bribes or broker bribes; abusing positions and powers to use socialist property illegally.

Article 8, the 2013 Constitution stipulates: “State agencies, cadres, bauraucrats and public employees must respect the People, devote themselves to serving the People, stay in close contact with the People, and listen to their opinions. and subject to the People's supervision; resolutely fight against corruption, wastefulness and all manifestations of bureaucracy, bossiness, and authority". The requirements of the 2013 Constitution can be generalized on civil service ethics of cadres, bureaucrats, and public employees as follows: Firstly, to respect the people; second, serving the people; third, close contact with the people; fourth, listen to people's opinions; five is, subject to the supervision of the people; Sixth, must have a positive attitude to fight against violations of the law, bureaucracy, bossiness, authority, and corruption. These are the most necessary civil service ethical standards institutionalized in the Constitution, serving as the foundation for building and perfecting the law on public service ethics.

From that, it can be seen that Vietnamese civil servant ethics is a system of opinions, rules, and standards formed in revolutionary practice and state management activities, reflecting not only national traditions, cultural patterns of humanity that at the same time reflect the nature of the State as a state of the people, by the people and for the people. Therefore, the morality of Vietnamese civil servants is an expression of a new and revolutionary morality.

The transition from a centralized subsidy mechanism to a multi-sector commodity economy, operating under the socialist-oriented market economy, has fundamentally changed many aspects of social life, where has been a change in the civil service ethics of our country's civil servants. That transformation mainly takes place in two trends: positive and negative. The survey and analysis of the status of changes in civil service ethics among bureaucrats under the influence of the market economy and understanding the causes of that change to propose solutions to limit the negative changes. Building a contingent of bureaucrats who are both virtuous and talented, aiming to build a democratic, modern, professional, dynamic, effective, and efficient administration to serve the people is a vital issue urgent in our country today.

3.2. The situation of changing civil service ethics of bureaucrats under the impact of the market economy in Vietnam today

Under the impact of the market mechanism, the civil service ethics of our country's bureaucrats have been undergoing a definite change. That transformation takes place in two directions: positive and negative.

Basic standards of public service ethics, including loyalty to the Party and State; awareness, attitude, and behavior towards the work of civil servants; spirit and attitude of serving the people; the sense of self-cultivation and self-training of civil servants and the spirit of solidarity and cooperation with colleagues in performing official duties. These standards have shifted in both consciousness and behavior and moral relations. That change, first of all, is the innovation in public service activities and the attitude of civil servants has many changes to suit the requirements of the market economy and market mechanism.

Compared to the pre-renovation period, our country's bureaucrats now live, study, and work in a more favorable environment, with increasingly high economic development, and constant economic, cultural, and social institutions are complete. As a result, the public service ethics of bureaucrats have conditions to further promote their role in building a democratic, modern, professional, dynamic, effective, and efficient administration serving the people, serving the society. The figures in the 2018 Summary Report of the Ministry of Home Affairs on the contingent of cadres and bureaucrats in our country show that the quality of our country's bureaucrats is constantly improving, in which civil service ethics have changed. Positive change, people's satisfaction index of civil servants, and public service activities have been enhanced. To meet the requirements and tasks in the new context, the contingent of bureaucrats in our country, on the one hand, needs to strictly abide by the discipline and operating regulations, and respect the law; on the other hand, protect state secrets and people's secrets, promote loyalty to the State and the Socialist Fatherland, and take responsibility for the effective and economical exploitation of state resources, especially budget and resources. At work, the contingent of bureaucrats has promoted dynamism, creativity, self-discipline, self-responsibility, constantly innovates working methods and means to improve the quality of service to the people, and improve the efficiency and effectiveness of employees duty performance. Before the people, one must respect, listen to and learn from the people, consider the settlement of the people's legitimate needs and interests as their responsibility, consider the people's satisfaction as a measure, and evaluate the work.

The development of the market economy also places an increasing demand on human factors. Facing that pressure, the contingent of bureaucrats in our country has been invariably learning and improving professional skills and ethics. Accordingly, the majority of bureaucrats invariably upgrade their sense of self-cultivation, self-discipline, strictness with themselves, practice integrity and impartiality in performing official duties, instead of relying on and relying on collective, superior; each cadre and civil servant is increasingly trying to improve themselves in all aspects, including ethics. The spirit of cooperation and solidarity with colleagues in the contingent of bureaucrats is increasingly strengthened and valued. The connection of bureaucrats in administrative agencies at all levels, as well as between bureaucrats and partners and businesses, has not only demonstrated professionalism and specialization in public service activities but also made the operation more efficient. of civil servants is increasingly effective, meeting the development needs of the country, bringing satisfaction to the people.

However, the market economy that we are rebuilding is not yet complete, not fully established. It leads to negative impacts from the negative side of the market economy to social ethics, including public service ethics. The negative influence of the market economy is the deterioration, degradation, adverse changes in civil service ethics comprehended bureaucrats. Compared with the pre-renovation period, our country's bureaucrats have appeared a section of bureaucrats showing signs of violating loyalty to the Party and State, violating bureaucrats obligations, failing to abide by the principles of public activities service, loss of will to strive, no example in work, even words and deeds that go against the interests of the State and the people. Worryingly, a part of our country's bureaucrats tends to follow personal interests, get caught up in material desires, and run after the power of money. It leads to embezzlement, corruption at work, lack of self-discipline, lack of creativity, doing whatever is beneficial. Otherwise, pushing the responsibility or doing it over the counter without concern for efficiency; with the people, it is bureaucratic, far from the people, causing difficulties when dealing with the people's legitimate interests; with himself, he is afraid to practice, lazy to strive, frightened of obstacles, apprehensive of suffering; with colleagues, competition, trumpet, disunity, etc.

The limitations on public service ethics of cadres and civil servants above stem from the main reasons:

Firstly, the achievements made by the development of the market economy are enormous, but the negative side of the market economy tends to stimulate excessive personal consumption, creating a hedonistic thought. A part of cadres and civil servants came out of an underdeveloped small-scale agricultural economy, with insufficient awareness, so they were overwhelmed by changes, especially economic growth. They are caught up in economic growth without seeing its downside, appear prejudiced about traditional values , and excessively accept new things, leading to luxury and enjoyment. It is worth mentioning that the tendency to focus on material benefits and economic efficiency has obscured good moral concepts. An immoral lifestyle, a decline in morality have formed and developed.

Second, in the current market economy in our country, cadres and civil servants at all levels and branches still have the phenomenon of "running for office," "running for power," "running for crime"... in the phenomenon of "running" includes There is "buying and selling" in many different levels and forms. When the phenomenon of "buying and selling" in the organization of cadres appears, the selection, evaluation, promotion, training, retraining, inspection... cadres and civil servants are often just a formality. This phenomenon often leads to weakening of the state apparatus, disunity, factions, and loss of working efficiency of Party and State organizations. In work, they do not take quality and efficient completion of work as a goal to strive for but seek to wriggle around and handle it. Illegally managing relationships leads to sin, discredits the Party, and reduces people's trust in the Party and State.

Third, leaders of agencies and units are not exemplary in ethics, lifestyle, and responsibilities at work. Lack of role models in ethics, lifestyle, in performing official duties. Lack of proper attention in work and life for subordinates has negatively affected subordinates' thinking in performing tasks. Agencies and units have not paid due attention to responsibility education, as well as strictly handling responsibility for cases of violation of civil service ethics, so there is no deterrent and exemplary character.

Fourth, the promulgation of the State's policies and laws on public service ethics is slow and lacks drastic implementation, so the effectiveness is not high. Specific regulations in the units on the responsibilities of cadres and bureaucrats; the management, inspection, and supervision mechanism of organizations and heads of units as well as of the people for the activities of cadres, bureaucrats, and public employees is still limited, not regular, not significant and lacking in consensus the set.

Under the impact of the market mechanism, the civil service ethics of our country's bureaucrats have been undergoing an absolute change. That change is both positive, facilitating the process of perfecting the civil service, but there are also negative changes affecting the service efficiency of the bureaucrats, affecting the development of the bureaucrats of the economy and society in general.

3.3. Some primary solutions to contribute to improving civil service ethics for bureaucrats in Vietnam today

Firstly, raise awareness of public service ethics responsibilities for cadres and bureaucrats.

First of all, it is necessary to raise awareness and promote the role of party committees and authorities in leading and managing public service ethics. Party committees at all levels must be more aware of the importance of ethics in public service activities. The heads of specialized departments must have sensitive, dynamic and realistic thinking to identify, detect and evaluate positive, rights, or negative, wrong behaviors in public service activities. At the same time, regularly propagate and educate about political ideology, morality, and lifestyle for cadres and civil servants; thoroughly understand and disseminate the guidelines, guidelines, policies, and laws of the Party and the State to the contingent of cadres and civil servants... fostering a sense of patriotism, educating the revolutionary moral qualities for cadres, officer.

The level, results, and quality of public service activities depend on the cadres and bureaucrats themselves. Therefore, raising awareness of public service ethics responsibilities for cadres and civil servants will be very decisive. The level of awareness, awareness and deep understanding of the law, duties, and responsibilities will determine the attitude and behavior of civil servants when performing their official duties. Cadres and bureaucrats, when performing their official duties, must be aware of and must comply with the principles prescribed by law, including 1) Comply with the Constitution and the law; 2) To protect the interests of the State, the lawful rights and interests of organizations and citizens; 3) Publicity, transparency, proper authority, and inspection and supervision; 4) ensure administrative hierarchy and close coordination.

Secondly, perfecting the socialist-oriented market economy institution.

One of the objective reasons leading to the change in civil service ethics in a negative direction today is the negative impact of the market economy. Therefore, perfecting the socialist-oriented market economy institution must be one of the indispensable solutions to overcome that changing situation. To perfect the socialist-oriented market economy in our country today, it is necessary to perform well on the following key issues:

Firstly, continue to perfect the legal system, mechanisms, and policies to create a legal corridor for all economic sectors operating under the market mechanism, equality and competition under the law; make a decisive contribution to overcoming corruption and bureaucracy; ensure transparency in production and business activities as well as administrative transactions.

Second, continue to perfect the institution of ownership, develop economic sectors and types of enterprises; Improve institutional protection for investors; protect ownership and property rights; Continue to speed up the restructuring of state-owned enterprises, not allowing a functional department to have the right to hold a large number of State assets for corruption, personal and group benefit.

Third, strengthen the leadership role of the Party and the management role of the State, ensure that all kinds of markets are increasingly completed and operated smoothly, with the fair, equal, and anti-monopoly competition improving the investment and business environment, ensuring to maintain the socialist orientation of the economy. To associate economic growth with ensuring sustainable development, social progress, justice, national defense and security, environmental protection and response to climate change, promoting and improving the efficiency of economic integration world.vv

Third, anti-individualism and pragmatic style of living

Anti-individualism and pragmatic lifestyle needs a system of specific and synchronous solutions, but in the immediate future, it is necessary to perform well a number of specific tasks as follows: strengthening civil service ethics education for the team officer; promote the role of the elected bodies, the Fatherland Front, the mass organizations, the mass media and the people in supervising cadres and civil servants, and have a mechanism for the people to participate in the construction of the Party and the construction of the State administration; develop working regulations, clearly define the rights and responsibilities of each individual and organization; promote democracy, promote self-criticism and criticism; formulating and perfecting the law on public service ethics; Increasing publicity and transparency in the activities of agencies and organizations in the political system, comercial and transparency is an important measure to prevent corruption of power; Implement democracy, publicity and transparency in cadre work in the units, especially in the stages of recruitment, planning, appointment, mobilization, rotation, evaluation, reward and discipline; Strengthen democracy at the grassroots; prevent and combat corruption in relation to the overall program of state administrative reform in general and the reform and modernization of the local government system in particular.

Fourth, step up the fight against bureaucracy, corruption, and waste.

Bureaucracy, corruption, and waste are essentially the corruption of power of public authorities. As a change in civil service ethics in a negative direction, this alienation manifests mainly on the outside as the phenomenon of paperwork, cumbersome apparatus, many intermediaries, and inside is a mentality that only focuses on achievements, position, authority, and abuse of position and jurisdiction, taking advantage of loopholes in the management mechanism to seek personal benefits, leading to abuse of power and abuse of power. The process of operating the civil service in our country in recent years has appeared bureaucracy, away from the masses in a part of civil servants. This situation is happening more and more complicated, showing signs of spreading more and more widely. As the 4th Central Conference (term XII) of the Party has pointed out is a disease that exists quite widely and directly harms the revolutionary cause of the Party and the nation.

Preventing and combating bureaucracy and corruption among bureaucrats is an urgent task. It is necessary to focus on solutions such as disseminating propaganda, thoroughly grasping guidelines, policies, and laws on anti-corruption, creating a forceful, positive and unified change effectively from awareness to the action of cadres, bureaucrats, and public employees in the prevention and fight against corruption; continue to improve institutions on socio-economic management to prevent and combat corruption; continue to strictly implement mechanisms and policies on organizational and cadre work to contribute to anti-corruption; strengthen inspection, examination and supervision to improve the effectiveness of bureaucratic corruption prevention and combat; strengthen supervisory role in preventing and combating bureaucracy and corruption.

Fifth, strengthen the education of political ideology, morality, and lifestyle for the current contingent of bureaucrats in our country.

Education of political ideology, morality, and lifestyle for our current contingent of bureaucrats should be formed on Directive 05-CT/TW of the Politburo on the content of promoting the study and following Ho Chi Minh's thought, morality, and style. It is necessary to concretize the contents and forms of conduct with the basic principles: ensuring the multi-faceted, rich and diverse nature of the impact of education on the formation and development of moral qualities ethics of cadres and bureaucrats; ensure close coordination and dialectic unity of all educational and mutual support activities towards the goal of comprehensively perfecting the civil service ethical qualities for bureaucrats; based on ensuring the multifacetedness and organic unity of all educational impacts, focusing on solving important tasks and pressing issues emerging in specific historical periods. Overcoming the situation of spreading, easily falling into generality, abstraction, and lack of persuasion in educational activities.

Associating with the educational work of political ideology, morality, and lifestyle, each cadre and bureaucrats should be proactive and creative in overcoming the negative changes of civil service ethics. Self-education, self-improvement, and self-training in public service ethics is the self-discipline process of each civil servant to raise awareness, strengthen emotions, train the will to strive to improve the efficiency of the state administration. That is the process by which cadres and bureaucrats cultivate their knowledge, self-training political courage, public service ethics, determination to overcome all difficulties to study and train to meet the goals and requirements of administrative reform and perfecting the civil service.

Protect ethics in the agency by measures to inspect, prevent violations of ethical standards, not to violate them before handling them. At the same time, continue to find solutions and ways to reduce pressure, encourage dynamism and creativity of cadres and bureaucrats in public service activities by ensuring appropriate remuneration regimes and policies. Thereby, directing individuals to strive to become good experts in their professional fields, recognized and honored by the people.

To regularly and effectively coordinate with agencies and organizations in charge of inspection and supervision of the Party and agencies and organizations in charge of inspection and reduction of the State's staff to resolutely prepare to filter, dismissing, replacing, forcing the resignation of cadres and bureaucrats who work inefficiently, fail to fulfill their tasks, are weak incapacity, have poor moral qualities, and have low trust without waiting the end of term, end of working age, especially leaders, managers and heads of government at all levels. Strengthening the relationship between the State and the people and social organizations, thereby strengthening the voice of society on the issue of civil service ethics, creating a legitimate and honest criticism of the citizens. At the same time, there must be an effective mechanism for people to exercise their supervisory rights to limit the situation of officials and public servants pushing responsibilities or taking actions that harm social interests.

4. Conclusion

In the current process of national construction and development, we are constantly innovating cadres at all levels and branches from the central to local levels. Qualities of cadres and civil servants in the new era that we aim to be cadres and civil servants with good moral qualities, professional and professional skills, living and working following the Constitution and the law, serving the effectively serving the people and society, contributing to building a wealthy people, strong country, democracy, justice, and civilization.

To overcome the degradation of politics, morality, lifestyle, and to prevent the negative changes in public service ethics in a part of our country's civil servants today, it is necessary to implement some major solutions in the immediate future: perfecting the socialist-oriented market economy institution; anti-individualism and pragmatic lifestyle; combat bureaucracy and corruption; strengthen control of power; enhance political, moral and lifestyle education for cadres and civil servants; promote the positivity, initiative, and creativity of cadres and civil servants in overcoming negative changes in public service ethics of civil servants under the influence of the negative side of the market economy. With the correct leadership of the Party, with the state administrative reform program in the direction of building a democratic, modern, professional, dynamic administration, serving the people, operating effectively and efficiently fruit; We have a theoretical and practical basis to believe in that remedy. With the solutions proposed by the author, we hope that soon we will have a contingent of civil servants who are both talented and virtuous, wholeheartedly, wholeheartedly serving the people, serving the society, towards building a Vietnam with rich people, a strong country, fair, democratic and civilized humanity.

HO CHI MINH WITH THE COMPREHENSIVE EDUCATION AND TRAINING FOR HUMAN IN VIETNAM

Dr. Nguyen Huu Cong

congnh@neu.edu.vn

Dr. Nguyen Thi Le Thu

lethu@neu.edu.vn

Falcuty of Political Theory, National Economics University, Hanoi, Vietnam

Abstract

Ho Chi Minh, the national liberation hero, the great man of the Vietnamese revolution in the 20th century, had great consideration in the relation between education, training and human progress as the main driving force for historical development. In his sense, education and training aiming to comprehensive development for human in which all aspects of learners are concerned is truly not only meaningful for our current educational activities but also in line with the mainstream of the world nowadays. Therefore, firstly, this writing clarifies Ho Chi Minh's thought about the role of education and training in building human personality in Vietnam. Then, his viewpoint on fullfilling inclusively and coherently the schooling syllabus as well as the learning contents that is the key part of his educational ideas are also analysed profoundly.

Keywords: *Ho Chi Minh, education and training, comprehensive development, inclusive human progress.*

1. Introduction

Education and training is an important sector in the upper-structure of a nation. Appropriate education and training activities have great influence on shaping human personality as well as enhancing their competence to take the proactive role in the process of social development.

The rapid changes in modern society are addressing new demands on our education system in which "Lifelong learning" is a major global trend raised in many current education forums worldwide, especially in the context that learning process is supported by modern scientific and technological achievements. These things require education systems in all countries to have clearer, more specific and up-to-date answers for four questions: Teach what? Teach whom? What is the purpose of teaching? How to teach?

In such context, aiming to the sustainable development of the country, it is necessary for Vietnam to build a comprehensive education and training in order to solve the core problems with the ultimate question that "*what kind of people do we want to create for future society through education and traning*?", thereby shaping the educational methods, goals and contents of modern education in Vietnam today. With a radical and progressive vision, Ho Chi Minh raised the issue of "comprehensive development for people" in education which is currently consistent with the four pillars of education for the 21st century that UNESCO has pointed out as "Learning to know, learning to do, learning to live, learning to be". In a nutshell, learning to develop inclusively and harmoniously in terms of intelligence, skills, ethics, and lifestyle. Ho Chi Minh's viewpoint of an education toward building ful-developed people was shown via a number of his writings as well as his practical actions, both directly and indirectly.

2. Method

The paper has used a combination of research methods including method of logic - history, method of analysis – synthesis, method of structure – function in order to point out the basic thoughts of Ho Chi Minh on education and training due to his writings and the scientific materials on Ho Chi Minh of other researchers inside and outside Vietnam.

3. Results

3.1. The role of education and training in shaping human personality

When contructing a new society, according to Ho Chi Minh, first of all, we must enhance actively creating people with proper qualities for that society. Every society has people who represent it. The feudalism assumed the knights, the warriors, the sages who are the core factor building feudal society. Capitalism considered merchants and manufacturers as the elites building capitalist society. But according to President Ho Chi Minh, the goal of our revolution is socialism, so "socialism is able to become reality, first of all, we must have socialist people" (Ho, C.M., 2011k, p.66). Hence, Ho Chi Minh espressed the significance of education in the development of the country, "Whether the Vietnam can become prosperous or not, whether the Vietnamese peoples are able to have the equal position with others powers over the world, that depends on the young people's learning" (Ho, C.M., 2011b, p.32).

Education is one of the most fundamental methods that mankinds have used from generations to generations in order to build people who can meet the demands of the societies in each historical period. President Ho Chi Minh conceived that people and human personalities are both products of history and a motivation for the development of history, thereby social circumstances impact on people in the good or the evil way. In his thoughts, it's all about "for peoples" and so does education an trainning purpose. So, as a great educator, Ho Chi Minh said: "For the sake of ten-year-time, we can plant trees, for the benefit of hundred-year-time, we need educating people. We must building up good citizens and good officers for the country" (Ho, C.M., 2011h, p.528).

Nowadays, a number of scientific achievements in psychology and biology proved that people are born with certain abilities which usually exists in the form of potential. Then the basic conditions in terms of nature (nutrition) and society (health care, education, training…) make them a reality. In fact, there are children who are born with good natural qualities, showing an outstanding talent in one or more fields, however, due to lack of material conditions or lack of caring, nurturing, education and training, those talents are gradually crippled, even disappeared. On the contrary, there are people who are born with normal qualities in all aspects, but they are properly brought up, their hidden abilities are stimulated and well developed. Therefore, in any society, in order to have people with sufficient qualities and capabilities to meet the requirements the development of the country, it is necessary to pay attention to education and training, creating an advanced educational system. In other words, education activities directly impact to the development of all aspects of human beings and played a decisive role in forming the qualities and abilities of each individual.

Ho Chi Minh highly appreciated the role of education and training in "building people", shaping and developing the Vietnamese human personality. He wrote: "The mind of young people is as pure as white silk, if dyed green, definitely it turns green. If dyed red, it will be red obviously. Therefore, learning process at school has a great influence on the future of young people" (Ho, C.M., 2011c, p.102). Or "Personalities is not innate but due to educating" (Ho, C.M., 2011a, p.383).

Ho Chi Minh profoundly believes in the ability to pursue the good, "leaving the darkness to the light", along with the spirit of self-effort that "people truly desire to be more and more progressive in order to serve best for their Fatherland" (Ho, C.M., 2011e, p.214), especially to Vietnamese people who always have been standing together to fight against foreign invaders and defend the country throughout the nation history. It is also his belief in the power of radical education in creating comprehensively developed people in which from his perspectives, it is necessary to conduct an education and training progame in a thoughtful, scientific, and comprehensive way that can both "facilitate all learners' existing capacities improved completely" (Ho, C.M., 2011b, p.32) and build necessary characteristics according with the specific conditions and circumstances of the country. The end result of this educational performance is "ful-developed people" created.

On the basis of Ho Chi Minh ideology, aware of the importance of education and training to the nation's prosperity, the Communist Party of Vietnam has addressed "education and training is the leading national policy" of the country. The basic task of education is to prepare necessary things that human-to-be must have for learners by educating, training, promoting and enriching human qualities and capacities through a system of educational levels, i.e. from kindergarten to university and post-graduate, with many forms of learning such as face-to-face learning, distance learning, home shooling, supervised learning or even on-job-training, etc. The more modern and civilized the society becomes, the more important the education and training is. It is education that plays the role as "the key to open the door to the future" (The Communist Party of Vietnam, 1993, p.27). Therefore, first of all, seting out a truly scientific content and curriculum in which vocational training and human education must be balanced are considered as a top-priority. The United Nations Development Program (UNDP) has identified the potential stimulating factors of human development that increase the value of individuals in relation to the community including education and training, health and nutrition, environment, employment, human emancipation in all aspects. These factors joined together in unity and interact mutually in a dialectical way. Accordingly, education and training for people is not only the basis of all other sectors but also the fundamental premise for human development in those sectors.

With such right viewpoints, Vietnam has achieved great achievements in the field of education, particularly in the enhancement of Vietnamese people's abilities and skills as the output of educational process. Education and training, on the one hand, help each member of the community shorten the process of grasping knowledge, save time, energy and intelligence for creativity or finding new things. On the other hand, it is said that the main method to form ful-developed people who have inclusive personalities including physical strength, intellectual power, moral and aesthetic capacity, civic responsibility, etc. To put it another way, a proper, scientific and humane education includes all the above factors will create hight quality human resources for national defense and development.

3.2. Ensuring the comprehensiveness of educational and training progame and content

Ho Chi Minh approached the issue of ful-developed people from the elements constituting their qualities on physical strength, intelligence, aesthetics, and morality which is reflected in many of his speeches and writings such as: "The letter to students on the first day of the new regime" (September 1945) ;"The new life"; "The letter to Tran Quoc Tuan Army High School" (November 9th 1949); "To General Nguyen Son" (March 1948); "Duties of the General" (August 1948), "To the students" in the People's Newspaper (October 24th 1955); the last letter he wrote for the education sector of our country (November 15th 1968) and especially in his sacred will left to the entire Party, the entire People of Vietnam.

* *In terms of the educational purpose*, according to Ho Chi Minh, "educating people must have the purposes and criteria as clear as building a house. An architect have to figure out how the house is before using bricks, mortar, lime, sand, bamboo, wood to make it, and so do educators"((Ho, C.M., 2011i, p.551). Therefore, education and trainning system have to create "good and usefull citizens" (Ho, C.M., 2011b, p.32); "the heirs of nation-building career are both radical and professional" (Ho, C.M., 2011i, p.510) that will " enhance completely all existing potentials" (Ho, C.M., 2011b, p.32) in Vietnamere people in current time. This is an crucial preparation for young people to be able to take over "the role of future masters of the country" (Ho, C.M., 2011e, p.135). In his letter to students on the first day of school in the Democratic Republic of Vietnam in September 1945, Ho Chi Minh wrote: "... from this moment on, the children begin to receive a completely Vietnamese education..., an education that fully develops your available abilities" (Nguyen, N.Y., Nguyen, T. T., 2007, p.71-72)

In addition, education must aim to promote the sense of self-education and self-training of each young man. He regularly reminded that young people should promote self-study abilitiy to become a man who are able to receive and complete all assigned tasks. He said: "Young people is now a glorious generation, so they should voluntarily renovate their thoughts to be worthy of their duties" (Ho, C.M., 2011f, p.87). On June 1st 1955, he sent a letter to the children and officials of Southern schools, writing: "You should practice to get used to self-reliance"(Ho, C.M., 2011e, p.80). Therefore, nonstop studying is an important task for young people because "if they do not learn hard, they can not improve themselve. No progress is regressive. The higher a society moves to, the more work requirement is and the more sophisticated the machines are. If someone stop learning he starts falling behind and eliminating hisself" (Ho, C.M., 201fe, p.87). The issue of developing the qualities along with promoting the positiveness and reliant ability of learners are actually concerned in the renovation process of our country's education, especially in the reformation of educational programs and textbooks.

Ho Chi Minh clarified the meaning of the ful-eveloped people based on the concepts of morality, intelligence, physical strength and aesthetics, then set the requirements for education and training process aiming to create those qualities in learners. He wrote: "For children, education includes: Physical education: To make the body healthy; Intellectual education: Review what you have learned and learn new knowledge; Aesthetic education: To distinguish the beauty from the unbeauty; Moral education: Love of the Fatherland, love of the peoples, love of labor, love of science, love of the public property (five loves)" (Ho, C.M., 2011e, p.75). In "The report on the Amended Constitutional Draft" at the 11th meeting session of the 1st National Assembly (1959), he continously affirmed: "The Government pays special attention to educating young people in the fields of physical education, intellectual education, aesthetic education and moral education" (Ho, C.M., 2011f, p.593). Ho Chi Minh directed that the new educational development tendency is expanding the people's minds, raising the intellectual quality and enhancing political level for people. In other words, it is the education for the whole people in which no one is left behind. It is also an advanced and modern education with the purpose of creating new generations for new society in Vietnam.

Additionally, in fact, political and social institutions have great influence on the comprehensive development of human qualities and capacities because these impacts take place consciously and intentionaly. According to Ho Chi Minh, the ultimate goal of education is to build high quaility human resources for the country. "To make a revolution, you have to know how to do everything - if you know how to shoot a gun, you need to know how to repair it when it's damaged also" (Ho Chi Minh Museum, 2009). To achieve that goal, in education and training, "it is necessary to pay attention to the following aspects: revolutionary ethics, socialist enlightenment, culture, technology, labour and production" (Ho, C.M., 2011g, p.190). Ho Chi Minh profoundly understood that "new Vietnamese people" will not appear accidentally but are the product of all purposeful activities of our new regime. Furthermore, with socialist orientation of the country, Ho Chi Minh asserted that " Leninist - Marxist theory are main leading thought for all direction in the constructive proccess of new society in Vietnam. A right direction makes the right action" (Ho, C.M., 2011e, p.138). It is the manipulation of the fundamental Marxist - Leninist principals in Vietnam practice that have created a radical scientific outlook for young people that give a hand in building necessary qualities for Vietnamese people in general. In simpler terms, in his sense, political education is an important activity, deciding the success of the revolutionary career throughout all periods of Vietnam history. If our thoughts are not unified, we're not going to be unified, our actions certainly become inconsistent, of "ununified thoughts make actions chaotic. In an illustrative way, Ho Chi Minh also said: “Politics is the soul, speciality is the body. Having speciality without politics is just a soulless body. It's got to be political first to have speciality” (Ho, C.M., 2011f, p.492).

* *In terms of educational progame and its content*, an inclusive education need to be implemented. The President Ho emphasized the purpose of education must be associated with the educational content. In short, education must be comprehensive. "In teaching and learning, it is necessary that we must focus on the following aspects: revolutionary ethics, socialist enlightenment, culture, technique, labour and production” (Ho, C.M., 2011i, p.647). Specifically, in “The letter to teachers, teachers, students, youth cadres, and children” on October 31st 1955, Ho Chi Minh wrote: "University level syllabus should focus on combining scientific theories with practice, acquiring international contemporary knowledge in line with appropriatly applying to Vietnam's practice. high school level have to guarantee students’ general knowledge suitable to the needs of the country even in the future, but leaving out the parts that are not necessary for real life. In elementary school, it is necessary to educate children: love of the country, love of the peoples, love of labour, love of science and respecting public properity. The teaching method must be gentle and cheerful. Don't force children into adults’ framework. The health of the children must be concerned appropriately" (Ho, C.M., 2011e, p.81). As the result, Vietnamese students have been equiped systmatically modern, radical and scientific knowledge or trained practical working skills as well as forming proper emotional states and attidude that make a harmonious development for Vietnamese people.

Education firstly provides knowledge of natural science, social sciences and humanities comprehensively. It can be said that this is the main path for students to be able to absorb scientific knowledge in order to improve their awareness and actions constantly. Therefore, Ho Chi Minh said, "Attempt to improve the knowledge of culture and techniques" (Ho, C.M., 2011e, p.364); "learning politics, culture and techniques to improve understanding" (Ho, C.M., 2011e, p.413); "a person who does not know how to count or write is half-blind. Someone who has knowledge moves forward faster. The more you learn, the more progressive you are" (Ho, C.M., 2011c, p.99). In fact, when a person is uneducated, their ability to grasp scientific knowledge will be onesided and extremely difficult. Moreover, the more society develops, the more important the role of education in equipping knowledge and professional skills for members of society becomes more important. “On the basis of political education, it is necessary to improve the quality of culture and speciality in order to solve the practical problems set by the revolution of our country and, in a short time, reaching the peaks of science and technology" (Ho, C.M., 2011i, p.403). “To increase production capacity, there must be improved techniques. If you want to use technology, you have to have knowledge” (Ho, C.M., 2011i, p.361). Hence, conducting an comprehensive education is the prerequisite for gaining fulfilled cognition in all aspects to promote Vietnamese people as the driving force in the process of building the country.

Additionally, also through comprehensive education and training, Vietnamese people are equipped scientific backgrounds on daily activities such as hygiene, disease prevention, physical training to build a healthy lifestyle to constantly enhance both physical and mental health, an important part making the comprehensiveness of human development. “Healthy person have a life as good as the gods” - it is the words of President Ho Chi Minh that asserted the importance of health as a precious asset or the happiness of each individual. Likewise, a body which is unhealthy in terms of physical organs will have to endures a lot of difficulties in intellectual activities as well as practical behaviours.

Besides, by the right way of education and training, learners are educated in terms of civil responsibility, human morality, revolutionary spirit, international reponsiblity contributing to the formation of new moral qualities called “revolutionary ethics”. Along with other educational contents, “doing well in aesthetic education will promote strongly the formation of personalities including the truth, the good and the beauty values that guiding people’s behaviours to contribute to society (Ho, C.M., 2011g, p.175). On that basis, they become willing to wholeheartedly serve the peoples, serve the Fatherland in order to bring freedom and happiness to the whole community.

Commenting on the content and programe of education and trainning leading to build ful-developed people in Ho Chi Minh’s thought, Professor Do Huy wrote: "Under the leadership of the Party and President Ho Chi Minh, the revolutionary education while re-establishing the schooling time for the youth and teenagers from the primary school to higher levels along with reforming constantly education and training contents simultaneously. In the new system, the viewpoint of general technical education is conducted. Beside the teaching of scientific knowledge, in Ho Chi Minh’s educational thought, ethical education, physical education, labor education, aesthetic education and political education need teaching at all levels of schooling" (Do, H., 2000, p.93).

3.3. Some principles in education and training proccess to create inclusive people

** Inclusive combination of school, family and social education*

Educational impacts from schools, families and society are considered as a principal matter facilitating for all educational activities to attain best consequenses. According to Ho Chi Minh, schooling education has to cooperatte with family an social education to insrease the effectiveness of education in schools. "No matter how good the education in the school is, without education in the family and society, the educational results are not completed" (Ho, C.M., 2011e, p.87). In other words, the tightened unification of three sectors as family, school and community will certainly create a combined force in which ful-developed people are formed as the ultimate purpose of education and trainning. Because when three above educational environments come together and plan for common action, it is certain that there is the unity in both awareness and actions. For example, on the one hand, all educational activites follow one direction, one trategy which motivate the development process of personality of learners; on the other hand, avoiding conflicts or nationtion mutally that make learners become suspected and confused when choosing the living values. The coordination of families, schools and society can take place in many forms. The top fundamental problem is that all educational forces must actively promote responsible spirit in cooperation for the purpose of educating young generation to become useful citizens for the country.

** The principle of unity between learning and practising, theory and reality, eduation and production*

Ho Chi Minh advocates to combine "learning with practice", "theories must be related to reality" (Ho, C.M., 2011e, p.496); "learning in combination with production" (Ho, C.M., 2011f, p.174); "schools, organisations, families, communities all must come together" (Ho, C.M., 2011f, p.330). He always emphasized the role of practical activities in the formation of personality and considered practical activities as the standard for the examination and assessment of human awareness in all aspects. The educational purpose of all time not only helps students master knowledge but also applies knowledge into practice, forming skills, learning to know and learn to do. "There is no point having knowledge without practising. But practising without knowledge is as same as moving in the dark, slowly and stumblingly"(Ho, C.M., 2011d, p.86). Hence, the consistent principle that Ho Chi Minh outlined in the strategy of "developing people" of "re-educating the people" (Ho, C.M., 2011b, p.8) to form ful-developed people in Vietnam is: "The method of combining theory with practice means turning what has been learned into action. Learning must go along with practice, not just on the tip of the tongue" (Ho, C.M., 2011i, p.249); “Studying in all other disciplines must be: learning with practice, studying with labouring” (Ho, C.M., 2011f, p.174).

Ho Chi Minh believed that this educational content and method not only overcomes the limitations of the onesided and theoretical study which existed quite popular in the old society with the purpose that "taking a degree to have high ranking position in the society"; "learning a way but doing another way" (Ho, C.M., 2011c, p.60) but also creates the new generations of the new society "both radical and specialized"; "to be loyal to the country as well as to the peoples"; "Every task is completed, every difficulty is overcomed, every enemy is defeated". The tightened combinations between theorerical awareness and practical activities, between scientific knowledge and labour activities, between learning and practice help learners attain a deep understanding on many the fields of social life as well as have enough capacity to actively participate in the process of protecting and developing the country.

In the context of glolisation nowadyas, tt is required that the education of Vietnam also needs to make a breakthrough change from a traditional approach - a content approach which provided knowledge mainly but paid less attention to the demand applying the knowledge in solving practical problems into new approach - access to capacity in which the qualities and abilities of learners are formed through the need to conduct dialectically all knowledge, skills, attitudes, behaviors. To put it differently, the ability to apply knowledge, practical skills, ability to perform other life skills are high appreciated. Regarding the qualities must-have for learners in many recent studies, educators say that with the new general education program, students need the following abilities: self-study, problem solving, critical thinking, self-management, communication, cooperation, using of information and communication technology, using language, calculation. And the result is a new generation of Vietnamese people with inclusive development of quality meeting the demand of modern society is born.

** Building equal and democratic environment in education for young people to develop their talents*

“Everyone have opportunity to study" (Ho, C.M., 2011b, p.161) is one of the most important thoughts in the Ho Chi Minh’s thought on education that expresses his desire for general education for both boys and girls, rich and poor, old and young .

Democray in education is also an basic principle that Presiden Ho Chi Minh concerned seriously. Because from his perspectives, people have to understand about their democratic right as well as their responsibility in democratic operating before excercising that right in practice. One of the top important factors to conduct demecratic right is in the field of human education expressed by the right and obligation to learn.

In the current context, in the industrial revolution 4.0, applying scientific and technical factors are becoming an indispensable element in education that is changing the traditional way of learning from direct to indirect, shortening geographical distances, narrowing social gaps as well as expanding opportunities for lifelong learning of each person. These changes have facilitated people in many countries, in many fields and in different social groups to have access to a similar educational platform, equally. On the basis of Ho Chi Minh's ideology, it is clear that one of the top priorities in education is equipping technical facilities and creating a lifelong learning ecosystem which are immediately able to catch up with the development trend of the world as well as adapt to accidentally unpredicted sittuation such as the Covid-19 pandemic outbreak in recent years.

4. Discussion and Conclusions

It can be said that human beings are the central factor that determines all social processes, while education and training are the most basic and direct tools to form human qualities and abilities. Ho Chi Minh’s thought on education and training to building ful-developed people still remain its values in contemporary context that demonstrates the proactiveness of countries and political institutions in defining sustainable development strategy. Those ideas also contain the great aspirations of the Vietnamese peoples particularly and of the mankinds generally in which everyone has opportunities to go to school and have facilities to enhance inclusively. UNESCO has appreciated President Ho Chi Minh's important contribution in many aspects of culture, education and the arts which is the convergence of the precious tradition of the Vietnamese people throughout the history and the aspirations of all peoples worldwide in affirming their national identity. Ho Chi Minh is a typical symbol in inheriting selectively the positive aspects of traditional education and absorbing the quintessence of modern education. His thoughts on education and training have become the fundamental methodology for the strategy of building Vietnamese people in the new era – inclusively developed people meeting the requirements of the comprehensive renovation process.

ISSUES OF IMPROVING QUALITY OF HUMAN RESOURCE IN MILITARY ENTERPRISES TODAY

PhD Candidate.Nguyen Thi Thanh Binh

dlbinhan@gmail.com

Political Academy, Hanoi, Vietnam

Abstract

Among resources for development, human resource is considered as the most important asset, holding the role of determining the socio-economic development of each countries, as well as the sustainable development of enterprises in general, and military enterprises in particular. The increasingly deep impact of globalization and international integration, especially the impact of the Fourth Industrial Revolution, has been changing fundamentally and comprehensively the economic structure as well as labor market at national and enterprise levels, including military enterprises. In such context, in order to develop sustainably, it is necessary for our country and Army to have solutions to improve quality of human resource. How to improve quality of human resource in military enterprises is the content of this article.

Keywords: *human resource; quality of human resource; military enterprise*

1. Introduction

Since the 2000s, the Fourth Industrial Revolution (the 4.0 Revolution) has fundamentally changed the way the world operates, from models of socio-economic structuring to method of national governing and administering. That brings about comprehensive economic, social, and environmental changes in all levels, from global to regional, and in all countries and territories. Together with opportunities created by the 4.0 revolution, there has been a variety of challenges that are hard to overcome, requiring countries and territories to both change their mindset and develop and improve the administration model to adapt to the continuous development of the 4.0 revolution. Developing countries, including Viet Nam, shall find it hard to avoid negative impacts of the 4.0 revolution.

Facing increasingly high requirements related to quality of human resource under the impacts of the 4.0 revolution, enterprises in general and military enterprises in particular must have synchronous measures to improve their quality of human resource to be industrial and modern in order to keep up with the development of sciences and technologies. The force of highly skilled workers, the rate of trained workers having high qualifications and professional working skills have brought about success and and brand recognitions for military enterprises, such as: Army Telecommunication Industry Corporation, Military Commercial Joint Stock Bank, Saigon Newport Corporation, etc. However, the number of scientific cadres and experts of all fields are small, professional qualifications of a portion of workers of military enterprises do not fully meet work requirements; activeness and responsibilities are not high; capabilities of management and governance in the digital transformation conditions are limited, etc. If these limitations and weaknesses are not remedied, military enterprises may encounter difficulties in meeting task requirements in the current context. Therefore, clarification of theoretical and practical issues of improving quality of human resource in military enterprises is of remarkable importance.

2. Method

To accomplish the research objective, the article uses logical and historical methods, statistical-comparative, analytical-synthetic and specific economic methods:

On-the-spot method: Interpreting and synthesizing studies on improving the quality of human resources in Vietnam and in the military enterprises.

The author surveys a number of military enterprises accurately assessing human resources in recent times. From there, the author proposes solutions to improve the quality of human resources of military enterprises in the coming time.

The author would love to consult experts through seminars.

3. Results

3.1. Theoretical and practical issues of improving quality of human resource in military enterprises

3.1.1. Concepts of human resource and improving quality of human resource in military enterprises

* Concept of human resource

According to Organization for Economic Cooperation and Development, human resource is the whole of knowledge, skills and capability of people related to the socio-economic development of a country.

International Labour Organization considers that human resource is the whole of workforce. That is the whole of labor potentials of the people being in working ages, having the capacity to work of a country, being prepared to a certain extent and being capable of mobilized into the process of socio-economic development. These potentials include the stock of physical, intellectual and personal factors of the people of a country to meet a certain structure required by the economy.

In addition, there is another concept that: “human resource is construed as the population and quality of people, including physical and mental conditions, health and intellect, capabilities, qualities and ethics of the workers. It is the stock of actual and potential human resource which are prepared to engage in socio-economic development of a country or a locality ...” [17, tr. 13].

These concepts presents different aspects of human resource, however they share the following point: To mention quantity and quality (physical, psychological and intellectual potentials) and structure of human resource, including existing and potential portions. The existing portion is the population in working ages and having working capabilities; the potential portion is the population out of working ages as specified by laws, having work capabilities and desires to work.

From the aforesaid concepts, the author considers that: human resource is the stock of physical, intellectual and psychological potentials existing in social work resources with an appropriate structure, to be mobilized and used for creating material and mental products to meet present and future demands of the society.

From the aforesaid consideration, it can be seen that human resource includes potentials of each individual, such as physical, intellectual and psychological potentials and the coordination between individuals in implementing tasks of their organization.

** Concepts of improving quality of human resource in military enterprises*

The term *improving quality* means conducting certain activity leading to an upward change in quality as compared to the current quality. Improving quality of human resource is construed in the same way. Improving quality of human resource is the manifestation of new values of factors constituting quality of human resource, including: Intellectual, physical and mental strengths of each individual. In other words, improving quality of human resource, in essence, is to to create a human resource having quality higher than the existing one. In a more generalized way of description, improving quality of human resource is the process of improving human values, including both material and mental values, and intellect and mind and professional skills, to make a person be a worker having higher new capabilities and qualities.

From the above analysis and discussion, it can be argued that: *Improving quality of human resource is the activities of actors using systems of mechanisms, policies and measures to enhance quality of components of quality of human resource, including physical, psychological and intellectual potentials, to meet demands of labor market.*

Quality of human resource is the primary factor that reflects the strength, potentials and capacities to complete assigned tasks of military enterprises, manifesting in qualities, qualifications, creativity, prestige and positions of human resource in the enterprises. Quality of human resource in military enterprises includes: Political quality; cognitive and creative capacity; educational and professional qualifications; capacity to perform tasks; ethical qualities (shown in the quality and effectiveness of performing tasks according to positions, duties and expertise). Therefore, improving quality of human resource in military enterprises, in essence, means improving quality of components of this resource.

Quality and improving quality of human resource in military enterprises are the results of the process of building and developing this human resource in long periods of time, in line with the process of building and developing the military enterprises. Due to the increasingly diversified development of tasks and the specificity of human resource of military enterprises, it is necessary to clarify the issues of improving quality of human resource in the new period.

According to Tran Dang Bo "military enterprises constitute an important component of state owned enterprises, being under management of the Ministry of National Defense, having registered their operations in various sectors and fields, and being organized into two types of: national defense and security enterprises, and national defense economic enterprises" [2, p.32]. As defined by this concept, military enterprises operates in a wide range of different sectors and fields of the national economy, including industrial, agricultural, and service ones.

Article 3 of Decree 93/2015/ND-CP dated 15/10/2015 of the Government on management and operation of enterprises in national defense and security specifies that: "Enterprises which are categorized as enterprises in national defense and security must fulfill following conditions: Being state owned enterprises of the Ministry of National Defense or Ministry of Public Security; having business lines and fields specified in the Appendix of List of sectors, fields or areas directly supporting national defense and security promulgated under this Decree; being assigned by competent authorities to produce and provide national defense and security products and services or perform national defense and security tasks in a regular and permanent basis using assets of the State or assets of the enterprises in accordance with investment and incorporation objectives of the enterprises" [7, tr.15].

From aforesaid analysis, the author considers that: *Military enterprises constitute a portion of State owned enterprises, which are managed by the Ministry of National Defense, assigned with tasks of producing, repairing, and improving weapons, technical materiel, and specialized equipment to meet demands of national defense consumption and socio-economic development.*

This concept clearly defines type, business fields, functions and tasks of military enterprises.

Firstly, military enterprises constitute a portion of State-owned enterprises. According to paragraph 11, Article 4 of the Law on Enterprises "*State-owned enterprises* include enterprises in which the State owns more than 50% of charter capital or of shares with voting rights"[20, tr. 53, 54]. Currently, military enterprises are enterprises in which the State owns more than 50% of charter capital or of shares with voting rights as specified by the current Law on Enterprises.

Secondly, military enterprises have two major types of enterprises in national defense and security and economic enterprises. Of which: Enterprises in national defense and security are State-owned enterprises including enterprises in national defense and security, and enterprises operating in crucial areas of national defense and security simultaneously performing national defense and economic tasks. The economic enterprises are gradually being transformed into the model of joint stock enterprises in accordance with the program of enterprise equitization of the Government. The Ministry of National Defense is currently managing 104 enterprises operating in various fields, such as: Banking, telecommunications, textiles and garments, footwear, pharmaceuticals, real property, etc.

As such, from the concepts of human resource, improving quality of human resource, and military enterprises, the author argues that: *Improving quality of human resource in military enterprises is the activity of the actors using systems of mechanisms, policies and measures to transform the quality of this resource in the direction of increasing values of components constituting quality of human resource, including physical, psychological and mental potentials, to better meet task requirements of military enterprises in each period.*

This concept comprises issues constituting the action of building, reflects objectives, contents and tasks of improving quality of human resource in military enterprises. It is an deliberate, purposeful and well-organized action, comprising following contents:

Purpose of improving quality of human resource in military enterprises is to transform the quality of this resource in the direction of increasing values of components constituting quality of human resource, including physical, psychological and intellectual potentials, to better meet task requirements of military enterprises in each period.

Actors of governance and management of improving quality of human resource in military enterprises are the system of Party organizations and the system of command and management of all levels in the Army as determined by the Ministry of National Defence and specified by laws.

Forces directly participating in the process of improving quality of human resource comprise all organizations and individuals in the Army, including military officers, professional servicepersons, national defense workers and other workers, and Union organizations, Youth Union, Women' associations of all levels in military enterprises.

Forms and measures to improve quality of human resource in military enterprises are diversified, including systems of mechanisms, policies and measures to impact on human resource to transform the quality of this resource in the direction of increasing values of components constituting quality of human resource.

3.1.2. Contents of improving quality of human resource in military enterprises

Improving quality of human resource in military enterprises is the process of supplementing and improving components of quality of human resource, including: Political quality; educational and professional qualifications; cognitive and creative capacity; capacity to perform and complete tasks; ethical qualities, lifestyle and working style.

Components of quality reflect degrees of task completion according to positions, tasks and professions of each individual and organization. Components of quality of human resource are constantly changing and developing due to the development of the tasks of Homeland construction and protection in each period. As such, improving quality of human resource in military enterprises is the process of improving quality of the components constituting quality of human resource. From the approach on researching improving *quality of human resource, it is possible to determine contents of improving quality of human resource, serving as criteria for assessing status quo of improving quality of human resource in military enterprises, including:*

Firstly, improving physical and mental strengths

Improving physical and mental strengths is an objective requirement aimed at meeting high demands of quality of human resource in military enterprises. This is especially important due to the fact that the nature and scope of tasks being assigned to human resource in military enterprises are increasingly difficult, complicated and stressful. As such, the human resource must have good physical and mental strengths, which include the strength of the body, agility, flexibility, resistance to disease-causing factors, along with the ability to withstand harsh environmental conditions and factors that affect human health; especially the ability to be confident to cope with stress while maintaining comfortable relationships and independent lives, to easily recover from difficult situations. This process requires regular and frequent training, so as to form habits of training physical and mental strengths.

Secondly, improving psychological strength

Improving quality of psychological strength of human resource in military enterprises, in essence, means improving political consciousness, sense of responsibility, work efficacy, sense of discipline, etc., of the human resource while working in accordance with assigned duties and tasks of each job position. Improving psychological strength is assessed by following criteria: Improving political virtues; improving ethical qualities and working style.

Thirdly, improving professional capacity and qualifications (intellectual potential)

This is an important content to improve quality of human resource in military enterprises nowadays. Contents of improving professional capacity, qualifications and expertise must be comprehensive and appropriate for each work division and individual worker in accordance with specific duties and tasks of each job position. In addition to general requirements of educational degrees, professional training qualifications, etc., for each work division and individual worker, there are other specific requirements related to capacity, profession and expertise of each job position. Improving capacity, professional qualifications and expertise of human resource in military enterprises are assessed by following criteria: Improving intellectual and professional capacity; improving qualifications.

3.1.3. Status quo of quality of human resource in military enterprises

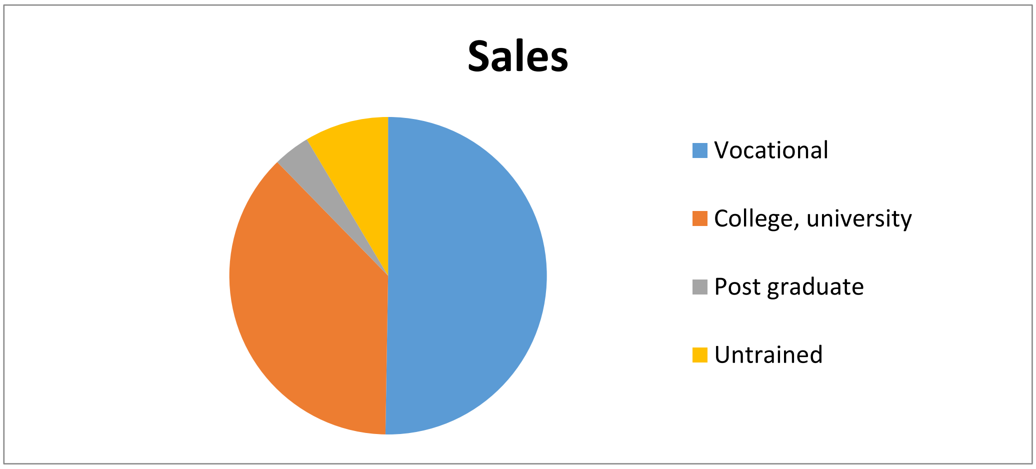
According to data of Department of Economics, Ministry of National Defense, military enterprises have made important contributions to the socio-economic development, been important material assets of the State economy and guaranteed socialist orientation in developing market economy in Viet Nam. The data shows that revenue in 2019 of military enterprises reached more than 383 trillion VND, being 19% higher than that in 2018; profit before tax reached 61 trillion VND, being 15% higher than that in 2018; and contribution to

State budget reached nearly 46 trillion VND, an being 13.23% higher than that in 2018 [9, tr.13]. In which, a number of military enterprises have achieved remarkable profits and State budget contributions, for examples: Army Telecommunication Industry Corporation, Military Commercial Joint Stock Bank, Saigon Newport Corporation. These significant and important contributions are due to the fact that military enterprises have human resources and policies of developing human resources being proper and appropriate to task requirements in each period.

Regarding physical potential, most of military officers, professional servicepersons, national defense workers and other workers have been selected carefully in terms of health, having good physical strength, flexibility, capability of withstanding all work pressure, especially that of heavy jobs or jobs that require employees to have good health, such as: Mining, construction, transportation, etc., Annually, the number of workers being dismissed due to health conditions is low, approximately 0,87% of the total of 181.339 workers in military enterprises [9, tr.15].

Regarding intellectual potential, according to statistics, most of the human resource in military enterprises have received fundamental training. Of which: The percentage of workers having postgraduate qualification is 3,5%; college and university qualifications 35%, vocational degrees 47%, primary level 6.5% and untrained 8% (Chart 3.1). 100% of managers (military officers, professional servicepersons) of all levels have bachelor, master and doctor degrees; a portion of technical cadres have been trained in foreign countries. Most of the workers are permanent staff as specified by the Ministry of National Defense or work under long-term contracts, with the percentage of short-term contract workers being 24,1%.

Figure 3.1. Qualifications of workers in military enterprises in 2019, sorted by educational levels



Sources: Enterprise Management Office, Department of Economics

A number of military enterprises operating in technological, banking and other service fields have relatively high quality human resource, for examples, Army Telecommunication Industry Corporation, Military Commercial Joint Stock Bank, and Saigon Newport Corporation. To be specific, of the 15.932 cadres, national defense workers and other workers of the Military

Commercial Joint Stock Bank, 9.326 workers have bachelor, master and doctor degrees, accounting for 58,5%. Most of managers and technicians have been trained in prestige universities and academies in Viet Nam and other countries.

Table 3.1. Labor structure in military enterprises, sorted by management categories

No.	Category:	Number (worker)	Percentage (%)
1	Military officer	4.720	2.6
2	Professional serviceperson	11.673	6.4
3	National defense worker	32.412	17.9
4	Long-term contract worker	88.711	49
5	Short-term contract worker	43.823	24,1
Sum		**181.339**	**100**

Sources: Enterprise Management Office, Department of Economics

According to the data (in Table 3.1), the total number of workers in military enterprises is 181.339, of which: Military officers holding management positions of all levels is 4.720, accounting for 2,6%; professional servicepersons 11.673, accounting for 6,4%; national defense workers 32.412, accounting for 17,9%; long-term contract workers 8.711, accounting for 49%; and short-term contract workers 43.823, accounting for 24,1%. Due to the guideline of equitization and divestment in State-owned enterprises, in the recent years, the number of long-term and short-term contract workers has been increasing, and military enterprises strongly switching to business accounting mechanism.

Regarding psychological potential: Human resource in military enterprises are carefully selected in terms of political stance, sense of responsibility in conducting assigned tasks, having high work efficacy and high sense of discipline. Results of annual quality assessment of managers and workers show that: 100% of cadres, military officers, national defense workers and other workers have good political virtues, ethical qualities and political awareness, and continuously improving working style.

However, apart from achievements related to human resource of military enterprises in the recent years, there have been a number of limitations, as elaborated below. While the number of workers in military enterprises is 181.339, the number of workers having vocational qualification is still high, accounting for 47% of the total number of the workforce; annually, the number of workers being dismissed due to health conditions accounts for approximately 0,87% of the total number of the workforce [9, tr.13].. In a number of enterprises, there have been cases of military officers, professional servicepersons, national defense workers and other workers violating regulations and laws. Workers are still slow to adapt to scientific and technological advances, especially the impacts of the 4.0 revolution. Therefore, in order to help military enterprises develop and be strong in competition and meet requirements set forth in the current context, improving quality of human resource is an issue to be solved.

3.2. Measures to improve quality of human resource in military enterprises

3.2.1. Changing mindset and perception of the actors of the importance of improving quality of human resource

Human resource, of which high quality human resource is the core, is the force that grasps and applies achievements of the 4.0 Revolution. Therefore, the actors of leadership and management of the Ministry of National Defense, and especially the actors of leadership and management in military enterprises, must change their mindset in order to have proper and comprehensive perception of positions and roles of human resource in sustainable development, and on that basis to improve their perception of the importance of improving quality of human resource. Such changed mindset and perception shall be the foundation for preparing schemes and plans of training for improving quality of human resource to match with situations and conditions, meeting requirements of the tasks of Homeland construction and protection of the Army, contributing to socio-economic development.

3.2.2. Improving quality of training human resource in military enterprises

In order to meet requirements and tasks of production and trade of military enterprises in the current context, the staff of military officers, professional servicepersons, national defense workers and other workers must be trained and fostered to improve comprehensive quality, including physical, intellectual and psychological potentials. The focuses of training and fostering are political consistency, capacity of corporate leading and managing, and professional expertise. Management cadres must be equipped with comprehensive knowledge; professional cadres must have deep expertise, combining improving theoretical reasoning capacity with fostering practical capacity. Priorities of training should be placed on specialized technical and technological fields, especially high-tech ones, matching with development trends of the 4.0 Revolution, such as fields related to information technology, automation, artificial intelligence, digital transformation, etc., in order to adapt to the era of digital technology, to quickly apply technological solutions, such a cloud computing, Cloud Drive, ProMail, etc., to overcome challenges and develop in a faster and more sustainable manner.

On the other hand, it is necessary to diversify types of training with appropriate number and structure. Emphasis must be placed on training from technical workers to graduate and postgraduate workers; linking training with planning and employing. Another work to be done is to apply segmentation of training specialization between military educational institutions and national educational institutions. It is also necessary to boost the application of information technology in training and teaching foreign languages and adaptation skills in international competitive environment. It is a must to have plans for training and fostering to improve comprehensive capacity of leading experts to be capable of approaching advanced scientific and technological development in their fields of expertise, to have creativity in researching and applying scientific and technological achievements; to promote initiatives and innovations to improve labor efficiency and product quality. At the same time, attention must be paid to training skillful workforce, including technicians and engineers capable of operating high-tech and automated equipment.

3.2.3. Reforming and improving mechanism of management, and policies of mobilizing investments in improving quality of human resource

Firstly, it is necessary to reform governance methods, improve capacity and efficacy of human resource development management for military enterprises. It is a must to research and add schemes and policies to guarantee material and mental benefits for the staff of leaders, managers, scientists, technical workers and other workers in military enterprises. Human resource should be used in the direction of: Attracting talents; reasonably allocating assignments; creating favorable working conditions and guaranteeing benefits for them to work. For the staff conducting scientific and technological researches, there must be favorable and respectful working policies, environment, and opportunities for them to contribute and promote their talents. If this issue is properly dealt with, it is possible to promote capabilities of the existing staff, contributing to preventing human capital flight in military enterprises nowadays. In order to achieve effective implementation, mechanisms and policies must ensure fairness and equality between contribution and benefits, and avoid equalitarianism-based distribution. Material encouragement should be closely combined with mental encouragement, to create motivation for each individual as well as organization. Investment from the State budget should be increased and resources from in and out of the country should be mobilized, even from private investment, in order to develop high quality human resource for military enterprises in the time to come. Investments in the system of educational institutions and research institutes in the Army should be increased in order to enhance capability and quality of training military human resource in general, and human resource for military enterprises in particular.

3.2.4. Expanding cooperation and coordination with universities in Viet Nam and in the world to improving quality of human resource in military enterprises

In order to improve quality of human resource in military enterprises nowadays, one of the indispensable measures is that the military enterprises must rely on their own functions, duties and business fields to forecast their need of human resource. Therefore, it is absolutely necessary to link training processes in universities with human resource demands of military enterprises. As such, Party committees, commanders and leaders of military enterprises must actively prepare plans for training cooperation and coordination with prestige universities in fields of: Financing, banking, business administration, information technology, automation, transportation, etc., for the purpose of training cooperation and coordination, so as to gradually improving quality of human resource in military enterprises. In addition, in the trend of increasingly intensive integration in various field, it is necessary to expand and effectively implement training and fostering cooperation and coordination programs for improving quality of human resource and management cadres, focusing on fields in which military enterprises do not have sufficient capabilities, especially in high-tech and economic fields related to digital transformation; to encourage cooperation models that link training and fostering with researching and technology transferring; and to promote training cooperation and coordination between military educational institutions and foreign entities to meet development needs of military enterprises. Favorable environments and conditions should be created in order to attract the pool of trainers and scientists experienced in international cooperation and overseas Vietnamese people to participate in the process of training and fostering high quality human resource for economic sectors in Viet Nam in general and for military enterprises in particular to meet task requirements.

4. Conclusions

Improving quality of human resource in military enterprises nowadays is an urgent task that requires appropriate measures. Therefore, it is necessary to have attention of leaders and commanders at all levels and to add and adjust mechanisms to attract and promote creativity of the staff of cadres, scientists, experts, skillful workers to meet requirements and tasks of building and developing of military enterprises in the new period. In order to improve quality of human resource in military enterprises to meet requirements of the Industry 4.0 in the time to come, it is necessary to focus on following essential solutions: Changing mindset and perception of the actors of the importance of improving quality of human resource; Improving quality of training human resource in military enterprises; Reforming and improving mechanism of management, and policies of mobilizing investments in improving quality of human resource; Expanding cooperation and coordination with universities in Viet Nam and in the world./.

BUILDING THE VIETNAMESE PEOPLE ACCORDING TO GOAL-ACTION APPROACH TO REALIZING THE PATH TOWARD SOCIALISM IN OUR COUNTRY AT PRESENT

Dr. Nguyen Kim Ton

tdpy.kimton@gmail.com

Institute of Scientific Socialism, Ho Chi Minh National Academy of Politics, Vietnam

Abstract

Building the Vietnamese people to develop comprehensively is an important goal and task, one of the factors that determines the success of building socialism in our country. Carrying out this task according to the goal-to-action approach ensures the correct orientation of the Communist Party of Vietnam (CPV) and creates a unity of action of the whole political system to achieve the goals. It requires fully grasping the CPV's viewpoint on the quality of Vietnamese people in the new period, and concretizing it into specific, clear and detailed goals and corresponding actions that feasibility, measurable, and evaluation results in order to ensure the realization of the defined objectives.

Keywords: *Build Vietnamese people, goals - actions approach, socialism*

1. Introduction

Like other tasks, in order to successfully build a socialist Vietnamese people, it is necessary to clearly define specific goals. In other words, what qualities of Vietnamese people need to be built, from which clearly define the task to achieve this goal. The required qualities of Vietnamese people can be described in the most general and general way to guide action for all fields. However, in order to act effectively, the general qualities must be concretized and detailed into smaller, clearly defined qualities to facilitate each specific field in building new human qualities. With a goal-to-action approach, the article wants to provide a view of Vietnamese human qualities in a dialectical relationship with practical actions to turn goals into reality.

2. Method

The article mainly uses the method of analysis and synthesis to study secondary documents such as documents of Communist Party of Vietnam and information on the mass media.

In addition, the article also uses analytical and systematization methods to analyze in detail the necessary qualities of Vietnamese people, and at the same time, systemize them into a unified whole.

3. Result

Approaching mecthod from goal to action in building socialist Vietnamese people.

President Ho Chi Minh once taught: "To build socialism, first of all, socialist people are needed."[68] Following his teachings, the Communist Party of Vietnam during the revolutionary leadership has always cared about building the Vietnamese people to meet the requirements and tasks of the new situation. Our Party affirms: "Building the Vietnamese people for comprehensive development must become an objective of the development strategy."[69] In that spirit, the building and perfecting of the Vietnamese people has been thoroughly grasped and implemented in all areas of social life, in which the most important fields are Culture, Health, Education and training... Each field play its own role and performs its own function, but all work together to create the qualities of Vietnamese people in the new era.

In particular, the field of education and training has the task of "comprehensive quality education of Vietnamese people to develop comprehensively and to bring out the best potential and creative ability of each individual; love family, love motherland, patriotism, love compatriots; live well and work productively."[70]

The health sector contributes to "improving the physical and mental health, stature, longevity and quality of life of Vietnamese people."[71]

The field of culture"focus on taking care of building people has good character and lifestyle with the basic characteristics: patriotism, compassion, love, honesty, solidarity, industriousnes and creativity"[72]

Those leadership and guidelines of the CPV have been orienting the activities of the whole CPV and our people on the path toward socialism, including the task of building a socialist Vietnamese people.

In order to turn the CPV's wise theories and orientations into concrete actions to successfully build socialism, it is necessary to further promote theoretical research activities

to concretize and detail the general and condensed goals and orientations that our Party has determined into more specific and detailed contents and goals, and at the same time outlines specific actions to achieve these goals.

This is really necessary in all the goals, guidelines and orientations of the CPV. If generalized goals and orientations of CPV not be fully grasped, not be clarified, concretized, it is very difficult to implement in real life, and may even lead to wrongdoing, deviate. It is the same for the goals and orientations in building the socialist Vietnamese people. It is also necessary to have specific and detailed steps corresponding to it, which are specific programs and action plans to achieve the goal. This is a goal-to-action approach.

This approach requires of definition goals is clear and specific. Each goal must define specific, appropriate, corresponding activities to achieve that goal. These activities must be feasible and can be implemented in practice; axamine, measure and evaluate actual results. Defining goals without identifying specific activities or activities are not feasible, cannot be organized in practice, cannot measure, examine and evaluate results is considered a failure. It happen when defining goals that are too large, inappropriate, or too general, vague, or unclear. It is easy to happen in case of the goals are abstract and qualitative like goals of building people, especially those in building personality, ideals, morals...

This is common in many Vietnamese educational institutions today. When developing educational and training programs, most of educational institutions have defined goals and Program Outcome Standards with content related to the personality, ideals and morals of learners. But specific action plans to achieve this goal are few or unclear, often mixed with other activities. It make measurement, examination and evaluation of the results difficult and unclear, inaccurate, making many people skeptical, lacking confidence in the development of goals as well as implementation activities. Therefore, fully and properly grasping the CPV's goals and orientations in building the socialist Vietnamese people, and at the same time concretizing them into more detailed, more specific and clearer goals, reasonable and feasible, and at the same time, setting out corresponding specific actions to achieve the goals is very necessary today. It contributes to unifying actions from all branches and levels, unifying educational goals from low to high, non overlapping, repeating...

Applying the goal to action approach in building the socialist Vietnamese people today.

To effectively apply this approach, it is necessary to perform the following tasks synchronously:

Firstly, fully and properly grasp the CPV's goals and orientations in building the socialist Vietnamese people.The CPV's viewpoints and orientations in building the socialist Vietnamese people have been drawn from the practice of leading the Vietnamese revolution for more than 90 years. It is always supplemented and perfected to meet the requirements of human quality in the new era. This is the process of summarizing, distilling and inheriting the noble qualities of the Vietnamese people in history, and at the same time absorbing the progressive values of mankind to meet the requirements of the mission in the new era . That is the "comprehensive development of Vietnamese people". In which there are typical qualities such as: patriotism, national pride, sense of respect for the law, ability to perceive aesthetics, scientific worldview; have a good physically, mentally and intellectually capable for meeting the requirements of the times; have a good moral and lifestyle; have a sense of self-respect, self-control, diligence, kindness; be responsible for themselves, their familly and society; know how to protect the good and fight the bad...

The above comprehensive qualities are both the goal and the orientation of the CPV in building the socialist Vietnamese person. It is general, succinct, and is the basis for the entire political system to carry out the tasks for developing human in the new era. Depending on the functions and tasks of each part constituting of the political system, it performs different tasks and goals, fostering different qualities of the new man. But no matter what task is performed, fully and properly grasping the goals and orientation of the CPV is the first important thing. It ensures the highest leadership of the CPV, and ensures the unity of action of the entire political system in building and developing the socialist Vietnamese people.

Second, concretize the CPV's goals and orientations into specific goals and actions in building the socialist Vietnamese people.

This concretization makes the CPV's goals and orientations closer to the requirements of reality; makes the implementation of those goals and orientations easier and more convenient. The goal is more specific, detailed and closely to reality, the more convenient implementation will be. Therefore, on the basis of the CPV's orientations, it is possible to divide and concretize and detail the qualities of Vietnamese people according to the three basic groups:

The group of qualities in terms of capacity and intelligence, including cognitive ability, understanding, workmanship level, labor skills (hard and soft), creative capacity, scientific worldview, aesthetic sensibility…

Concretizing and detailing this group of qualities requires building the specific goals about abilities and intelligence for each education level (general knowledge, basic knowledge, advanced knowledge, etc.). ...); building goals for each specific object according to the requirements of each job, each industry, specialty, specific field of expertise... These qualities need to be divided into stepped achievement according to levels from low to high to easily measure and evaluate results.

The group of healthiness qualities, including physical and mental health, stature, longevity, quality of life…

To concretize and detail this group of qualities, on the one hand, it is necessary to determine common goals in each aspect such as: goals on life expectancy, stature, birth and death rates, infection status, accident, injury rates, quality of life... On the other hand, it is necessary to concretize and detail healthiness goals for each subject such as: healthiness by age, gender, healthiness for specific subjects who doing specific jobs such as athletes, policemen, military, pilots, miners, sailors, drivers, teachers, doctors...

A group of moral and lifestyle qualities, including patriotism, national pride, sense of respect for the law; have a good moral and lifestyle; have a sense of self-respect, self-control, diligence, kindness; be responsible for themselves, their familly and society; know how to protect the good and fight the bad...

This group of qualities is highly abstract and qualitative, so concretizing and detailing is defficult and controversial. Moreover, the constituent parts of this group of qualities are very close to each other, bordering on, even merging into each other and it is difficult to separate them. Patriotism and national pride always go hand in hand. Social responsibility is always associated with a sense of respect for the law. Moral qualities can be devided into many different qualities. This division seems to be endless. It is not easy to clearly describe the requirements of each quality. How is national pride, sense of self-respect, self-control, industrious, and kindness expressed? These difficulties will inevitably lead to difficulties in determining specific tasks and action programs to achieve goals; Difficulty in measuring and evaluating the achieved results. In fact, most of the moral and lifestyle education programs in all educational levels in Vietnam for many years have been very general, without specific measurement and evaluation tools. Ethical and behavioral classification of learners is mainly based on the sense of law implementation, the sense of implementing the rules and regulations of the educational institution and the subjective judgment of the evaluator, so it is difficult to get the exact results.

Face to face with the above specific difficulties, in order to concretize and detail this group of qualities, on the one hand, it is necessary to select and list the required moral qualities. On the other hand, describe in detail the manifestations, requirements of each of those according to each specific object, each working position, each age, each level of education... About moral qualities, lifestyle, must have the following basic qualities:

- Having a sense of law enforcement, including the sense of implementing the State's regulations, the legal regulations of organizations and the community.

- Having national pride, expressed in understanding, aspiration to learn, honor, propagate and protect the noble values of the nation.

- Have great aspirations and ambitions: Know how to build and nurture great aspirations and ambitions for myself, family and the country.

- Having courage: bravely fighting evil, protecting the good values of oneself, family, country and humanity; bravely face difficulties and challenges, not afraid of sacrifices, hardships, fearless, faltering before evil forces, difficulties and challenges.

- Persistence, industrious: Persistence, industrious in action, persistently pursuing goals and ideals of oneself, family and country. Do not be hasty, discouraged, never give up when face of difficulties and challenges.

- Ability to endure difficulties and hardships: Recognizing and anticipating difficulties and hardships of oneself, family and the country in pursuit of goals and ideals. Ready to face with difficulties and hardships when encountered, without resentment, blame for the others.

- Community service spirit: Having the consciousness and necessary skills to serve members of the family, community, society and the country, including serving in study, at work, entertainment, living; serving the common requirements of the country…

- Creative spirit: Having the consciousness, motivation and skills to find new things that are useful for study, work, entertainment, living of oneself, family, society and the country.

- Solidarity: Having the consciousness and skills with low to high level to coordinate, associate and cooperate with members of the family, community and society in order to perform the tasks more effectively.

The above ethical qualities quite fully cover the ethical requirements of Vietnamese people according to the CPV's orientation, and reflect the patriotic spirit of Vietnamese people in the new era. Although it is possible to list and detail into many other moral qualities, however, to the extent possible, it is necessary to emphasize on the most basic and indispensable qualities above, turning it into a red thread that throughout the activities of all individuals and organizations in order to build the moral qualities of Vietnamese people in the new era. On the basis of these most basic, indispensable and mandatory qualities, in the process of building moral qualities and lifestyles, depending on their ability to perform, each individual and organization can add other qualities appropriately. However, when adding other qualities, it is necessary to ensure that the most basic moral qualities above are fully implemented, and at the same time, the added moral qualities must be done in practice. Do not show general, big, formalistic slogans but cannot be implemented in practice.

When determining those ethical qualities as an indispensable content in all activities to build morality and lifestyle of Vietnamese people, it is necessary to concretize, setting requirements for each specific objects, conditions and circumstances. How can be shown the moral qualities, lifestyle for pupils, students, jobholders, officers and the other..? what are the requirements for them? what they need to do to get those qualities? How is the measure achieved results?.. This is an indispensable work in building morality and lifestyle of Vietnamese people today. This work can help train moral qualities and lifestyle that is both suitable for each subject, each condition, not be repeated, overlapping, and at the same time guarantee for feasibility, not be general and unrealistic.

Third, develop specific plans and action programs to actualize the goals in building socialist Vietnamese people.

This plans and action programs is built base on the identified goals of the quality of the socialist Vietnamese people, with the motto of certainty and effectiveness. No impatience, no haste, no unrealistic illusions. The general, directional qualities correspond with development of common plans and action programs. Specific, detailed goals and qualities will build detailed action plans. Each agency or organization, depending on its functions and tasks, and depending on actual conditions, develops appropriate programs and activities to build one or some necessary qualities of Vietnamese people. Programs and action plans must be clear, deployable in practice, suitable for specific goals and objects, and must be able to test, evaluate and measure results. Do not develop specific programs for general goals. On the contrary, do not build a general program for a specific goal. Do not build an action plan if it is not possible to measure and evaluate the performance results and do not measure and evaluate if the measurement or evaluation results are inaccurate. With this, the noble qualities of socialist Vietnamese people will be gradually created and gradually perfected. Although it takes a long time to perfect, but with the right approach, with a firm and appropriate steps, it will create belief for the Vietnamese people about a good future of realistic socialism.

4. Discussion and Conclusion

Building and comprehensively developing the Vietnamese people is a long-term, regular and continuous task. It requires the participation of the whole society, under the leadership of the Communist Party of Vietnam. However, the desire for a perfect Vietnamese people is great, but actions to achieve that desire are not always met. Therefore, in each time and specific circumstances, it is necessary to identify the goals and tasks that are necessary, key and feasible for prioritizing implementation. The goal-to-action approach in building Vietnamese people is an important solution that helps to resolve the contradictions between the big goals and the limitations of execution capacity at present. It is the unification between comprehensive and specific, the general and the particular, in the immediate and long term in both goals and actions to make Vietnamese people develop comprehensively in the new era.

Abstract

Gratitude is extremely important for the perfection and development of children's personality. Gratitude education for children through the gratitude birthday activities needs to be expressed through awareness, attitude and behavior based on many indicators such as feeling care, love, responding to positive emotions about gifts, being reinforced the good behaviors, enjoying the event, feeling the thoughtfulness, feeling grateful, happy and understanding the meaning of birthdays, the close connection. The article is based on the qualitative research (review, document analysis) and the quantitative research through a survey of 138 teachers in three kindergartens in order to answer two main research questions: 1) What is the current status of gratitude education for children through the gratitude birthday activities? 2) Evaluating the effectiveness of integrating the gratitude into children education through gratitude birthday activities? Research results show that gratitude education plays an important role; and is expressed through many indicators such as children's awareness, attitudes and behaviors of gratitude through birthday activities.

Key words: *Gratitude, gratitude education, gratitude birthday activities*

1. Introduction

Gratitude has been identified as “one of the most neglected emotions and one of the most underestimated virtues” (Solomon, 2004). Several religions of the world also teach the importance of gratitude (Emmons & Crumpler, 2000), and many claim that grateful expression makes themselves happy (Gallup, 1998). To date, many researchers have emphasized that gratitude should be considered as a moral virtue, an attitude, an emotion, a habit, a personality trait, or a coping response. (Emmons, McCullough, & Tsang, 2003). Sometimes, gratitude is simply the recognition of one person as the beneficiary of another's act of kindness. Emmons (2004) defines gratitude as the awareness of a gift from another person. However, many other researchers have gone beyond seeing gratitude as a mere recognition of kindness, such as Simmel (1950) emphasized that gratitude is also a cognitive-emotional reminder to people of their need to reciprocate. Similarly, Fitzgerald (1998) identified three important components of gratitude, including: 1) A sense of appreciation for something or someone, 2) A sense of good will towards that person or thing, 3) A disposition to act positively towards that person or object. More specifically, gratitude may be an important component of happiness (McCullough et al., 2001; Watkins, 2004). A recent study has found that gratitude could predict 8% of the individual differences in satisfaction with life (Wood, Joseph et al., 2008), and between 2% and 6% in personal growth, positive relationships with others, purposes in life, and self-acceptance (Wood, Joseph, & Maltby, 2009). Gratitude seems to strengthen relationships and promote the relationship formation and maintenance, as well as relationship connection and satisfaction (Algoe, Gable, & Maisel, 2008), and experimental evidence suggests that gratitude maypromote the conflict resolution and increase reciprocally helpful behavior (Baron, 1984). Adler and Fagley (2005) also discuss gratitude in a greater sense but called appreciation. This means "acknowledging the value and meaning of something— an event, a person, a behavior, an object—and feeling a positive emotional connection to it". This approach to definition is used in the present study of gratitude education through gratitude birthday events for kindergarten children.

Jacqueline Woolley, PhD in psychology, Department of Developmental Psychology, University of Texas (USA) emphasizes advocating the significance of children's birthdays in a meaningful way, because children, just like adults, always seek explanations for private occasions. Especially, for children of kindergarten age, birthday is a milestone that marks the day when a child moves from one age to another. Therefore, the birthday party is an important event, reminding children that they have grown one year older; thereby improving children's self-esteem; increasing the emotional bond between parents and children; helping children establish social relationships; creating beautiful memories and helping children perceive time.

In particular, gratitude needs to be considered an important emotion and through the birthday celebration, it can be effectively integrated into children's education. However, the current situation of kindergartens shows that most young parents still misunderstand the issue of celebrating children's birthdays when they buy a lot of food to bring to school and thanks to teachers to organize their children's birthdays. The teacher and mother prepare everything, the children just need to rot the candles and wait for people to give gifts, congratulations...Those emotions do not leave children with many emotions and meaningful lessons. Besides, children have a default perception that it's their birthday, everyone is responsible for making them happy, which leads to wrong perceptions, attitudes and behaviors in children. If they continue to maintain the current form of birthday celebrations, children will not fully understand the meaning of birthdays; and through that activity, they will not be able to educate children about gratitude for the people who born and raised them.

Therefore, the article “***Gratitude education for children through gratitude birthday activities***” is conducted to answer two questions: What is the current status of gratitude education for children through gratitude birthday activities? Evaluating the effectiveness of integrating gratitude into children education through gratitude birthday activities?

2. Method

2.1. Demographic characteristics and sampling

In addition to qualitative research methods including document analysis, in-depth interviews, this study uses a quantitative method which is a survey by questionnaire to obtain numerical data to collect information. Quantitative research method through surveying teachers at Dai Mo A Kindergarten (Hanoi), Dich Vong Hau Kindergarten (Hanoi) and Thanh Lam Kindergarten (Bac Giang). . The data collection technique used is a semi-structured questionnaire sent to managers and teachers at 3 kindergartens. The mean age of the participants is 33.51 years old (SD = 5.61, range = 20 - 47). Teachers have an average of 10.82 years of the teaching experience in kindergarten (SD = 4.01, group of 1 - 23 years of experience). The sample size of the study is all kindergarten teachers selected with 138 participants who answer the questionnaire

2.2. Tools and data collection

Data are collected by using a questionnaire which has the fixed-question combination with a Likert scale running from 0 to 4 (0= Lowest, 4=Highest). The questionnaire is divided into three main parts including (1) information of survey respondents: mainly provides information about the purpose and meaning of the survey form, basic information about the survey respondents; (2) main information of survey responses including questions and choice of answer options according to different levels of gratitude value indicators through gratitude birthday activities and (3) the quality assessment information of effectively integrating the gratitude value indicators through gratitude birthday activities. After collecting the questionnaires, the research conducted to clean information, filter the questionnaires and encode necessary information in the questionnaires, import information and analyze data by using SPSS statistical software - version 22.

3. Results

3.1. Descriptive statistics

Gratitude is a grateful heart, always remembers people's merits of raising and helping for us; or expressed in both thoughts and actions from the concrete to the great. That is the awareness, the attitude of respect, esteem, and the action of oneself towards those who are grateful to us. The results are partly shown through the survey when up to 72.5% of teachers rated the gratitude education for children through the activities of celebrating gratitude birthdays. Of which, 89.1% of teachers highly appreciated the effectiveness of the implementation plan of the Board of Directors on gratitude education for children; 89.1% of teachers think that it is necessary to raise teachers' awareness about gratitude education for children and 86.1% of teachers highly appreciate the effectiveness of integrating the gratitude into education for children. Gratitude here has been concretized through indicators and partly affirms gratitude as aspects of awareness, attitude, emotion, and personality and behavioral traits.

Table 3.1: Children's awareness, attitudes and behaviors of gratitude through gratitude birthday activities

Variables on the gratitude value	Likert scale				
	0	**1**	**2**	**3**	**4**
B1. Understanding the efforts and merits of parents	2.9	1.4	21.0	33.3	41.3
B2. Understanding the meaning of birthdays	1.4	2.9	19.6	23.2	52.9
B3. Understanding emotional values, the close connection	2.9	2.9	18.8	25.4	50.0
B4. Feeling the love, care, happiness	-	-	13.0	31.9	55.1
B5. Feeling Appreciated, Modest	-	-	10.1	38.4	51.4
B6. Feeling Satisfied, Grateful, Acknowledged	-	-	10.1	37.0	52.9
B7. Appreciating the birthday event	-	9.4	18.8	29.7	42.0
B8. Evaluating gifts positively	-	10.9	18.1	29.0	42.0
B9. Being reinforced the positive behaviors	-	8.1	15.9	34.8	41.3

Research results in Table 3.1 show three groups of factors named F1 - Awareness of gratitude including Understanding the efforts and merits of parents (B1), Understanding the meaning of birthdays (B2); Understanding emotional values, close connection (B3); F2 - Attitudes of gratitude include Feeling love, care, happiness (B4), Feeling appreciated, modest (B5), Feeling satisfied, grateful, acknowledged (B6); and F3 - Behaviors of Gratitude include Appreciating the gratitude birthday event (B7), Evaluating gifts positively (B8), Being reinforced the positive behaviors (B9). The survey results show that the majority of children achieve gratitude indicators of approximately over 71% in terms of awareness, attitude, and behavior of gratitude through aspects such as feeling care, love, responding to positive emotions about gifts, being reinforced good behaviors, enjoying event, feeling thoughtful, feeling grateful, happy; understanding the meaning of birthday, the close connection. At the same time, the results also show a small difference between the three groups assessing children's awareness, attitude and behavior of gratitude through gratitude birthday activities.

Table 3.2. Awareness, attitude and behavior of gratitude

Awareness, attitude and behavior of gratitude	**Number (N)**	**Min**	**Max**	**Mean**	**SD**
F1. Awareness of Gratitude	138	0	4	3.16	.94
F2. Attitude of Gratitude	138	2	4	3.42	.38
F3. Behaviors of Gratitude	138	1	4	3.05	.78

Specifically, the mean score of the variable on gratitude attitude F2 (B4, B5, B6) is the highest (M=3.42, SD=0.38); next is the perception of gratitude F1 (B1, B2, B3) (M=3.16, SD = 0.94); and finally is the gratitude behavior F3 (B7, B8, B9) (M=3.05, SD=0.78). This means that there are many factors that show children's gratitude through gratitude birthday activities, but the most obvious factor is the attitude of gratitude, the awareness of gratitude and the lowest factor is the behavior of gratitude. From the achieved results, it partly reflects the plan to implement the children's gratitude education through the gratitude birthday celebration. Gratitude shows to be positively associated with reciprocal care, emotional and material support, and satisfaction with school, family, friends, community, and self. In addition, gratitude seems to be associated with a range of social outcomes and positive relationship; the awareness quality of the relationships through the achieved indicators Therefore, gratitude education for children through gratitude birthday activities is very important and has a high human value.

3.2. Analysis of Reliability and Exploratory Factor

The statistical method used to test the reliability of the scale is Cronbach's Alpha coefficient. The results of testing the reliability of the scale show that all Cronbach's Alpha values reach 0.828 and are greater than the required value, and the Cronbach's Alpha of Ttem Deleted values are lower than Cronbach's Alpha values and the value of Correted Item-Total Correlation are all greater than 0.3. Therefore, the scales in this study have high reliability and the items of each group of factors are kept in the research model. Table 1 summarizes the results of analyzing the reliability of the scales of the variables.

Table 3.3: Cronbach's Alpha analysis synthesis

Group of variables	No of item	Corrected Item-Total Correlation	Cronbach’s Alpha if Item Deleted
F1.Awareness of Gratitude	3	.714	.317

F2. Attitude of Gratitude	3	.511	.403
F3. Behaviors of Gratitude	3	.396	.373

The results of testing the suitability of EFA are shown through the KMO index. The analysis results of the research model of the article, the KMO coefficient reached 0.727, ensuring the fit with the actual data (Required 0.5 <= KMO <= 1.0). The results of testing the correlation between the observed variables are expressed through the Chi-square index of Bartlett's test which reached the value of 557.992 with Sig.=0.000. Therefore, the variables in the teacher quality model are correlated with one another and satisfy the conditions of factor analysis. Perform the factor analysis according to Principal components with Varimax rotation. The results show that 3 groups of factors with a total variance of 67.134%>50% meet the requirements, so these 3 groups of factors are explained by the data evaluation variables. The score used when extracting factors at the 3rd factor with Eigenvalues results is .598 It shows that the results of factor analysis are a perfect fit. The (EFA) exploratory factor analysis results of 3 factors as shown in the table below are retained in the model and will be analyzed in the next step.

Table 3.4: Results of the exploratory factor analysis (EFA) with independent variables - Rotated Component Matrix[a]

Group of variables	Variables	Component		
		Group 1	Group 2	Group 3
F1	B1	.962		
	B2	.958		
	B3	.951		
F2	B4		.783	
	B5		.762	
	B6		.818	
F3	B7			.733
	B8			.607
	B9			.555

Similarly, exploratory factor analysis (EFA) with the dependent variable of the research model also gives EFA results: 0.5 <= KMO=0.838 <=1. Factor analysis is suitable for actual data. Test the correlation between observed variables: Sig = 0.000 <= 0.05. The evaluative variables are correlated in each factor. The results of Varicance Explained Analysis explain for 62.19% of the change of factors which are explained by the evaluative variables including the awareness factor, the attitudes factor and the behaviors factor of children's gratitude.

3.3. Linear regression analysis

Linear regression analysis is carried out to find out the linear regression coefficient of the gratitude value variable which is expressed by the children's awareness, attitude, and behavior of gratitude through gratitude birthday activities. The results of the correlation coefficient test show that the correlation coefficient values are within the limits between the variables in the model, which are significant and most of them have no abnormal signs. The results of the regression analysis are performed with 3 independent variables, whose results are shown in the table below.

Table 3.5: Regression analysis results - Coeficients[a]

Variables	Coefficients β	Errors	t	Significance level (P)
Constant	1.548	.247	6.263	.000
F1. Awareness of Gratitude	.209	.075	2.793	.006
F2. Attitude of Gratitude	.400	.180	2.223	.028
F3. Behaviors of Gratitude	.221	.074	.2.981	.003

Note: R2=.047; F= 77.881 p<.001

The regression coefficient test ensures the statistical significance with 95% reliability (Sig<0.05). The importance order of each variable (According to the normalized Beta coefficient) is F3, F1 and F2. The coefficient of R^2 (The fit of the overall model) is 0.540 and the adjusted R^2 (Adjust Square) of the model is 0.571 This coefficient means that there are 57.1 awareness, attitudes, and behaviors of gratitude that tend to be appreciated through gratitude birthday activities. The model has a coefficient of Sig.=0.000 (<5%), so the independent variables are linearly correlated with the dependent variable. The regression equation of the model is shown as follows (According to unnormalized Beta coefficient):

Appreciate Gratitude = 1.548 + .209*F1 + 400*F2 + .221*F3

Thus, it can be concluded that the model is tested. The factors affecting gratitude are arranged in descending order of importance: attitude of gratitude, behavior of gratitude, awareness of gratitude. The results of the linear regression equation show that, when other conditions are constant, the assessment of gratitude increases by 1 unit, the variable of the gratitude attitude also increases by .400; the variable of gratitude behavior also increases .221; the variable of gratitude awareness also increases .209. This means that children's awareness, attitudes and behaviors of gratitude through gratitude birthday activities are highly appreciated.

4. Discussion and Conclusion

4.1. Discussion

Gratitude is extremely important for the perfection and development of a child's personality. If gratitude is closely related to happiness and there are indications that this relationship may be unique and causal, thequestion arises on how to effectively educate children about gratitude. The gratitude interventions have commonly been highlighted as a key success of the positive psychology movement (Bono et al., 2004; Seligman, Steen, Park, & Peterson, 2005), and as an especially clinically relevant technique (Seligman et al., 2006). These interventions have can be classed into three categories: (a) listing of things for which to be grateful, (b) grateful contemplation, and (c) behavioral expressions of gratitude. Therefore, in order to comprehensively educate children about gratitude, it is necessary to see the objectivity in assessing the quality of gratitude education for children.

Specifically, gratitude education for children has been partly shown through children's awareness, attitudes and behaviors in gratitude birthday activities. Most children have understood the meaning of birthdays, emotional connections and recognized the merits of their parents. Therefore, they can feel the care, love, respect and satisfaction, and recognize what they currently have. Moreover, children also know how to appreciate the event, show positive behavior about gifts, and are reinforced by those positive behaviors. In addition, the assessment results have revealed the positive effects on children about gratitude through celebrating gratitude birthdays; as well as have shown the importance of the school; staff, teacher, parents in the children education.

Gratitude education for children has partly shown the important meanings and roles in perfecting the child's personality. Therefore, the survey results in three kindergartens show not only strives for the quality of children's education, but also aims at comprehensive education for children in life skills as well as education on gratitude, so that children can realize the importance and meaning of those who have given them the best. The school also has a plan to evaluate and monitor through practical activities and report on the organization and effectiveness of teachers' classroom activities. Towards educating children about gratitude through gratitude birthday parties, the kindergarten has held professional meetings; has widely spread the importance of educating children about gratitude; has developed the implementation and evaluation plans; committed to supporting teachers in the process of organizing educational activities.

4.2. Conclusion

Gratitude education for children is not only the task of the school but also the responsibility of children's parents, the community, mass organizations and social organizations. For the gratitude education for children to be effective, the educational environment of the family, school and society must be unified, and at the same time have a close coordination, towards the same goal of educating children. As a kindergarten administrator, I also want to contribute my efforts to educate gratitude to children in a practical and effective way. Research results show that, during the implementation process, the kindergarten has shown high support and determination in planning the gratitude education for children through specific activities. The principal is also the one who initiates, attracts, gathers forces, encourages and motivates teachers and staff to implement; well organize and supervise the activities of assigned teachers in the process of planning and organizing the implementation of the plan. Besides, families will also contribute to the activity when participating in gratitude birthday activities in the classroom with their children, sharing interesting stories about children, young siblings in the family, children's experiences...By that way, the teacher will contemplate, and honor the children's unique life experiences, while at the same time, associate them with the passage of time, the growth day by day. Furthermore, teachers will also honor the event, interpret its meaning and suggest questions for children to answer about the meaning of the activity, their feelings, etc. Parents can experience children's care for them, that is, feeling grateful for the merits of birth and nurturing through practical activities such as expressing children's feelings about their parents, giving flowers, do- it-yourself paintings and sharing the meaningful action that is sometimes just the act of gently wiping the mother's hand with a towel…This is also an exciting time for children, who find themselves organized by the two closest sources: family and friends, teachers. At the same time, the gratitude birthday activity is also a very touching experience for families who have the opportunity to join along with the school on their children's special day to uniquely, surprisingly record when seeing their children grow up every day. And this is also a special moment to reflect on how exciting it is for parents when seeing the journey of their children, from children with daily experiences until becoming the unique, wonderful children under teacher's care.

CHALLENGES TO ASEAN MULTILATERALISM AND INITIATIVES TO ITS IMPROVEMENT

MA. Nguyen Phu Hai

Abstract

Multilateralism and ASEAN multilateral organization are currently facing a lot of debate about their content as well as their actual role. The article will clarify the content of multilateralism and clarify what ASEAN has done and failed to do as an important multilateral organization in Asia, thereby proposing some solutions to overcome those difficulties of ASEAN.

Keywords: *ASEAN, Liberalism, Multilateralism.*

1. Introduction

ASEAN is an institution realized by the theory of multilateralism. Therefore, the article will be divided into three main parts: Inheriting some views on multilateralism that the authors accept, thereby clarifying and adding more connotations to multilateralism. Overview of the multilateral spirit of ASEAN, survey the actual achievements that the ASEAN multilateral institution has achieved; In addition, it points to the failures encountered by this organization that threatens its mission to bring good multilateral results to the region. Offer several initiatives for ASEAN to improve its multilateralism.

2. Method

The article mainly uses qualitative methods; In addition, some available quantitative data are used to support the authors' argument.

3. Results

3.1. An overview of multilateralism

Today, multilateralism is an ideology, a familiar reality that mankind, in general, is aiming to perfect. Quantitatively, multilateralism is “the coordinated diplomatic interaction” of at least three actors (usually states (Keohane, 1990)) “in international politics” (Maull, 2020). Qualitatively, multilateralism must have a system of ideas (Maull, 2020) about common interests among actors, thereby forming common values, common goals, and common commitments among those actors (Britannica Encyclopedia, n.d.). Thus, multilateralism is a product with the colors of liberalism and constructivism, distinct from unilateralism, bilateralism, and realism. Specifically:

Multilateralism is realized by a clear institution that the participants voluntarily agree to. There is no coercion by hard power from any actors inside or outside the multilateral institutional alliance. The position and role of each member are almost equal, so the powerful influence of each member is almost equal.

A multilateral institution is formed to increase interests or to solve problems that one member cannot handle. It can be the construction of some new interests or the protection of existing interests that one actor (unilateral) or two actors (bilateral) in the multilateral community cannot do. Although each subject pursues its interests, all understand that the individual interests of each member lie in the common interests of the multilateral community to which they are voluntarily attached.

The actors participating in the multilateral mechanism accept a clear, common rule of the game, whose outcome should always be win-win for the members. The operation of the multilateral institution that the actors build is transparent, predictable, and the definitive outcome must be in the common interest of all members of that multilateral community.

The establishment mechanism, as well as the changing movement of the multilateral institution, has always been: the appearance of an idea of some value -> thereby forming the principles of conduct -> forming the transparent (even predictable) behavior of members.

If problems arise between members, the solution is always peaceful, conciliatory, and amicable. This is one of the important criteria of multilateralism because the existence of any multilateral institution is aimed at protecting a common heritage of peace, good values (maybe community identity), and common public goods (France Diplomacy, 2020).

Multilateralism is a statement that globalization of certain values is utopian, while regionalization of certain values is possible; In today's world, unilateralism is fraught with danger, and bilateralism is not safe enough in terms of security and economy.

3.2. ASEAN with regional multilateralism

3.2.1. Aspiration towards multilateralism of ASEAN

Association of Southeast Asian Nations (ASEAN) was officially established on 8/8/1967 with 5 members: Indonesia, Malaysia, Singapore, Thailand, Philippines; By 1999, the number of members of this organization reached 10, due to many other countries participating as follows: Brunei Darussalam (joined in 1984), Vietnam (joined in 1995), Laos, Myanmar and Cambodia (joined in 1999). And on December 31, 2015, the ASEAN community was officially established (The Association of Southeast Asian Nations, n.d.a).

As early as 1967, ASEAN issued its Declaration with specific aims and purposes of multilateralism as follows: “To accelerate the economic growth, social progress and cultural development in the region through joint endeavours in the spirit of equality and partnership in order to strengthen the foundation for a prosperous and peaceful community of Southeast Asian Nations; To promote regional peace and stability through abiding respect for justice and the rule of law in the relationship among countries of the region and adherence to the principles of the United Nations Charter; To promote active collaboration and mutual assistance on matters of common interest in the economic, social, cultural, technical, scientific and administrative fields; To provide assistance to each other in the form of training and research facilities in the educational, professional, technical and administrative spheres; To collaborate more effectively for the greater utilisation of their agriculture and industries, the expansion of their trade, including the study of the problems of international commodity trade, the improvement of their transportation and communications facilities and the raising of the living standards of their peoples; To promote Southeast Asian studies; and To maintain close and beneficial cooperation with existing international and regional organisations with similar aims and purposes, and explore all avenues for even closer cooperation among themselves” (The Association of Southeast Asian Nations, n.d.a).

The ASEAN Charter issued in 2008 set out 15 goals, but in general, they all revolved around the above 7 basic things. In addition, ASEAN's work towards these goals is governed by the following fundamental multilateral principles: “Mutual respect for the independence, sovereignty, equality, territorial integrity, and national identity of all nations; The right of every State to lead its national existence free from external interference, subversion or coercion; Non-interference in the internal affairs of one another; Settlement of differences or disputes by peaceful manner; Renunciation of the threat or use of force; and Effective cooperation among themselves” (The Association of Southeast Asian Nations, n.d.a).

In terms of organization to realize the above goals and principles, “the ASEAN Community is comprised of three pillars, namely the ASEAN Political-Security Community, ASEAN Economic Community, and ASEAN Socio-Cultural Community. Each pillar has its Blueprint, and, together with the Initiative for ASEAN Integration (IAI) Strategic Framework and IAI Work Plan Phase II (2009-2015), they form the Roadmap for an ASEAN Community 2009-2015” (The Association of Southeast Asian Nations, n.d.a).

It can be seen that the idea of an ASEAN multilateral institution has been introduced since 1967 with full of common interests in security, economy, politics, culture, and society. Not only that, with the gradual expansion of members and the establishment of action organizations to realize common interests, ASEAN is demonstrating the maturity of a multilateral institution with achievements in more than the past 50 years as:

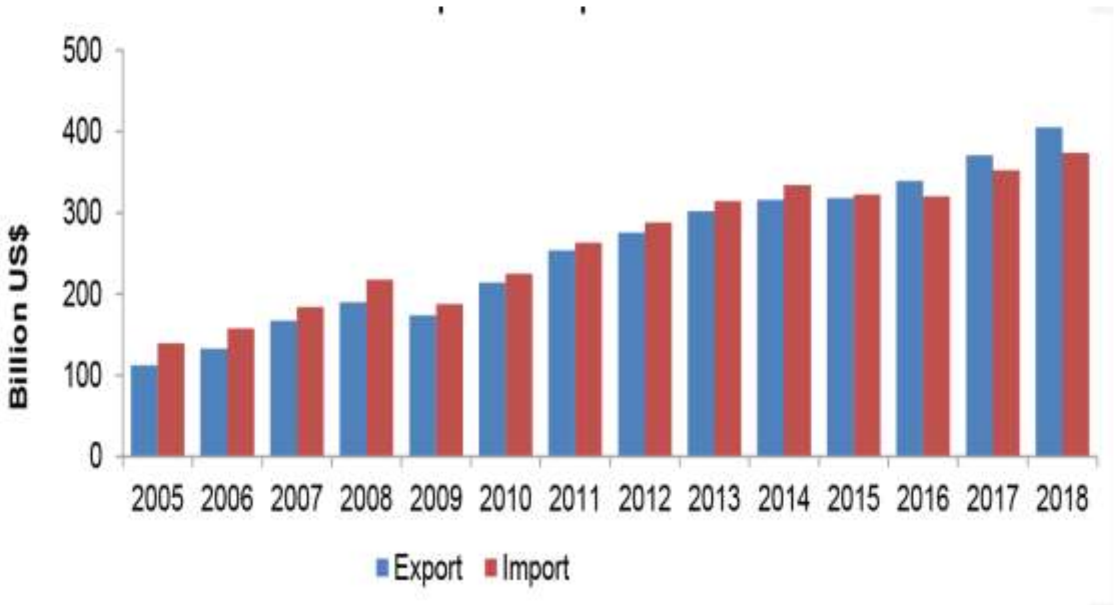
It has preserved (relative) peace and stability in the region (Pakpahan, n.d.).

It has also adopted the ASEAN Convention on Counter-Terrorism in 2007, the ASEAN Convention against Trafficking in Persons in 2015 (Pakpahan, n.d.).

There are several useful areas of cooperation such as: “maritime security, humanitarian assistance, peacekeeping operations, disaster response, counter-terrorism, cybersecurity, and military medicine” (Pakpahan, n.d.).

Economically, statistics show that the ASEAN community has good growth in GDP, especially in the service sector:

ASEAN’s Export and Import of Services

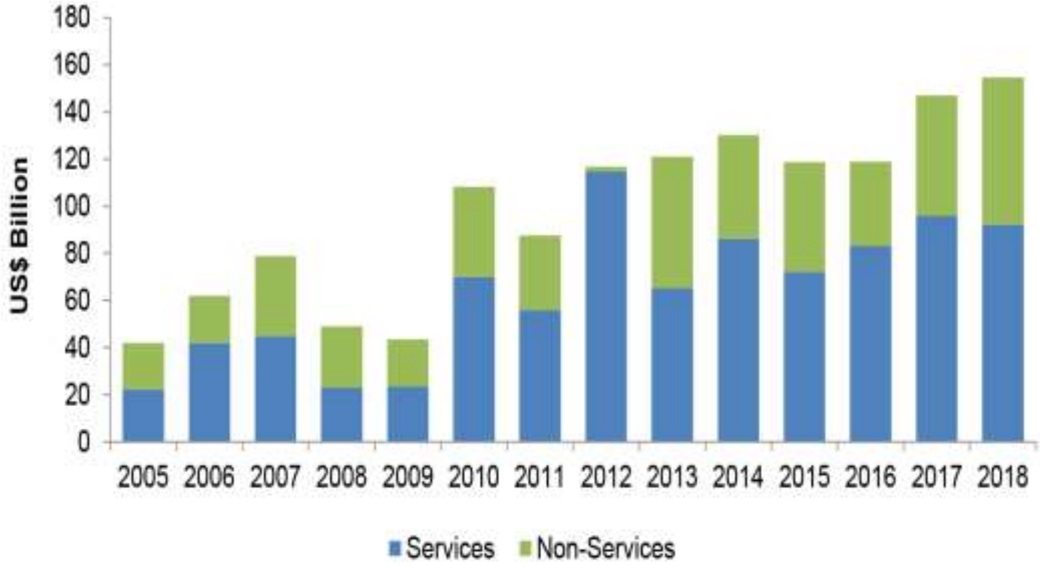


Source: https://asean.org/asean-economic-community/sectoral-bodies-under-the-purview-of-aem/services/

The chart above shows that ASEAN's service exports have always grown steadily at a rate of more than 10% a year (The Association of Southeast Asian Nations, n.d.b); Although the chart shows a trend of imports outperforming exports, from 2016 onward, ASEAN has become a trade surplus in services.

The service industry is also the place to receive a lot of foreign direct investment (FDI) as shown in the following chart:

FDI Inflow to ASEAN by Sector



Source: https://asean.org/asean-economic-community/sectoral-bodies-under-the-purview-of-aem/services/

In the future, ASEAN will certainly maintain these achievements. However, unlike it was in the 1960s, "today, ASEAN is larger, and its agenda has expanded considerably to extra-regional issues and actors covering the wider Asia-Pacific region. The grouping is both more diverse and divided" (Acharya, n.d.). Therefore, ASEAN multilateralism has encountered difficulties as discussed in the following section.

3.2.2. The difficult reality of ASEAN multilateralism

According to Hanns Maull, "the inherent difficulties and limitations of multi-lateralism are often underestimated, and its potential overestimated" (Maull, 2020). This is not surprising, since the ideology of multilateralism was born not very long ago in human history. Therefore, the current multilateral institutions are rife with criticisms both in terms of their operating principles as well as their operational reality. ASEAN is no exception, at a glance, some limitations of ASEANism can be seen as follows:

<u>*Security:*</u>

The cluster of ASEAN countries forms an important and strategic transportation position and is adjacent to two great powers, China and India, moreover, this region always attracts the attention of many other great powers in the world both in history and in the present. Therefore, many countries in the ASEAN group are directly or indirectly involved in the troubles of territorial sovereignty and territorial waters (Mahmood, 2018).

The most specific and obvious is the issue of China imposing unreasonable and illegal claims and actions in the East Sea, such as its claims to sovereignty over the East Sea within the nine-dash line, the announcement of international tenders 9 oil and gas blocks are located deep in the continental shelf of Vietnam, provoked by sending drilling rigs and fishing fleets to invade the waters of some ASEAN countries, etc. This behavior, unfortunately, did not receive the unanimous objection of all ASEAN countries. Specifically, Brunei and Cambodia fully support the view that China solves the above sovereignty issues through bilateral relations between China and each relevant country (Quang, 2016). This completely goes against the spirit of multilateralism of ASEAN, which so far shows that the division of views on the national security of the countries in this organization is completely real. The world understands that China is implementing the strategy of dividing and conquering ASEAN (Mcbeth, 2020), and the fate of ASEAN multilateralism is very fragile when it cannot have a common voice to protect the sovereignty of its members.

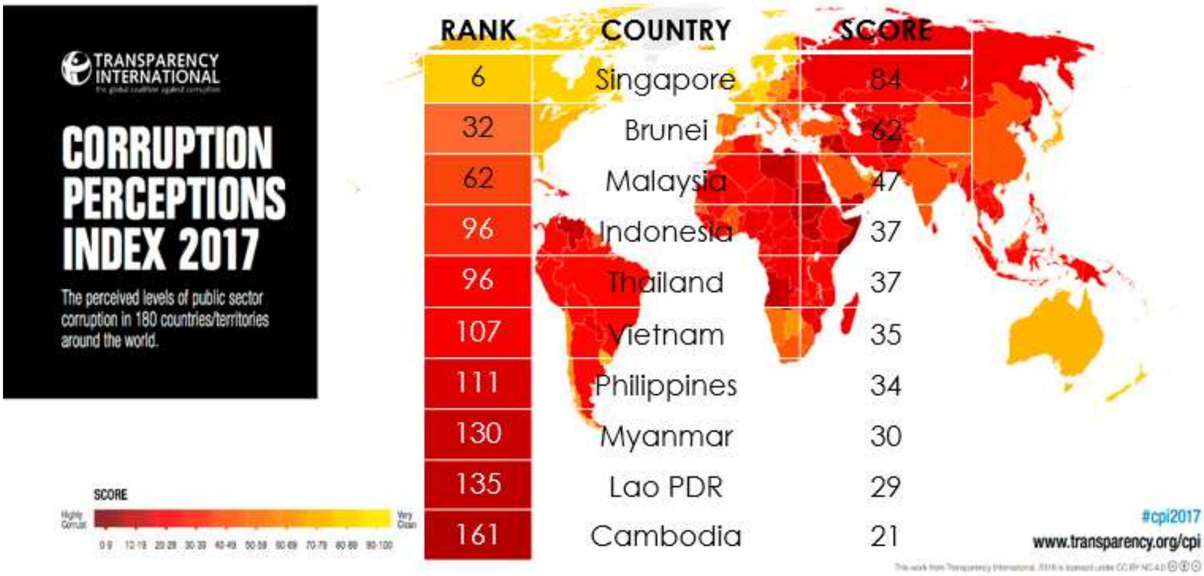
The turmoil in Myanmar also shows the weakness of ASEAN multilateralism. When the people of this country are daily shedding blood and sacrificing their lives to protest the unreasonable military coup and desperately call for the help of the international community, ASEAN shows its "the impotence of ASEAN governments in dealing with a regional crisis" (Idrus, 2021). That is the comment of "six prominent former and current lawmakers from Cambodia, Indonesia, Malaysia, Singapore, the Philippines, and Thailand. They are Cambodian opposition leader Sam Rainsy, Indonesian lawmaker Fadli Zon, Malaysian opposition leader Anwar Ibrahim, Filipino Senator Kiko Pangilinan, former Singaporean lawmaker Charles Chong, and Kasit Piromya, former prime minister of Thailand" (Idrus, 2021). They also criticized that "all other ASEAN governments are demonstrating a lack of political will and unity to pressure the military junta to end the killings" (Idrus, 2021), because multilateralism ASEAN has been "handicapped by the self-imposed doctrine of non-interference" (Idrus, 2021).

Only the above two outstanding cases show that, so far, "ASEAN AS a community has been a failure so far, as the notion of national sovereignty continues to undermine its integration while the identity of the grouping has yet to crystallize, according to Eduardo C Tadem, an associate professor of Asian Studies at the University of the Philippines Diliman" (Rojanaphruk, 2013).

It is a failure of ASEAN multilateralism when it fails to protect the sovereignty of its members and does not protect the human rights of its people.

Economy:

Economically, there are many problems within ASEAN as well, according to Ishtiaq Pasha Mahmood (Professor at the National University of Singapore Business School and Co-curator of the ASEAN Transformation Map): "Entrenched interests with the large conglomerates, paired with widespread corruption, is undermining the region's business environment and is particularly hurtful for small enterprises" (Mahmood, 2018). The following table shows that although corruption rates are not uniform across ASEAN countries, this is a significant problem in many countries:



Source: https://aseanrbf.org/newsroom/news-press-release/1286-instilling-the-culture-of-business-integrity-and-anti-corruption-in-asean

The disparity in economic living standards among members is also huge, in 2017 the World Bank said that “while 98% of adults in Singapore and 85% in Malaysia had a bank account, just 22% of Cambodian adults and 26% Burmese adults did” (Mahmood, 2018).

The economic integration process of the ASEAN multilateral region is also weakened by the realist competition among the member countries. According to Eduardo C Tadem (an associate professor of Asian Studies), the competition is fierce, while Singapore, Malaysia, and Thailand even outnumber other countries to the point of achieving intra-ASEAN trade dominance (accounting for about approx. 70%) (Rojanaphruk, 2013).

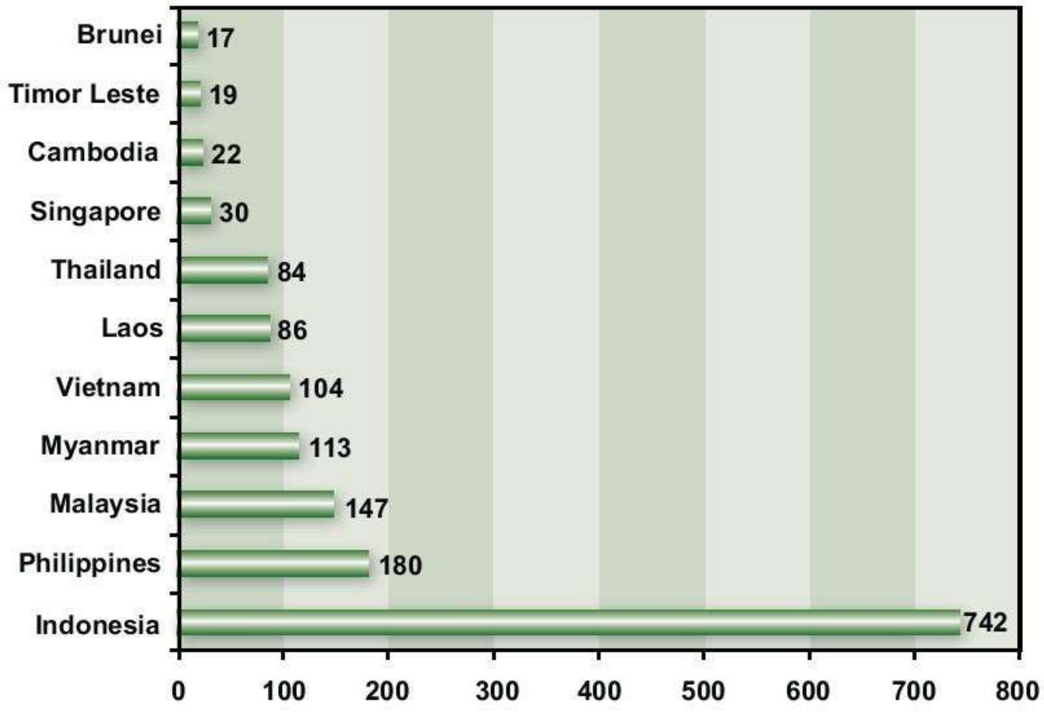
Roderick Macdonald points out that the threat to ASEAN multilateralism is worse, because “states pursue bilateral or trilateral arrangements rather than building a supranational practice. This is evident in the political economy of the ASEAN states, where the attempt to achieve an ASEAN economic community masks an actual practice of growing bilateralism and the fragmentation rather than integration of the ASEAN political economy together with the growing dependence of these smaller states on the wider region’s illiberal economic powerhouse, China” (Macdonald, 2019). That shows: “crucial norm of non-interference and its practice of nonbinding consensus inhibit deeper integration either within ASEAN” (Macdonald, 2019).

Besides vital security, economics is an essential reason for forming any multilateral alliance. Failure to ensure the legitimate interests and equality of alliance members will make the ASEAN institutional bloc likely to exist only in name.

Sociocultural:

A common identity is what ASEAN as well as all other multilateral institutions aspire to. However, to become a reality, this is quite difficult given the tremendous cultural diversity among ASEAN countries today. The statistics below show it just in terms of language:

Figure 1. Estimated Numbers of Languages Spoken in Southeast Asian Countries
(Source: Ethnologue, 2005)



Source: https://foxhugh.com/2012/03/23/asean-cultural-diverstiy/

In addition, “income inequality and wealth concentration, discrimination, food insecurity, ongoing human rights challenges and environmental degradation” (Mercado, 2018) are also a problem in each member and throughout ASEAN (Mercado, 2018).

Right now, the COVID-19 epidemic is also proving the weakness of ASEAN's leadership mechanism, demonstrating the need to restructure this organization as commented by Herman Joseph S. Kraft (Associate Professor and Chair of the Department of Political Science at the University of the Philippines) (Kraft, 2020).

3.3. Some suggestions for the development of ASEAN multilateralism

The problems that ASEAN is facing above show that the current multilateralism is difficult to completely break up/opposite from realism and bilateralism, but can only rely on and apply the theory is dominating international politics to continue to preserve and build this regional multilateral institution only (however, the result must be the common interest, the common identity of the actors in accordance with the objectives of liberalism and constructivism). In that spirit, some suggestions for ASEAN multilateralism are given as follows:

Building a common security organization with the participation of ASEAN peacekeepers, and with the participation of observers and consultants from the US, China, and Russia:

The world in general and the Asia region, in particular, have not yet been able (and probably cannot) to have eternal peace. Therefore, a military force is essential to keep the peace and to keep the peace in the face of a world full of actors willing to use realism in foreign affairs. ASEAN countries should build a common armed force with a peacekeeping mission for members in their region. This armed force has the presence of all ASEAN countries and rotates in countries, especially in hot spots that require military presence. In the current situation, the above force needs to be urgently established and must be present in Myanmar to protect the people and media about the truth in this country. In addition, an ASEAN naval force must be established quickly to solve the complicated maritime issues in the Vietnamese East Sea.

This earth for thousands of years has always been the playground of the great powers, they have always been the main subjects regulating the direction of mankind. Reality also shows that ASEAN always fails in security and sovereignty situations when it has to confront issues with certain superpowers behind them. Therefore, it is necessary to actively bring those big countries to the public so that they can partly predict the movements of that power. In addition, power can only be controlled by power, so it is necessary to invite all three current superpowers, the US, Russia, and China to participate (at least to advise and observe) on the security issues of the ASEAN region to somewhat limit the status of an autocratic superpower in any issue.

Since then, ASEAN can handle the problem of crime and solve some sovereignty and defense issues in the region peacefully. Such an open multilateral mechanism is safer and more realistic than the current glamor and weakness of ASEAN multilateralism.

Establishment of ASEAN universities:

Ishtiaq Pasha Mahmood (Professor at the National University of Singapore Business School and Co-Curator of the ASEAN Transformation Map) said: “ASEAN is home to young, literate and increasingly urbanized and aspirational populations” (Mahmood, 2018), and asks “governments must help prepare young people to face the demands of an increasingly integrated economic region, through education and training” (Mahmood, 2018).

To speed up this process, although there are many educational mechanisms established by ASEAN, it is necessary to promote the construction of universities named ASEAN Universities and ASEAN Intermediate Schools to train professionals and skilled workers that ASEAN countries currently and will need to employ. These educational institutions receive full scholarships, study in English, and are guaranteed jobs in the countries of the bloc right after graduation. But the trainees must commit to working for at least 5 years abroad after completing the training program. This will help countries have local resources, and enhance mutual understanding between people in the region, in order to help ASEAN multilateralism be built "from the bottom-up", not "from the top-down" as it is today.

Strengthen communication in ASEAN with art products:

Art is also an important tool to help people in ASEAN get to know each other better. In the context of the current booming demand for art entertainment, there is a great need for painting, photography, and drama products, especially short clips and feature films for people of different countries to enjoy and through which more honest and friendly knowledge about the culture of ASEAN countries.

Social networking apps Facebook, Tiktok, Instagram, etc. and TV dramas, short messages on news conveying information about ASEAN culture need to appear more often with attractive and impressive forms, which will greatly help people understand more about countries in the region, and from there, the work to close the cultural gap between the members of the bloc will be possible. There should be favorable mechanisms (even monetary rewards) for people to actively create and post to share their cultural content with people from other countries in the region. Governments, no matter how hard they try, cannot use their power to force people to understand and integrate culture, this can only be done through a natural and spontaneous way among people.

Encourage bilateral relations within ASEAN:

Multilateralism should not be viewed as the opposite of bilateralism. It must be understood that if bilateral relations are beneficial or at least do not harm multilateral relations, multilateral institutions can still be used. Therefore, it is necessary to encourage bilateral relations within ASEAN, especially economic relations, in order to help countries have closer relationships with each other, more beneficial for the alliance countries. Roderick Macdonald also asserts that: "The proliferation of additional bilateral treaties between member nations and other countries outside of ASEAN, as well as multilateral treaties between ASEAN or several members and other countries, does not contradict the purpose of the ASEAN Economic Community but can reinforce the pursuit of the region's prosperity" (Macdonald, 2019).

Encouraging bilateral relations also means understanding that each country always follows its realist interests. However, if it is only bilateral between the countries within ASEAN, then this is using realism as a means to serve the goal of the common interest desired by liberalism.

4. Conclusion

In conclusion, multilateralism in ASEAN has been an on-going process and faced many challenges. Although such difficulties have the potential to make this insitution nominal, there are approaches that ASEAN can take on to improve its multilateral mechanism. An improtant approach is to further strengthen bilateral relations among members in order to achieve accessible understanding towards mutual issues. If the ASEAN member states are willing to work truthfully with each other in the collective mindset of creating a mutual identity of the region, these issues might be reduced and worked forwards to preserve and improve the the institutional multilateralism.

Abstract

This study focuses on the aim of measuring the impact of the direct and indirect relationships between Emotional Intelligence and University students' group work results, in which the mediating determinants in the indirect relationship were studied, practicing two factors of self-managed teams and cross-functional teams. Data from 372 Economics students from different universities in Hanoi, Vietnam was collected using questionnaire systems. The research team then determined and analysed to conclude that emotional intelligence strongly affects the groups' work results, even though the cross-functional team factor does not impact the mediation relationship. Limitations and future directions, as well as implications for research and practice, are discussed.

Keywords: *Emotion Intelligence, cross-functional teams, self-managed teams, students' group work results.*

1. Introduction

A group is a combination of two or more than two interactive individuals depending on each other to achieve common objectives (Morgan & Krueger, 1993). With group members having the following characteristics: (i) have a shared collective identity, (ii) have common goals, (iii) are interdependent in terms of their assigned tasks or outcomes, (iv) have distinctive roles within the team, and (v) are part of a larger organizational context that influences their work and that they, in turn, can influence (Kozlowski & Ilgen, 2006; Nahrgang et al., 2009) .

Through the benefits in many practical contexts was the importance of group working proved. Furthermore, many documents also confirm the advantages of working in groups

(Marin-Garcia & Lloret, 2008). Firstly, working in groups let students handle the work relating to using expertise, evaluating knowledge to solve a specific issue (Galbraith & Webb, 2013; Pineda & Lerner, 2006). Secondly, students shall have an opportunity to experience and acquire skill sets that they need in the future not only for their career but also for their daily activities. Thirdly, the positive effects of working in groups directly influence students' performance, motivation, and attitude in school (Gatfield, 1999; Kalliath & Laiken, 2006).

Research in recent years increasingly focused on cooperation among students in classes (Gillies & Boyle, 2010, 2011). Initiated from the fact approved by researchers and educators that efficiency in the students' group work result is affected by many distinctive factors. (Gujral & Ahuja, 2011; Horwitz, 2005; Kirkman & Rosen, 1999). Zhou & Wang (2016) showed that one of the major deciding factors in ensuring the operation's efficiency is emotional intelligence. Troth et al. (2012) also indicated that emotional intelligence was vital when it came to working efficiency and group cooperation.

Gujral and Ahuja (2011) gave a conclusion about the thorough similarities between self-managed teams and cross-functional teams. Working as self-managed teams can clarify the common goals, required crucial objectives, and better the alignment of goals within groups with the main goals of organizations. However, working as a cross-functional team provides more advantages such as accelerating the completion, supplying more strength to overcome challenging tasks, enhancing creativity, and helping members focus more on customers, organizing students to study are crucial factors improving group work's effectiveness.

With the mentioned analysis, this study was undertaken for two purposes. Firstly, to analyse direct and indirect relationships between emotional intelligence and University students' group work results, in which the mediating determinants in the indirect relationship were studied, practicing two factors of self-managed teams and cross-functional teams. Secondly, to give recommendations for administrators, lecturers, and students to maximize the effectiveness of group working in Vietnam's universities.

Relationship between emotional intelligence and group work results

Emotional Intelligence

Emotional Intelligence has been a particular research topic that interests many scholars over the past decades, rooted in Gardner's theory of multiple intelligence (Gardner, 1983). Goleman (1998) defined emotional intelligence as the understanding of emotion on one's own and that of others and using them in decision-making. Mayer and Salovey (1997) defined EI as "The ability to accurately perceive, evaluate and express emotions; the ability to reach and/or create emotions when they think; ability to understand emotions and knowledge about emotions; and the ability to regulate emotions to promote emotional and intellectual development".

Emotional Intelligence model (EI)

The conceptual framework that underpins this study is based on the work of Mayer and Salovey (1997) concerning the four branches of the EI model (Mayer & Salovey, 1997):

1. Emotional Awareness
2. Emotion's Usage
3. Emotional Understanding
4. Emotional Control

Emotional Awareness (EA) is understood as the ability to self-perceive the emotions of self and that of others accurately.

Emotion's Usage (EU) is defined as the ability to use one's emotions to promote thinking, support judgment, thinking, and awareness about mood swings, leading to consideration in alternative attitudes and understanding about a change in state by using emotions to solve different problems.

Emotional Understanding (EUS) is the ability to help individuals understand emotions, causes, and development of emotions, including the ability to define, distinguish types of emotions, understand the complexity of emotions as well as patterns. emotionally: loss often entails boredom, anger removes fear...

Emotional Control (EC) is the capability for the individual to control their own emotions and organize their emotions.

Many earlier studies have confirmed a link between students' group work results and emotional intelligence, one of which is the work of Gujral and Ahuja (2011). According to these authors, emotional intelligence plays a significant role in how they collaborate and collaborate when team members work on a shared mission and goals. Meanwhile, McCALLIN & Bamford (2007) argue that the central elements of emotional intelligence such as self-awareness, self-management, social awareness, and social skills are the values of group work results. Emotional Intelligence can also improve team members' ability to communicate with each other (Stephens & Carmeli, 2016), be opened to opposing opinions, ideas and using emotions to increase team performance, and team decision-making (Clarke, 2010). The relationship between Emotional Intelligence and students' group work results in students is mentioned in the study by Brackett & Mayer, 2003. These authors examined the relationship between Emotional Intelligence and students' group work result in the medical-health educational environment. Emotional intelligence has been found to provide an opportunity for students to reflect on and apply group work skills well while doing practical exercises.

Previous studies have confirmed the relationship between the success of group work and EI, Muhammad (2014) including improvement of communication which increases the value of team productivity, enhances collaboration to achieve common goals (Pineda & Lerner, 2006), provide opportunities for students to reflect and well-applied group work skills while doing practical exercises (Muhammad, 2014). Therefore, the proposed research hypothesis is:

H1. Emotional Intelligence has a positive influence on student group work results.

Relationship among self-managed teams, cross-functional teams, EI, and group work results.

Self-managed teams are defined by Moravec *et al.* (1998) as a non-decentralized workgroup that handles specific areas or tasks within the organization. Bobek et al (2009) argue that self-managed teams are made up of individuals who self-regulate and are responsible for a number of activities such as planning, scheduling, performance evaluation, and continual improvement. In addition, self-managed teams are understood as groups where individuals are interdependent, and the team members can self-regulate their behaviour in relative tasks (Goodman & Kruger, 1988). Working as self-managed teams shall accelerate the efficiency and improve the final result (Liu et al., 2004). According to the idea, efficiency in group working includes high productivity (Kirkman & Rosen, 1999; Locke & Latham, 2002), good customer service (Shamsul et al., 2013); group work result includes superior quality (Locke & Latham, 2002; Lou, 2011); satisfaction in work (Locke & Latham, 2002; Marin-Garcia & Lloret, 2008), organization's commitment (Liu et al., 2004; Martinez-Pons, 1997)**.** Based on the definition of Goodman *et al.* (1988), the authors argue that the student self-management team is a team where individuals are interdependent and team members have full discretion to decide on tasks such as work tasks, methods of doing work, and schedule activities.

Cross-functional teams are defined as a team of highly specialized teams, individuals from different functional areas within a company working together to achieve a particular goal. Cross-functional teams are used to develop new products (Bunduchi, 2009), transform organizations (Daspit et al., 2013), speed up market access (Daspit et al., 2013), and a host of other tasks. From the definition of Webber (2002), the authors argue that a student's cross-functional team is a team consisting of students with specialized expertise (or specialized knowledge), students from different disciplines in universities work together to achieve a specific goal and team members engage in shared leadership roles.

When comparing the relationship of Emotional Intelligence with self-managed teams and cross-functional teams, Gujral & Ahuja (2011) show a higher correlation of Emotional Intelligence with self-managed teams than cross-functional teams. That suggests that self-managed teams are smarter emotionally and emotionally intellectually, contributing to excessive group work performance compared to cross-functional teams. This is explained by Gujral and Ahuja (2011) because the cohesion between the members of self-managed teams is higher than cross-functional teams. In addition, Kirkman and Rosen (1999) identified that self-managed teams help improve team productivity and Horwitz (2005) pointed out the diversity of knowledge in cross-functional teams positively affects performance due to the different perspectives each member brings to the team. This important interrelation leads us to pose the following hypotheses:

H2. Emotional Intelligence has a positive influence on self-managed teams of university students.

H3. Self-managed teams have a positive influence on students' group work results of university students.

H4. Emotional Intelligence has a positive influence on cross-functional teams of university students.

H5. Cross-functional teams have a positive influence on the group work results of university students.

2. Method

Sample and Procedure

The authors clarify the scales: emotional intelligence, self-managed team, cross-functional team, and students' group work results through in-depth interviewing with the subjects are university students and lecturers conducted within one hour in a designated location chosen by the interviewers.

To clarify the results collected from previous methods, the authors proceeded to create a form to initiate the inspection. Surveys used questions from the form are distributed and acquired from October to December of 2020. The content of the questionnaire is divided into two parts: the first part is to investigate the rate of agreement from the respondents about statements relating to Emotional Intelligence, self-managed team, cross-functional team, and students' group work results; the second part is to get to know more about respondents' information such as gender, frequency of joining and working in a group.

Table 1. Characteristics of the sample

Demographic information	Frequency	Number of respondents	Percentages (%)
Gender	Female	182	48.9
	Male	189	50.8
Year of students	1st	52	14.0

	2nd	101	27.2
	3rd	166	44.6
	4th	48	12.9
	Other	5	1.3
Frequency of working in groups	Never	2	0.5
	Rarely	10	2.7
	Sometime	96	25.8
	Usually	264	71.0

The authors also focused on universities having Economics as their primary major, including National Economics University, Foreign Trade University, University of Commerce, Economics University - National University, Academy of Banking. With 385 responses from university students, of which 372 later used for the study. The responses between genders do not differ significantly, respectively 50.8% and 49.2%. In terms of study time, Junior students account for the highest percentage of 44.6%, and most of the students also maintain the regular frequency of group working of 71.0% as shown in Table 1.

Procedure

A set of standardized questions about emotional intelligence, students' group work results, self-managed teams, cross-functional teams were used through a questionnaire survey to collect data from students in some economics universities in Vietnam. The authors have reached out to students in classrooms and public areas such as libraries, dorms, and canteens. The objectives of the study were briefly explained to the respondents, which enabled them to answer the survey accurately (Figure 1).

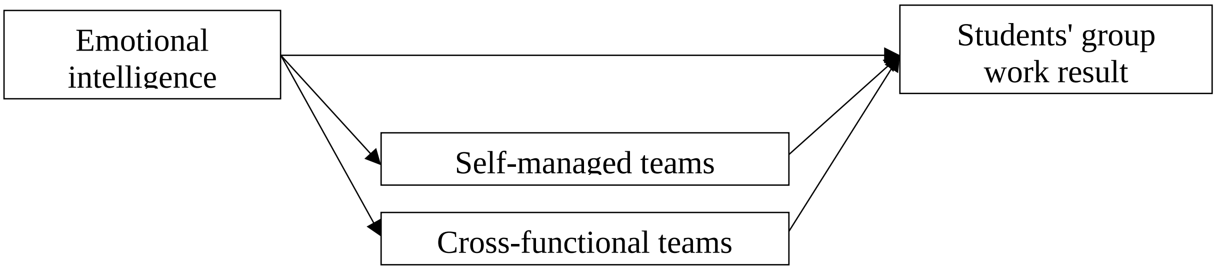

Figure 1. The conceptual model

Measures

Emotional Intelligence (EI): The 18-item scale was designed by Bar-On (1997); Goleman (1998) and Mayer & Salovey (1997) to examine four dimensions (emotional awareness - EA, using emotions - USE, understanding emotions - UDE and managing emotions - ME) (α's = 0.865, 0.817, 0.888 and 0.849 respectively). A sample item is, "I am aware of personal feelings when I meet someone." USE1 was excluded due to the item-total correlation < 0.3. A confirmatory factor analysis (CFA) was conducted for the scale, and the result demonstrated an acceptable model fit: $\chi2 = 256.666$, df = 113, p = 0.000, CMIN/df = 2.271 (between 1 and 3) (Kettinger & Lee, 2005), CFI = 0.959 > 0.9, SRMR = 0.057 < 0.08, RMSEA = 0.059 < 0.06, PClose = 0.068 > 0.05 (Hu & Bentler, 1999) suggesting that the dimensions reflected the overall construct.

Self-managed teams (SMT) (Cronbach's alpha = 0,786): The scale was measured with Goodman & Kruger (1988) (α's = 0.949 and 0.786 respectively). A sample item is, "I am willing to express my opinion on issues even when the members of the group think differently." Each item was rated from 1 (strongly disagree) to 5 (strongly agree).

Cross-functional teams (CFT) (Cronbach's alpha = 0,786): The scale of cross-functional teams was assessed by using the 4-item developed by Daspit et al. (2013) and Webber (2002), including 'When others with my functional background are successful, I feel that all of us with the same functional background have been successful' (0,670).

Group work results (Cronbach's alpha = 0,876): This scale was designed by Volet & Mansfield (2006), has 6 items, including "The team worked together to complete tasks in a timely manner." (0,849), "The team acted with composure and control Prompts: Applicable emotions? Conflict management issues." (0,851).

Analyses

The authors established a question set about EI, self-manage team, cross-functional team, and students' group work result to start the survey and collect data from many Economics university students in Hanoi, Vietnam. After approaching and amassing answers, the authors analysed using the following main steps.

❖ *Firstly,* assessing the scale's reliability using Cronbach's alpha coefficient.

❖ *Secondly*, examining Explorative Factor Analysis (EFA) to evaluate variables' reliability.

❖ *Thirdly,* inspecting Confirmatory Factor Analysis (CFA) to determine the model and the scale.

❖ *Finally*, analyzing Structural Equation Modelling (SEM) with the assistance of AMOS 22.0 Software.

3. Results

Exploratory factor analysis (EFA)

After evaluating the reliability of the scales using Cronbach's alpha, a total of 25 items were used in exploratory factor analysis (EFA).

The results of testing the reliability of the scale by exploratory factor analysis showed that KMO = 0.901; Sig. (Bartlett test) = 0.000 < 0.005. The final results of the exploratory factor analysis are presented in Table 1.

Table 2. The results of exploratory factor analysis (EFA)

Rotated Component Matrix[a]							
	Component						
	1	2	3	4	5	6	7
SMT2	0.881						
SMT3	0.859						
SMT4	0.824

EA5				0.796			
EA2				0.747			
EA4				0.746			
EA3				0.642			
EA1				0.626			
EU4					0.886		
EU3					0.782		
EU2					0.780		
EU5					0.712		
CFT1						0.875	
CFT2						0.767	

CFT3						0.761	
CFT4						0.729	
EC3							0.849
EC1							0.802
EC2							0.760
Cumulative = 68,992%							
Total Variance Explained= 1.261							

Confirmatory Factor Analysis (CFA)

This research conducted a confirmation factor analysis (CFA) to confirm the variability of the variables in this study. These CFA results confirmed the satisfactory discriminatory value and showed no bias of the common method bias.

The model is consistent with the data: $\chi 2$ = 789.731, df = 443, p = 0.000, CMIN/df = 1.783 (between 1 and 3) (Kettinger & Lee, 2005), CFI = 0.953 > 0.9, SRMR = 0.05 < 0.08, RMSEA = 0.046 < 0.06, PClose = 0.901 > 0.05 (Hu & Bentler, 1999).

The three important indicators of convergent validity are factor loadings (standardized estimates), the average variance extracted (AVE), and composite reliability (CR). The standardized estimates of each construct range from 0.603 to 0.963 and are statistically significant (p-values). AVE ranges from 0.507 to 0.791 and CR ranges from 0.800 to 0.950. According to Hair et al. (2010), the results of standardized estimates, AVE, and CR are all in the acceptable region, thereby providing support for convergent validities of constructs.

Structural Equation Modelling Analysis (SEM)

Structural equation modelling (SEM) suggested that the hypothesized model fit the data well ($\chi 2$ = 830.875, df = 455, p = 0.000, CMIN/df = 1.826 (between 1 and 3) (Kettinger & Lee, 2005), CFI = 0.949 > 0.9, SRMR = 0.039 < 0.08, RMSEA = 0.047 < 0.06, PClose = 0.817 > 0.05 (Hu & Bentler, 1999). The hypothesized model shows the relationship between two factors in the model including: Emotional Intelligence, students' group work result, self-managed teams and cross-functional teams.

Figure 2 shows the overall structure model with standardized path coefficients. Hypotheses H1, H2, and H3 are accepted. Emotional Intelligence has a positive relationship with group work results and self-managed teams (β = 0.048 and 0.061 respectively). Self-managed teams have a positive relationship with group work results (β = 0.035 respectively). Cross-functional teams have the opposite relationship with Emotional Intelligence and students' group work results (β = -0.063 and -0.034).

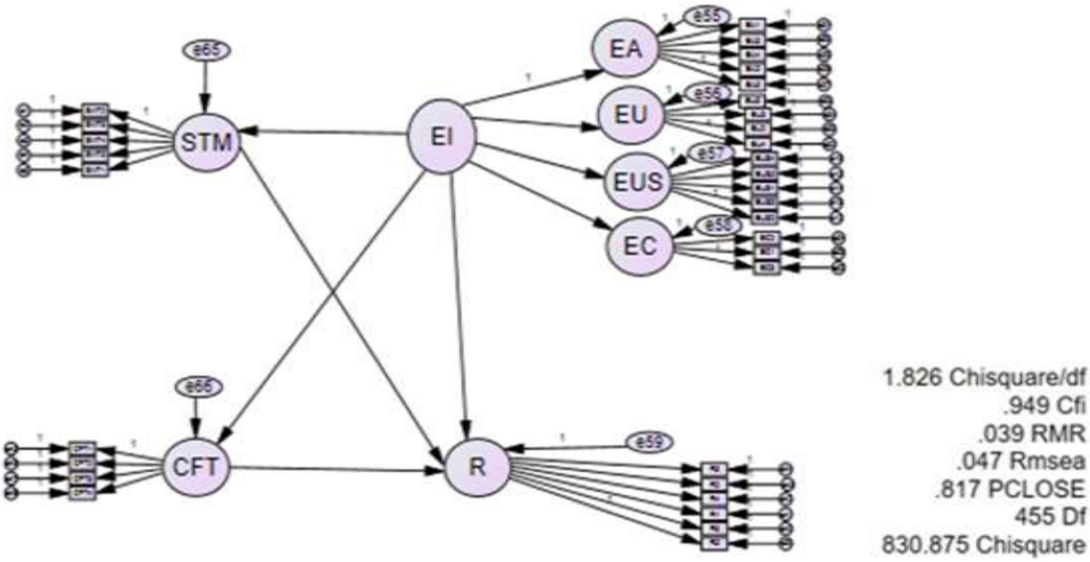

Figure 2: Structural Equation Model Analysis (SEM)

Thus, the models are considered suitable for SEM analysis. Meanwhile, with the data set collected from the survey, the research model is expected to be created from the fitting overview and theoretical supports, and the relationship among scales ensures statistical significance. SEM analysis of the linear structural model, we have the test results in Table 1.3.

Table 3: The result of the path analysis among variables with standardized regression weights

Relationships			Estimate	SE	CR	P-value	Results
SMT	<---	EI	0.660	0.061	10.806	***	*Supported*
CFT	**<---**	**EI**	**0.009**	**0.063**	**0.140**	**0.888**	***Rejected***
R	<---	SMT	0.391	0.035	11.057	***	*Supported*
R	**<---**	**CFT**	**0.009**	**0.034**	**0.273**	**0.785**	***Rejected***
R	<---	EI	0.297	0.048	6.217	***	*Supported*

The results of the mediation test with Process v3.5 by Andrew F. Hayes are shown in Table 3. Emotional Intelligence increased group work efficiency through the positive individual goal (β in positive effect = 0.048, $p < 0.05$), and the relationship between Emotional Intelligence and students' group work result was mediated by self-managed teams (β negative effect = 0.061, $p < 0.05$) so H3 (self-managed teams mediate the relationship between Emotional Intelligence and students' group work result of university students) was not rejected. The linkage between Emotional Intelligence and group work result was not mediated by cross-functional teams so H4 and H5 were rejected.

4. Discussion and Conclusion

Discussion

This study focuses on the aim of measuring the impact of the direct and indirect relationships between Emotional Intelligence and University students' group work results, in which the mediating determinants in the indirect relationship were studied, practicing two factors of self-managed teams and cross-functional teams. However, the hypothesis relating to mediating variables cross-functional teams are not endorsed for $p > 0.01$.

❖ *Firstly*, Emotional Intelligence is positively related to students' group work results. This conclusion is acknowledged in Bar-On (1997); Goleman (1998); Mayer & Salovey (1997). In particular, Gujral & Ahuja (2011) confirmed that Emotional Intelligence is the key factor in cooperation and collaboration among team members upon accomplishing a common objective. The ability to use social intelligence, process personal emotional information and other relationships will help students adapt and handle the fluctuations of the work or study environment. When students have the ability to process emotional information, recognize, use, understand and control emotions well, students can learn a lot from their friendships and listen from lecturers more effectively, knowledge and skills both professional and social are improved, helping students develop the qualifications and quality of work that are useful for themselves in the future. Therefore, to facilitate the progression toward success, it is crucial to motivate each team member's Emotional Intelligence.

❖ *Secondly*, Emotional Intelligence positively affects self-managed teams. This result is consistent with some previous studies of Gujral & Ahuja (2011). Self-managed teams had their common goals, key objectives, and the alignment between team's goals with the organization's goals set so that each team member shall discover, be aware of, and take control of not only their emotions but also other members to reduce internal conflict, increase trust and knowledge-sharing ability in a team. The greater the EI control is, the more students can achieve excellent results.

❖ *Thirdly*, self-managed teams have a positive relationship with student group work results. This assertion is recognized in several studies such as Cohen & Ledford Jr (1994); Goodman & Kruger (1988); Kirkman & Rosen (1999). Suggestive evidence shows that self-managed teams operate effectively and provide high productivity, which enhances the group work results. In order to function effectively, a team needs to maintain a relationship between self-efficacy and team efficiency. In addition, team leaders should delegate the work fairly, making a table that is prudent for the capacity and ability of each team member.

❖ *Finally*, this study confirms the mediating effect of self-managed teams on the relationship between Emotional Intelligence and student group work result. The above result is aligned with the preceding study which found that the belief of mediating effect of self-managed teams (Gujral & Ahuja, 2011; Kirkman & Rosen, 1999). However, this study does not confirm the mediating relationship between cross-functional team's variables and Emotional Intelligence affecting students' group work results.

Practical implications

The ultimate goal of the research is through the relationship between the scales in the research model to make recommendations to enhance the group work results of university students. For university students, the authors give some suggestions to enhance students' group work results as follows:

❖ *Firstly,* the student needs to be aware that the development of Emotional Intelligence plays a significant role through interactions with others. In addition to actively studying, reading many books and references, students need to actively take part in collective activities, build collective emotional relationships. Through experience, students need to know and understand their feelings and know how to use and control emotions appropriately.

❖ *Secondly,* students should form teams in the form of self-managed teams in which team members have full authority to decide on tasks such as assigning tasks, methods of doing work and, scheduling activities. This will help increase the team performance of university students.

❖ *Thirdly,* team leaders and team members need to create an open and comfortable working environment based on trust, consolidate common goals and responsibility toward just and information publicity relating to students' group work. Team leaders must exchange with team members by meeting in person directly or indirectly through mobiles, applications assisting contacting to receive recommendations, replies from team members immediately.

❖ *Fourthly,* team members must follow the interpretations from other members. Supposing an individual in the group does not feel they are not respected or neglected, they shall not put their trust in the team and the group work.

❖ *Finally,* students can apply the Kaizen technique in group work. Team leaders encourage team members to give innovative ideas and recommendations, then together with team members evaluate and select the effectiveness of the given ideas and recommendations to apply to the work. Kaizen technique is successfully applied to team leaders and team members who have creativity and excellent knowledge suitable for students' group work. This technique motivates the spirit of the group, eliminating the team members' dependence on the team leader.

For managers and lecturers at universities, the authors give some suggestions to enhance students' group work results as follows:

❖ *Firstly,* building collective activities in universities, classes, teams to create a dynamic and inclusive environment for students to participate in group work activities. Such group work activities will help students gain more confidence when expressing themselves in front of the team, having greater responsibility for themselves and their team.

❖ *Secondly*, encouraging students' creativity, motivating students with personal achievement from subjects in the university or college is a way for each student to think about their individual goals and find out the fastest, most effective way to accomplish their goals.

❖ *Finally*, organizing short courses or seminars to share personal emotional management and control skills, skills in shaping individual goals, and building common goals for each group work.

ASSURANCE OF ETHNIC MINORITIES' CULTURAL RIGHTS IN VIETNAM - THE IMPORTANT BASIS FOR EQUALITY AMONG ETHNIC GROUPS

MA. Tran Toan Trung

trungtt@napa.vn

National Academy of Public Administration, Hanoi, Vietnam

Abstract

In the process of national construction and development, the Party and State are always consistent in implementation of principle: "Equality, respect, solidarity, relation settlement between ethnic groups and mutual development" and especially pay attention to the implementation of cultural rights of the people in general and ethnic minorities in particular through a legal system and specific policies on the basis of compliance with international treaties to which Vietnam is a member. This research focuses on analyzing the cultural right assurance of ethnic minorities in Vietnam, which is an important basis for equality among ethnic groups in the whole country. The result of research show that Vietnam has issued many guidelines and policies to ensure the cultural rights of ethnic minorities, contributing to the socio-economic development and the realization of equality among ethnic groups during 76 years of construction and development. From the research results, the author proposes some solutions to improve the legal system as well as improve the implementation effectiveness of ethnic minorities' cultural rights in Vietnam.

Keywords: *cultural rights, ethnic minorities in Vietnam, ethnic equality.*

1. Introduction

1.1. Human rights are significant and valuable values

Human rights are the result of the bloody and tearful struggle in human history, the development and progress of human rights has reflected the development and progress of society and human rights are the expression of human values. Insurance and protection of human rights is always one of the important tasks that countries must implement in order to contribute to the country's stability and development and this is also a premise for peace and prosperity of human.

The United States Declaration of Independence stated: "All human beings are born free and equal in dignity and rights". They are entitled with inalienable rights by the Creator; Among these rights are "Right of Life, Liberty and the Pursuit of Happiness" [4, page 9]. In the French Declaration of the Rights of Man and of the Citizen in Article 1 has stated: " Men are born and remain free and equal in rights "[4, page 15-16]. With specific provisions on human rights such as freedom, equality, ownership, free exchange of ideas and opinions, equality in front of the law, freedom of speech, freedom of thought, belief, etc.

Especially the ideas of freedom, freedom is being able to do anything as long as it doesn't harm others. This is a very progressive idea with deep influence on the legal system of many countries. These two declarations recognized a lot of human rights and civil rights on the basis of freedom and equality, these were the great progressive ideas at that period. It is said that this is a great progress in human thought on human rights.

The Universal Declaration of Human Rights (1948) affirmed the rights as well as the role and position of human rights assurance in life, " recognition of the inherent dignity and of the equal and inalienable rights of all members of the human family is the foundation of freedom, justice and peace in the world. People everywhere in the world ought to enjoy - freedom of speech and belief and freedom from want and fear because poverty has been proclaimed as the highest aspiration of human beings, etc. It is essential that human rights must be protected by law, etc. The member States have committed to cooperate within the United Nations framework and promote the common respect and comprehensive assurance of human rights and fundamental freedoms" [4, page 62-63].

Inheriting the progressive views of the previous philosophical schools, Karl Marx, Friedrich Engels and Vladimir Lenin gave a dialectical materialistic conception of the origin of human rights. Human rights are not given by nature or by a force in society but a natural human right, reflecting the human need for freedom, equality, rights and obligations. Human rights are closely associated with human history and close relationship with socio-economic bases in each historical period. Starting from viewpoint that Human is a "social - biological" entity, human nature is the sum of social relationships, classics of Marxist theory assert that human rights are born based on two natural and social origins.

Marx, Engels, and V.I. Lenin said that human rights are always associated with freedom and equality ", etc. Freedom and equality must be declared as human rights" [11, page 153]. About freedom, Marx and Engels said: " The non-freedom period in the world history required the laws expressed the non-freedom, because that animal right - is different from the human rights as the embodiment of freedom - the embodiment of non-freedom" [10, page 183]. Human existence itself has proven freedom, freedom of thought and action, in the progress of the real world to serve life, freedom is associated with human and belonging to Human. In order to overcome injustices to get the opportunity to develop capacity and realize their rights, people must liberate themselves, overcome dependence and loss of freedom. Therefore, human rights are synonymous with human freedom. As for equality, that is the equality in legal terms, in terms of political, economic and cultural interests among all members of society, regardless of ethnicity, religion, class of the subjects.

In Vietnam, in the light of Marxism-Leninism, the protection and execution of human rights is always an important content throughout the leading process of the Party and State. In the guidelines and lines of the Party, policies and laws of the State always aim to ensure and maximize the human rights. Over the years, civil rights, political and economic rights, social and cultural rights which have been effectively implemented, contributed to ensure the rights and interests of the people. In addition to the achievements that have been reached, there are still some issues that need to be settled. In theoretical terms, our Party always affirms that Marxism-Leninism is the ideological foundation and guideline for action, so the research and clarification of the concept of human rights as well as the ideology application should be clarified, thereby affirming the value and sustainable survival of those ideas. In practical terms, the assurance and implementation of human rights still have violations, foreign hostile forces colluded with reactionary in the country to make misrepresentations about the human rights situation in our country in order to serve their schemes. In our country, freedoms and equal rights are considered as basic human rights which is a condition and a prerequisite for the execution of other rights.

The Vietnamese government has given the consistent viewpoint on human rights issues. In the book "Protection and Promotion of Human Rights in Vietnam" (White Paper on Human Rights 2018), the State of Vietnam stated that human rights are reflected in the following aspects: "Firstly, human rights are the aspirations and common values of all mankind. Human rights are universal but when applied, it should be appropriate to the characteristics of nations and peoples, etc. Secondly, sovereignty, human right and self-determination have a close and unifying relationship, etc. Thirdly, human rights are the unity between the rights and obligations of each individual, between the individual’s rights and interests and the community’s rights and interests, etc. Fourthly, human rights are closely related to peace, security and development, etc. Fifthly, ensuring and promoting human rights is first of all the responsibility and authority of each country” [2, page 7-8].

Human rights are a historical category which is influenced by the historical context and always moving along with the development of history. Therefore, in the current context, assurance of human rights also needs some appropriate adjustments. In the context of deep globalization and international integration, Vietnam cannot integrate internationally on human rights, we must "Vietnamize" for the international views and laws on human rights that are suitable with our country's conditions in order to ensure the people's legitimate rights and interests as well as suitable with the new situation.

1.2. Cultural rights are a category of human rights

Cultural rights are a category of human rights that ensures no discrimination for all people, they can freely access, participate and contribute to cultural life [6]. Article 27 of the Universal Declaration of Human Rights (UDHR) stated that “everyone has the right freely to participate in the cultural life of the community, to enjoy the arts and to share in scientific advancement and its benefits”. Article 27 of the International Covenant on Civil and Political Rights (ICCPR) also stated: In those States in which ethnic, religious or linguistic minorities exist, persons belonging to such minorities shall not be denied the right in community with the other members of their group, to enjoy their own culture, to profess and practice their own religion, or to use their own language. Regarding aspects of cultural rights, the 1966 Convention on Economic, Cultural and Social Rights (CESCR) has been concretized in Articles 13, 14 and 15. Accordingly, the cultural rights of people generally include [8]:

- The right of each individual to participate in cultural life;
- The right of each individual to enjoy the benefits of scientific progress and its applications;
- The right to enjoy the protection of moral and material interests derived from artistic, literary and scientific products of which the beneficiary is the author; be respected and acknowledged for customs, practices, histories, or cultural differences;
- Freedom in the creative activity of scientific research.

Particularly for ethnic minorities, Article 2 of the 1992 Declaration on the Rights of Persons belonging to ethnic, racial, religious and linguistic minorities: Persons belonging to national or ethnic, religious and linguistic minorities (hereinafter referred to as persons belonging to minorities) have the right to enjoy their own culture, to profess and practise their own religion, and to use their own language, (hereinafter referred to as persons belonging to minorities) have the right [9]:

- Enjoy the culture in individually or collectively form, freely and without interference or discrimination of any kind;
- Actively participate in cultural, religious, social, economic and community life;
- Participate effectively in decisions at the national level and, where appropriate, at the regional level when it comes to the minorities of which they are members or to the regions where they live in a manner not contrary to national law.

Convention on the Protection and Promotion of the Diversity of Cultural Expressions of General Conference of The United Nations Educational, Scientific and Cultural Organization affirms that "cultural diversity is developing strongly in environment of freedom, justice and democracy and mutual respect among peoples and cultures, which are integral to peace and security at the local, national and international levels” and “Emphasizing the importance of cultural diversity for the full implementation of human rights and fundamental freedoms enshrined in the Universal Declaration of Human Rights as well as in internationally recognized instruments received globally” [14, page 1].

Assurance and promotion of the implementation of human rights by ethnic minorities is also a common obligation of States. However, starting the unique characteristics of ethnic minorities, assurance of the rights of this group also requires appropriate policies, taking into account the factors associated with ethnic minorities. The Committee on Economic, Cultural and Social Rights in its Joint Statement 21 also affirmed: Ethnic minorities as well as those belonging to ethnic minorities not only have their own identity rights but also the right to development in all areas of cultural life. Any program aimed at promoting the constructive integration of minorities and persons belonging to minorities into the general society of a Member State should be based on inclusion, participation and non-discrimination in order to preserve the distinctive identity of minority cultures [7].

2. Method

To carry out this research, on theoretical term, the author has based on the viewpoint of Marxism - Leninism, Ho Chi Minh's thought, the view of the Communist Party of Vietnam on culture and based on the provisions of Vietnamese law on human rights and citizenship. Regarding the scientific research method, the author uses the method of scientific inheritance from the authors who have studied before; method of synthesizing and analyzing information and data to give an objective view on the issue of ensuring the cultural rights of ethnic minorities in Vietnam - an important basis for realizing equality among ethnic groups.

3. Result

Vietnam is a unified country with 54 ethnic groups. As of April 1, 2019, the population of 53 ethnic minorities is 14.1 million people, accounting for 14.7% of the total population of the country [13], concentrated mainly in mountainous areas, especially in the Northwest, Central Highlands and Southwest regions. The ethnic groups of Vietnam have a tradition of solidarity and support in the struggle against foreign invaders, nature disaster and the country development. Each ethnic group has its own cultural identity, creating the diversity and richness of the unified Vietnamese culture.

The 2013 Constitution in Article 5 stated: “The Socialist Republic of Vietnam is a unified nation of all ethnicities living together in the country of Vietnam. All the ethnicities are equal and unite with, respect and assist one another for mutual development; all acts of discrimination against and division of the ethnicities are prohibited. The national language is Vietnamese. Every ethnic group has the right to use its own spoken and written language to preserve its own identity and to promote its fine customs, practices, traditions and culture. The State shall implement a policy of comprehensive development and create the conditions for the minority ethnicities to fully utilize their internal strengths and develop together with the country. In addition, to ensure the rights of ethnic minorities, Article 42 of the 2013 Constitution also stated: “A citizen has the right to determine his or her ethnicity, use his or her mother tongue and choose his or her language of communication." At the same time, it also affirms: “Everyone is equal before the law. No one shall be discriminated against in political, civil, economic, cultural and social life”.[3] This principle has also been reflected throughout the entire legal system of Vietnam, institutionalized and concretized in legal documents such as the Law on Election of Deputies to the National Assembly and Deputies to People's Councils; Criminal Procedure Code; Civil Code; Civil Procedure Code; Labor Law; Education Law; Law on Protection of People's Health; Law on Compensation Liability of the State and many other legal documents, etc. [2, page 43-44).

As for ensuring the cultural rights of ethnic minorities, Vietnam has also paid special attention to better ensure the cultural rights of ethnic minorities in the Vietnamese territory, this is shown in the contents:

3.1. The right to prioritize cultural development of ethnic minorities

The cultural rights of ethnic minorities are reflected throughout in the Party's viewpoints and policies and the State laws. The Platform for National Construction in the Transitional Period to Socialism" in 1991 affirms that "respect for the interests, traditions, culture, languages, customs and beliefs of the peoples, opposing the people's large and narrow ethnic groups, discrimination and separation of the nation" [15]; The provisions of the 2013 Constitution (Articles 5, 42) as mentioned above also reaffirm that viewpoint.

With the policy of building a unified and diverse culture in the community of ethnic minorities in Vietnam, in which priority is given to the development of ethnic minority culture along with Socio-economic development, social security assurance, hunger eradication and poverty reduction, the preservation and promotion of ethnic minority culture are both urgent and strategic tasks to be performed for long-term. The Government has approved policies and schedules to effectively preserve, promote and develop ethnic minority cultural values. On September 15, 2020, the Prime Minister issued Decision No. 1409/QD-TTg on the issuance of a plan to implement Resolution No. 120/2020/QH14 dated June 19, 2020 of the National Assembly on approval of investment policy of the National Target Program on socio-economic development in ethnic minority and mountainous areas for the period of 2021-2030, in which the cultural sector emphasizes the focus on preserving and promoting traditional culture values of ethnic minorities associated with tourism development and special attention to investment in the development of ethnic groups still face many difficulties. Enhancing the quality of the movement " All people unite to build cultural life ". Thereby propagating and mobilizing for ethnic groups in the Vietnamese ethnic community to understand each other, get close to each other, support and develop the economy, culture and society to meet the demands and aspirations of the people. Creating conditions for people to participate and promote their mastery role in the construction of a new cultural life, contributing to enhance the level of cultural enjoyment of people in ethnic minority and mountainous areas [16].

3.2. The right to preserve and maintain the cultural identity and to participate in activities of cultural life

According to statistics, there are 62,283 intangible cultural heritages of 63 provinces and cities inventoried, 288 intangible cultural heritages included in the list of national intangible cultural heritages (including 145/288 heritages of ethnic minorities - accounting for more than 50% of the total heritage); 05 heritages in the form of spoken and written language, etc. in the whole country. In the period from 2016 to 2020, there have been 3 special national relics, 8 historical - cultural relics and scenic spots related to the ethnic minorities which are ranked national heritage; There are 126 intangible cultural heritages, 276 elite artisans who are ethnic minorities [15].

The right to preserve and develop ethnic minority culture is considered a special right with important significance for ethnic minorities and has been regulated in many different documents. Article 41, Article 42 of the 2013 Constitution stipulates: “Everyone has the right to enjoy and access cultural values, participate in cultural life, and use cultural facilities; Citizens have the right to identify their ethnicity, use their mother tongue, and choose a language of communication. To ensure this right, our State not only promulgates specialized legal documents as a solid legal basis for the rights execution but also develops the policies and projects on cultural preservation and development such as: Project on preserving and developing culture of Vietnam's ethnic minorities until 2020 according to Decision No. 1270/QD-TTg or the regulations of the Ministry of Education and Training on promulgating the ethnic minority languages teaching framework for children and civil servants working in ethnic minority areas; preserving and maintaining the traditional costumes of Vietnam's ethnic minorities in the current period [1], etc.

3.3. The right to use and popularize one's own language and choice of language for communication

In the civil rights stated in the 2013 Constitution, the right to use and access a language is mentioned in Article 42 as follows: “A citizen has the right to determine his or her ethnicity, use his or her mother tongue and choose his or her language of communication” [12].

Article 5 of the 2013 Constitution clearly stated: "Ethnic groups have the right to use their own language and script, preserve their national identity, and promote their fine customs, practices, traditions and culture";

The 2005 Education Law stipulates: “The State creates favorable conditions for ethnic minorities to learn their own language and writing in order to preserve and promote their national cultural identity and to help ethnic minority students easily absorb knowledge when studying in schools and other educational institutions”;

The 2014 People's Courts Organization Law stipulates on the spoken and written language used before the People's Court: "The spoken and written language used before the Court is Vietnamese. The Court assurances to proceeding participants the right to use their own language and writing before the People's Court. In this case, an interpreter is required.

Article 21 of the 2013 Cultural Heritage Law also has similar provisions. Then, the Vietnamese Government issued Decree No. 82/2010/ND-CP regulating the teaching and learning of languages and scripts of ethnic minorities in general education institutions and regular education centers through.

3.4. The right to access and enjoy cultural values

The right to enjoy cultural values can be understood as the right to recognize and ensure the demand of feeling and exploiting the values and good social capital created and kept in the community life of an individual or community.

The right to enjoy cultural values was first recognized in our country in a legal document in the 2013 Constitution (Article 41). Accordingly, this right focuses on the aspects of creativity, access and enjoyment of socio-cultural and spiritual values. Specifically, Article 24 of the 2013 Constitution stipulates: “Everyone has the right to freedom of belief and religion, and has the right to follow any religion or to follow no religion. All religions are equal before law. The State shall respect and protect the freedom of belief and religion.

No one may violate the freedom of belief and religion, nor may anyone take advantage of a belief or religion in order to violate the law”; Article 39: “Citizens have the right, as well as the obligation, to learn”; Article 40 of the 2013 Constitution stipulates: “Everyone has the right to conduct scientific or technological research, or literary or artistic creation, and to enjoy the benefits brought about by those activities”; Article 41: “Everyone has the right to enjoy and access cultural values, participate in cultural life, and use cultural facilities”.

Together with creating conditions for ethnic minority cultures to be preserved and promoted, the authorities at all levels have also implemented practical actions for every person to gradually improve and enhance their spiritual and cultural life. At the present, there are more than 90% of households in ethnic minority areas listening to Voice of Vietnam and over 80% of households watching television. Radio and television programs in both Vietnamese and 26 ethnic languages are broadcast to remote villages [5].

In general, it can be seen that people, whether belonging to any ethnic group or Kinh group, are ensured by the State to have equal rights in enjoyment and encouraged to promote cultural values created by themselves or the community. In addition, the State also creates all conditions, both in law and in physical facilities, to ensure this right of the people, including ethnic minorities.

4. Discussion and Conclusion

The achievements in ensuring the cultural development right of ethnic minorities are detailed examples in ensuring and promoting the ethnic minorities' rights in particular and human rights in general in Vietnam which maintains equality among all ethnic groups in the country. In addition to the achieved results, the cultural rights assurance of ethnic minorities and the system of Vietnamese policies and laws on ethnic minorities in general and laws on ethnic minorities' cultural rights in particular. There are still some limitations, such as: an overlap and an inappropriate relationship between regional and community policies, policies for households in general and ethnic policies leading to ineffective policy interventions; The cultural identity of many ethnic groups is facing the risk of being lost and assimilated, especially in poor communities under the impacts of modern socio-economic life, the cultural invasion and religion - belief transformation which has been happening more and more strongly. Many of organization and management regulation of traditional villages associated with cultural communities are broken (or destroyed in the process of development); Although the basic cultural institutions for ethnic minority areas have been invested, they are still poor, especially in the northern mountainous areas and the Central Highlands due to difficult topographical conditions.

The context of globalization and the wave of the fourth industrial revolution that has brought great achievement in socio-economic development is undeniable. However, it also brings challenges and negatives such as the gap between rich and poor; changes of social norms; inverting the social human resource structure, the collision between the indigenous culture and the imported culture is inevitable. Besides, industrialization - modernization and market economy made a strong influence on the cultural identity of ethnic minorities. The above context and practical situation also made a significant impact on ensuring the cultural rights of ethnic minorities. In order to improve the effectiveness of the enforcement of cultural rights of ethnic minorities in Vietnam in the coming time, the author proposes a number of solutions as follows:

Firstly, it is necessary to continue to implement specific cultural policies for ethnic minorities and well implement socio-economic development policies in ethnic minority and mountainous areas; review, adjust and supplement to complete existed policies and study and issue new policies to meet the requirements of developing ethnic regions and ethnic minority work tasks in the new period. Especially with the preservation of ethnic minority cultures, it is necessary to issue a new scheme on preserving and developing the culture of Vietnam's ethnic minorities in the coming period on the basis of inheriting and continuing to implement the key objectives and tasks have been set forth in the Project "Preservation and promotion of culture of Vietnam's ethnic minorities until 2020".

Secondly, it is necessary to prioritize investment in preserving and promoting the traditional performing arts of ethnic minorities; at the same time, effectively, openly and transparently use the state's investment sources with a focus and priority on mountainous areas, border areas, islands, ethnic minority areas and a number of different types of people. Preserve and promote traditional art forms need. Collect, restore and develop some traditional art forms at risk of being lost.

Thirdly, developing policies to encourage research, collection, preservation, transmission and introduction of the intangible cultural heritage of ethnic minority communities; building a contingent of intellectuals, writers and artists among ethnic minorities, adopt policies to encourage them to return to work in the locality. Focusing on training and fostering a contingent of teachers teaching cultural specialties. Adopting policies to discover, foster, employ, treat and honor cadres in the fields of culture and art; respecting talented and virtuous people. Adjusting salary and allowance regimes for those operating in specific arts disciplines.

Fourthly, continuing to implement hunger eradication, poverty reduction, and raising the living standards of ethnic minorities, focusing on people in highland, remote and remote areas is a prerequisite for ethnic minorities to entitle cultural rights. Combining with radio and television coverage programs; strengthening grassroots-oriented cultural, information and propaganda activities; increasing the duration and improve the quality of radio and television programs in ethnic minority languages; doing well in researching, collecting, preserving and promoting good values and traditions in the cultures of the nations. Implementing the universalization of lower secondary education and mountainous education programs, improve the quality and effectiveness of education and training, especially the system of boarding schools for ethnic minorities at all levels.

Fifthly, strengthening bilingual education programs for ethnic minority children and local language training for Kinh teachers in ethnic minority areas, employing more ethnic minority teachers, allowing to use and teach in ethnic minority languages as a medium of instruction in schools, supporting cultural education programs for ethnic minority groups.

Sixthly, promoting education, propaganda to raise awareness for ethnic minorities, overcoming customs and psychological barriers, especially ethnic minorities with difficult conditions about the importance of education access in hunger eradication, poverty reduction and socio-economic development. Developing communication programs appropriate to cultural, gender, age and ethnic factors. Developing effective communication models in the community; expanding and diversifying communication activities to raise awareness of all levels of party committees, authorities and people about education in hunger eradication, poverty reduction and socio-economic development. Strengthening the dissemination of laws and information on ethnic minority policy mechanisms in general and policies related to education for ethnic minority areas in particular.

Seventhly, organizing cultural activities such as festivals, entertainment services, building bookcases, establishing clubs, creating an environment for ethnic minorities to have the opportunity to fully enjoy themselves. cultural rights. Eliminating all outdated customs, associate legal propaganda with criticism of bad habits, ideas that favor men and despise women; uphold and honor the fine traditions of ethnic minorities.

Eighthly, ethnic minorities also need to be proactive in exercising their cultural rights such as actively participating in the process of formulating programs to preserve and develop national cultural traditions; training for the next generations the values of their own nation and building a sense of preserving them in the process of economic development and integration.

The Party and State of Vietnam always identify people as both the goal and the driving force of development; in all socio-economic policies, people are always placed at the center; The assurance and protection of human rights, cultural rights in general, and cultural rights of ethnic minorities in particular are one of the important factors in realizing equality among ethnic groups and for the development of ethnic minorities. sustainable development, contributing to the victory of industrialization and modernization of the country, building socialism in our country according to the goals of democracy, justice and civilization, for the happiness and progress of human./.

Abstract

Culture plays an important role not only in the formation of human personality, identity, and character of a nation, but today, culture is also considered as one of the important factors determining the strength and position of each nation state. Therefore, it is very necessary to build and develope Vietnamese culture and people, in which building a synchronous cultural environment to meet the requirements of sustainable development of the country. One of the factors contributing to the formation of the cultural environment is ethics, including environmental ethics. The term "environmental ethics" is new to the contemporary world, but ideas about it have existed for a long time in the development history of human society. Up to now, environmental ethics has received more and more attention from research stemming from pressing practical issues, it has become a topic discussed at many scientific conferences and has a certain position in many fields. in the field of science, at the same time, environmental ethics is also an effective measure and method to adjust human perception and behavior in dealing with the natural world. Environmental ethics is to promote the self-discipline, voluntariness and sense of responsibility of people in environmental protection. In order to build a synchronous cultural environment, it is necessary to build environmental ethics, towards the practice of environmental ethics in practice.

Keywords: *Cultural Environment, Environmental ethics, Sustainable development, Vietnam.*

1. Introduction

1.1. Environmental Ethics concept

Discussing the concept of environmental ethics has many different conceptions depending on the approaches of researchers from the perspective of philosophy, sociology and psychology, especially there are many studies on environmental ethics comes from philosophers.

In both the East and the West, there have existed many different views on environmental ethics, reflecting different worldviews and human views, as well as showing different levels of awareness of human society through each historical period. Environmental ethics is also known as environmental ethics or ecological ethics. From the perspective of ecological ethics, the term "ecology" in Greek is "oikos" which means housing, residence and living place of living beings from inorganic to organic, from small to big, from plants, animals to humans. From another perspective, ecology can be expressed as the interrelationship between living organisms and the environment, including the interaction between human society and the entire biosphere. The term environmental ethics appeared in the 60s of the twentieth century, so far around the term "environmental ethics" there is much controversy about its definition as well as its connotations and characteristics.

In the framework of the article, the authors concept : *environmental ethics including perspectives, concepts, principles, standards of work adjustment, assessment, guidance and impaired control the behavior of all voluntary and voluntary social action towards the environment towards sustainable development (sustainability for humans and sustainability for the natural environment).*

Firstly, environmental ethics is the whole set of rules and standards to regulate and evaluate human behavior and behavior with the environment in order to bring benefits, happiness for present and future generations. Not only that, environmental ethics also contribute to sustainable development. Second, through these rules and standards, people adjust their behavior to the environment voluntarily and voluntarily. Third, environmental ethics represents the harmonious relationship between humans and nature. This is a relationship that shows respect and responsibility of people towards the environment. After all, environmental ethics is the expression of people's very high self-consciousness towards the environment, which reflects the conscience, responsibility, goodness, and obligations of people towards the environment. Environmental ethics consists of two components: environmental ethical awareness and environmental ethical behavior..

Environmental ethics is expressed in the consciousness and behavior of people with the environment, which is both mandatory and voluntary. It is mandatory because these standards and rules reflect the demands and requirements of society. These requirements and requirements are not legal, but the scope of impact and adjustment is inevitable and regular through public opinion to evaluate, so any move related to the environment one must also adopt the rules of environmental ethics to act. On the other hand, the environment is not the property of anyone alone, it involves many people, is community and human. Therefore, implementing environmental ethical standards is the responsibility, obligation and conscience of all individuals, organizations and social subjects. It is voluntary because individuals and communities implement rules and standards for the environment motivated by conscience, self-consciousness and goodwill towards the environment, not because of a commitment. legally required. They are aware of the need to protect the environment for their own life, for their own benefit, so they act, and even feel happy and happy when performing environmentally ethical behaviors.

Thus, environmental ethics consists of two components: environmental ethical consciousness (including: environmental ethical standards, environmental ethical knowledge, environmental ethical sentiments) and environmental ethical behavior.

Environmental ethics has some basic characteristics such as:

Environmental ethics of self-discipline, voluntary very high in humans. In environmental ethics, people voluntarily set forth principles and rules of environmental ethical standards to adjust their behavior within the framework of that principle; that shows compliance with environmental ethics due to the urge of conscience, self-consciousness and they see their responsibility and obligation in environmental protection, and they feel happy when protecting the environment.

Environmental ethics is the expression of human social responsibility towards the environment (environmental responsibility) . Because humans are playing a leading role in the process of exploiting and transforming nature, people have soon become aware of their responsibility in improving nature and protecting the natural environment. Human environmental responsibility towards nature is formed on the basis that people have a sense of environmental ethics and have a sense of environmental rule of law. Human social responsibility towards nature is expressed by people being aware of the consequences caused by their actions to nature and taking responsibility for those consequences.

Thus, there are many forms to protect the environment, however, protecting the environment by ethical means creates the ability to restrain and prevent bad and evil acts, harming nature and society. It also has the ability and motivation to motivate people to fight against acts of destroying resources and polluting the environment.

1.2. Cultural environment concept

In general, the cultural environment is the sum total of all kinds of cultural and spiritual conditions that exist around people and affect human activities. The main factors forming the cultural environment are education, science, economy, art, *morality*, religion, philosophy, national psychology and traditional customs. From a macro perspective, the cultural environment is an integral part of the entire social environment, therefore, it plays a great role in the stability, development and progress of the entire society.

Firstly, the cultural environment has an influence on the formation of value views and the concept of social distribution in a reasonable and humane way, suitable for different classes in society to ensure stability.

Second, the cultural environment affects social stability through human-to-human relations. Society is made up of people. Individuals and families are cells of society. People living in society will of course arise many types of relationships and these relationships to different degrees will affect social stability.

Third, the cultural environment creates opportunities and conditions for cultural enjoyment and education. Besides, enjoying other spiritual values through books, television, music, exhibitions, cultural tourism and ecotourism is also very important. The problem for us today is that in parallel with the expansion of cultural space and environment, it is necessary to pay more attention to the quality of cultural enjoyment, to gradually reduce the gap between rural and urban areas, between fast-growing and slow-growing regions, especially remote and deep-lying areas.

The cultural environment is highly structured in both breadth and depth. That structure can be approached in many different ways such as: dividing into tangible and intangible elements; natural and social factors; existing, completed, selectively inherited elements and elements in the process of arising, forming and developing... The way to divide the cultural environment is only relative. When entering a specific cultural environment, it is necessary to base on the characteristics of the object, objective and subjective conditions to have the correct ways of seeing the cultural environment. In addition, according to the approach to the systematic structure of the cultural environment, it is possible to define the cultural environment with the following five elements: The whole cultural landscape; System of cultural institutions; System of forms of cultural activities; The system of cultural behavioral relations; Cultural people in each community.

The cultural environment is a unified whole, always moving and changing. The elements of the cultural environment have a dialectical relationship with each other, both as a cause and as an effect of each other. People and their cultural behavior are the factors that determine the content, nature and face of the cultural environment. Therefore, building a cultural environment must be carried out synchronously and comprehensively, without neglecting (or omitting) a single factor. At the same time, it is necessary to pay attention to the important factors so that appropriate solutions can be taken to protect and build a healthy, civilized and humane cultural environment in each locality and production unit. This is a matter of great significance both in theory and practice in order to promote social development, especially in the renovation process in our country today.

1.3. Literature reviews

There are many papers on ecological ethics. Some typical papers such as *"Some theoretical issues about environmental ethics"* by Vu Dung. Directly related to ecological ethics is the article *"On environmental ethics"* by Ho Si Quy. The Japanese researcher Tomnobu Imamichi has the article *"The concept of ecological ethics and the development of ethics ideology"*, the translator Nguyen Thi Lan Huong.

The research paper has focused on clarifying the concept of environmental ethics, the constituent elements of environmental ethics, the factors affecting the environmental ethics in general. Although there are still different notions about the concept of environmental ethics, these works are generally united in the assumption that environmental ethics is formed in the process of human impact on nature, it is a system of views, concepts, thoughts, feelings, principles, rules, norms ... regulating and adjusting human behavior in the process of natural gender transformation to serve the human life, ensuring the development of both human beings and the natural world.

Recently, researching on environmental ethics in students has attracted more attention of researchers, including the National Conference on *"Environmental Education in Schools"*, Research Center Natural Resources and Environment with Hanoi National University to coordinate implementation; In particular, in 2009, the National Political Publishing House published a monograph *"Ecological Ethics and Ecological Ethical Education"* by Vu Trong Dung. More concretely, some works focused on studying the ethical education in specific scope and subjects such as: master's thesis in Philosophy *"Environmental ethical education for students of Resource and Environment College of Central in current"*(2014) by Mai Thi Thu Hang;

In the above works, the authors also assessed the situation, analyzed achievements, limitations in environmental ethics of students in Vietnam today. With evidence of serious environmental degradation in many urban areas, cities, craft villages, rivers, and coastal areas, the authors have shown weaknesses in environmental ethics and environmental ethical education in schools. The solutions to improve environmental ethics proposed by the authors are quite comprehensive and feasible; based on relatively focused theoretical research, based on fairly comprehensive assessments and international experience references ... The above mentioned environmental ethical researches achievements have the scope of research at the social level, national level. Only in certain specific cases, ecological ethics in schools were mentioned as an example.

In the social sciences in Vietnam, researches on the cultural environment, and the cultural environment in Vietnam are still very limited at present. Some of these studies include: Author Nguyen Thi Huong with the article *"Building a cultural environment to develop culture and people for sustainable development of the country"* published in the Journal of Political Theory The article has outlined the orientations of the Communist Party of Vietnam on building a cultural environment through congresses. At the same time, the author also believes that: "Cultural environment is the living totality of tangible and intangible cultural factors that surround people in a definite space and time, those factors affect each other and have an interactive relationship with people, in order to develop and promote the role of human being both as a product and as a cultural subject. (Nguyen Thi Huong, 2016). The article has pointed out the content of the task of building a cultural environment in Vietnam today, including: building a synchronous cultural environment, associated with a specific value system and standards; building cultural life; building a system of cultural institutions and cultural landscapes in association with improving the quality and efficiency of activities of cultural institutions; create conditions for people to actively organize community cultural activities. Article *On the current cultural and cultural environment in Vietnam*, author Ho Si Quy. The article has an interesting way of posing the problem when comparing the concept of social environment and cultural environment. According to the author, compared with the concept of social environment, the concept of cultural environment is often used with a less defined meaning, with the outside being the whole of human life and the connotation being the cultural aspect, or the aspect of social environment. cultural; That is, it is almost identical to the concept of social environment in terms of scope, differing only in the aspect of considering culture, but not in other respects. Very rarely the cultural environment is understood to consist of purely cultural activities. The article also analyzes the cultural environment of Vietnam in terms of: ideology - theory; Socioeconomic; social spiritual life and affirmation: never before has the cultural environment in Vietnam been so rich and varied, dynamic and positive, encouraging and tempting, with many opportunities and challenges... like nowadays.

2. Method

The article is based on the theoretical basis of Marxism-Leninism, Ho Chi Minh's thought, viewpoints and lines of the Communist Party of Vietnam, policies and laws of the State of Vietnam on environmental ethics, cultural environment and related issues. Selectively acquire research results published by scientists on environmental ethics, cultural environment. To study the topic, the authors base themselves on the actual achievements and limitations and inadequacies in implementing environmental ethics, cultural environment in Vietnam through 35 years of renovation.

The research is based on the methodology of Marxism-Leninism and Ho Chi Minh's thought to deploy research tasks. Focus on using interdisciplinary methods of social sciences and humanities. Using a combination of methods: History, logic, combining history with logic, analysis, synthesis, comparison, forecasting... These specific research methods are used flexibly and appropriately to have a analyzes, comments and assessments on the issue that the Communist Party of Vietnam continues to promote environmental ethics on constructing cultural environment on sustainable national development.

3. Results

3.1. The relationship between environmental ethics and building cultural environment

Environmental ethics contributes to the formation of a new cultural lifestyle

In the process of national construction and development, we are not only interested in economic development, transforming nature to suit the purposes and aspirations of people, but we also have to renovate and build lifestyle for people towards human values, that is to build a lifestyle, a cultural way of life to behave with the natural environment, towards practicing environmental ethics. In the production process, people create material and spiritual values that not only satisfy people's needs in daily life and consumption, but also create for people to live in harmony, attachment, and friendliness towards nature, towards Truthfulness, Compassion and Beauty through the process of perception and human behavior towards nature.

The Resolution of the 5th Conference of the Central Committee of the Communist Party of Vietnam (Term VIII) in 1998 emphasized the requirements of building a new Vietnamese person: a healthy lifestyle, a civilized lifestyle, thrift, honesty, humanity, respect for rules and regulations, community conventions, and a sense of environment protection and improvement (Communist Party of Vietnam, 1998) . By 2014, in the Resolution of the 9th Central Committee of the XI session on building Vietnamese human culture to meet the country's sustainable development requirements, it continued to emphasize: We can easily accept a new civilization, but it is not easy to build a new cultural lifestyle; new people need to have a new civilized and modern way of life, always loving and attached to nature, then environmental ethics will turn into a habit, a new civilized and modern way of life, always loving and attached to nature, then the culture of friendly behavior with the natural environment becomes a good habit, become a human way of life, an inevitable human behavior. Improving the culture of dealing with the natural environment is also a cultural revolution - the culture of dealing with the natural environment. Improve environmental ethics, improve the culture of dealing with the natural environment and form an environmentally friendly cultural lifestyle is an urgent need in the current period and an indispensable need, the driving force of development, contribute to building a synchronous cultural environment in Vietnam.

Environmental ethics contributes to promoting socio-economic development

In the process of man's impact on nature to create material and spiritual values for society, man needs to consciously control the relationship between man and nature. understand the laws of nature and be able to apply those laws correctly in practical activities, especially activities that produce material wealth for society. Currently, humans are affecting nature in a stronger and faster way, polluting the environment, even destroying the environment. Therefore, it is necessary to build environmental ethics to contribute to the promotion of socio-economic development, when everyone living in society consciously obeys the requirements of natural laws, they will achieve with high efficiency in economic activities, labor productivity and real income of the society will constantly increase, making an important contribution to promoting the country's economic growth. From there, society will invest back into production such as purchasing more production materials, applying modern science and technology to production, improving the professional qualifications of workers, etc. It is important to stimulate social production to develop in both breadth and depth. As a result, the social production is more and more stable and sustainable.

In the relationship between man and nature, man needs to live in real harmony with nature, *"according to nature"*, which does not stop at the fact that man must obey the requirements of the laws but also in the fact that humans have to respond promptly and appropriately to erratic changes of natural conditions such as storms, earthquakes, tsunamis. Nowadays, with the development of science and technology, people have accurate predictions about the change of natural conditions, through which people will actively and actively prevent natural mutations in the direction of minimizing their harmful effects on people and the economy - society, thus, the economy - society society will have conditions to develop more and more.

At the same time, in economic activities, there must be a harmonious and balanced combination between economic efficiency and environmental efficiency, production is developed but the environment is not polluted, natural resources are not exhausted. ensure the survival and development of both humans and nature. There must be a close combination between economic development and environmental protection, in order to maintain the existence of people and nature. In order to survive, people still have to develop production, but are only allowed to develop it within the limits of nature's tolerance for the survival of nature itself, so that the capital of natural resources is used effectively and long lasting. The rational exploitation of natural resources will create good conditions for production development and promote socio-economic development.

In economic activities, people not only use products available from nature, rationally exploit natural resources, but also have to find ways to reproduce the natural resources that have been consumed, regenerate the exploited resources to the extent possible to restore the necessary and indispensable resources in their practice, creating conditions for a continuously reproduced social production and expanding, contributing to maintaining the economic growth rate of the society in a sustainable way. At the same time, the restoration of natural resources also has the effect of protecting and improving the quality of the living environment, helping society to maintain ecological balance, ensuring the existence of all natural resources. species in the natural environment according to its laws of survival and extinction. Thus, environmental ethical practices will make an important contribution to the protection and improvement of the quality of factors of production in society, creating a driving force to promote socio-economic development more and more stably and sustainably, so that life gets better and better, satisfy the material and spiritual needs of people in a healthy natural environment.

Building a cultural environment is a premise for building a harmonious relationship between people and nature

The cultural environment is a product of human society, and in each different community, different cultural environments will be established. In turn, those cultural environments have the power to absorb, sensitize and educate people, turning biological people into social people with typical qualities. Thereby, it will create people who not only know how to evaluate their perceptions and behaviors according to the criteria of what is right, good and beautiful, but more importantly, awaken in them the values of life, the reason for living, the joy of living in harmony between the social environment and the natural environment. Further, forming in people and social subjects a positive life attitude, fighting against actions that destroy the environment and resources, shaping a green lifestyle and green consumption. To build a healthy socio-cultural environment, it is necessary to pay attention to the harmonious development between people and people and the harmony between people and nature. Building the current cultural environment in Vietnam by people and for people, towards values for the community, and at the same time must be directed to each specific person, towards human liberation and human potential. Through building a harmonious relationship between people and people, it will create a social foundation to establish a harmonious relationship between people and nature. Therefore, in order to build environmental ethics, it is necessary to pay attention to policy mechanisms to create sustainable development.

3.2. Environmental ethics in building the cultural environment in Vietnam today

The XIII Congress of the Communist Party of Vietnam (2021) affirmed that awareness of environmental protection has been raised, the State has issued many policies and increased investment in this field. However, besides the achieved results, the Document of the XIII Congress also frankly looked at the weaknesses such as: "Legal awareness on management, economical and efficient use of natural resources, environmental protection. environment, adaptation to climate change is still low… Environmental quality in some places continues to deteriorate; adaptation to climate change is still passive and confusing. Natural ecosystems and biodiversity continue to decline, industry and environmental services, waste recycling, and waste treatment are underdeveloped and backward" (Communist Party of Vietnam, 2021). Currently, environmental ethics is in decline. The violation of legal regulations on environmental protection in organizations, individuals and business entities is taking place very complicatedly. The lack of consciousness also manifests in daily activities such as littering, wasteful use of resources, etc.

Despite being an agricultural country in the process of industrialization and modernization, with the goal of 2045 celebrating the 100th anniversary of the country's founding, becoming a high-income developed country with socialist orientation, Vietnam is also facing many serious environmental problems. With a population of nearly 100 million people, it poses serious problems on people's livelihood, improving living standards, increasing income and environmental protection. Currently, ecological hazards in our country under the impact of industrialization, modernization, climate change, especially the contradiction between development and backwardness, due to the heavy influence of unfinished smallholder farmers' thinking and habits.

Our country's nature, besides being affected by the effects of wars in the past, is now also destroyed by unconscious activities, arbitrary irresponsible attitudes, lack of planning in the exploitation and use of natural resources. natural resources. According to statistics before 1945, forest coverage accounted for 43.8%, now only more than 28% (ie below the alarming level of 30%). The area of arable land that is being eroded has increased sharply to about 13.4 million hectares (Tran Nguyen Tuyen, 2021). The main cause of this situation is shifting cultivation, illegal logging, traffic expansion, hydropower construction... not according to the unified planning. The problem of unreasonable land use planning is wasting this valuable resource of the country. Increasing ecological pollution is a difficult problem today. Many factories discharge industrial and domestic waste, toxic substances from the production process that are not treated seriously, but put directly into the environment. causing environmental pollution, causing diseases to people. According to statistics of the Ministry of Natural Resources and Environment, the country now has more than 5,400 craft villages, Hanoi alone has more than 1350 craft villages, but 95% of production activities pollute the environment, more than 50% cause serious pollution. important (Tran Nguyen Tuyen, 2021). These are small-scale enterprises and production facilities, with generally outdated technology, and have not invested properly in the treatment of environmental pollution and waste.

The problem of polluted wastewater management is more complicated and difficult. According to environmental experts, most rivers and most lakes in Hanoi and some urban areas are heavily polluted. Every year, millions of cubic meters of untreated water are poured into rivers such as To Lich River, Set River, Nhue River, Kim Nguu River, Lu River, etc. According to the Ministry of Natural Resources and Environment, the country currently has 615 industrial clusters, but only about 5% have centralized wastewater treatment systems, nearly 300 industrial parks with a discharge volume of over 2 million m3/day, but there are up to 70% of wastewater has not been thoroughly treated, 23% of FDI enterprises discharge discharges exceeding the allowed standards by 5-12%. According to statistics, every year, the country has about 9,000 deaths and over 200,000 cancer cases detected due to the use of polluted water (Nguyen The Trung, 2019). Along with waste and wastewater, the problem of emissions is also very serious. At the beginning of March 2019, the Green Innovation Development Center (GreenID) of the Vietnam Union of Science and Technology Associations announced the report of Greenpeace organization "On the current state of global air quality in 2018". . According to this report, Hanoi ranks second, Ho Chi Minh City ranks 15th in terms of air pollution in Southeast Asia. According to the Pollution Control Department under the General Department of Environment, Vietnam has about 43 million motorbikes and more than 2 million cars in circulation, mainly using fossil fuels such as diesel and gasoline, which is a major source of smoke and dust, toxic gases into the air (Nguyen The Trung, 2019).

Along with waste and wastewater, the problem of emissions is also very serious. At the beginning of March 2019, the Green Innovation Development Center (GreenID) of the Vietnam Union of Science and Technology Associations announced the report of Greenpeace organization "On the current state of global air quality in 2018". According to this report, Hanoi ranked second, Ho Chi Minh City ranked 15th in terms of air pollution in Southeast Asia. According to the Pollution Control Department under the General Department of Environment, Vietnam has about 43 million motorbikes and more than 2 million cars in circulation, mainly using fossil fuels such as diesel and gasoline, which is a major source of smoke and dust emissions, toxic gas into the air (Nguyen The Trung, 2019).

The concentration of dust in urban areas exceeds many times the allowable norm. The concentration of CO_2 emissions, especially in big cities and industrial zones, exceeds the allowable standards by 1.5 to 2.5 times. In addition, noise pollution is also a problem for residential areas (Tran Nguyen Tuyen, 2021). Besides, the issue of mining, building materials, gold and gems... official and free has also been destroying the ecological environment. The use of mines in many fields is disrupting the balance of the ecological environment. According to many international experts, Vietnam is currently facing many serious environmental problems such as deforestation, soil erosion, over-exploitation of coastal resources threatening ecosystems, biodiversity and genetic depletion. This deterioration in environmental ethics and environmental status is posing hot issues and challenges for Vietnam's rapid and sustainable development in the coming time.

There are many reasons leading to the above-mentioned violations of environmental ethics :

Objective reasons

Vietnam is a country that has to go through fierce and prolonged wars. Currently, it has not escaped from the status of an outdated agricultural economy, the concentration of capital, human resources and technology for the task of protecting environment is still difficult.

The downside of the market economy is a factor leading to the deterioration of environmental quality. Starting from putting the interests first, especially economic interests, the market economy has created a strong stimulus for people in exploiting natural resources.

People's awareness of environmental protection is not high and there has not been a positive change from a small-scale ecological cultural lifestyle to a new ecological cultural lifestyle. Traditional environmental ethics has many positive aspects but still has negative aspects and is not suitable for the new development conditions of Vietnamese society.

Subjective reasons

Due to inadequate awareness of natural laws and people's awareness of environmental protection is still limited. The awareness of the environment and environmental protection of the people in general and the leaders and state managers in particular is still low, not meeting the development requirements of modern society. People's awareness of environmental ethics is still at the emotional level, not yet entering into the lifestyle and lifestyle to become the habits and customs of the majority of the people.

Awareness of environmental sanitation is too low, indiscriminate living habits in some rural areas are also big problems causing environmental pollution and diseases affecting human health.

There are many shortcomings in the enforcement of sanctions and the implementation of the environmental protection function by some relevant agencies. The legal system is not yet complete. The enforcement of the law on environmental protection in the past time has been weak, there have not been strong enough economic, legal and administrative measures to guide and adjust human activities in the direction of "environmentally friendly".

The Party's view of sustainable development has not been recognized, absorbed and respected. Many leaders of ministries, branches, provinces and cities still consider economic development the number one priority. Economic development first, environmental pollution treatment later, while pollution prevention and control is one of the basic principles of environmental protection activities. This ideology has led to the compromise of environmental goals in order to obtain economic benefits.

4. Discussion and Conclusion

4.1. Some solutions to build environmental ethics towards building a synchronous cultural environment in Vietnam

In order to protect environmental resources and sustainable development of the country, it is necessary to promote the construction of a cultural environment and a cultural lifestyle through promoting the roles of three actors: the State, people and businesses, thereby contributing to building successful environmental ethics in Vietnam.

First, the role of the State in building a cultural environment, a cultural lifestyle creates a premise for successful environmental ethics building.

In order to build environmental ethics, it is necessary to promote the role of the State as the subject of policy-making, legislation and management of environmental resources. To do this, the State needs to take the following solutions:

The State through functional agencies should have a specific and effective management mechanism for the cultural lifestyle of the people. The State, through the functional agencies, should have specific regulations and sanctions capable of deterring in order to create a habit of civilized behavior towards the environment. It is necessary to combine laws with customary laws and conventions in natural resource management in general and forest management in particular. Developing environmental protection criteria to create a basis for consideration and recognition of cultural villages, communes and families. Rewarding and commend activities and good examples in environmental protection towards sustainable development.

The State should issue specific regulations to prevent and avoid wasteful and inefficient use of natural resources and the environment. Natural resources and the environment are the assets of the nation, closely related to the survival and development of many generations of Vietnamese people, so the State needs to publicly announce the expenditures of the budget. State (except for secrets related to national defense and security), especially public investment, publicize projects and plannings related to natural resources and the environment. The fact shows that the publicity and transparency associated with the accountability of the state apparatus are very important to overcome the thinking of tenure and group interests in the formation of mechanisms and policies, in the land use or regulation, in public investment and in the use of public assets in relation to natural resources and the environment. To bring about long-term effectiveness, fight waste and effectively use natural resources, it is necessary to change the mindset of people and the whole society towards this evil. Society should consider the waste of natural resources as a social evil, a manifestation of moral degradation and consider this a "national evil".

In order to build environmental ethics, it is necessary to supplement environmental ethics criteria for the contingent of cadres and civil servants. The current cadres, in addition to professional knowledge, must also have a level of awareness about natural resources and the environment, self-discipline in the implementation of environmental ethical behaviors, and persuading people to protect the environment. environment. At the same time, the state needs to have an effective mechanism to prevent group interests between enterprises and state officials in violating regulations on environmental protection.

The State through agencies and departments mobilizes people, businesses, production and business establishments to change their production methods towards sustainability.

Second, the role of people in building environmental ethics.

Building a cultural lifestyle of the community contributes to building environmental ethics. In order to build a cultural lifestyle, it is necessary to selectively inherit the good values of the tradition and at the same time absorb the cultural lifestyle of humanity to contribute to building environmental ethics. The restoration and development of a lifestyle in harmony with nature contributes to repelling pragmatic conceptions of life, pursuing material benefits at the expense of nature. When we care about building a cultural lifestyle, people will pay more attention to the community. That "on the one hand, demonstrates intergenerational justice, the responsibility of the present generation to future generations; On the other hand, it shows the cultural and ethical behavior of the previous generation towards future generations (Pham Van Duc, 2015).

In order to build environmental ethics, each citizen needs to well deal with the relationship between material needs and spiritual needs, between material values and spiritual values. In human life, material life and spiritual life always have a dialectical relationship with each other. Therefore, each of us should know how to harmoniously combine both material life and spiritual life between the interests of humans and the interests of nature, the interests of present and future generations. In order to build environmental ethics, it is necessary to build a movement to save material consumption while promoting spiritual values. "When people pay more attention to the meaning of life, to human morality, to the categories of right, love and responsibility, passion for needs and material comfort will certainly be pushed back and overcome" (Tran Van Binh, 2011).

To build environmental ethics, it is necessary to promote the positive, proactive and creative spirit of each individual and group in environmental protection. Each citizen by specific work can participate in environmental protection propaganda activities, show responsibility for environmental protection such as: helping environmental protection organizations, participating in public activities. , through the mass media and public opinion to fight against the phenomena of violating environmental ethics and overcome.

Third, promote the role of enterprises (production and business establishments) in building environmental ethics. In order to successfully build environmental ethics, promoting the active role of enterprises and production and business establishments is an indispensable requirement, therefore, businesses need to:

Enterprises need to pay attention to cleaner production. The goal of cleaner production is to avoid pollution by using resources, materials and energy in the most efficient and economical way. Cleaner production includes the reduction of negative effects from production, distribution, exchange and consumption associated with the design to dispose of the product. Cleaner production associated with the environmental responsibility of the enterprise is reflected in the specific strategies and activities of the enterprise in which the interests of customers are associated with environmental benefits.

Build organizational culture. Currently, with the trend of globalization and international integration deepening, businesses are facing great opportunities as well as challenges that require improving their competitiveness. through business strategy, technology, productivity, quality... To do this, each enterprise has been and is not only interested in building business ethics. but also build environmental ethics associated with corporate culture. Building corporate culture associated with building environmentally friendly production methods to create quality products that contribute to improving corporate profits.

Implement environmental responsibility associated with protecting customers' interests. Success and business benefits are tied to customers. Ethical and environmental behavior of enterprises reflected in product quality and service attitude can attract customers to products of enterprises. and create trust and motivation for businesses to affirm their brand value through environmental ethics. Thus, when an enterprise implements environmental ethics well, it is the basis for affirming its environmental responsibility to the community. Implementing environmental responsibility is demonstrating business ethics that build the trust of partners, customers and consumers in the business.

Developing and harmonizing strategies of business ethics and environmental ethics in accordance with the development goals of the enterprise. The development of strategies, business ethical standards, and environmental ethics need to be concretized into specific business models and strategies: corporate logo, ethical criteria in business, business strategy Business associated with community benefits through the implementation of social responsibility, through environmental protection should be given importance from the very beginning associated with the process of business formation and development. In order to implement a business ethics strategy associated with environmental ethics, it is necessary to strengthen the dissemination and education of business ethics for employees in the company and group so that they are properly and fully aware of the legal regulations, responsibilities as well as business ethics.

4.2. Conclusion

Environmental ethics including views, concepts, principles, standards of work adjustment, assess, guide and control the behavior of social actors on the environment in a self-conscious, voluntary towards sustainable development (sustainability for people and sustainability for the natural environment). Environmental ethics requires a very high self-discipline in people, demonstrating human social responsibility for the environment (environmental responsibility).

Environmental ethics has a great role in environmental protection and sustainable development of the country . In the current conditions with the impact of social conditions, people still violate environmental ethics, so it is necessary to build environmental ethics. Building environmental ethics in Vietnam today is the process by which social actors with certain roles and positions come up with ways to build unified environmental ethics based on environmental ethical standards in order to forming and perfecting in each citizen the awareness and ethical behavior of the environment on the basis of the current socio-economic conditions in Vietnam today.

THE ROLE OF THE SOFT POWER OF VIETNAMESE CULTURE IN THE DEVELOPMENT OF THE COUNTRY

Prof. Dr. Tran Van Phong

tvphong61@gmail.com

Ho Chi Minh National Academy of Politics, Vietnam

Abstract

In the current context of integration and globalization, the soft power of culture plays a particularly important role in creating the position and influence of each nation. Vietnam is a country with many attractive cultural resources to become a soft power. On the basis of outlining the content of soft power of Vietnamese culture, the article analyzes and clarifies the role of soft power of Vietnamese culture in the development of the country. This role is reflected in the following basic contents: The soft power of Vietnamese culture is the spiritual foundation for the development of the country; Favorable conditions are created for international integration to develop the country; the soft power of Vietnamese culture combines with the hard power of Vietnam to develop the country, promoting the country's rapid and sustainable development.

Keywords: *Culture, development, soft power.*

1. Introduction

In 2002, J.Nye, an American researcher published a book titled *The Paradox of American Power: Why the world's Only Superpower Can't Go It Alone*, in which he introduced the concept of soft power. He believes that a country can achieve the results it wants in international political relations, because other countries want to follow them, follow their values, learn and follow the model. their own, hoping to achieve the same level of prosperity and openness as theirs [2, p.154]. From above this meaning can be understood that, in international political relations, through institutions, policies and culture to attract others. That is soft power. That is, soft power is opposite, in contrast to "hard" power - which is coercion by military power, economic power, etc. Soft power is power through attraction, not attraction, not by violence or coercion to force other people or other nation to follow them. Culture is a very broad concept and has many different approaches. But it can be agreed that culture is material and spiritual values created by humans. Thus, it can be understood that the soft power of culture is the cultural values of a nation, which have the power to attract other peoples and cultures of other peoples by oneself, not by way of "assimilation", "coercion", "forced" of the culture of another nation. In the current international integration conditions, promoting the soft power role of Vietnamese culture to develop the country is a matter of great theoretical and practical significance.

2. Method

The author applies the interdisciplinary approach of cultural philosophy, combined with the method of comparison and contrast to explain the soft power of culture in comparison with the hard power and the soft power role of Vietnamese culture for the development of the country.

3. Results

3.1. Soft power of Vietnamese culture

As we all know, the strength of culture is one of the basic components constituting the soft power of a country. It is the values of Vietnamese culture such as the tradition of patriotism, love of peace, the spirit of solidarity, tolerance, altruism, the spirit of peace, the importance of humanity, diligence, love of labor, Self-reliance, self-reliance, the desire to rise up of Vietnamese people, of Vietnamese culture has been, is and will continue to be an attraction for many other peoples.

In addition to spiritual cultural values, Vietnam also has extremely valuable tangible cultural values. Although located in a tropical climate, monsoon, unfavorable weather, many storms, floods, thunderstorms, but Vietnam is a country with many attractive natural landscapes, recognized by UNESCO as the top-ranked natural heritage of mankind such as Sapa ancient rock; Dong Van Plateau; Ha Long Bay; Phong Nha - Ke Bang Cave; many beautiful beaches such as Non Nuoc, Lang Co, Nha Trang..; unique system of rivers, canals and gardens in the South; there are many beautiful islands such as Cat Ba, Con Dao, Phu Quy, Phu Quoc; etc. There are also tangible cultural heritages such as the architecture of Hue ancient capital, Cham towers, relics of My Son holy land, Imperial Citadel of Thang Long;etc. All these tangible cultural heritages contain many attractions, creating cultural attraction for other peoples, other cultures.

The soft power of Vietnamese culture is also reflected in the attraction of other ethnic groups with a unique culinary culture, associated with tropical agricultural products, associated with an elegant, eco-environmental culture. own flavor and color, good for health. Different from Eastern culinary culture and Western culinary culture, in Vietnamese culinary culture, there are dishes such as pho, fried spring rolls, rice vermicelli, rice noodle roll, Hue pancakes, etc. Along with culinary culture Food, culture of healing by methods of traditional medicine and Vietnamese herbs also attracts many foreign tourists. With a tropical climate, Vietnam has many valuable traditional medicines that have the effect of curing diseases, nourishing the body, and enhancing physical health. On that basis, the Vietnamese have created traditional medicines with Vietnamese brands and characteristics. This is also an attraction, attracting tourists and foreign investors. If we can promote the culinary culture and the culture of oriental medicine, we will certainly contribute to promoting this power of culture to increase Vietnam's soft power, on that basis to develop the country.

3.2. The role of the soft power of Vietnamese culture in the development of the country

Firstly, the soft power of Vietnamese culture is the spiritual foundation, the spiritual foundation for the development of the country.

This means that the soft power of culture “determines the direction, manner, and appearance of development. That is, no matter what level of development, people and communities of each society can only feel safe and progress when development does not separate from their traditional identity, inseparable from history, not turning away from universal human values, and not far from humanitarian tendencies” [3, p. 23]. It is based on traditional cultural values that Vietnam chooses the development path for a society "Rich people, strong country, democracy, justice and civilization", in which people are the center, the goal is is also the driving force of development.

The soft power of culture is also shown as a basis for creating consensus in society, supporting truth - good - beauty, fighting evil, evil, falsehood, inhumanity, not because human. In particular, it is cultural soft power that will arouse and bring into play the hidden strength in each people and the whole nation in protecting the integrity of territorial sovereignty, peace and peace of the Fatherland. At the same time, cultural soft power also arouses and multiplies the aspiration for development, making this aspiration become the psychology of all classes of people and in the Government, to create unity and consensus in land development. country. On that basis, promote the country to develop for the people, for the people.

Second, the soft power of culture facilitates international integration to develop the country.

The soft power of culture is like knowledge, the more information spreads, the more it is replicated, the more it is promoted, the more it multiplies its power, the more it develops inexhaustibly like commodity consumption. Therefore, in the context of deep and wide international integration, promoting the soft power of culture in foreign affairs is extremely important. By culture, through culture, the acquisition, attraction, sensibility, ethnicity, and other countries will be effective and sustainable. From surprise to admiration and admiration, they learn about Vietnamese culture in general and the soft power of Vietnamese culture in particular. On the basis of cultural understanding, the soft power of culture combined with feelings of admiration and love will only allow them to receive, feel it, enjoy it, and gradually transform that perception, that knowledge becomes their own culture. At that time, culture has successfully performed the function of persuading, attracting and attracting other people and ethnic groups. Our Vietnamese culture has inherent human values similar to the cultural values of humanity. Therefore, Vietnamese culture has more and more bases and conditions to perform the function of persuading, attracting and attracting other people and other ethnic. In the current international integration, together with political diplomacy, economic diplomacy, cultural diplomacy plays an important role in realizing the soft power of Vietnamese culture. It is no coincidence that the XIII Congress of the Communist Party of Vietnam set the task: *"To ensure the highest interests of the nation - the ethnic on the basis of the basic principles of the United Nations Charter and international law, equality, cooperation, mutual benefit"* [1, p.110], *"proactively and actively integrating into the world comprehensively and deeply; Vietnam is a friend, a reliable partner and an active and responsible member of the international community"* [1, p.162]. When we respect the basic principles of the Charter of the United Nations, respect international law, respect equality, cooperation and mutual benefit of nations and peoples, we have shown the soft power of Vietnamese culture. Vietnam respects other cultures, respects other ethnic groups, values equality and mutual benefit with other ethnic groups, and in foreign affairs we are friends, reliable partners and active members. and responsible in the international community. This motto fully expresses the value of Vietnamese culture and Vietnam's soft power in the foreign policy of our Party and State. Because, in order to admire and attract other people and other ethnic groups, we must first respect them, respect equality and mutual benefit. In political cooperation we clearly represent friends, not *objects*. In economic cooperation we represent a reliable business partner, not their *object*. In international relations, we represent an active and responsible member. In the spirit of being a friend, a partner in economic activities, an active and responsible member of the international community, has shown power in culture, power of the nation and power in the policy of nation. That is the soft power of Vietnamese culture. Like knowledge and information, culture is not exclusive, but pervasive and resonant. The more culture is spread, used and followed, the more the value of culture increases, not "*wears out*" like other consumer goods. Therefore, we must promote the soft power of culture in foreign affairs, serving the development of the country.

Third, the soft power of Vietnamese culture combines with the hard power of Vietnam to develop the country.

In relation to hard power, under the conditions that allow it, the soft power of culture acts as an influence, complement, support, and substitute for hard power. Hard power must use economic power, military power, etc. to force other people, other peoples to follow. Meanwhile, cultural soft power attracts, sensitizes, on the basis of similarities, mutual understanding and consensus among the parties. In international integration, each country has the opportunity to express themselves, each has the right to choose their own development path, the soft power of culture plays an increasingly important role. The hard power of a country may decline over time, but the country's soft power can still be maintained and effective. The soft power of culture has always existed, reflected in the spiritual and cultural values, the material cultural values as well as through the people and policies of that country or nation. The spread of the soft power of culture is through the spread of material cultural values, cultural and spiritual values, and through people and policies of nations and nations. This pervasiveness depends on the level of civilization, humanity, science and practice of cultural values; depends on the quality and personality of people as a representative representative of the soft power of culture. If the similarity of cultural values and human qualities (representing the soft power of culture) of ethnic groups is higher, the spread and exchange of soft power becomes stronge , wider and deeper.

In the current trend of international integration, each country and each ethnic group has the opportunity to spread and spread the soft power of their own culture. However, this opportunity also includes the challenge, the problems of the risk of being "assimilated", attracted by the soft forces of another culture. Therefore, the 13th Party Congress set out the task: "Building Vietnam into an attractive place for international cultural exchange. Selectively acquire the quintessence of human culture in accordance with Vietnamese practice. At the same time, actively raise the resistance of people of all classes, especially young people, to foreign and toxic cultural products; step by step bring Vietnamese culture to the world" [1, p. 147). The fact that the struggle to protect our country's sovereignty over the sea and islands as well as the fight against the Covid-19 epidemic has shown that it plays an important role in the soft power of national culture. We have aroused the love of the motherland, the spirit of solidarity, mutual affection, love, care, etc… of each Vietnamese people, we have enlisted the support of the cause, the support of the cause. compliance with the 1982 United Nations Convention on the Law of the Sea worldwide. Therefore, we are not alone in defending our sovereignty over seas and islands, although this is a problem for Vietnam.

Fourth, the soft power of culture promotes rapid and sustainable development of the country.

The reality of our country's development today has made us realize that the development model based on natural resources and cheap labor has revealed certain limitations. Because natural resources are increasingly depleted, along with that, unpredictable climate and weather changes have adversely affected production; Competitive advantage in cheap labor is also lost. Therefore, Vietnam is transitioning to an inclusive development model - this model is people-centered, with the slogan that everyone is involved, everyone benefits, no one is left behind, no one is back behind. It is a model of growth and development based on the power of creative intelligence of people, for people, for people, which means based on the soft power of culture. It is no coincidence that the 13th Party Congress set the orientation: "Developing a comprehensive human being and building an advanced Vietnamese culture imbued with national identity so that Vietnamese culture and people become endogenous strength, driving force for national development and defend the Fatherland" [1, p.116].

As we all know, our country's economic growth in recent years has mainly relied on natural resources and is reaching its limit, unable to grow more. If we continue to implement this growth model, it will be difficult for us to avoid the middle income "*trap*". While we are striving to turn our country into a high-income developed country by the middle of this century. To achieve this goal, we must transform the growth model based on innovation and application of science and technology. That is, we must innovate the growth model based on the power of people, the soft power of culture. The limitations of natural resources can only be limited and overcome by human innovation, by the successful application of achievements of modern science and technology. Among the factors of production force, human resources are the most basic and core factor, the driving force of development. Humans play the role of activating and determining factors for other factors such as capital, resources, science and technology, etc. These factors can only be effective when used by humans (with a combination between physical strength, mental strength, and potential for innovation) to exploit and use effectively. All these things belong to the soft power of Vietnamese culture and people.

Rapid development is an objective requirement for our country, otherwise we will fall into the middle-income "trap" like many countries and ethnic groups have fallen into. But the important thing is, the humaneness of development and the healthy level of social life are the cultural measure of the development process of a country. This poses the requirement that cultural and humanistic criteria must be taken as the criterion to evaluate development. Therefore, development is fast but must be sustainable. Sustainable development requirements require promoting the soft power of culture in sustainable economic development, sustainable development in culture, people, society and sustainable development in the environment. To do so, there is no other way but to rely on the soft power of the national culture. Practice shows that the cultural values of the soft power of culture (such as truth - goodness - beauty, love for people, tolerance, love for labor, hard work, study, etc .) once violated nothing in society is developed. If there is development, it is only temporary, unsustainable and will definitely have to pay a heavy price. Therefore, the 13th Congress of the Communist Party of Vietnam set out the task to thoroughly grasp the point of view: "Arousing the patriotic spirit, the will to self-reliance of the nation, the strength of the great unity of the whole nation and the aspiration to develop a prosperous and happy country; promote socialist democracy, the synergy of the whole political system and of Vietnamese culture and people, ..." [1, p. 110].

It is not a coincidence that our Party considers "arousing patriotic tradition, national pride, belief and aspiration to develop a prosperous and happy country; Talents, intelligence and qualities of Vietnamese people are the most important center, goal and driving force of the country's development" [1, p. 116].

The practice of fighting against the Covid-19 epidemic as well as against natural disasters and floods over the past time shows that the Party and State of Vietnam have actively sacrificed the economy for people, not for the economy but for people. Therefore, it has aroused, multiplied the soft power of Vietnamese culture, brought the soft power of Vietnamese culture to a new level, created a Vietnamese patriotism, love, care, sympathy, mutual sharing of Vietnamese people, Vietnamese culture with new signs. Surely other countries and peoples will forever admire, enjoy and recognize the invention and invention of "Rice ATM", "Book ATM", "Free Supermarket"; about the joint efforts, solidarity, consensus and synergy of the people with the Party and State of Vietnam in combating the Covid-19 epidemic, as well as fighting floods, floods and natural disasters. The free help and successful treatment for many foreigners suffering from influenza in Vietnam, while the conditions in Vietnam are not rich in economy, not strong in science and technology; not very modern in terms of the health system... will make many countries and peoples around the world admire and admire. That is the soft power of Vietnamese culture, because Vietnam is a country rich in compassion, love, sympathy and understanding of people! That is the soft power of Vietnamese culture - if we can promote this strength, we will have the basis and conditions to develop the country quickly and sustainably.

.4. Conclusion

Through the above analysis, it can be seen that the soft power of Vietnamese culture plays a huge role in the development of the country. In order to promote the values of the soft power of Vietnamese culture, we need to well implement the Resolution 9 of the XI Party of the Party on building and developing Vietnamese culture and people to meet the requirements of sustainable development. steady the country. At the same time, well perform the task of building and promoting the cultural values and strength of the Vietnamese people set out by the 13th Congress of the Communist Party of Vietnam: "Focus on research, identification and construction implementation. national value system, cultural value system and human standards associated with preserving the Vietnamese family value system in the new period” [1, p.143]. Because these are the elements of the soft power of Vietnamese culture that need to be promoted.

THE COMMUNIST PARTY OF VIETNAM CONTINUES TO INHERIT AND PROMOTE HO CHI MINH'S THOUGHT ON SUSTAINABLE DEVELOPMENT OF THE COUNTRY

Assoc. Prof. Dr. Hoang Phuc Lam

hoangphuclam@hcma.vn

Ho Chi Minh National Academy of Politics, Hanoi, Vietnam

MA. Hoang Dieu Thao

hdthao@hunre.edu.vn

Hanoi University of Natural Resources and Environment, Vietnam

Abstract

Ho Chi Minh's thought on sustainable development is his system of views on the development of political, economic, cultural and social fields in association with the protection of natural resources and the environment, in which people are the center of development to build Viet Nam as a peaceful, unified, independent, democratic, and strong country; fulfill international obligations and ensure the development of the next generation. His concept shows the scientific, revolutionary and humanistic nature, agrees with the modern world's concept of sustainable development, continues to be considered as the ideological foundation and guideline for the Party's actions and the Vietnamese Revolution. It is an invaluable spiritual asset for our Party and nation to continue to successfully implement the country's sustainable development strategy in the current period of national renewal, integration and development.

Keywords: *Communist Party of Vietnam, innovation, sustainable development*

1. Introduction

President Ho Chi Minh lived and operated in an era where the development of the industrial economy had not yet set an urgent need, and the problem of environmental pollution was not widespread, that is, there is no basis for the theory of sustainable development to appear. However, with his strategic vision, in reasoning as well as directing the development of the country, President Ho Chi Minh has always focused on putting people as the center for development, economic development associated with economic development. Cultural and social development and protection of the living environment - these are also the fundamental ideas of sustainable development today. Inheriting and continuing to apply Ho Chi Minh's thought on sustainable development, the Party's policy through each period, especially through each congress, has made great strides in awareness as well as in guiding the implementation of sustainable development in Vietnam.

2. Method

The research is based on the theoretical basis of Marxism-Leninism, Ho Chi Minh's thought, viewpoints and lines of the Communist Party of Vietnam, policies and laws of the State of Vietnam on sustainability development and related issues. Selectively acquire research results published by scientists on sustainable development. To study the topic, the authors base themselves on the actual achievements and limitations and inadequacies in implementing sustainable development in Vietnam through 35 years of renovation. Especially focusing on the changes in awareness and actions to achieve the sustainable development goals Since Vietnam started to carry out activities on a national scale as well as attend and sign commitments at international conferences on sustainable development (from 1991 to present)

The research is based on the methodology of Marxism-Leninism and Ho Chi Minh's thought to deploy research tasks. Focus on using interdisciplinary methods of social sciences and humanities. Using a combination of methods: History, logic, combining history with logic, analysis, synthesis, comparison, forecasting... These specific research methods are used flexibly and appropriately to have a analyzes, comments and assessments on the issue that the Communist Party of Vietnam continues to apply and promote President Ho Chi Minh's thought on sustainable national development in theoretical awareness as well as practical direction.

3. Results

Ho Chi Minh's thought on sustainable development has been interested and researched by many scientists. Some typical works related to the topic: “Book of Development Philosophy - From Marxism-Leninism to Ho Chi Minh” (Huyen, Nguyen Van, 2001); “Culture and Philosophy of Development in Ho Chi Minh Thought” (Lam, Dinh Xuan, & Phong, Bui Dinh, 2007); “The work of Ho Chi Minh Thought - Human values and development” (Tan, Ta Ngoc, 2015)… pointed out the core arguments, propositions, and ideas that contain human values and developed in Ho Chi Minh's thought, has great significance for the revolutionary cause of Vietnam and the world. Human values and development in his thought are the basis for our Party to develop policies and guidelines for economic, political, cultural, social and foreign development, in order to build Vietnam as a developed, people-oriented country.

The Party's policy and views on developing the country in a sustainable, long-term and certain direction, there are also many research works such as: “30 years of renovation and development in Vietnam”, this is a combined work research results of the state program (Huynh, Dinh The, Phu, Phung Huu, Nghia, Le Huu, Hien, Vu Van & Thong, Nguyen Viet, 2015); In general, when assessing sustainable development in Vietnam, there is “Vietnam Report 2035, Towards Prosperity, Innovation, Equity and Democracy” (Ministry of

Planning and Investment & World Bank Group, 2016). Through research works, scientists of Vietnam and the world believe that: The success of 30 years of renovation puts more expectations and heavier responsibilities on the future of Vietnam.

In-depth research on the perception of the Party and the State in implementing sustainable development has the article “Sustainable development in Vietnam - Guidelines and some results” (Dung, Vu Thi Mac, 2019), showing that sustainable development Sustainability is an inevitable global trend and becomes the focus of development strategies of many countries. The work has generalized and systematically on the leadership of the Party for the sustainable development of Vietnam; “Our Party's awareness and resolution of the relationship between innovation, stability and development” (Phong, Tran Van, 2019) has re-organized the entire process of cognitive development and practical direction of the Communist Party of Vietnam. From the 6th to the 12th congress on the relationship between innovation, stability and development.

The research works have initially generalized and suggested the viewpoints, contents and values of Ho Chi Minh's thought on sustainable development, showing that Ho Chi Minh's thought on sustainable development is not only an invaluable asset for the Vietnamese revolution but also has profound contemporary significance.

Through studying the status of sustainable development in Vietnam, researchers have focused on affirming that in order to survive and develop, Vietnam must have policies and measures for economic development but still ensure social justice. National security is guaranteed and associated with environmental protection.

In fact, the Party and State of Vietnam were soon aware of the great role of the country's sustainable development, so in the international perspective, Vietnam is a country that has made commitments as well as roadmap to achieve the United Nations' Sustainable Development Goals. However, the issue of the Communist Party of Vietnam leading the country's sustainable development according to Ho Chi Minh's thought has not yet been systematically discussed and needs to be further studied.

Therefore, the results of the study of the problem: *“The communist Party of Vietnam continues to inherit and promote Ho Chi Minh’s thought on sustainable development of the country”* will contribute to supplementing and enriching the scientific awareness of Ho Chi Minh's ideological values on sustainable development as well as the application of Ho Chi Minh's thought to solving problems development sustainable in Vietnam today. In particular, it will contribute to providing more scientific basis for the Communist Party of Vietnam to continue to apply Ho Chi Minh's thought in the process of formulating guidelines and policies to ensure the sustainable development of the country in the period of renovation, integration and development.

4. Discussion and Conclusion

Values of Ho Chi Minh's thought on sustainable development

The term “sustainable development” does not appear directly in President Ho Chi Minh's expression, but the conceptual content has been discussed by Ho Chi Minh when referring to each element of sustainable development as well as the harmonious combination between them to achieve the goal of sustainable development. Even, President Ho Chi Minh also made many profound, comprehensive, systematic, and forward-looking comments on issues related to sustainable development. In today's modern society, these contents have gradually been proven to be true. Maintain political stability, clean up the apparatus, ensure the sustainable development of the country; comprehensively develop Vietnamese culture and people, creating a driving force for sustainable development; Economic development is the premise, the basis for cultural and social development, in order to eliminate poverty and backwardness, bring enough food, warm clothes and happiness to the people, and bring Vietnam to the next level. progressive countries in the world; Economic development is not “trade-off” at all costs even though the cause of national construction and development after the war requires exploitation of many natural resources. Exploitation needs to be planned, associated with economical, efficient and reasonable use and associated with environmental protection, planting trees causing forests, protecting forests... President Ho Chi Minh had the right perception of Sustainable development, linking economic development with protection of the ecological environment, he initiated the movement “Tree planting festival”. In the economic development of the country to serve the construction of socialism in the North and to support the South, he always emphasized the importance of forest resources, coal, land... He considered this as “gold”, both exploiting for economic development but also having to have a plan for protection, rational use, exploitation of timber combined with afforestation, economical and rational use of coal... In the end of his life, President Ho Chi Minh taught us that we should cremate our bodies and use clean energy sources to protect the environment for us and for future generations. Knowing how to live not only for the common good but also to take care of the interests of future generations is one of the contents of sustainable development, which was not until 1992 when the United Nations proposed in the “Environment and Development Summit” held in Rio de Janeiro.

In Ho Chi Minh's thought, when he emphasized the role and focus of directing the development of political, economic, cultural, social, and environmental fields, these pillars were dialectical, harmonious relationship, not overemphasizing the one and not taking the other lightly. President Ho Chi Minh did not set them apart, but one pillar will be the premise for another pillar. As he once advised: “Those construction works are closely related to each other” (Minh, Ho Chi, 2011). The development of the country is not only shown through quantitative economic figures, but also through qualitative assessments of areas such as culture, society, and environment. And above all, the basis for harmonious unification for all these factors is to take people as the center for development.

The important thing is, not only thinking about the development of the country with the content is the harmonious development, closely linked between the fields of social life, between society and the natural environment, Ho Chi Minh said. Minh always emphasizes that this development must be ensured for future generations. Building and developing the country in Ho Chi Minh's thought is to build and develop a country in a sustainable, sure and long-term direction.

Before his death, his last wish was still the goal of sustainable development of the country: “My last wish is: The entire Party and people of our country unite to strive to build a peaceful Vietnam. peace, unity, independence, democracy and prosperity, and worthy contribution to the cause of world revolution” (Minh, Ho Chi, 2011). Sustainable national development in the view of President Ho Chi Minh is to maintain independence and self-control; meet the material and spiritual needs of the people, ensure democratic and equal rights, and fulfill lofty international obligations. The above striving goals are currently continuing to be inherited and strived for by the Communist Party of Vietnam.

In the 21^{st} century, besides brilliant achievements in science and technology and strong development of economies, mankind is also facing great challenges in terms of politics, culture and society and especially environment. A series of serious problems related to the environment have appeared such as: climate change, biodiversity degradation, pollution of toxic and persistent organic substances, soil pollution, air pollution, water pollution, etc. These challenges are increasing day by day, directly threatening human existence on Earth and forcing humanity to switch from a development strategy that focuses on economic growth to a strategy. Sustainable development, 8 *Millennium Goals* were also added, developing into 17 *Sustainable Development Goals* to match the current situation and requirements of global development.

The vitality and value of Ho Chi Minh's thought for the times, with the progressive development of mankind is something that no one can deny, as General Vo Nguyen Giap once affirmed: “The world is still changing. but Marxism-Leninism and Ho Chi Minh's thought live forever” (Giap, Vo Nguyen, 2016). In particular, Ho Chi Minh's thought on sustainable development clearly shows that value. While, the United Nations officially launched 8 Millennium Development Goals for Agenda 21 on Sustainable Development in 2007, almost all of these goals have been approved by President Ho Chi Minh mentioned and implemented for decades before, such as: eradicating poverty; raising the people's intellectual level, popularizing education; promoting equality between men and women and empowering women; reducing the child mortality rate; maternal health; prevention of diseases; environmental Protection; establishing international relations for development. It can be seen that, although the wording is different, the millennium goals, today's sustainable development goals and development goals in Ho Chi Minh's thought all aim at good, humane values, for human, putting people at the center of development.

The issue of sustainable development has gradually become a global issue, requiring the cooperation and contribution of the whole community. In Ho Chi Minh's thought, this issue was recognized by him early. When answering international journalists about foreign policy, President Ho Chi Minh stated that Vietnam “wants to be friends with all democratic countries in the world”. During the first year of the new State of Vietnam, as President, he wrote letters and telegrams many times to the US President, Soviet leader Stalin and the governments of some countries asking to recognize the independence of Vietnam, building friendly relations with Vietnam. The person who expressed Vietnam's desire and determination to join the United Nations.

After 35 years of Vietnam's renovation, construction and development, besides great achievements in economy, culture, society and increasing position in the international arena, Vietnam are also facing many difficulties and challenges. The war has long since receded, but the consequences of the war left on people and nature in Vietnam are still heavy. The psychology of hot economic development leading to uncontrolled exploitation of natural resources causing the danger of environmental pollution is still common. Environmental management is still inadequate, etc. These difficulties show that the awareness of sustainable development is not really complete, the organization and management of sustainable development is not really tight, human resources are also inadequate for sustainable development has not been properly invested and effectively mobilized and promoted...

Moreover, sustainable development is both a problem for the world and a problem for the development path of each country, including Vietnam. Therefore, implementing sustainable development requires both a roadmap, in line with common commitments, and separate measures and steps to suit the context of the country. In order to solve the problems posed in the implementation of sustainable development today, Vietnam needs to make more efforts, not only perfecting the policy lines on sustainable development, but also raising the awareness of political - social organizations, people on sustainable development. These instructions, from the twenties of the twentieth century, were mentioned by President Ho Chi Minh. It can be said that President Ho Chi Minh laid the foundation and continued to orient and suggest sustainable development in Vietnam. Ho Chi Minh's thought on sustainable development is an invaluable spiritual asset for our country's revolution, has great topical significance in the period of industrialization, modernization, renewal, integration and development with the goal: “Fast and sustainable economic development, striving to turn our country basically into a modern industrialized country” (Communist Party of Vietnam, 2016).

Thus, Ho Chi Minh's thought on sustainable development has profound theoretical and practical value, continuing to orient and suggest for the implementation of the Sustainable Development Strategy in Vietnam today. Ho Chi Minh's thought on sustainable development has similarities, even surpasses those of progressive humanity's view of sustainable development, which is not only valuable to the nation but also has a profound meaning to the times, with the implementation of the global sustainable development strategy. In the context of innovation, integration and development, the implementation of sustainable development in Vietnam, besides the great achievements, also has limitations, shortcomings, development is not commensurate with the potential and position. Many pillars in development are not really sustainable. Therefore, the Communist Party of Vietnam needs to continue to research, orient and propose solutions to apply Ho Chi Minh's thought on sustainable development to help Vietnam develop stronger and stronger as expected. His wish: To build a new Vietnam, which in the new era can be comparable with the great powers of the five continents.

Perception and policy of the Communist Party of Vietnam on sustainable development according to Ho Chi Minh's thought

The Party's process of awareness and policy on sustainable development

The value of Ho Chi Minh's thought is affirmed by the Communist Party of Vietnam: “His thought, together with Marxism-Leninism, is the ideological foundation, a guideline for the actions of the Party and the Vietnamese revolution, is the extremely great and precious spiritual assets of the Party and our nation, forever illuminating the way for the revolutionary cause of the Party and our people” (Communist Party of Vietnam, 2016). Inheriting and affirming the value of Ho Chi Minh's thought, the Communist Party of Vietnam once again affirms that Ho Chi Minh's thought on Vietnam's development is the thought that ensures the country's sustainable development, have national and epochal values: “His thought has been paving the way for our people's struggle to win, becoming sustainable values of the Vietnamese nation and spreading to the world” (Anh, Pham Ngoc & Phong, Bui Dinh, 2018). From the beginning of the renovation period, the Sixth Congress (1986) to the Seventh Congress (1991) and the Eighth Congress (1996), in these congresses, although the term sustainable development has not yet appeared in the the Party's conditions, but it can be affirmed that the chapters and guiding views in the country's development have been directed towards the realization of the country's sustainable development goals. In these documents, it is not difficult to see the common occurrence of the phrases: economic growth associated with progress and social justice; welfare; environmental Protection; implementation of equality between men and women; protection and rational use of resources; against the trend of chasing growth and immediate benefits, harming the environment... Development history has shown that these are all goals of sustainable development in Vietnam and the world. Inheriting Ho Chi Minh's thought, the concept as well as the direction of the Party on the implementation of sustainable development of the country has formed and developed more and more clearly, showing the correctness, science and creativity.

Especially, since the 9th National Congress (2001), the Party's policy on sustainable development has been clearly demonstrated when the field of environment has been really valued and placed in parallel with economic and social development in the goals for developing the country.The rational and economical use of natural resources, together with the protection and improvement of the natural environment, have become an important content in the Socio-Economic Development Strategy 2001-2010: "Fast, efficient and sustainable development. sustainable, economic growth goes hand in hand with progress, social justice and environmental protection" (Communist Party of Vietnam, 2011). The Party advocates that socio-economic development must be closely linked with environmental protection and improvement. Growth is fast, but growth quality must be ensured, that is, growth quality must be improved with a growth model that focuses on balanced investment, not only in the economic field, but also in investment in people. education, health care, renewable resources and environmental protection to ensure the sustainable development of the country.

In the Party's concept, sustainable development is to ensure the simultaneous development of all three pillars of economic, social and environmental sustainability. Economic growth must go hand in hand with the realization of social progress and justice, which is to improve capacity and create opportunities for everyone to bring into full play their talents, participate in the development process and enjoy the benefits. development results. As a subject, people have the opportunity and ability to catch development opportunities. At the same time, socio-economic development must be closely associated with environmental protection and improvement, and environmental protection requirements are considered an important criterion in evaluating development solutions. With the viewpoints on sustainable development identified, the 9th Congress approved the 10-year socio-economic development strategic goals (2001 - 2010) with contents focusing on sustainable development such as: Bringing our country out of underdevelopment, significantly improving the people's material, cultural and spiritual life; creating a foundation for our country to basically become a modern industrialized country by 2020; human resources, scientific and technological capacity, infrastructure, economic potential, national defense and security are enhanced; socialist-oriented market economic institutions are basically formed; Vietnam's position in the international arena is enhanced.

In 2004, in order to realize the Party's stance that has set forth and implement international commitments on sustainable development, the Government issued the *Strategic Orientation for Sustainable Development in Vietnam (Agenda 21 of the Government Vietnam – Agenda21).* The content of the Strategy includes long-term goals, principles, priority areas, policy directions and organizational measures to implement sustainable development.

Strategic orientation sets out a policy framework for sectors, localities, and social organizations to design and implement action plans towards their sustainable development goals. With long-term development strategic orientations, the Strategy document is regularly reviewed, supplemented and adjusted to suit each stage of the country's development, updating new perceptions to improve the sustainable development path in Vietnam. Agenda 21 sets out the key goals and principles for sustainable development in Vietnam. In particular, the overall goal of sustainable development is to implement the orientation set out in the 2001-2010 Socio-Economic Development Strategy of the Ninth National Party Congress. The specific objectives of the three aspects of development, namely economic, social and environmental protection, no matter how developed, must ensure a close, reasonable and harmonious combination with each other.

The 10th Party Congress (2006) has drawn 5 great lessons after realizing the development perspective and also the guiding thought on socio-economic development for the next period (2006 - 2010). In particular, the first lesson concluded is the lesson on rapid and sustainable development. Rapid and sustainable development are two sides of the same issue, expressed at both the macro and micro levels, demonstrating the comprehensiveness of the development strategy. In the Five-Year Plan (2006 - 2010), an overall goal has been set, although economic development is emphasized as a premise for development, but the prerequisite is still “effective” along with “sustainable”: “Accelerate economic growth, achieve important changes in improving the efficiency and sustainability of development, and soon bring our country out of underdevelopment” (Communist Party of Vietnam, 2006).

By the 11th Congress (2011), the view of sustainable development was reflected throughout the Party's document. The first of the five development perspectives stated in this Strategy is: “Fast development is associated with sustainable development, sustainable development is a requirement throughout the Strategy” (Communist Party of Vietnam, 2011). In the Party's concept, the Party always attaches special importance to the quality, efficiency and sustainability of development, demonstrating the consistency in awareness of the relationship between development and sustainable development as well as the relationship between development and sustainable development. rapid growth and sustainable development. Specifically: sustainable development is the basis for fast development and rapid development to create resources for sustainable development. Rapid and sustainable development must always be closely linked in the country's socio-economic development plans, plans and policies.

At the 12th National Congress (2016), sustainable development was expanded, deepened, and penetrated into all areas of social life. It can be seen that at the very beginning of the title, Section II of the Political Report, it is affirmed that “Fast and sustainable development, striving to turn our country basically into a modern industrialized country” (Communist Party of Vietnam, 2016). Our Party has set a goal by 2020 to ensure rapid and sustainable development on the basis of macroeconomic stability: to ensure harmony between economic growth and cultural development, human development, practical implementation. progress, social justice, ensuring social security, environmental protection, and sustainable social development. During the 12th National Congress, for the first time, the implementation of the United Nations 2030 Agenda was included in the tasks and solutions to implement cultural and social development and improve people's living standards: “Implementation: United Nations 2030 Agenda, effectively integrating sustainable development goals into socio-economic development plans of the whole country, each sector and each locality” (Communist Party of Vietnam. 2016).

The 13th Party Congress (in 2021) takes place in the context of the Party's assessment: “sustainable development becomes an all-encompassing trend in the world” (Communist Party of Vietnam. 2021), Agenda 2030 of the United Nations continues to be mentioned and is considered an issue that “has great influence on the mode of growth, economic cooperation, trade and investment in the world” (Communist Party of Vietnam, 2021). The issue of rapid and sustainable development of the country is paid special attention by the Party when seriously looking back at the advantages and limitations, as well as pointing out some experiences and orientations for the country's development institutions in the period of 2021 - 2030 is: “Continuing strongly renewing thinking, building and completing synchronously the institutions of sustainable development in terms of economy, politics, culture, society, environment... trouble, difficulty; awakening all potentials and resources, creating new impetus for the country's rapid and sustainable development” (Communist Party of Vietnam, 2021). The key tasks in the 13th Party Congress term are determined to include 6 tasks, 2 of which are in the field of environmental protection and sustainable development. The second task, affirms the need: “to mobilize, allocate and effectively use resources, create motivation for rapid and sustainable economic development” (Communist Party of Vietnam, 2021). Task 6 also defines: “Strictly manage, rationally and effectively use land and resources; protect and improve the environment; proactively and actively implement solutions to adapt to climate change and extreme natural disasters” (Communist Party of Vietnam, 2021)

The Party's policy on sustainable development today

2020 is considered to be an extremely difficult and challenging year when the COVID-19 pandemic rages, causing great loss not only to the global economy but also dangerously affecting all fields of social life in countries, including Vietnam. In such circumstances, the issue of global cooperation against the pandemic becomes more and more urgent, and it also proves President Ho Chi Minh's vision of the era on sustainable development, on building a new world with civilized behavior and fulfillment of noble international obligations, including solidarity to fight the epidemic, is extremely right.

Continuing to inherit and apply President Ho Chi Minh's thought on sustainable development, the Communist Party of Vietnam soon had appropriate guidelines and policies to help the country overcome difficulties before the attack of the epidemic, which is highly appreciated by the international community. In 2020, not only effectively fighting the epidemic, along with that, Vietnam also highly promotes the strength of solidarity of the whole people, overcoming the difficulties of historical floods, bringing the lives of central people early return to stability. Once again, the concept in sustainable development of the country “no one is left behind”, “willing to sacrifice some economic benefits to protect the safety and health of the people” was adopted by the Party and State. Vietnam's country “said coupled to do”, showing the superiority, humanity and goodness in the Party's guidelines and directions on sustainable development of the country.

In the context of international implementation of the global goals on sustainable development, as an active member of the United Nations, the National Action Plan for the implementation of the 2030 Agenda for Sustainable Development was issued under Decision No. 622/QD-TTg of the Prime Minister. The plan clearly states 17 Vietnam's Sustainable Development Goals (VSDG) by 2030, including 115 specific goals, corresponding to the global sustainable development goals (SDGs) adopted at the Association United Nations Summit. A set of 158 sustainable development indicators that help provide “real evidence” for the process of monitoring, monitoring and evaluating the implementation of sustainable development goals in Vietnam has also been issued. The action plan has demonstrated the efforts and commitment of the Government and the State of Vietnam in the implementation of the Sustainable Development Goals. Based on actual conditions, Vietnam has made adjustments to specific targets compared to the United Nations and has obtained certain results, initially highly appreciated, since then, every year, Vietnam's sustainable development ranking has increased significantly.

Together with *the 2030 Agenda Programm*, the Government of Vietnam and the United Nations have developed a joint strategic plan to integrate the Sustainable Development Goals with the Socio-Economic Development Strategy (2011-2020) and Socio-economic development plan (2016 - 2020). This plan focuses on four main areas: Investing in people; ensure climate adaptability and environmental sustainability; prosperity and cooperation; promoting justice, peace and inclusive governance are used to inform how the Sustainable Development Goals are being implemented. Under the leadership of the Party, the concept of sustainable development has been integrated by the Government throughout the Socio-Economic Development Strategy for the period 2011 - 2020, the Socio-Economic Development Plan for the 2011 - 2020 period. 2015 and the period 2016 - 2020, have been and continue to be integrated in the Socio-Economic Development Strategy for the period of 2021 - 2030. Therefore, after 35 years of renovation under the leadership of the Party, “our country has never had the opportunity, potential, position and international prestige as it is today” (Communist Party of Vietnam, 2021).

In terms of achievements, the macro-economy is stable, the scale and competitiveness are increased, the economic structure is gradually rationalized, and the economic integration is proactive and in-depth. The economy has continuously maintained a good growth rate, from a country in the group of poorest countries in the world, Vietnam has come out of underdeveloped status, becoming a middle-income country and a dynamic economy market. Vietnam has joined most international organizations, becoming an active and responsible member in activities of the international community. In 2020, under the impact of the COVID-19 pandemic, the global economy declined, many countries fell into negative growth, but Vietnam's economy was still one of the very few countries in the world that achieved positive growth, “GDP growth in 2020 still reached 2.91%, which is the highest growth rate in the world” (Communist Party of Vietnam, 2021). In 2020, Vietnam was elected by the United Nations General Assembly with a very high number of votes of confidence, almost absolute, for the second time becoming a non-permanent member of the United Nations Security Council. Vietnam's position in the region has also increased dramatically when Vietnam holds the chair of ASEAN and has made great contributions to the common prosperity of this region. In addition, social security issues have been paid attention and guaranteed, sustainable poverty reduction, material and spiritual life of the people have been increased markedly. Natural resource management and environmental protection have made positive changes, more proactive in responding to climate change and disaster prevention, the sustainable development index has increased many levels. According to the United Nations: “Vietnam's sustainable development index in 2017 increased 20 places to 68/157 countries and territories. Vietnam's sustainable development index in 2019 ranked 54/162 countries and territories, thus, 34 steps up compared to 2016 and 3 steps up compared to 2018” (United Nations Development Programme, 2018).

However, there are also limitations, inadequacies and difficulties that need to be overcome for Vietnam's development to be truly sustainable. The economy faces many difficulties, challenges, potential risks, and development is not really sustainable. The development of culture and society is still slow, not commensurate with the economic and political development of the country. Natural resources are exploited unsustainably, management and use efficiency is not high. Environmental pollution is still widespread and leaves serious consequences. In the process of national development, especially in the integration period with the aim of turning our country into an industrialized country soon, the demand for exploitation and use of natural resources is increasing, requiring management solutions, reasonable and effective use, while there are still some obstacles and conflicts in the Laws leading to difficulties in implementation. The decline and degradation of natural resources takes place in many places. Faced with the successes achieved as well as the remaining difficulties in the process of implementing sustainable development of the country, it is even more demanding that the Communist Party of Vietnam continue to study and effectively apply Ho Chi Minh's thought on the principles of sustainable development.

Continuing to inherit and promote Ho Chi Minh's thought on sustainable development, the Communist Party of Vietnam leads the country's development consistently with the goal: "Continue to develop rapidly and sustainably the country; closely linking and synchronously implementing tasks, in which socio-economic development is the center; Party building is key; cultural development is the spiritual foundation; ensuring national defense and security is vital and regular" (Communist Party of Vietnam, 2021). Specifically, Vietnam's development policies focus on efforts to minimize the impact of growth on the environment and adapt to climate change. Many strategies and plans to promote green growth and sustainable use of natural resources are being implemented, which are initially effective. Thus, the views and direction of the Party on sustainable development have been gradually developed and perfected, the pillars of sustainable development have appeared clearer, have a closer relationship with each other, suitable and promoting the advantages of the path of national development that President Ho Chi Minh, together with the Party, State and people of Vietnam have chosen: National independence is associated with socialism.

COOPERATION BETWEEN UNIVERSITIES IN VIETNAM IN LECTURER DEVELOPMENT

PhD Candidate. Le Hung Diep
hungdiep2112@gmail.com
Office Administration Department, Faculty of Library, Office of Sai Gon University, HCMC, Vietnam

Abstract

The fundamental and comprehensive renovations of university educations have become an urgent requirement of the current Vietnamese education. Facing the trend of globalization, internationalization and industrial revolution 4.0 have posed many challenges for universities and lecturers in Vietnam. It is time for universities to connect and cooperate in the orientation from the State in developing their lecturers.

Keywords: *Cooperation, development, higher education, lecturers*

1. Introduction

The trend of globalization, internationalization, and industrial revolution 4.0 currently has set an urgent need for fundamental and comprehensive innovations in education and training, especially in university education. Series of issues from the planning of training institutions, renovation of management mechanisms, policies, training programs, etc., have been carried out, including the teaching force - the core part of university education.

One of the current important goals of universities is to develop teaching force in both quantity and quality, ensuring that there are enough lecturers with high professional qualifications and innovative pedagogical skills with competent foreign language and computer skills to adapt well to the tasks of teaching and scientific researches in the new era. That requires teachers to be planned and trained to update educational research achievements as well as applications of science, technology, and communication in their working; to assess student learning outcomes according to competency approach, and to enhance curriculum development.

In universities around the world, the lecturer development is not the sole responsibility of any individual teacher or university, but it is a common task of the industry and universities to connect, collaborate, and share experiences to develop teaching force.

The above problems have been addressed by universities in some countries such as the UK, Korea, etc in actively linking and creating networks, regularly making professional exchange forums with the participation of a large number of lecturers in different professional positions.

2. Method

To clarify the necessity of cooperation between universities in lecturer development, the article presents some typical experiences of university education in some countries and clarifies the actual situation of quantity and quality of teaching force at universities in Vietnam.

The two selected countries are the UK and South Korea - where the cooperation between universities has been formed for many years by the model of an association between university education institutes

The analysis of the current situation on the quantity and quality of university lecturers in Vietnam is based on statistics of the Ministry of Education and Training from 2013 to 2019. This is the time when the Law on University Education 2012 took effect and is also the time to organize the implementation of a fundamental and comprehensive renovation of university education following Resolution No. 29-NQ/TW dated November 4th, 2013 of Central Committee of the Communist Party of Vietnam.

From the analysis of the structure of the quantity, quality, and professional qualifications of the Vietnamese teaching force, the article analyzes the weaknesses in the cooperation between universities in Vietnam today and offers some recommendations on roles of the Government and the Ministry of Education and Training, roles of universities, and models of an association between university education institutes in Vietnam.

3. Results

a) Experience in some countries around the world

Experience in the United Kingdom

In the UK, the lecturer development is led by the Universities Council for the Education for Teachers (UCET). This is an independent organization established in 1967 by universities, colleges, and other educational institutions to connect and cooperate constructively in training and fostering teachers; support members to upgrade the quality, sustainability, and professionalism of teachers, and promote researches in university educations across the UK and globally. UCET works on the following aspects:

- Act as a focal point for collecting and exchanging information about job positions in higher education institutions and providing recruitment information to the society to attract suitable candidates for teaching positions at universities and colleges which are members of UCET.

- Organize regular and periodic conferences and seminars for members who are managers and lecturers to discuss all issues related to higher education, methods, and pedagogical practical skills of teachers.

- Design and organize basic and advanced training programs for university lecturers that have a positive impact on learners, in a way that is consistent with UCET's values and principles, through the sharing of information, promulgating and championing relevant research and providing networking opportunities.

- Sponsor for researches related to university education, methods, and pedagogical practical skills of lecturers.

- Pro-actively monitoring the changing social, political and economic environment and helping UCET's members plan and adapt appropriately.

- Share information with members of UCET by publishing advisory materials; conference and seminar documents; formal responses to Government consultations; scientific research reports and newsletters.

UCET performs as a national forum for the discussion of issues related to training, lecturer development, and researches about education and training in the university sector, and provides a network to exchange information between members of universities and colleges.

Experience in South Korea

Korea Council for Universities Education (KCUE) was established in 1982 as an intermediary between the Government and universities that seeks to promote the development of universities through the mechanism of autonomy and cooperation between universities; represent the common voice of universities to the Government and the National Assembly of Korea and is responsible for implementing projects authorized by the Government. As of 2020, more than 200 universities have participated in KCUE.

Through the process of building consensus and cooperation among universities, KCUE plays the role of a bridge between them and between universities and the Government by representing the voice, needs, and requirements of universities in front of the Government and orientalize and consult for the development of universities members.

KCUE is the only consultancy agent for universities in Korea. Through the association and cooperation among members of universities with the orientation from the Government, KCUE has consulted, collected, and represented opinions of university members on current issues and policies, seek to solve the problems facing the universities, and made policy proposals and proposed to the Congress and Government. In addition, KCUE shares information and collaborates with university consultancy agencies around the world to promote the globalization of university education in Korea and provide training programs for university lecturers to upgrade their professional capacity.

Compared to the UK's UCET, KCUE has a broader scope of activities, covering many aspects of higher education to promote and improve the quality of university education. The full role and functions of KCUE:

- Conduct research on higher education;
- Address common issues to policy makers and educators;
- Maintain quality assurance of institutions;
- Coordinate university admissions system;
- Provide training to university faculty/staffs;
- Provide information on university to public;
- Support high education internationalization and globalization.

Particularly within the scope of activities to develop the teaching force, KCUE is the center providing high-quality training programs for the lecturers and managers, and service staff. In details:

- Provide high-quality training programs for faculty and staffmember to develop competencies and sharpen skills.
- Provide systematical and continuous opportunities for faculty and staff to enhance their expertise in areas necessary for the operation of universities.

b) Reflect on Vietnam

In Vietnam, the development of teaching staff has always been an important issue in universities' education renovation. Resolution No. 29-TW/NQ dated November 4th, 2013, declared the task of "Developing teachers and managers, meeting the requirements of education and training renovation" by "building resource plans and training plans and strengthening teachers and educational managers in association with the needs of socio-economic development, assurance of security, national defense and international integration"; "strongly renovating the goals, contents, training methods, retraining, fostering and evaluating learning and training results of teachers according to the requirements of improving the quality, responsibility, ethics and competence of professional force" [1].

From 2013 when the Law on Universities Education 2012 officially took effect to 2019, the number of universities and the number of students and lecturers increased each year, in which the group of public universities accounted for a large proportion, up to 72.6% in 2019. From 2013 to 2019, the number of lecturers increased by 2.77 times, and the number of students increased by 2.33 times, in which, the non-public group tended to significantly increase upward.

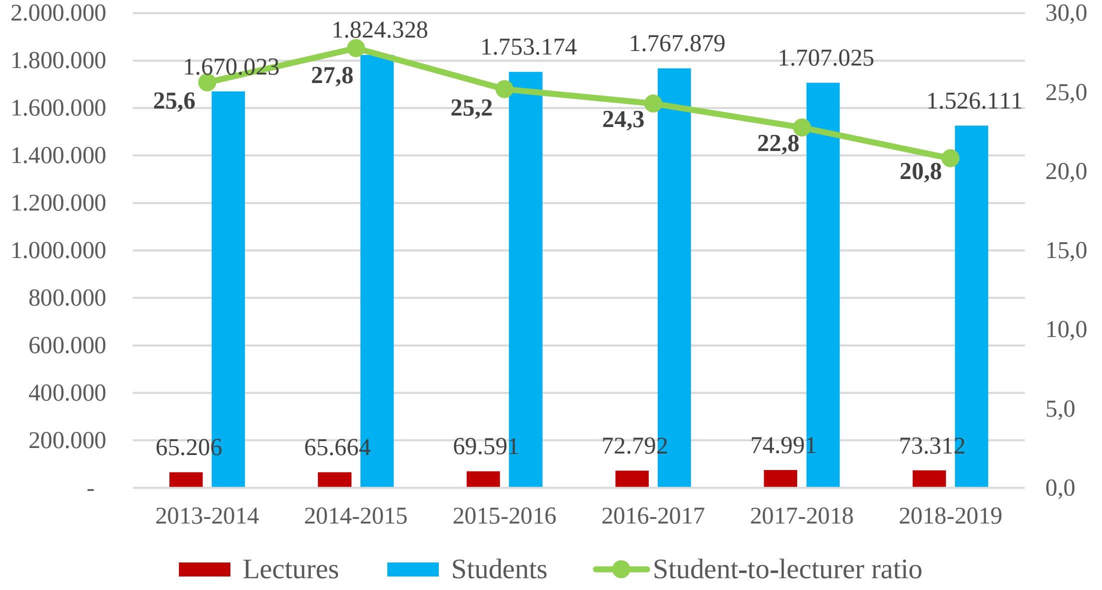
Table 1: Number of universities, lecturers and students over school years

School year	2013-2014	2014-2015	2015-2016	2016-2017	2017-2018	2018-2019
Number of University	**214**	**217**	**223**	**235**	**236**	**237**
- Public	187	189	163	170	171	172
- Non-public	27	28	60	65	65	65
Lecturer	**65.206**	**65.664**	**69.591**	**72.792**	**74.991**	**73.312**
- Public	52.500	52.689	55.401	57.634	59.232	56.985
- Non-public	12.706	12.975	14.190	15.158	15.759	16.327
Student	**655.428**	**539.614**	**1.753.174**	**1.767.879**	**1.707.025**	**1.526.111**
- Public	1.493.354	1.596.754	1.520.807	1.523.904	1.439.495	1.261.529
- Non-public	176.669	227.574	232.367	243.975	267.530	264.582

Source: Statistics of the Ministry of Education and Training over the years, www.moet.gov.vn

However, the number, proportion, and structure of teachers have not met the immediate and long-term needs. The student-to-lecturer ratio has decreased to 20,8:1 but compared to countries with advanced universities education in general, it is still low. In such countries, the ratio ranges from 15 to 20:1 [3].

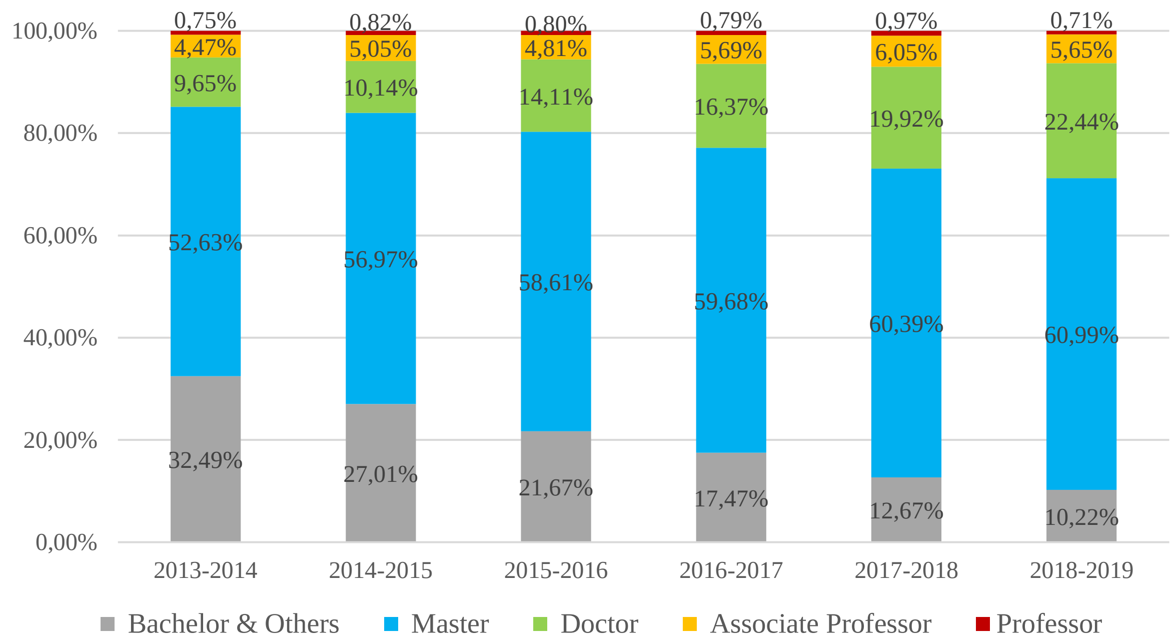
Figure 1: Number of lecturers, students, and student-to-lecturer ratio over school years



Source: Statistics of the Ministry of Education and Training over the years, www.moet.gov.vn

The current quality of university lecturers is not commensurate with the development of the country and international integration, and there is a lack of highly qualified lecturers.

Figure 2: Structure of lecturers by academic qualifications



Source: Statistics of the Ministry of Education and Training over the years, www.moet.gov.vn

The percentage of lecturers who are professors and associate professors over the country only reached 6.35% in 2019, the rate of doctors reached 22.44%, and masters accounted for 60.99%. The quality of Vietnamese university lecturers is much lower than the goal of the education development strategy, which is that by 2020 Vietnam will have at least 25% of the lecturers holding PhDs [4]. Besides, the foreign language and computer skills of the lecturers are still not high, and the number of lecturers capable of teaching in English is small.

The development of university teachers still lacks the connection, cooperation, and exchange of experiences with each other. Many universities have set up departments and centers to perform the function of international cooperation (including domestic cooperation), but the efficiency is not high because each university performs the cooperation in their ways and their resources are also limited. Especially, there is a scare of collaboration between universities in sharing and exchanging faculty resources as well as in training and upgrading teaching force.

4. Discussion and Conclusion

In the context of our country's deeper and more comprehensive international integration with countries around the world and within a region, the training of human resources not only meets domestic needs but also participates in the allocations of labor and international cooperation. Each university has different strengths in terms of the number, qualifications, experience of the teachers to resources, facilities, technology, etc., which requires a connection with each other to supplement, minimize existing weaknesses and create sustainable development in the future, including the use of human resources, finance, facilities, etc. in lecturers development.

Therefore, Resolution No. 29-TW/NQ has emphasized the connection among university education institutions in developing the teaching force through "deploying solutions, models of communication, linking between training institutions, especially universities with science and technology organizations, especially research institutes" [1]. These connections are not simply between schools and schools, institutes and institutes, but the interweaving link between schools and institutes, from which schools can expand, not only the vision but also create broad information channels to adopt new knowledge.

From that, it is necessary to organize an increasingly close and comprehensive association among university education institutions including national universities, regional universities, universities, and scientific research institutes in reinventing university education in general and lecturers development in particular.

Looking at the global experiences, the association between universities in developing teaching staff has been formed for a long time, as a requirement and an inevitable need of managers and lecturers.

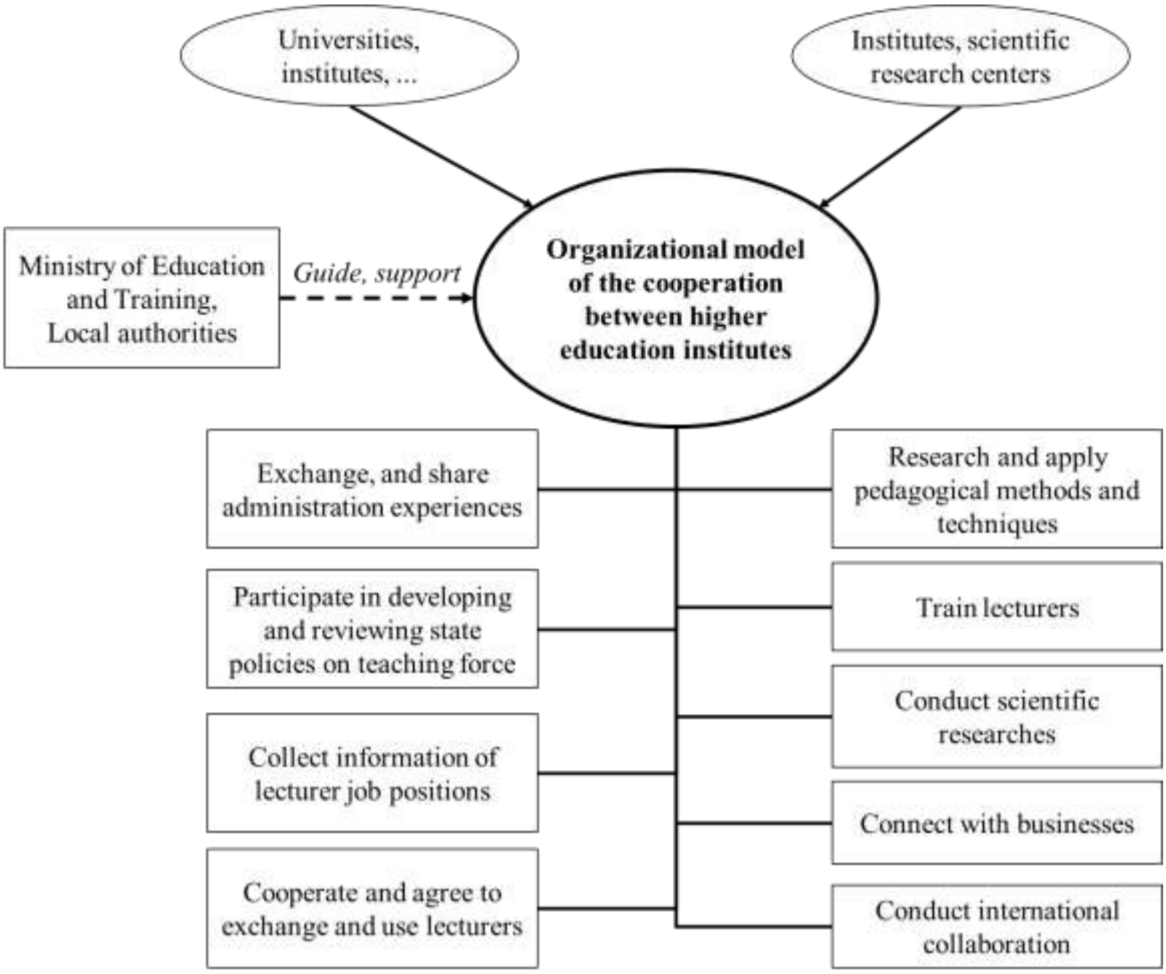
Concerning university education in Vietnam, when the policy of university autonomy is being strongly piloted, the roles of state management in education and training is changing from giving orders to becoming the one who promotes, supports, and guide, the formation of cooperation between universities education institutions needs the orientation, expedition, and support of the state management.

In particular, the National Assembly and the Government need to develop and issue legal documents regulating association activities between universities to create a legal corridor and orientation for this activity. The Ministry of Education and Training and local authorities need to direct and guide universities to build and form connections between universities education institutions, firstly between local schools; determine the mechanism, resources, and direction of operation; pay attention to invest and create new motivation for universities to shake hands to cooperate and support each other to develop based on proactive cooperation and linkage between universities. In addition, the two National Universities of Hanoi and Hochiminh City, and regional universities also need to promote their pioneering roles and foster the remaining universities.

The model of the association between universities in the participating localities, with resources and operating budgets from the universities themselves, with partial support from the State and local authorities.

The organizational model and operational aspects of this affiliate can be visualized through the following diagram:

Figure 3: Organizational model of the association between higher education institutions



The association between universities operates on the initiatives of cooperation, exchange, and sharing among universities education institutions in the following aspects:

- Is a place for cooperation, exchange, and sharing of information and experiences among universities in management and the development of universities education in general and the development of lecturers in particular.

- Represents the interests of member universities and promotes the development of lecturers through state policy research and also proposals on various areas of higher education.

- Act as a focal point to collect information on the demand for lecturer positions of university members.

- Develop a mechanism for collaboration and exchange of lecturers among universities. This helps to limit the shortage of lecturers among universities in the short term, and it is also a solution to increase income and experience for competent lecturers.

- Is the center for scientific researches on pedagogy; studying and designing training programs, fostering pedagogical skills, applying scientific and technological achievements in teaching activities.

- Is the focal point to organize scientific researches, organize large-scale seminars towards building a database of scientific research results to support scientific research activities of lecturers in universities and other institutions and organizations.

- Gathering resources of member universities together to support and promote external linkage activities such as: linking with businesses, international cooperation in scientific research, and application development faculty members.

ROLE, IMPACT OF CULTURE ON HUMAN RESOURCES QUALITY AND ECONOMIC DEVELOPMENT IN VIETNAM TODAY

PhD Candidate. Nguyen Thi Hoai Thanh

nguyenhoaithanh.sfl@tnu.edu.vn

School of Foreign Language, Thai Nguyen University, Thai Nguyen, Vietnam

Abstract

Culture is created by man. With the function of orienting and training people according to the values of truth - goodness - beauty, culture is capable of building and forming positive values of human resources to contribute to the cause of economic development - society of the country. There is a close relationship between culture, quality of human resources and economic development. Promoting the role and value system of culture to human resources will contribute to the creation of high-quality human resources, and high-quality human resources will create potentials for economic development. On the basis of analyzing the role and impact of culture on the quality of human resources and the economy, the article proposes some key solutions to promote the role of culture in human resource development and economic development in Vietnam today

Keywords: *Culture, economy, human resources quality.*

1. Introduction

Currently, we are building an advanced culture imbued with national identity based on the view of sustainable development between people and nature, people with people and the development of people themselves. Cultural development cannot fail to refer to the human resources of society in the process of participating in the preservation, promotion, development and creation of cultural values; and cultural development cannot but be associated with economic development. Today, in the context of globalization, Vietnam is a developing country with low per capita income, in order to avoid the risk of lagging behind in terms of economy, science - technology, education - culture. Focusing on improving the quality of human resources, being able to adapt and be creative in the current conditions is an important solution in the socio-economic development of the country.

2. Method

On the basis of using methods of analysis, synthesis, systematization and generalization of relevant documents on culture, quality of human resources and economy; the article analyzes the role and impact of culture on the quality of human resources and economic development; on that basis, to propose key solutions to promote the role of culture in human resource development and economic development in Vietnam today.

3. Results

3.1. Culture, human resources, the role and impact of culture on the quality of human resources

** Cultural*

Although it appeared early in linguistic life in both the East and the West, it was not until the eighteenth century that the word culture was used as a scientific term. And since then, culture has become a concept mentioned by many researchers and analysts in the humanities: ethnology, sociology, history.... The concept of culture is therefore also become more multifaceted, richer. Although in the past few decades, due to the position and role of culture being increasingly affirmed in human life as well as in the sustainable development of countries, the concept of culture is being mentioned more and more often, became popular and penetrated into all human activities and inseparable in all areas of social life such as: labor culture, school culture, leadership culture, culture business, traffic culture, network culture, consumer culture....

From different perspectives, experts in each field want to come up with their own definition of this concept. Therefore, up to now, there have been hundreds of definitions of culture. These definitions complement each other, contributing to enriching mankind's knowledge of culture.

Through many definitions of culture, in general, the concept of "culture" can be understood in two main meanings: in the broad sense and in the narrow sense.

In a broad sense, culture is the totality of material and spiritual values created by man in history through human activities to satisfy his material and spiritual needs.

In a narrow sense, culture refers to one side, one area of social life, that is, the spiritual life of society, distinguishing cultural life from material life such as the economy. Specific areas of human life such as culture in daily life, religious life, spirituality, festivals, customs, practices, ethics, lifestyles of individuals people, communities, of a nation….

Each definition of culture is reasonable, because it is a broad category that scientists exploit it under different approaches, but it helps people to imagine what culture is and what culture is. things. The difference is due to the approach and research objectives. But they all agree on the most common and basic issues and are expressed in the following basic characteristics:

Firstly, culture is a unique characteristic of man, a product created by man in the course of his long history, therefore, culture is imbued with "humanity". Cultural products are created through human creative activities. That activity takes place in three basic areas: people are constantly learning, practicing, and developing all their inherent abilities to perfect themselves, creating for themselves a cultural personality to meet the requirements of society; Humans are constantly fighting and renovating to perfect their society, making each individual and community have an increasingly happy life, reaching for high ideals; Humans are constantly active in exploring nature, renovating, conquering and adapting to nature to build a perfect and perfect cultural nature. It is thanks to these creative activities that the society is constantly developing.

Second, culture is what counts. Not everything man-made is culture, but only what man-made has value is culture. Everything towards truth, goodness and beauty is culture.

Third, culture is both stable and stable and transformative, developing because culture is always preserved, inherited and created. Culture crystallizes the values created by humans, preserved, preserved and handed down from generation to generation, forming relatively stable and sustainable traditional cultural values.

Fourth, culture is class, national and human. The class character of culture is reflected in the ideological regulation of the ruling class towards the direction of cultural development, content and ideology of culture. Culture development in the direction of progress, positive or conservative, backward depends on the class nature of the oriented culture. In addition, each culture is associated with a certain nation, created by the people of that culture, so it is imbued with the bravery and character of the nation.

** Human Resources*

Human resources are understood as the total professional qualifications that people accumulate, capable of generating future income (Beng, Fischer & Dornhusch, 1995). Human resources, according to Prof. Pham Minh Hac (2001), is the sum total of the labor potential of a country or a locality willing to participate in a certain labor job.

When it comes to human resources, people talk about qualifications, structure, and responsiveness to the requirements of the labor market. The quality of human resources is reflected in the knowledge, skills and attitudes of employees. The classification of human resources by occupations and fields of activity (industry, agriculture, and services) is very popular in our country today, but when switching to the knowledge economy, the classification of labor according to access to jobs and occupations of workers will be more appropriate. The workforce is thus divided into information workers and non-information workers. Information workers are divided into two categories: knowledge workers and data workers.

Data workers (secretaries, technicians, etc.) work mainly with encrypted information, while knowledge workers are faced with idea generation, or prepare for encoding information. Management labor lies between these two categories. Non-information labor is divided into labor producing goods and labor providing services. Non-informational labor is easily coded and replaced by techniques and technology.

Thus, it is possible to classify the workforce into 5 categories: knowledge workers, management workers, data workers, service workers, and goods production workers. Each of these types of labor has different contributions to the creation of products. The high or low level of knowledge and intelligence in the labor product depends mainly on the contribution of the knowledge workforce, management and to what part of the data labor in our country, the rate of unskilled labor Information is still very high in the structure of the labor force, so goods have a low rate of intelligence. In order to increase competitiveness in the international market, it is necessary to rapidly increase the percentage of intellectual property in goods in the coming time.

** The role and impact of culture on the quality of human resources*

From a cultural perspective, deep research into the quality of human resources as the driving force of human creativity (from competence to artistic style and aesthetic enjoyment in culture) can be seen. the motivation for creative activities is the mechanism of spiritual enjoyment as a specific direct benefit, not a direct material benefit. The capacity to form aesthetic enjoyment is the ability to be human, which is the intrinsic forces in man or subjective sensibility in the creative subject.

The process of socializing the human and material resources of society and the process of personalizing the individual's levels, creative capacity and aesthetic perception, cultural creative subjects are two-sided, two-sided. parallel process, making the guiding principles of artistic and cultural activities. This is the fundamental driving force of human cultural creation activities. Meanwhile, in the rather special field of spiritual creative activity, which is the field of artistic creation, the specific motivation is the source for human spiritual enjoyment (aesthetics) through practice. human labor and creativity.

The impact of culture on human resource quality is expressed in the following aspects:

Firstly, focusing on building human resources in the fields of creative labor, promoting personal capacity in the fields of economy, politics, society, education and technology in combination with creating a working environment. convenient, modern work, avoiding brain drain.

Second, orienting creative activities of individuals and society, ensuring the values of truth - goodness - beauty of tradition in modernity, constantly developing and enhancing the human values of Vietnam. nation. Building an advanced culture imbued with national identity.

Third, focus on positive cultural factors in order to promote the dynamism and originality of individuals' creative abilities in the trend of cultural development, promoting the process of cultural socialization. In the process of building and developing Vietnamese culture, the influence of culture on the quality of human resources is aimed at building a comprehensive human being who is qualified in terms of ideology, morality, and style. life and cultural personality, to meet the requirements of the period of industrialization and modernization of the country and international integration.

3.2. The role and impact of culture on economic development

The relationship between culture and economy is the basic relationship in the process of socio-economic development of nations. This is a dialectical relationship and plays an important role in maintaining the economic, political, cultural and social stability of each country. The role and impact of culture on economic development is shown as follows:

Firstly, culture is both the goal and the driving force of socio-economic development.

Culture is the goal of socio-economic development. The goal of socio-economic development is, after all, for people, but it is people with culture, economic construction and development must aim at building a rich people's society, strong country, and democracy. , fair, civilized, people are prosperous, happy, comprehensive development. Therefore, culture serves as an immediate and long-term goal of economic development.

Culture is the driving force of development. Culture is not only the goal but also the driving force of development. It is thanks to culture that people become the leading factor in the process of production and creation of human values. In particular, thanks to the great values of spiritual culture (science, technology, management knowledge...) can create high-quality human resources - the most quintessential part of the productive force. . Then it is also thanks to culture that people are freed from ignorance and darkness in order to highly promote the creativity and development of society, especially in the fields of economy and science - technology.

In this day and age, the source of a nation's wealth is not only natural resources, capital, techniques and technology, but an increasingly important and decisive factor is human resources, which is potential. human creativity. This potential lies in the culture, intellect, morality, soul, personality, lifestyle, will, energy, talent and work proficiency of each individual and community. Thus, the most valuable resource, the most precious capital is people, culture, high quality human resources, knowledge and wisdom in the knowledge economy.

Reality in the world shows that many countries have many natural resources but are very poor; On the contrary, some countries are poor in natural resources but very rich in economy, because they attach importance to improving people's knowledge, developing education and training, training high-quality human resources, fostering talents ... that is to say, attach great importance to culture. After all, the most valuable resource is people.

Second, culture is the basis for the sustainable development of the economy.

Sustainable and safe development is the eternal goal of every social system. Development must not only be considered in terms of mere material things, but also must include the spiritual aspects of society, that is, cultural and development issues must be taken into account. Development and culture, culture and development are two sides of the same goal of existence and achievement of all communities and mankind. It is culture that is the factor used to regulate sustainable and safe development, towards the right, the beautiful, the good, the reasonable.

To achieve that goal, it is necessary to have a high development in economy, material and technical foundations, science and technology... But that alone is not enough and very one-sided, if understood. Economic construction and development is simply growth, growth at any cost, even at the expense of social, cultural, and human dignity benefits...

In fact, humanity has been paying the price for fast and one-sided economic development, growth is not associated with sustainable development. In 1996, the United Nations Development Program (UNDP) recommended five types of bad growth, including: 1- Growth without employment, which is growth that does not go hand in hand with expanding job creation opportunities. .. 2- Growth without conscience, that is, the fruits of growth are mainly for the rich, while the poor enjoy little, the gap between rich and poor is widening; 3- Growth without a voice, that is, economic growth without the expansion of democracy, limiting the population's demands for greater participation in social life; 4- Rootless growth, which is the growth that makes the cultural life of people become dry; 5- Growth without a future, ie the present generation squanders the resources that future generations need, including the environment and natural resources.

Any development that is not associated with culture is a crippled development that is heavily technical and inevitably leads to social injustice, leading to the rich-poor divide and social division.

3.3. Solutions to promote the role of culture in the development of the quality of human resources and economic development in Vietnam today

Firstly, building people, cultural lifestyle.

The construction and development of Vietnamese culture must firstly aim at building a comprehensive human being with sufficient qualities of ideology, morality, lifestyle and cultural personality, meeting the requirements of economic development. economic, social and requirements of the period of international integration. The development of human resources in Vietnam is built on the foundation of respecting and protecting human rights, forming the Vietnamese human personality, converging full of good qualities, imbued with traditional human character. Vietnam, that is:

- Having a spirit of patriotism, national self-reliance, promoting internal strength, having the will to learn and rise.

- Having a healthy lifestyle, a civilized, thrifty, honest, humane lifestyle, obeying the law, respecting community conventions, taking care of community building.

- Constantly improving knowledge, lifelong learning; independent thinking and self-responsibility, and a spirit of cooperation; work effectively in the organization, according to the professional group. Having an open mind to the new, dynamic, creative, making efforts to approach and apply the most advanced knowledge of science and technology in the world to serve the development of the country.

- Exercise physical strength, improve physical condition, cultivate, accumulate knowledge, professional skills and human ethics.

- Building family unity, harmony, equality, discipline and order, ensuring stable and developing economic life; promote the spirit of solidarity, mutual love, voluntariness, self-governance, democracy and mastery capacity in community activities, building a healthy social environment, and protecting the ecological environment.

Second, continue to supplement and perfect cultural policies for human resource development and the economy.

To support the development culture, it is necessary to apply many different policies, suitable to the development situation. In the early stages of socio-economic development, the cultural sector is supported by the State as a key, both ensuring cultural development and contributing to improving the people's spiritual life. As the economy has developed better, the role of the private sector and businesses has been increasingly affirmed, and indeed has become the main and important sponsor of culture. The active participation of the private sector is encouraged by tax policies and preferential fees for cultural and artistic activities. On the other hand, when some cultural fields have become highly profitable entertainment businesses, the State may not need to support and tax to generate investment income back into the cultural industry.

In addition, the level of investment of the State in culture must correspond to the level of economic growth. Effectively, openly and transparently use the State's investment sources, with focus, focus, priority on mountainous areas, border areas, islands, ethnic minority areas and some types of art Traditional art needs to be preserved and promoted.

Constantly interested in building a culture in the economy. Create a legal cultural environment, a transparent, progressive and modern market for cultural products for businesses to participate in building and developing culture. Building corporate culture, entrepreneurial culture with a sense of respect for the law, keeping credibility, healthy competition, for sustainable development and defense of the Fatherland.

Promoting national consciousness and spirit, encouraging the entire people, first of all, businesses and entrepreneurs to build and develop reputable Vietnamese brands in the domestic and international markets.

Third, build economic culture, human resource culture, of which the most important are corporate culture, business culture and entrepreneurial culture.

Corporate culture.

In order for enterprises to become a gathering place, promoting all human resources, multiplying the value of each individual human resource, contributing to the sustainable development of enterprises, it is required that enterprises Build and maintain corporate culture. Corporate culture is the culture of an organization, so it's not just communication culture or business culture as we often think, but it's all cultural values built during the process, the existence and development of the enterprise, influencing the emotions, thinking patterns and behaviors of all members in the enterprise, making the difference between enterprises.

The core of corporate culture is the spirit and values of the enterprise. According to researchers, corporate culture has 5 components, which are: management and business philosophy; motivation of individuals and organizations; prescribed process; information exchange system; movement, rite, ritual.

Business culture.

In a broad sense, business culture is an aspect of culture in society, a culture in business activities, including all material and spiritual values, methods and results of human activity, created and used in business processes.

Business culture manifests itself through all aspects and relationships of business activities, in business organization and management; manifest in business communication. Specifically, the implementation of corporate social responsibilities, such as making full contributions to the state budget, protecting the environment, respecting ethical codes in social relations, business relations, etc. business...; in the ethical qualities, talents and style of the businessman.

In addition, business culture is also reflected in the cultural and spiritual activities of the enterprise. Business culture is influenced by many factors, such as social culture, social institutions, cultural differences and exchanges, as well as the process of globalization.

Business culture has a great role and effect in production and business activities. When culture crystallizes into business activities, it will form a cultured business method, it is an honest and upright way of doing business, stimulating healthy competition, without harming the good traditions and customs of the nation, creating a close relationship between manufacturers, traders, businesses and consumers on the principle of mutual benefit. Only when implementing a cultured business model can high efficiency and sustainable development of the subject be combined.

Entrepreneurial culture.

Entrepreneurial culture can be understood as belonging to the line of individual culture formed in the environment of a successful entrepreneurial culture. It is the entire capital of knowledge and experience expressed as values and behavioral patterns accumulated into an individual to create an entrepreneurial culture - a person with aspiration to get rich, knowledgeable to get rich, dare take risks to get rich by organizing business activities, continuously creating high added value, constantly increasing personal and business assets.

Building corporate culture and entrepreneurial culture with a sense of respect for the law, keeping credibility, and healthy competition for the sustainable development of the country.

Fourth, attach economic growth and human resource development to the realization of social progress and justice.

Social progress and justice are two parallel goals of social development. On the one hand, the ultimate goal of economic development is human development, the ultimate goal of socialism is to realize social progress and justice. On the other hand, economic growth at the same time helps people have more opportunities, access to cultural values, and move society forward. Therefore, building a culture in the economy for the sustainable development of the country needs to ensure the harmony between economic growth and social progress and justice.

Social progress is the movement of society from low to high level, from backward to civilized and modern. According to our Party, social progress during the transition to socialism in our country includes the following criteria: 1- The productive forces develop with increasing scientific content with appropriate production relations in accordance with the socialist orientation; economic growth fast, high quality and sustainable; 2- The people's right to mastery over all aspects of social life is guaranteed; The socialist rule of law state of the people, by the people and for the people is pure and strong; democracy is promoted; discipline is respected; 3- Culture, education - training, science and technology are expanded, people's intellectual level is developed, people-to-people relationships are healthy, bad habits and social evils are promoted. backward; 4- The ecological environment is protected and improved; 5- People have the conditions to gradually develop physically, intellectually, morally and professionally; have an increasingly prosperous, free and happy life; contribute and enjoy the fruits of development equitably.

Social justice is an expression of social progress. The content of the concept of social justice is very broad, so although this concept is very common and popular, it is very complicated and difficult to uniformly measure.

In general, social justice is the fairness in income distribution, development opportunities and conditions for realizing development opportunities. Thus, social justice is a very broad concept that includes economic, political, cultural and social factors. The main measures of social justice are the human development index (HDI), the Lorenz curve, the GINI coefficient, the level of poverty, the level of satisfaction of basic human needs.

4. Conclusion
